DeveloperProviderName A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

OpenIdConnectProviderARNs A list or pillar name that contains a list of OpenID Connect provider ARNs.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.23 salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
boto_datapipeline.present:
- name: my-datapipeline
- pipeline_objects:
  DefaultSchedule:
    name: Every 1 day
    fields:
      period: 1 Day
      type: Schedule
      startAt: FIRST_ACTIVATION_DATE_TIME
- parameter_values:
  myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the `service_name` does not exist

name Name of the service to ensure a data pipeline does not exist for.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_datapipeline.present`(*name*, *pipeline_objects=None*, *pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects'*, *parameter_objects=None*, *parameter_objects_from_pillars='boto_datapipeline_parameter_objects'*, *parameter_values=None*, *parameter_values_from_pillars='boto_datapipeline_parameter_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

name Name of the service to ensure a data pipeline exists for.

pipeline_objects Pipeline objects to use. Will override objects read from pillars.

pipeline_objects_from_pillars The pillar key to use for lookup.

parameter_objects Parameter objects to use. Will override objects read from pillars.

parameter_objects_from_pillars The pillar key to use for lookup.

parameter_values Parameter values to use. Will override values read from pillars.

parameter_values_from_pillars The pillar key to use for lookup.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.24 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKRBj08H
key: askdjghsdfjkghWupUjasdfkdkflgjsdfjajkgghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKRBj08H
```

```
key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkghs
region: us-east-1
```

```
Ensure DynamoDB table does not exist:
boto_dynamodb.absent:
- table_name: new_table
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkghs
- region: us-east-1

Ensure DynamoDB table exists:
boto_dynamodb.present:
- table_name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkghs
- region: us-east-1
- local_indexes:
  - index:
    - name: "primary_id_end_timestamp_index"
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: end_timestamp
    - range_key_data_type: N
- global_indexes:
  - index:
    - name: "name_end_timestamp_index"
    - hash_key: name
    - hash_key_data_type: S
    - range_key: end_timestamp
    - range_key_data_type: N
    - read_capacity_units: 3
    - write_capacity_units: 4
```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```
Ensure DynamoDB table exists:
boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
```

```

    statistic: Sum
    comparison: '>='
    # threshold_percent is used to calculate the actual threshold
    # based on the provisioned capacity for the table.
    threshold_percent: 0.75
    period: 300
    evaluation_periods: 2
    unit: Count
    description: 'DynamoDB ConsumedWriteCapacityUnits'
    alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
    insufficient_data_actions: []
    ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  - region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_dynamodb_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

```

Ensure DynamoDB table exists:

```

boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
      ConsumedWriteCapacityUnits:
        attributes:
          threshold_percent: 0.90
          period: 900

```

`salt.states.boto_dynamodb.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the DynamoDB table does not exist.

name Name of the DynamoDB table.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_dynamodb.present` (*name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backup_configs'*)

Ensure the DynamoDB table exists. Note: all properties of the table can only be set during table creation. Adding or changing indexes or key schema cannot be done after table creation

name Name of the DynamoDB table
table_name Name of the DynamoDB table (deprecated)
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
read_capacity_units The read throughput for this table
write_capacity_units The write throughput for this table
hash_key The name of the attribute that will be used as the hash key for this table
hash_key_data_type The DynamoDB datatype of the hash key
range_key The name of the attribute that will be used as the range key for this table
range_key_data_type The DynamoDB datatype of the range key
local_indexes The local indexes you would like to create
global_indexes The local indexes you would like to create
backup_configs_from_pillars Pillars to use to configure DataPipeline backups

14.16.25 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
```

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
```

```
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

The below code deletes a key pair:

```
delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

salt.states.boto_ec2.eni_absent (*name*, *release_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

name Name tag associated with the ENI.

release_eip True/False - release any EIP associated with the ENI

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.eni_present (*name*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *description=None*, *groups=None*, *source_dest_check=True*, *allocate_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

name Name tag associated with the ENI.

subnet_id The VPC subnet ID the ENI will exist within.

subnet_name The VPC subnet name the ENI will exist within.

private_ip_address The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

description Description of the key.

groups A list of security groups to apply to the ENI.

source_dest_check Boolean specifying whether source/destination checking is enabled on the ENI.

allocate_eip allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

arecords A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the

arecord dict to use the ENI's public IP address

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.instance_absent(name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None)
```

Ensure an EC2 instance does not exist (is stopped and removed).

name (string) - The name of the state definition.

instance_name (string) - The name of the instance.

instance_id (string) - The ID of the instance.

release_eip (bool) - Release any associated EIPs during termination.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

filters (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```
salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None, image_id=None, image_name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type=None, placement=None, kernel_id=None, ramdisk_id=None, vpc_id=None, vpc_name=None, monitoring_enabled=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interfaces=None, network_interface_name=None, network_interface_id=None, attributes=None, target_state=None, public_ip=None, allocation_id=None, allocate_eip=False, region=None, key=None, keyid=None, profile=None)
```

Ensure an EC2 instance is running with the given attributes and state.

name (string) - The name of the state definition. Recommended that this match the instance_name attribute (generally the FQDN of the instance).

instance_name (string) - The name of the instance, generally its FQDN. Exclusive with `instance_id`.

instance_id (string) - The ID of the instance (if known). Exclusive with `instance_name`.

image_id (string) - The ID of the AMI image to run.

image_name (string) - The name of the AMI image to run.

tags (dict) - Tags to apply to the instance.

key_name (string) - The name of the key pair with which to launch instances.

- security_groups** (list of strings) – The names of the EC2 classic security groups with which to associate instances
- user_data** (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.
- instance_type** (string) – The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.
- placement** (string) – The Availability Zone to launch the instance into.
- kernel_id** (string) – The ID of the kernel with which to launch the instances.
- ramdisk_id** (string) – The ID of the RAM disk with which to launch the instances.
- vpc_id** (string) – The ID of a VPC to attach the instance to.
- vpc_name** (string) – The name of a VPC to attach the instance to.
- monitoring_enabled** (bool) – Enable detailed CloudWatch monitoring on the instance.
- subnet_id** (string) – The ID of the subnet within which to launch the instances for VPC.
- subnet_name** (string) – The name of the subnet within which to launch the instances for VPC.
- private_ip_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).
- block_device_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.
- disable_api_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.
- instance_initiated_shutdown_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:
- ‘stop’
 - ‘terminate’
- placement_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.
- client_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
- security_group_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.
- security_group_names** (list of strings) – The names of the VPC security groups with which to associate instances.
- additional_info** (string) – Specifies additional information to make available to the instance(s).
- tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are:”default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.
- instance_profile_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.
- instance_profile_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.
- ebs_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.
- network_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.
- network_interface_name**
(string) – The name of Elastic Network Interface to attach
New in version 2016.11.0.
- network_interface_id**
(string) – The id of Elastic Network Interface to attach
New in version 2016.11.0.
- attributes** (dict) – Instance attributes and value to be applied to the instance. Available options are:
- instanceType – A valid instance type (m1.small)
 - kernel – Kernel ID (None)
 - ramdisk – Ramdisk ID (None)
 - userData – Base64 encoded String (None)

- `disableApiTermination` - Boolean (true)
- `instanceInitiatedShutdownBehavior` - stop|terminate
- `blockDeviceMapping` - List of strings - ie: `['/dev/sda=false']`
- `sourceDestCheck` - Boolean (true)
- `groupSet` - Set of Security Groups or IDs
- `ebsOptimized` - Boolean (false)
- `sriovNetSupport` - String - ie: 'simple'

target_state (string) - The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

public_ip: (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an `allocation_id` instead.

allocation_id: (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a `public_ip` instead.

allocate_eip: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the `'release_eip'` flag to `'instance_absent'`.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key pair

`salt.states.boto_ec2.key_present` (*name*, *save_private=None*, *upload_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure key pair is present.

`salt.states.boto_ec2.snapshot_created` (*name*, *ami_name*, *instance_name*, *wait_until_available=True*, *wait_timeout_seconds=300*, ***kwargs*)

Create a snapshot from the given instance

New in version 2016.3.0.

`salt.states.boto_ec2.volume_absent` (*name*, *volume_name=None*, *volume_id=None*, *instance_name=None*, *instance_id=None*, *device=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

name State definition name.

volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

volume_id Resource ID of the volume.

instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with `'instance_id'`. Requires `'device'`.

instance_id Only remove volume if it is attached to this instance. Exclusive with `'instance_name'`. Requires `'device'`.

device Match by device rather than ID. Requires one of `'instance_name'` or `'instance_id'`.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

```
salt.states.boto_ec2.volumes_tagged(name, tag_maps, authoritative=False, region=None,
                                   key=None, keyid=None, profile=None)
```

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

name State definition name.

tag_maps List of dicts of filters and tags, where `filters` is a dict suitable for passing to the `filters` argument of `boto_ec2.get_all_volumes()`, and `tags` is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the `Name` tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

authoritative Should un-declared tags currently set on matched volumes be deleted? Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.26 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
```

```

- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

# Using a profile from pillars
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

```

`salt.states.boto_elasticache.absent`(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

name Name of the cache cluster.

wait Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.creategroup`(*name*, *primary_cluster_id*, *replication_group_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

name Name of replication group

wait Waits for the group to be available

primary_cluster_id Name of the master cache node

replication_group_description Description for the group

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None,
                                     num_cache_nodes=None, preferred_availability_zone=None, port=None,
                                     cache_parameter_group_name=None,
                                     cache_security_group_names=None,
                                     replication_group_id=None,
                                     auto_minor_version_upgrade=True, security_group_ids=None,
                                     cache_subnet_group_name=None,
                                     engine_version=None, notification_topic_arn=None,
                                     preferred_maintenance_window=None, wait=None,
                                     region=None, key=None, keyid=None, profile=None)

```

Ensure the cache cluster exists.

name Name of the cache cluster (cache cluster id).

engine The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

cache_node_type The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster

num_cache_nodes The number of cache nodes that the cache cluster will have.

preferred_availability_zone The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

port The port number on which each of the cache nodes will accept connections.

cache_parameter_group_name The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

cache_security_group_names A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

replication_group_id The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

auto_minor_version_upgrade Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

security_group_ids One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

cache_subnet_group_name The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

engine_version The version number of the cache engine to be used for this cluster.

notification_topic_arn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

wait Boolean. Wait for confirmation from boto that the cluster is in the available state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, subnet_names=None,
                                                    description=None, tags=None, region=None, key=None,
                                                    keyid=None, profile=None)

```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

name The name for the ElastiCache subnet group. This value is stored as a lowercase string.
subnet_ids A list of VPC subnet IDs for the cache subnet group. Exclusive with `subnet_names`.
subnet_names A list of VPC subnet names for the cache subnet group. Exclusive with `subnet_ids`.
description Subnet group description.
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

14.16.27 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via `package`, or `pip`.

This module accepts explicit `vpc` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure domain exists:
  boto_elasticsearch_domain.present:
    - DomainName: mydomain
    - profile='user-credentials'
    - ElasticsearchClusterConfig:
      InstanceType: "t2.micro.elasticsearch"
      InstanceCount: 1
      DedicatedMasterEnabled: False
      ZoneAwarenessEnabled: False
    - EBSOptions:
      EBSEnabled: True
      VolumeType: "gp2"
      VolumeSize: 10
      Iops: 0
    - AccessPolicies:
      Version: "2012-10-17"
      Statement:
        - Effect: "Allow"
```

```

- Principal:
  AWS: "*"
- Action:
  - "es:*"
- Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
- Condition:
  IPAddress:
    "aws:SourceIp":
      - "127.0.0.1",
      - "127.0.0.2",
- SnapshotOptions:
  AutomatedSnapshotStartHour: 0
- AdvancedOptions:
  rest.action.multi.allow_explicit_index": "true"
- Tags:
  a: "b"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

```

`salt.states.boto_elasticsearch_domain.absent`(*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

name The name of the state definition.

DomainName Name of the domain.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain exists.

name The name of the state definition

DomainName Name of the domain.

ElasticsearchClusterConfig Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) -- The instance type for an Elasticsearch cluster.

InstanceCount (integer) -- The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) -- The instance type for a dedicated master node.

DedicatedMasterCount (integer) -- Total number of dedicated master nodes, active and on standby, for the cluster.

EBSOptions Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) -- Specifies whether EBS-based storage is enabled.

VolumeType (string) -- Specifies the volume type for EBS-based storage.

VolumeSize (integer) -- Integer to specify the size of an EBS volume.

Iops (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

AccessPolicies IAM access policy

SnapshotOptions Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

AdvancedOptions Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.28 salt.states.boto_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure myelb ELB exists:
boto_elb.present:
  - name: myelb
  - region: us-east-1
  - availability_zones:
    - us-east-1a
    - us-east-1c
    - us-east-1d
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  - listeners:
```

```

- elb_port: 443
  instance_port: 80
  elb_protocol: HTTPS
  instance_protocol: HTTP
  certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
  policies:
    - my-ssl-policy
    - cookie-policy
- elb_port: 8210
  instance_port: 8210
  elb_protocol: TCP
- backends:
  - instance_port: 80
    policies:
      - enable-proxy-protocol
- health_check:
  target: 'HTTP:80/'
- attributes:
  cross_zone_load_balancing:
    enabled: true
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5
  connecting_settings:
    idle_timeout: 60
- cnames:
  - name: mycname.example.com.
    zone: example.com.
    ttl: 60
  - name: myothercname.example.com.
    zone: example.com.
- security_groups:
  - my-security-group
- policies:
  - policy_name: my-ssl-policy
    policy_type: SSLNegotiationPolicyType
    policy:
      Protocol-TLSv1.2: true
      Protocol-SSLv3: false
      Server-Defined-Cipher-Order: true
      ECDHE-ECDSA-AES128-GCM-SHA256: true
  - policy_name: cookie-policy
    policy_type: LBCookieStickinessPolicyType
    policy: {} # no policy means this is a session cookie
  - policy_name: enable-proxy-protocol
    policy_type: ProxyProtocolPolicyType
    policy:
      ProxyProtocol: true

```

```
# Using a profile from pillars
```

```
Ensure myelb ELB exists:
```

```

boto_elb.present:
- name: myelb
- region: us-east-1
- profile: myelbprofile

```

```
# Passing in a profile
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key `boto_elb_attributes`, which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```
my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
  s3_bucket_name: 'mybucket'
  s3_bucket_prefix: 'my-logs'
  emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - attributes_from_pillar: my_elb_attributes
    # override cross_zone_load_balancing:enabled
    - attributes:
        cross_zone_load_balancing:
          enabled: false
    - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms:
        UnHealthyHostCount:
          name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
          attributes:
            metric: UnHealthyHostCount
            namespace: AWS/ELB
            statistic: Average
            comparison: '>='
            threshold: 1.0
            period: 600
```

```

evaluation_periods: 6
unit: null
description: ELB UnHealthyHostCount
alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that ``boto_elb_alarms`` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

Overriding the alarm values on the resource:

```

Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
    # override UnHealthyHostCount:attributes:threshold
    - alarms:
      UnHealthyHostCount:
        attributes:
          threshold: 2.0

```

Tags can also be set:

New in version 2016.3.0.

```

Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
      MyTag: 'My Tag Value'
      OtherTag: 'My Other Value'

```

`salt.states.boto_elb.absent` (*name, region=None, key=None, keyid=None, profile=None*)
Ensure an ELB does not exist

name name of the ELB

```
salt.states.boto_elb.present(name, listeners, availability_zones=None, subnets=None, subnet_names=None, security_groups=None, scheme='internet-facing', health_check=None, attributes=None, attributes_from_pillar='boto_elb_attributes', cnames=None, alarms=None, alarms_from_pillar='boto_elb_alarms', policies=None, policies_from_pillar='boto_elb_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, tags=None, instance_ids=None, instance_names=None)
```

Ensure the ELB exists.

name Name of the ELB.

availability_zones A list of availability zones for this ELB.

listeners A list of listener lists; example:

```
[
  [
    ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
    ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/↪mycert']
  ]
]
```

subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.

subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.

security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

scheme The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

health_check A dict defining the health check for this ELB.

attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the [salt.modules.boto_elb.set_attributes](#) function for recognized attributes.

attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

cnames A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: `name`, `zone`, `ttl`, and `identifier`. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the `cnames` dict will be passed to the state as `kwargs`.

See the [salt.states.boto_route53](#) state for information about these attributes.

alarms: a dictionary of `name->boto_cloudwatch_alarm` sections to be associated with this ELB. All attributes should be specified except for `dimension` which will be automatically set to this ELB.

See the [salt.states.boto_cloudwatch_alarm](#) state for information about these attributes.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

tags dict of tags

instance_ids list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_names.

instance_names list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_ids.

```
salt.states.boto_elb.register_instances(name, instances, region=None, key=None,
                                       keyid=None, profile=None)
```

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

name The name of the Elastic Load Balancer to add EC2 instances to.

instances A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2
```

14.16.29 salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
```

```
- policies:
  mypolicy: |
    {
      "Version": "2012-10-17",
      "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
    }
- password: NewPassword$$1
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
          "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"}]
        }
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
change-policy:
  boto_iam.account_policy:
    - change_password: True
    - region: eu-west-1

`salt.states.boto_iam.account_policy` (*name=None, allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, password_reuse_prevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None*)

Change account policy.

New in version 2015.8.0.

name (string) The name of the account policy

allow_users_to_change_password (bool) Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

hard_expiry (bool) Prevents IAM users from setting a new password after their password has expired.

max_password_age (int) The number of days that an IAM user password is valid.

minimum_password_length (int) The minimum number of characters allowed in an IAM user password.

password_reuse_prevention (int) Specifies the number of previous passwords that IAM users are prevented from reusing.

require_lowercase_characters (bool) Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

require_numbers (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

require_symbols (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: `!@#$%^&*()_+ -= [] {} | ``

require_uppercase_characters (bool) Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string)

`salt.states.boto_iam.group_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM group is absent.

name (string) The name of the group.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None, managed_policies=None, users=None, path='/', region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM group is present

name (string) The name of the new group.

path (string) The path for the group, defaults to `/'

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of policy names or ARNs that should be attached to this group.

users (list) A list of users to be added to the group.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.keys_absent(access_keys, user_name, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM user access_key_id is absent.

access_key_id (list) A list of access key ids

user_name (string) The username of the user

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.keys_present(name, number, save_dir, region=None, key=None, keyid=None, profile=None, save_format='{2}\n{0}\n{3}\n{1}\n')
```

New in version 2015.8.0.

Ensure the IAM access keys are present.

name (string) The name of the new user.

number (int) Number of keys that user should have.

save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

save_format (dict) Save format is repeated for each key. Default format is ``{2}{0}{3}{1}``, where {0} and {1} are placeholders for new key_id and key respectively, whereas {2} and {3} are ``key_id-{number}`` and ``key-{number}`` strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name, region=None, key=None, keyid=None, profile=None*)
New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

name (string) The name of the new policy.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_present` (*name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)
New in version 2015.8.0.

Ensure the IAM managed policy is present

name (string) The name of the new policy.

policy_document (dict) The document of the new policy

path (string) The path in which the policy will be created. Default is `/'.

description (string) Description

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the SAML provider with the specified name is absent.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_present` (*name, saml_metadata_document, region=None, key=None, keyid=None, profile=None*)

Ensure the SAML provider with the specified name is present.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.server_cert_absent` (*name, region=None, key=None, keyid=None, profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None,
                                         path=None, region=None, key=None, keyid=None,
                                         profile=None)
```

Crete server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

public_key (string) The contents of the public key certificate in PEM-encoded format.

private_key (string) The contents of the private key in PEM-encoded format.

cert_chain (string) The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

path (string) The path for the server certificate.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True,
                                  delete_profile=True, region=None, key=None, keyid=None,
                                  profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

name (string) The name of the new user.

delete_keys (bool) Delete all keys from user.

delete_mfa_devices (bool) Delete all mfa devices from user.

New in version 2016.3.0.

delete_profile (bool) Delete profile from user.

New in version 2016.3.0.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.user_present(name, policies=None, policies_from_pillars=None, managed_policies=None,
                                   password=None, path=None, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is present

name (string) The name of the new user.

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of managed policy names or ARNs that should be attached to this user.

password (string) The password for the new user. Must comply with account policy.
path (string) The path of the user. Default is `/'.

New in version 2015.8.2.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.30 salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQLSPolicy:
        Statement:
          - Action:
              - sqs:*
            Effect: Allow
            Resource:
              - arn:aws:sqs:*:*:*
            Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
```

```

        - s3:GetObject
      Effect: Allow
      Resource:
        - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdjfjkghWupUjasdfkldfklgjsdfjajkghs
      region: us-east-1

```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

name Name of the IAM role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_iam_role.present` (*name*, *policy_document=None*, *path=None*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *create_instance_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*)

Ensure the IAM role exists.

name Name of the IAM role.

policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policies A dict of IAM role policies.

policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

managed_policies A list of (AWS or Customer) managed policies to be attached to the role.

create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

14.16.31 salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure policy exists:
  boto_iot.policy_present:
    - policyName: mypolicy
    - policyDocument:
        Version: "2012-10-17"
        Statement:
          Action:
            - iot:Publish
          Resource:
            - "*"
          Effect: "Allow"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

```
Ensure topic rule exists:
  boto_iot.topic_rule_present:
    - ruleName: myrule
    - sql: "SELECT * FROM 'iot/test'"
    - description: 'test rule'
    - ruleDisabled: false
    - actions:
```

```

- lambda:
  functionArn: "arn:aws:us-east-1:1234:function/functionname"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs

```

`salt.states.boto_iot.policy_absent`(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

name The name of the state definition.

policyName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_attached`(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_detached`(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition.

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_present`(*name*, *policyName*, *policyDocument*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy exists.

name The name of the state definition

policyName Name of the policy.

policyDocument The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_absent`(*name*, *thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

name The name of the state definition.

thingTypeName Name of the thing type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.thing_type_present(name, thingTypeName, thingTypeDescription,
                                       searchableAttributesList, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure thing type exists.

New in version 2016.11.0.

name The name of the state definition

thingTypeName Name of the thing type

thingTypeDescription Description of the thing type

searchableAttributesList List of string attributes that are searchable for the thing type

region Region to connect to.

key Secret key to be used.

keyid Access key to be used

profile A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

```
salt.states.boto_iot.topic_rule_absent(name, ruleName, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure topic rule with passed properties is absent.

name The name of the state definition.

ruleName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.topic_rule_present(name, ruleName, sql, actions, description='',
                                       ruleDisabled=False, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure topic rule exists.

name The name of the state definition

ruleName Name of the rule.

sql The SQL statement used to query the topic.

actions The actions associated with the rule.

description The description of the rule.

ruleDisable Specifies whether the rule is disabled.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.32 salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdjkgHwupUjasdfldkflgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdjkgHwupUjasdfldkflgjsdfjajkghs
  region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdjkgHwupUjasdfldkflgjsdfjajkghs
```

```
salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
                                grants=None, manage_grants=False, key_rotation=False,
                                enabled=True, region=None, key=None, keyid=None, pro-
                                file=None)
```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

name Name of the key.

policy Key usage policy.

description Description of the key.

key_usage Specifies the intended use of the key. Can only be set on creation, defaults to `ENCRYPT_DECRYPT`, which is also the only supported option.

grants A list of grants to apply to the key. Not currently implemented.

manage_grants Whether or not to manage grants. False by default, which will not manage any grants.

key_rotation Whether or not key rotation is enabled for the key. False by default.

enabled Whether or not the key is enabled. True by default.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.33 salt.states.boto_lambda module

Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
  region: us-east-1
```

```
Ensure function exists:
  boto_lambda.function_present:
    - FunctionName: myfunction
    - Runtime: python2.7
    - Role: iam_role_name
    - Handler: entry_function
    - ZipFile: code.zip
    - S3Bucket: bucketname
    - S3Key: keyname
    - S3ObjectVersion: version
    - Description: "My Lambda Function"
    - Timeout: 3
    - MemorySize: 128
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

`salt.states.boto_lambda.alias_absent` (*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

Name Name of the alias.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present`(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

name The name of the state definition.

FunctionName Name of the function for which you want to create an alias.

Name The name of the alias to be created.

FunctionVersion Function version for which you are creating the alias.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

name The name of the state definition.

EventSourceArn ARN of the event source.

FunctionName Name of the lambda function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_present`(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

name The name of the state definition.

EventSourceArn The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

FunctionName The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, ``Thumbnail``) or you can specify Amazon Resource Name (ARN) of the function (for example, ``arn:aws:lambda:us-west-2:account-id:function:ThumbNail``). AWS Lambda also allows you to specify only the account ID qualifier (for example, ``account-id:Thumbnail``). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

StartingPosition The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)

Enabled Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

BatchSize The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is

100 records.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_absent(name, FunctionName, region=None, key=None,
                                       keyid=None, profile=None)
```

Ensure function with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler,
                                       ZipFile=None, S3Bucket=None, S3Key=None,
                                       S3ObjectVersion=None, Description='', Timeout=3,
                                       MemorySize=128, Permissions=None, RoleRe-
                                       tries=5, region=None, key=None, keyid=None,
                                       profile=None, VpcConfig=None)
```

Ensure function exists.

name The name of the state definition

FunctionName Name of the Function.

Runtime The Runtime environment for the function. One of `nodejs`, `java8`, or `python2.7`

Role The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

Handler The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.class-name.

ZipFile A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

S3Bucket Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3Key The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3ObjectVersion The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

Timeout The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

MemorySize The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

VpcConfig If your Lambda function accesses resources in a VPC, you provide this parameter identifying the list of security group IDs and subnet IDs. These must belong to the same VPC. You must provide at least one security group and one subnet ID.

New in version 2016.11.0.

Permissions A list of permission definitions to be added to the function's policy

RoleRetries IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.34 salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
      - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
      - '/dev/sda1':
```

```

        size: 20
        volume_type: 'io1'
        iops: 220
        delete_on_termination: true
- cloud_init:
  boothooks:
    'disable-master.sh': |
      #!/bin/bash
      echo "manual" > /etc/init/salt-master.override
  scripts:
    'run_salt.sh': |
      #!/bin/bash

      add-apt-repository -y ppa:saltstack/salt
      apt-get update
      apt-get install -y salt-minion
      salt-call state.highstate
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile: myprofile

# Passing in a profile.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
  region: us-east-1

```

`salt.states.boto_lc.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

name Name of the launch configuration.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lc.present` (*name*, *image_id*, *key_name=None*, *security_groups=None*, *user_data=None*, *cloud_init=None*, *instance_type='m1.small'*, *kernel_id=None*, *ramdisk_id=None*, *block_device_mappings=None*, *instance_monitoring=False*, *spot_price=None*, *instance_profile_name=None*, *ebs_optimized=False*, *associate_public_ip_address=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the launch configuration exists.

name Name of the launch configuration.

image_id AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

key_name Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

security_groups List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

user_data The user data available to launched EC2 instances.

cloud_init A dict of cloud_init configuration. Currently supported values: scripts, cloud-config. Mutually exclusive with user_data.

instance_type The instance type. ex: m1.small.

kernel_id The kernel id for the instance.

ramdisk_id The RAM disk ID for the instance.

block_device_mappings A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.

volume_type Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

delete_on_termination Indicates whether to delete the volume on instance termination (true) or not (false).

iops For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.

size Desired volume size (in GiB).

encrypted Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

instance_monitoring Whether instances in group are launched with detailed monitoring.

spot_price The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.35 salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myrds RDS exists:
  boto_rds.present:
    - name: myrds
    - allocated_storage: 5
    - storage_type: standard
    - db_instance_class: db.t2.micro
    - engine: MySQL
    - master_username: myuser
    - master_user_password: mypass
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
    - tags:
      -
        - key1
        - value1
      -
        - key2
        - value2
```

```
Ensure parameter group exists:
  create-parameter-group:
    boto_rds.parameter_present:
      - name: myparametergroup
      - db_parameter_group_family: mysql5.6
      - description: "parameter group family"
      - parameters:
        - binlog_cache_size: 32768
        - binlog_checksum: CRC32
      - region: eu-west-1
```

depends boto3

salt.states.boto_rds.absent (*name, skip_final_snapshot=None, final_db_snapshot_identifier=None, tags=None, region=None, key=None, keyid=None, profile=None, wait_for_deletion=True, timeout=180*)

Ensure RDS instance is absent.

name Name of the RDS instance.

skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.

timeout (in seconds) The amount of time that can pass before raising an Exception.

```
salt.states.boto_rds.parameter_present(name, db_parameter_group_family, description,
                                       parameters=None, apply_method='pending-reboot',
                                       tags=None, region=None, key=None, keyid=None,
                                       profile=None)
```

Ensure DB parameter group exists and update parameters.

name The name for the parameter group.

db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

description Parameter group description.

parameters The DB parameters that need to be changed of type dictionary.

apply_method The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username,
                             master_user_password, db_name=None, storage_type=None, db_security_groups=None,
                             vpc_security_group_ids=None, availability_zone=None, db_subnet_group_name=None,
                             preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None,
                             tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None,
                             backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None,
                             auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None,
                             publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None,
                             key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)
```

Ensure RDS instance exists.

name Name of the RDS state definition.

allocated_storage The amount of storage (in gigabytes) to be initially allocated for the database instance.

db_instance_class The compute and memory capacity of the Amazon RDS DB instance.

engine The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

master_username The name of master user for the client DB instance.

master_user_password The password for the master database user. Can be any printable ASCII character except ``/`,`'`,`"`,`@``.

- db_name** The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance
- storage_type** Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the Iops parameter.
- db_security_groups** A list of DB security groups to associate with this DB instance.
- vpc_security_group_ids** A list of EC2 VPC security groups to associate with this DB instance.
- availability_zone** The EC2 Availability Zone that the database instance will be created in.
- db_subnet_group_name** A DB subnet group to associate with this DB instance.
- preferred_maintenance_window** The weekly time range (in UTC) during which system maintenance can occur.
- db_parameter_group_name** A DB parameter group to associate with this DB instance.
- db_cluster_identifier** If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.
- tde_credential_arn** The ARN from the Key Store with which the instance is associated for TDE encryption.
- tde_credential_password** The password to use for TDE encryption if an encryption key is not used.
- storage_encrypted** Specifies whether the DB instance is encrypted.
- kms_keyid** If storage_encrypted is true, the KMS key identifier for the encrypted DB instance.
- backup_retention_period** The number of days for which automated backups are retained.
- preferred_backup_window** The daily time range during which automated backups are created if automated backups are enabled.
- port** The port number on which the database accepts connections.
- multi_az** Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.
- engine_version** The version number of the database engine to use.
- auto_minor_version_upgrade** Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.
- license_model** License model information for this DB instance.
- iops** The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.
- option_group_name** Indicates that the DB instance should be associated with the specified option group.
- character_set_name** For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.
- publicly_accessible** Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.
- wait_status** Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up
- tags** A list of tags.
- copy_tags_to_snapshot** Specifies whether tags are copied from the DB instance to snapshots of the DB instance.
- region** Region to connect to.
- domain** The identifier of the Active Directory Domain.
- key** AWS secret key to be used.
- keyid** AWS access key to be used.
- monitoring_interval** The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.
- monitoring_role_arn** The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.
- domain_iam_role_name** Specify the name of the IAM role to be used when making API calls to the Directory Service.
- promotion_tier** A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
                                     availability_zone=None, port=None,
                                     auto_minor_version_upgrade=None, iops=None, op-
                                     tion_group_name=None, publicly_accessible=None,
                                     tags=None, region=None, key=None, keyid=None,
                                     profile=None, db_parameter_group_name=None)
```

Ensure RDS replica exists.

```
Ensure myrds replica RDS exists:
boto_rds.create_replica:
- name: myreplica
- source: mydb
```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, sub-
                                         net_names=None, tags=None, region=None,
                                         key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

name The name for the DB subnet group. This value is stored as a lowercase string.

subnet_ids A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

subnet_names A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

description Subnet group description.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.36 salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkdflkjlsdfjajkgsh
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

Using a profile from pillars

```
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile: myprofile
```

Passing in a profile

```
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

salt.states.boto_route53.absent(*name, zone, record_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False*)

Ensure the Route53 record is deleted.

name Name of the record.

zone The zone to delete the record from.

record_type The record type (A, NS, MX, TXT, etc.)

identifier An identifier to match for deletion.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using `split_dns`, specify if this is the private zone.

salt.states.boto_route53.hosted_zone_absent(*name, domain_name=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 Hosted Zone described is absent

name The name of the state definition.

domain_name The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

```
salt.states.boto_route53.hosted_zone_present(name, domain_name=None, private_zone=False, comment='', vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private_zone (AWS API limitation).
- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc_id (same story - we really need to rewrite this module with boto3)
- vpc_name (really just a pointer to vpc_id anyway).
- vpc_region (again, supported in boto3 but not boto2).

name The name of the state definition. This will be used as the `caller_ref` param if/when creating the hosted zone.

domain_name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

comment Any comments you want to include about the hosted zone.

private_zone Set True if creating a private hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored if passed for a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored if passed for a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

```
salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

name Name of the record.

value

Value of the record. As a special case, you can pass in: private:<Name tag> to have the function autodetermine the private IP public:<Name tag> to have the function autodetermine the public IP

zone The zone to create the record in.

record_type The record type (A, NS, MX, TXT, etc.)

ttl The time to live for the record.

identifier The unique identifier to use for this record.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using split_dns, specify if this is the private zone.

14.16.37 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure bucket exists:
  boto_s3_bucket.present:
    - Bucket: mybucket
    - LocationConstraint: EU
    - ACL:
      - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
    - CORSRules:
      - AllowedHeaders: []
        AllowedMethods: ["GET"]
        AllowedOrigins: ["*"]

```

```

        ReplaceKeyWith: "string"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdfldkfdklgjsdfjajkghs

```

`salt.states.boto_s3_bucket.absent`(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

name The name of the state definition.

Bucket Name of the bucket.

Force Empty the bucket first if necessary - Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_s3_bucket.present`(*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket exists.

name The name of the state definition

Bucket Name of the bucket.

LocationConstraint `EU'|eu-west-1'|us-west-1'|us-west-2'|ap-southeast-1'|ap-southeast-2'|ap-northeast-1'|sa-east-1'|cn-north-1'|eu-central-1'

ACL The permissions on a bucket using access control lists (ACL).

CORSRules The cors configuration for a bucket.

LifecycleConfiguration Lifecycle configuration for your bucket

Logging The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

NotificationConfiguration notifications of specified events for a bucket

Policy Policy on the bucket

Replication Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

RequestPayment The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

Tagging A dictionary of tags that should be set on the bucket

Versioning The versioning state of the bucket

Website The website configuration of the bucket

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.38 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - rules:
      - ip_protocol: tcp
        from_port: 80
        to_port: 80
        cidr_ip:
          - 10.0.0.0/0
          - 192.168.0.0/0
      - ip_protocol: icmp
        from_port: -1
        to_port: -1
        source_group_name: mysecgroup
    - rules_egress:
      - ip_protocol: all
        from_port: -1
        to_port: -1
        cidr_ip:
          - 10.0.0.0/0
          - 192.168.0.0/0
    - tags:
      SomeTag: 'My Tag Value'
      SomeOtherTag: 'Other Tag Value'
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

Using a profile from pillars

```
Ensure mysecgroup exists:
  boto_secgroup.present:
```

```

- name: mysecgroup
- description: My security group
- profile: myprofile

# Passing in a profile
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
      region: us-east-1

```

Note: When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_secgroup.absent` (*name*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a security group with the specified name does not exist.

name Name of the security group.

vpc_id The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.

vpc_name The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

`salt.states.boto_secgroup.present` (*name*, *description*, *vpc_id=None*, *vpc_name=None*, *rules=None*, *rules_egress=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *tags=None*)

Ensure the security group exists with the specified rules.

name Name of the security group.

description A description of this security group.

vpc_id The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.

vpc_name The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

rules A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

rules_egress A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key`, and `keyid`.

tags List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

14.16.39 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

salt.states.boto_sns.absent (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

name Name of the SNS topic.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

unsubscribe If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present`(*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

name Name of the SNS topic.

subscriptions List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
  {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
  {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.40 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
  region: us-east-1
```

```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
    - attributes:
        ReceiveMessageWaitTimeSeconds: 20
```

```
# Using a profile from pillars
```

```

myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile

# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

```

salt.states.boto_sqs.absent (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

name Name of the SQS queue.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_sqs.present (*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SQS queue exists.

name Name of the SQS queue.

attributes A dict of key/value SQS attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.41 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1

```

```

aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
        region: us-east-1

```

```

Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
    - subnet_names:
      - subnet1
      - subnet2
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_id: pcx-1873c371
    - region: us-west-2

```

VPC peering connections can be deleted, as shown below.

```

delete a named vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering

```

Delete also accepts a VPC peering connection id.

```

delete a vpc peering connection by id:
  boto_vpc.delete_vpc_peering_connection:
    - conn_id: pcx-1873c371

```

`salt.states.boto_vpc.absent`(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

name Name of the VPC.

tags A list of tags. All tags must match.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.accept_vpc_peering_connection`(*name=None*, *conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state

conn_id The connection ID to accept. Exclusive with `conn_name`. String type.

conn_name The name of the VPC peering connection to accept. Exclusive with `conn_id`. String type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2
```

salt.states.boto_vpc.delete_vpc_peering_connection(*name*, *conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

name Name of the state

conn_id ID of the peering connection to delete. Exclusive with *conn_name*.

conn_name The name of the peering connection to delete. Exclusive with *conn_id*.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both *conn_name* and *conn_id* will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

salt.states.boto_vpc.dhcp_options_absent(*name=None*, *dhcp_options_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist.

name (string) Name of the DHCP options set.

dhcp_options_id (string) Id of the DHCP options set.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.dhcp_options_present` (*name*, *dhcp_options_id=None*, *vpc_name=None*, *vpc_id=None*, *domain_name=None*, *domain_name_servers=None*, *ntp_servers=None*, *netbios_name_servers=None*, *netbios_node_type=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or `dhcp_options_id` param.

name (string) Name of the DHCP options.

vpc_name (string) Name of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

vpc_id (string) Id of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

domain_name (string) Domain name to be associated with this option set.

domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.

ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.

netbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.

netbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

tags (dict of key:value pairs) A set of tags to be added.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent` (*name*, *detach=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named internet gateway is absent.

name Name of the internet gateway.

detach First detach the internet gateway from a VPC, if attached.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present` (*name*, *vpc_name=None*, *vpc_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an internet gateway exists.

name Name of the internet gateway.

vpc_name Name of the VPC to which the internet gateway should be attached.

vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of `vpc_name` or `vpc_id` may be provided.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent` (*name=None, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, wait_for_delete_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

name Name of the state.

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.nat_gateway_present` (*name, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet
```

name Name of the state

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.present` (*name, cidr_block, instance_tenancy=None, dns_support=None, dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure VPC exists.

name Name of the VPC.

cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

instance_tenancy Instances launched in this VPC will be in single-tenant or dedicated hardware.

dns_support Indicates whether the DNS resolution is supported for the VPC.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, region=None,
                                                    key=None,
                                                    keyid=None, profile=None)
```

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name. String type.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer_vpc_id. String type.

conn_name The (optional) name to use for this VPC peering connection. String type.

peer_owner_id ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

```
salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None,
                                         profile=None)
```

Ensure the named route table is absent.

name Name of the route table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None,
                                         routes=None, subnet_ids=None, subnet_names=None,
                                         tags=None, region=None, key=None, keyid=None,
                                         profile=None)
```

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```

boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: eni-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
  - subnet_names:
    - subnet1
    - subnet2

```

name Name of the route table.

vpc_name Name of the VPC with which the route table should be associated.

vpc_id Id of the VPC with which the route table should be associated. Either `vpc_name` or `vpc_id` must be provided.

routes A list of routes. Each route has a cidr and a target.

subnet_ids A list of subnet ids to associate

subnet_names A list of subnet names to associate

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_absent (*name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

name Name of the subnet.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_present (*name, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None*)

Ensure a subnet exists.

name Name of the subnet.

cidr_block The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

vpc_name Name of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

vpc_id Id of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

availability_zone AZ in which the subnet should be placed.

tags A list of tags.

route_table_id A route table ID to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, re-
                                                    gion=None, key=None,
                                                    keyid=None, profile=None)
```

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with `requester_vpc_name`.

requester_vpc_name Name tag of the requesting VPC. Exclusive with `requester_vpc_id`.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with `peer_vpc_id`.

conn_name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321
```

14.16.42 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that `npm`, `git` and `bower` must be installed for these states to be available, so `bower` states should include `requisites` to `pkg.installed` states for the packages which provide `npm` and `git` (simply `npm` and `git` in most cases), and `npm.installed` state for the package which provides `bower`.

Example:

```

npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower

```

`salt.states.bower.bootstrap`(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute `bower install` on the specified directory.

user The user to run Bower with

`salt.states.bower.installed`(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```

underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project

```

name The package to install

dir The target directory in which to install the package

pkgs A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument

user The user to run Bower with

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.removed`(*name*, *dir*, *user=None*)

Verify that the given package is not installed.

dir The target directory in which to install the package

user The user to run Bower with

14.16.43 salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

```
cabal-install: pkg.installed
```

```
ShellCheck:
```

```
  cabal.installed:
```

- require: - pkg: cabal-install

`salt.states.cabal.installed` (*name*, *pkgs=None*, *user=None*, *install_global=False*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
ShellCheck-0.3.5:
```

```
  cabal:
    - installed:
```

name The package to install

user The user to run cabal install with

install_global Install package globally instead of locally

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed` (*name*, *user=None*, *env=None*)

Verify that given package is not installed.

14.16.44 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

`salt.states.chef.client` (*name*, ***kwargs*)

name Unique identifier for the state. Does not affect the Chef run.

server The chef server URL

client_key Set the client key file location

config The configuration file to use

config-file-jail Directory under which config files are allowed to be loaded (no `client.rb` or `knife.rb` outside this path will be loaded).

environment Set the Chef Environment on the node

group Group to set privilege to

json-attributes Load attributes from a JSON file or URL

localmode Point chef-client at local repository if True

log_level Set the log level (debug, info, warn, error, fatal)

logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
pid Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist Permanently replace current run list with specified items
user User to set privilege to
validation_key Set the validation key file location, used for registering new clients

salt.states.chef.solo(*name*, ***kwargs*)
name Unique identifier for the state. Does not affect the Chef run.
config The configuration file to use
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to

14.16.45 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

salt.states.chocolatey.install(**args*, ***kwargs*)
 Deprecated, please use `installed`. This function will be removed in Salt Nitrogen.

salt.states.chocolatey.installed(*name*, *version=None*, *source=None*, *force=False*,
pre_versions=False, *install_args=None*, *override_args=False*,
force_x86=False, *package_args=None*)

Installs a package if not already installed

name The name of the package to be installed.
version Install a specific version of the package. Defaults to latest version.
source Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed.
force Reinstall the current version of an existing package. Default is false.
pre_versions Include pre-release packages. Default is False.
install_args A list of install arguments you want to pass to the installation process i.e product key or feature list
override_args Set to true if you want to override the original install arguments (for the native installer)in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments
force_x86 Force x86 (32bit) installation on 64 bit systems. Defaults to false.
package_args A list of arguments you want to pass to the package

```

Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
  
```

salt.states.chocolatey.uninstall(**args*, ***kwargs*)

Deprecated, please use `uninstalled`. This function will be removed in Salt Nitrogen.

```
salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None, override_args=False)
```

Uninstalls a package

name The name of the package to be uninstalled

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller)in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

14.16.46 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

```
salt.states.chronos_job.absent(name)
```

Ensure that the chronos job with the given name is not present.

Parameters **name** -- The app name

Returns A standard Salt changes dictionary

```
salt.states.chronos_job.config(name, config)
```

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

- **name** -- The job name
- **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

14.16.47 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

```
salt.states.cloud.absent(name, onlyif=None, unless=None)
```

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

name The name of the instance to destroy
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed

`salt.states.cloud.present` (*name*, *cloud_provider*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

name The name of the instance to create
cloud_provider The name of the cloud provider to use
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed
opts Any extra opts that need to be used

`salt.states.cloud.profile` (*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

name The name of the instance to create
profile The name of the cloud profile to use
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed
kwargs Any profile override or addition
opts Any extra opts that need to be used

`salt.states.cloud.volume_absent` (*name*, *provider=None*, ***kwargs*)

Check that a block volume exists.

`salt.states.cloud.volume_attached` (*name*, *server_name*, *provider=None*, ***kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached` (*name*, *server_name=None*, *provider=None*, ***kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present` (*name*, *provider=None*, ***kwargs*)

Check that a block volume exists.

14.16.48 salt.states.cmd

Execution of arbitrary commands

The `cmd` state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
date > /tmp/salt-run:
cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
> /var/log/messages:
cmd.run:
- unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
cmd.run:
- creates: /tmp/foo
```

`creates` also accepts a list of files:

```
echo 'foo' | tee /tmp/bar > /tmp/baz:
cmd.run:
- creates:
  - /tmp/bar
  - /tmp/baz
```

Note: The `creates` option was added to version 2014.7.0

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the `stateful` argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

Using the ``Stateful'' Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. If there's a comment then it will be used as the comment of the state.

Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. The stateful argument can optionally include a `test_name` parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

Note: Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

`cmd.wait` will be deprecated in future due to the confusion it causes. The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.call`(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, out-put_loglevel='debug', use_vt=False, **kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments (`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
  'comment': result if isinstance(result, string_types) else ''
}
```

`salt.states.cmd.mod_run_check`(*cmd_kwargs*, *onlyif*, *unless*, *creates*)

Execute the *onlyif* and *unless* logic. Return a result dict if: * *onlyif* failed (*onlyif* != 0) * *unless* succeeded (*unless* == 0) else return True

`salt.states.cmd.mod_watch`(*name*, ***kwargs*)

Execute a `cmd` function based on a watch call

`salt.states.cmd.run`(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *quiet=False*, *timeout=None*, *ignore_timeout=False*, *use_vt=False*, ***kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the *onlyif* option returns true

unless A command to run as a check, only run the named command if the command passed to the *unless* option returns false

cwd The current working directory to execute the command in, defaults to `/root`

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
```

```
- name: ls -l /
- env:
  - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

umask The umask (in octal) to use when running the command.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

quiet The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the 2014.1.0 release, and is being replaced with `output_loglevel: quiet`.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Note: `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True
```

`salt.states.cmd.script` (*name, source=None, template=None, onlyif=None, unless=None, creates=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, timeout=None, use_vt=False, output_loglevel='debug', defaults=None, context=None, **kwargs*)

Download a script and execute it with specified arguments.

source The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name Either ```cmd arg1 arg2 arg3..''` (`cmd` is not used) or a source ```salt://...''`.

onlyif Run the named command only if the command passed to the `onlyif` option returns true

unless Run the named command only if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to `/root`

runas The name of the user to run the command as

shell The shell to use for execution. The default is set in `grains['shell']`

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
```

```
- env:
  - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

saltenv [base] The Salt environment to use

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

args String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3``

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults New in version 2016.3.0.

Default context passed to the template.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

```
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None,
                    shell=None, env=(), stateful=False, umask=None, output_loglevel='debug',
                    use_vt=False, **kwargs)
```

Run the given command only if the watch statement calls it.

Note: Use `cmd.run` with `onchange` instead.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

- onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true
- unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false
- cwd** The current working directory to execute the command in, defaults to `/root`
- runas** The user name to run the command as
- shell** The shell to use for execution, defaults to `/bin/sh`
- env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- umask** The umask (in octal) to use when running the command.
- stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.
- creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

- output_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: `DEBUG`) regardless, unless `quiet` is used for this value.
- use_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

`salt.states.cmd.wait_script`(*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *use_vt=False*, *output_loglevel='debug'*, ***kwargs*)

Download a script from a remote source and execute it only if a watch statement calls it.

source The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`

template If this setting is applied then the named templating engine will be used to render the downloaded file, currently `jinja`, `mako`, and `wempy` are supported

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

- onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true
- unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false
- cwd** The current working directory to execute the command in, defaults to `/root`
- runas** The user name to run the command as
- shell** The shell to use for execution, defaults to the shell grain
- env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal ``$PATH``:

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- umask** The umask (in octal) to use when running the command.
- stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the ``Stateful'' Argument](#) section.
- use_vt**

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- output_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: `DEBUG`) regardless, unless `quiet` is used for this value.

14.16.49 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```
get-composer:
  cmd.run:
```

```

- name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
- unless: test -f /usr/local/bin/composer
- cwd: /root/

install-composer:
  cmd.wait:
  - name: mv /root/composer.phar /usr/local/bin/composer
  - cwd: /root/
  - watch:
    - cmd: get-composer

/path/to/project:
  composer.installed:
  - no_dev: true
  - require:
    - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
  - composer: /path/to/composer.phar
  - php: /usr/local/bin/php
  - no_dev: true

```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True)

```

Verify that the correct versions of composer dependencies are present.

dir Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source --prefer-source option of composer.

prefer_dist --prefer-dist option of composer.

no_scripts --no-scripts option of composer.

no_plugins --no-plugins option of composer.

optimize --optimize-autoloader option of composer. Recommended for production.

no_dev --no-dev option for composer. Recommended for production.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home \$COMPOSER_HOME environment variable

always_check If True, `_always_run composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.

```

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root')

```

Composer update the directory to ensure we have the latest versions of all project dependencies.

dir Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute ``composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source --prefer-source option of composer.

prefer_dist --prefer-dist option of composer.

no_scripts --no-scripts option of composer.

no_plugins --no-plugins option of composer.

optimize --optimize-autoloader option of composer. Recommended for production.

no_dev --no-dev option for composer. Recommended for production.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home \$COMPOSER_HOME environment variable

14.16.50 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of *. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x` minutes very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
cron.present:
- user: root
- minute: random
- hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `@reboot` or `@hourly`.

```
/path/to/cron/script:
cron.present:
- user: root
- special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
cron.absent:
- user: root
- special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

salt.states.cron.absent(*name*, *user*='root', *identifier*=False, *special*=None, ***kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

name The command that should be absent in the user crontab.

user The name of the user whose crontab needs to be modified, defaults to the root user

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

special The special keyword used in the job (eg. @reboot, @hourly...)

salt.states.cron.env_absent(*name*, *user*='root')

Verifies that the specified environment variable is absent from the crontab for the specified user

name The name of the environment variable to remove from the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

salt.states.cron.env_present(*name*, *value*=None, *user*='root')

Verifies that the specified environment variable is present in the crontab for the specified user.

name The name of the environment variable to set in the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

value The value to set for the given environment variable

salt.states.cron.file(*name*, *source_hash*='', *source_hash_name*=None, *user*='root', *template*=None, *context*=None, *replace*=True, *defaults*=None, *backup*='', ***kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

source_hash This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
cron.file:
- name: https://mydomain.tld/dir2/foo.txt
```

```
- source_hash: https://mydomain.tld/ashes
- source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

user The user to whom the crontab should be assigned. This defaults to root.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context Overrides default context variables passed to the template.

replace If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults Default context passed to the template.

backup Overrides the default backup mode for the user's crontab.

`salt.states.cron.present`(*name*, *user*='root', *minute*='*', *hour*='*', *daymonth*='*', *month*='*', *dayweek*='*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

name The command that should be executed by the cron job.

user The name of the user whose crontab needs to be modified, defaults to the root user

minute The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is *

hour The information to be set in the hour section. Default is *

daymonth The information to be set in the day of month section. Default is *

month The information to be set in the month section. Default is *

dayweek The information to be set in the day of week section. Default is *

comment User comment to be added on line previous the cron job

commented The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state id

special A special keyword to specify periodicity (eg. @reboot, @hourly...)

New in version 2016.3.0.

14.16.51 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

`class salt.states.cyg.DictDiffer`(*current_dict*, *past_dict*)

Calculate the difference between two dictionaries.

1.items added

2.items removed

- 3.keys same in both but changed values
- 4.keys same in both and unchanged values

added()

Return a set of additions to `past_dict`.

changed()

Return a set of the keys with changed values.

removed()

Return a set of things removed from `past_dict`.

same()

True if the two dicts are the same.

unchanged()

Return a set of the keys with unchanged values.

`salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is installed.

name The name of the package to install

cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is not installed.

name The name of the package to uninstall

cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.updated(name=None, cyg_arch='x86_64', mirrors=None)`

Make sure all packages are up to date.

name [None] No affect, salt fails poorly without the arg available

cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

14.16.52 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends

- [dnspython](#)

Note: The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspsy_tsig_key.txt
```

`salt.states.ddns.absent` (*name, zone, data=None, rdtype=None, **kwargs*)

Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., `'webserver'`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check

data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

rdtype DNS resource type. If omitted, all types will be purged.

****kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the [dnspython](#) spec.

`salt.states.ddns.present` (*name, zone, ttl, data, rdtype='A', **kwargs*)

Ensures that the named DNS record is present with the given ttl.

name The host portion of the DNS record, e.g., `'webserver'`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check/update

ttl TTL for the record

data Data for the DNS record. E.g., the IP address for an A record.

rdtype DNS resource type. Default `'A'`.

****kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the [dnspython](#) spec.

14.16.53 salt.states.debconfmod

Management of debconf selections

depends

- debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

Available Functions

The debconfmod state has two functions, the `set` and `set_file` functions

set Set debconf selections from the state itself

set_file Set debconf selections from a file

```

nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
      'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
      'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
  debconf.set:
    - name: ferm
    - data:
      'ferm/enable': {'type': 'boolean', 'value': True}

```

Note: Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

`salt.states.debconfmod.set`(*name*, *data*, ***kwargs*)

Set debconf selections

```

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

```

name: The package name to set answers for.

data: A set of questions/answers for debconf. Note that everything under this must be indented twice.

question: The question that is being pre-answered

type: The type of question that is being asked (string, boolean, select, etc.)

value: The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, ***kwargs*)

Set debconf selections from a file or a template

```

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
      some_value: "false"

```

source: The location of the file containing the package selections

template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

14.16.54 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```

my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle

```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```

proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1

```

```

username: root
password: saltstack1
datacenter: london
location: rack-1-shelf-3
management_mode: 2
idrac_launch: 0
slot_names:
  - 'server-1': blade1
  - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-3:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.20
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-4:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}

```

```

- idrac_launch: {{ details['idrac_launch'] }}
- slot_names:
  {% for entry details['slot_names'] %}
  - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
  {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
  dellchassis.blade_idrac:
    - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}

```

Note: This state module relies on the `dracr.py` execution module, which runs `racadm` commands on the chassis, blades, etc. The `racadm` command runs very slowly and, depending on your state, the proxy minion return might timeout before the `racadm` commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```

salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
                                   idrac_ip=None, idrac_netmask=None,
                                   idrac_gateway=None, idrac_dnsname=None,
                                   idrac_dhcp=None)

```

Set parameters for iDRAC in a blade.

Parameters `idrac_password` -- Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password) :param idrac_ipmi: Enable/Disable IPMI

over LAN :param idrac_ip: Set IP address for iDRAC :param idrac_netmask: Set netmask for iDRAC :param idrac_gateway: Set gateway for iDRAC :param idrac_dhcp: Turn on DHCP for iDRAC (True turns on, False does nothing

because setting a static IP will disable DHCP).

Returns A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

`salt.states.dellchassis.chassis` (*name*, *chassis_name=None*, *password=None*, *datacenter=None*, *location=None*, *mode=None*, *idrac_launch=None*, *slot_names=None*, *blade_power_states=None*)

Manage a Dell Chassis.

chassis_name The name of the chassis.

datacenter The datacenter in which the chassis is located

location The location of the chassis.

password Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

mode The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

idrac_launch The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

slot_names The names of the slots, provided as a list identified by their slot numbers.

blade_power_states The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

`salt.states.dellchassis.firmware_update` (*hosts=None*, *directory=''*)

State to update the firmware on host using the `racadm` command

firmwarefile filename (string) starting with `salt://`

host string representing the hostname supplied to the `racadm` command

directory Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

`salt.states.dellchassis.switch` (*name*, *ip=None*, *netmask=None*, *gateway=None*, *dhcp=None*, *password=None*, *snmp=None*)

Manage switches in a Dell Chassis.

name The switch designation (e.g. switch-1, switch-2)

ip The Static IP Address of the switch

netmask The netmask for the static IP

gateway The gateway for the static IP

dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

password The access (root) password for the switch

snmp The SNMP community string for the switch

Example:

```
my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
    - netmask: 255.255.255.0
    - gateway: 192.168.1.254
    - dhcp: True
    - password: secret
    - snmp: public
```

14.16.55 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
```

```
- name: rm -r /var/cache/app
- onfail:
  - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True
```

`salt.states.disk.status` (*name*, *maximum=None*, *minimum=None*, *absolute=False*)

Return the current disk usage stats for the named mount point

name Disk mount with which to check used space

maximum The maximum disk utilization

minimum The minimum disk utilization

absolute By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

14.16.56 salt.states.dockerio

Manage Docker containers

Deprecated since version 2015.8.0: Future feature development will be done only in *dockerng*. See the documentation for this module for information on the deprecation path.

Docker is a lightweight, portable, self-sufficient software container wrapper. The base supported wrapper type is *LXC*, *cgroups*, and the *Linux Kernel*.

Note: This state module requires *docker-py* version `>= 0.6.0` which supports *Docker Remote API* version `1.12`.

Available Functions

- built

```
corp/mysuperdocker_img:
  docker.built:
    - path: /path/to/dir/container
```

- pulled

```
ubuntu:
  docker.pulled:
    - tag: latest
```

- pushed

```
corp/mysuperdocker_img:
  docker.pushed
```

- installed

```
mysuperdocker-container:
  docker.installed:
    - name: mysuperdocker
    - hostname: superdocker
    - image: corp/mysuperdocker_img
```

- loaded

```
mysuperdocker-file:
  docker.loaded:
    - name: mysuperdocker
    - source: salt://_files/tmp/docker_image.tar
```

- running

```
my_service:
  docker.running:
    - container: mysuperdocker
    - image: corp/mysuperdocker_img
    - ports:
      - "5000/tcp":
          HostIp: ""
          HostPort: "5000"
```

Note: The `ports` argument above is a dictionary. The double indentation is required for PyYAML to load the data structure properly as a python dictionary. More information can be found [here](#)

- absent

```
mys_old_uperdocker:
  docker.absent
```

- run

```
/finish-install.sh:
  docker.run:
    - cid: mysuperdocker
    - unless: grep -q something /var/log/foo
    - docker_unless: grep -q done /install_log
```

Use Cases

Ensures the container is running with the latest image available

```
my-service-image:
  docker.pulled:
    - name: registry/my-service:latest
    - force: true

my-service-container:
  docker.installed:
    - image: registry/my-service:latest
    - watch:
```

```

    - docker: my-service-image

my-service:
  docker.running:
    - container: my-service-container
    - watch:
      - docker: my-service-container

```

Note: The docker modules are named `dockerio` because the name `'docker'` would conflict with the underlying `docker-py` library.

`salt.states.dockerio.absent` (*name*)

Ensure that the container is absent; if not, it will be killed and destroyed. (*docker inspect*)

name: Either the container name or id

`salt.states.dockerio.built` (*name*, *tag*='latest', *path*=None, *quiet*=False, *nocache*=False, *rm*=True, *force*=False, *timeout*=None, **args*, ***kwargs*)

Build a docker image from a path or URL to a dockerfile. (*docker build*)

name Name of the image

tag tag of the image (defaults to 'latest')

path URL (e.g. *url/branch/docker_dir/dockerfile*) or filesystem path to the dockerfile

`salt.states.dockerio.installed` (*name*, *image*, *tag*='latest', *command*=None, *hostname*=None, *user*=None, *detach*=True, *stdin_open*=False, *tty*=False, *mem_limit*=None, *ports*=None, *environment*=None, *dns*=None, *volumes*=None, *volumes_from*=None, *cpu_shares*=None, *cpuset*=None, **args*, ***kwargs*)

Ensure that a container with the given name exists; if not, build a new container from the specified image. (*docker run*)

name Name for the container

image Image from which to build this container

tag tag of the image (defaults to 'latest')

environment

Environment variables for the container, either

- a mapping of key, values
- a list of mappings of key, values

ports

List of ports definitions, either:

- a port to map
- a mapping of mapping `portInHost : PortInContainer`

volumes List of volumes (see notes for the running function)

For other parameters, see absolutely first the `salt.modules.dockerio` execution module and the [docker-py python bindings for docker documentation](#) for `docker.create_container`.

Note: This command does not verify that the named container is running the specified image.

`salt.states.dockerio.loaded` (*name*, *tag*='latest', *source*=None, *source_hash*='', *force*=False)

Load an image into the local docker registry (*docker load*)

name Name of the docker image

tag tag of the image (defaults to 'latest')

source The source .tar file to download to the minion, created by docker save this source file can be hosted on either the salt master server, or on an HTTP or FTP server.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

Note: See first the documentation for Salt [file.managed](#)

`source_hash`

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

force Load even if the image exists

`salt.states.dockerio.present`(*name*, *image=None*, *tag='latest'*, *is_latest=False*)

If a container with the given name is not present, this state will fail. Supports optionally checking for specific image/tag (*docker inspect*)

name: container id

image: image the container should be running (defaults to any)

tag: tag of the image (defaults to 'latest')

is_latest: also check if the container runs the latest version of the image (latest defined as the latest pulled onto the local machine)

`salt.states.dockerio.pulled`(*name*, *tag='latest'*, *force=False*, *insecure_registry=False*, **args*, ***kwargs*)

Pull an image from a docker registry. (*docker pull*)

Note: See first the documentation for *docker login*, *docker pull*, *docker push*, and [docker.import_image](#) (*docker import*). NOTE that we added in SaltStack a way to authenticate yourself with the Docker Hub Registry by supplying your credentials (username, email & password) using pillars. For more information, see `salt.modules.dockerio` execution module.

name Name of the image

tag Tag of the image

force Pull even if the image is already pulled

insecure_registry Set to `True` to allow connections to non-HTTPS registries. Default `False`.

`salt.states.dockerio.pushed`(*name*, *tag='latest'*, *insecure_registry=False*)

Push an image from a docker registry. (*docker push*)

Note: See first the documentation for *docker login*, *docker pull*, *docker push*, and [docker.import_image](#) (*docker import*). NOTE that we added in SaltStack a way to authenticate yourself with the Docker Hub Registry by supplying your credentials (username, email & password) using pillars. For more information, see `salt.modules.dockerio` execution module.

name Name of the image

tag Tag of the image [Optional]

insecure_registry Set to `True` to allow connections to non-HTTPS registries. Default `False`.

`salt.states.dockerio.run`(*name*, *cid=None*, *hostname=None*, *onlyif=None*, *unless=None*, *docked_onlyif=None*, *docked_unless=None*, **args*, ***kwargs*)

Run a command in a specific container

You can match by either name or hostname

name command to run in the container

cid Container id or name
state_id state_id
onlyif Only execute cmd if statement on the host returns 0
unless Do not execute cmd if statement on the host returns 0
docked_onlyif Only execute cmd if statement in the container returns 0
docked_unless Do not execute cmd if statement in the container returns 0

salt.states.dockerio.running(*name, image, tag='latest', container=None, command=None, host_name=None, user=None, detach=True, stdin_open=False, tty=False, mem_limit=None, ports=None, environment=None, dns=None, volumes=None, volumes_from=None, start=True, cap_add=None, cap_drop=None, privileged=None, lxc_conf=None, network_mode=None, check_is_running=True, publish_all_ports=False, links=None, restart_policy=None, cpu_shares=None, cpuset=None, kill_signal=None, *args, **kwargs*)

Ensure that a container is running. If the container does not exist, it will be created from the specified image. (*docker run*)

name / container Name for the container
image Image from which to build this container
tag tag of the image (defaults to `latest`)
environment

Environment variables for the container, either

- a mapping of key, values
- a list of mappings of key, values

ports

List of ports definitions, either:

- a port to map
- a mapping of mapping portInHost : PortInContainer

```
- ports:
  - "5000/tcp":
      HostIp: ""
      HostPort: "5000"
```

publish_all_ports Publish all ports from the port list (default is false, only meaningful if port does not contain portinhost:portincontainer mapping)

volumes List of volumes to mount or create in the container (like `-v` of `docker run` command), mapping host directory to container directory.

To specify a volume in the container in terse list format:

```
- volumes:
  - "/var/log/service" # container-only volume
  - "/srv/timezone:/etc/timezone" # bound volume
  - "/usr/local/etc/passwd:/etc/passwd:ro" # read-only bound volume
```

You can also use the short dictionary form (note that the notion of source:target from docker is preserved):

```
- volumes:
  - /var/log/service: /var/log/service # mandatory read-write implied
```

Or, alternatively, to specify read-only mounting, use the extended form:

```
- volumes:
  - /home/user1:
      bind: /mnt/vol2
      ro: True
  - /var/www:
      bind: /mnt/vol1
      ro: False
```

Or (for backwards compatibility) another dict style:

```
- volumes:
  /home/user1:
    bind: /mnt/vol2
    ro: True
  /var/www:
    bind: /mnt/vol1
    ro: False
```

volumes_from List of containers to share volumes with

dns List of DNS servers.

```
- dns:
  - 127.0.0.1
```

network_mode

- `'bridge'`: creates a new network stack for the container on the docker bridge
- `'none'`: no networking for this container
- `'container:[name|id]'`: reuses another container network stack)
- `'host'`: use the host network stack inside the container

```
- network_mode: host
```

restart_policy Restart policy to apply when a container exits (no, on-failure[:max-retry], always)

```
- restart_policy:
  MaximumRetryCount: 5
  Name: on-failure
```

cap_add List of capabilities to add in a container.

cap_drop List of capabilities to drop in a container.

check_is_running Enable checking if a container should run or not. Useful for data-only containers that must be linked to another one. e.g. nginx <- static-files

cpu_shares CPU shares (relative weight)

```
- cpu_shares: 2
```

cpuset CPUs in which to allow execution ('0-3' or '0,1')

```
- cpuset: '0-3'
```

kill_signal If defined, its value will be sent as a kill signal to the running container. i.e. It will use `client.kill(signal=kill_signal)` instead of `client.restart()`, when the state is triggered by a watcher requisite.

possible use case: Soft reload of nginx

```
nginx:
  docker.running:
    - image: some-fictional-registry.com/nginx
    - tag: latest
    - kill_signal: SIGHUP
```

```
- watch:
  - file: /etc/nginx/nginx.conf
```

This state will ask nginx to reload (instead of restart) each time the `/etc/nginx/nginx.conf` is modified.

New in version 2015.8.0.

For other parameters, see `salt.modules.dockerio` execution module and the `docker-py` python bindings for docker documentation <<https://github.com/dotcloud/docker-py#api>>`_ for `docker.create_container`.

Note: This command does not verify that the named container is running the specified image.

`salt.states.dockerio.script(*args, **kw)`

Placeholder function for a `cmd.script` alike.

Note: Not yet implemented. Its implementation might be very similar from `salt.states.dockerio.run`

14.16.57 salt.states.dockerng

Management of Docker containers

New in version 2015.8.0.

This is the state module to accompany the `dockerng` execution module.

Why Make a Second Docker State Module?

We have received a lot of feedback on our Docker support. In the process of implementing recommended improvements, it became obvious that major changes needed to be made to the functions and return data. In the end, a complete rewrite was done.

The changes being too significant, it was decided that making a separate execution module and state module (called `dockerng`) would be the best option. This will give users a couple release cycles to modify their scripts, SLS files, etc. to use the new functionality, rather than forcing users to change everything immediately.

In the **Nitrogen** release of Salt (due in 2017), this execution module will take the place of the default Docker execution module, and backwards-compatible naming will be maintained for a couple releases after that to allow users time to replace references to `dockerng` with `docker`.

Note: To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.dockerng.absent(name, force=False)`

Ensure that a container is absent

name Name of the container

force [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  dockerng.absent
```

```
multiple_containers:
  dockerng.absent:
    - names:
      - foo
      - bar
      - baz
```

`salt.states.dockerng.image_absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

images Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  dockerng.image_absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  dockerng.image_absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

force [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `dockerng.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{dockerng.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `dockerng.force.image_name` will affect only the named image.

`salt.states.dockerng.image_present` (*name, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None, **kwargs*)

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, or loaded from a saved image. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed). Repo identifier is mandatory, we don't assume the default repository is docker hub.

If neither of the `build` or `load` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:mytag:
  dockerng.image_present
```

build Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:mytag:
  dockerng.image_present:
    - build: /home/myuser/docker/myimage

myuser/myimage:mytag:
  dockerng.image_present:
    - build: /home/myuser/docker/myimage
    - dockerfile: Dockerfile.alternative

.. versionadded:: develop
```

The image will be built using `dockerng.build` and the specified image name and tag will be applied to it.

load Loads a tar archive created with `dockerng.load` (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:mytag:
  dockerng.image_present:
    - load: salt://path/to/image.tar
```

force [False] Set this parameter to True to force Salt to pull/build/load the image even if it is already present.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version develop.

`salt.states.dockerng.network_absent` (*name*, *driver=None*)

Ensure that a network is absent.

name Name of the network

Usage Examples:

```
network_foo:
  dockerng.network_absent
```

`salt.states.dockerng.network_present` (*name*, *driver=None*, *containers=None*)

Ensure that a network is present.

name Name of the network

driver Type of driver for that network.

containers: List of container names that should be part of this network

Usage Examples:

```
network_foo:
  dockerng.network_present
```

```
network_bar:
  dockerng.network_present
  - name: bar
  - containers:
    - cont1
```

```
- cont2
```

```
salt.states.dockerng.running(name, image=None, force=False, stop_timeout=10, validate_ip_addrs=True, watch_action='force', client_timeout=60, start=True, **kwargs)
```

Ensure that a container with a specific configuration is present and running

name Name of the container

image Image to use for the container. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

Note: This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `dockerng.image_present` should be used to manage the image.

force [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

stop_timeout [10] If the container needs to be replaced, the container will be stopped using `dockerng.stop`. The value of this parameter will be passed to `dockerng.stop` as the `timeout` value, telling Docker how long to wait for a graceful shutdown before killing the container.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

watch_action [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  dockerng.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

Note: If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

CONTAINER CONFIGURATION PARAMETERS

command or cmd Command to run in the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - command: bash
```

OR

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cmd: bash
```

Changed in version 2015.8.1: `cmd` is now also accepted

hostname Hostname of the container. If not provided, and if a name has been provided, the `hostname` will default to the name that was passed.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: web1
```

Warning: `hostname` cannot be set if `network_mode` is set to `host`. The below example will result in an error:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

domainname Domain name of the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - hostname: domain.tld
```

interactive [False] Leave stdin open

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - interactive: True
```

tty [False] Attach TTYs

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - tty: True
```

detach [True] If True, run the container's command in the background (daemon mode)

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - detach: False
```

user User under which to run docker

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - user: foo
```

memory [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - memory: 512M
```

memory_swap [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - memory_swap: 1G
```

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

network_disabled [False] If True, networking will be disabled within the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - network_disabled: True
```

working_dir Working directory inside the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

entrypoint Entrypoint for the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

The entrypoint can also be specified as a list of arguments:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format VARNAME=value. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - environment:
```

```
- VAR1: value
- VAR2: value
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

Note: Values must be strings. Otherwise it will be considered as an error.

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

volumes [None] List of directories to expose as volumes. Can either be a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

cpu_shares CPU shares (relative weight)

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cpu_shares: 0.5
```

cpuset CPUs on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cpuset: "0,1"
```

binds Files/directories to bind mount. Each bind mount should be passed in the format `<host_path>:<container_path>:<read_only>`, where `<read_only>` is one of `rw` (for read-write access) or `ro` (for read-only access).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

Binds can be passed as a YAML list instead of a comma-separated list:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

Optionally, the read-only information can be left off the end and the bind mount will be assumed to be read-write. The example below is equivalent to the one above:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf
```

port_bindings Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - port_bindings: "5000:5000,2123:2123/udp,8080"
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - port_bindings:
      - 5000:5000
      - 2123:2123/udp
      - "8080"
```

Note: When configuring bindings for UDP ports, the protocol must be passed in the `containerPort`

value, as seen in the examples above.

lxc_conf Additional LXC configuration parameters to set before starting the container.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
```

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has not been the default for some time.

security_opt: Security configuration for MLS systems such as SELinux and AppArmor.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - security_opts:
      - 'apparmor:unconfined'
```

Note: See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

publish_all_ports [False] Allocates a random host port for each port exposed using the `ports` parameter

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

links Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, either as a comma separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

dns List of DNS nameservers. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_search List of DNS search domains. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

volumes_from Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `null` - No networking (equivalent of the Docker CLI argument `--net=none`)
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `dockerng.network_present`.

Warning: Using host mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - network_mode: null
```

restart_policy Set a restart policy for the container. Must be passed as a string in the format `pol-`

icy[:retry_count] where policy is one of always or on-failure, and retry_count is an optional limit to the number of retries. The retry count is ignored when using the always restart policy.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  dockerng.running:
    - image: bar/baz:latest
    - restart_policy: always
```

cap_add List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

cap_drop List of capabilities to drop within the container. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

privileged Give extended privileges to container.

extra_hosts Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  dockerng.running:
    - image: bar/baz:latest
```

```
- extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

Note: This option requires Docker 1.3.0 or newer.

pid_mode Set to `host` to use the host container's PID namespace within the container

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - pid_mode: host
```

Note: This option requires Docker 1.5.0 or newer.

labels Add Metadata to the container. Can be a list of strings/dictionaries or a dictionary of strings (keys and values).

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      - LABEL1
      - LABEL2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      KEY1: VALUE1
      KEY2: VALUE2
```

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - labels:
      - KEY1: VALUE1
      - KEY2: VALUE2
```

start [`True`] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the `django migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

stop_signal Specify the signal docker will send to the container when stopping. Useful when running `systemd` as PID 1 inside the container.

```
foo:
  dockerng.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

`salt.states.dockerng.stopped`(*name=None, containers=None, stop_timeout=10, unpause=False, error_on_absent=True*)

Ensure that a container (or containers) is stopped

name Name or ID of the container

containers Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  dockerng.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  dockerng.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

stop_timeout [10] Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed.

unpause [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

error_on_absent [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

`salt.states.dockerng.volume_absent`(*name, driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

name Name of the volume

Usage Examples:

```
volume_foo:
  dockerng.volume_absent
```

`salt.states.dockerng.volume_present`(*name, driver=None, driver_opts=None, force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This function no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

name Name of the volume

driver Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

driver_opts Options for the volume driver

force [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  dockerng.volume_present
```

```
volume_bar:
  dockerng.volume_present
  - name: bar
  - driver: local
  - driver_opts:
    foo: bar
```

```
volume_bar:
  dockerng.volume_present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value
```

14.16.58 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
  drac.network:
    - ip: 10.225.108.29
```

- netmask: 255.255.255.224
- gateway: 10.225.108.1

`salt.states.drac.absent`(*name*)

Ensure a user does not exist on the Dell DRAC

name: The users username

`salt.states.drac.network`(*ip, netmask, gateway*)

Ensure the DRAC network settings are consistent

`salt.states.drac.present`(*name, password, permission*)

Ensure the user exists on the Dell DRAC

name: The users username

password The password used to authenticate

permission The permissions that should be assigned to a user

14.16.59 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

`salt.states.elasticsearch_index.absent`(*name*)

Ensure that the named index is absent

`salt.states.elasticsearch_index.present`(*name, definition*)

Ensure that the named index is present

14.16.60 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

`salt.states.elasticsearch_index_template.absent`(*name*)

Ensure that the named index template is absent

`salt.states.elasticsearch_index_template.present`(*name, definition=None*)

Ensure that the named index template is present

14.16.61 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.setenv`(*name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False*)

Set the salt process environment variables.

name The environment key to set. Must be a string.

value Either a string or dict. When string, it will be the value set for the environment key of `name` above. When a dict, each key/value pair represents an environment variable to set.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
  environ.setenv:
    - name: foo
    - value: bar
    - update_minion: True

a_dict_env:
  environ.setenv:
    - name: does_not_matter
    - value:
      foo: bar
      baz: quux
```

14.16.62 salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```
profile:
  eselect.set:
    target: hardened/linux/amd64
```

salt.states.eselect.set(*name*, *target*, *module_parameter=None*, *action_parameter=None*)

Verify that the given module is set to the given target

name The name of the module

target The target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

14.16.63 salt.states.etcmod

Manage etcd Keys

New in version 2015.8.0.

depends

- python-etcd

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar_opts* must be set to `True`.

Be aware that setting *pillar_opts* to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Available Functions

- `set`

This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- `wait_set`

Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- `wait_rm`

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.mod_watch(name, **kwargs)`

Execute a etcd function based on a watch call requisite.

`salt.states.etcd_mod.rm(name, recurse=False, profile=None)`

Deletes a key from etcd. This function is also aliased as `rm`.

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to `False`. If `True` performs a recursive delete.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.set(name, value, profile=None)`

Set a key in etcd and can be called as `set`.

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.wait_set(name, value, profile=None)`

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

14.16.64 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the [ESXi Proxy Minion Tutorial](#) for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
                                     dump_port=6500)
```

Ensures a host's core dump configuration.

name Name of the state.

enabled Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

dump_ip The IP address of host that will accept the dump.

host_vnic Host VNIC port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

```
salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None,
                                service_restart=False, update_datetime=False)
```

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

name Name of the state.

service_running Ensures the running state of the `ntp` daemon for the host. Boolean value where `True` indicates that `ntpd` should be running and `False` indicates that it should be stopped.

ntp_servers A list of servers that should be added to the ESXi host's NTP configuration.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the `yaml` parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the `ntp` daemon will be restarted, regardless of its previous running state. Default is `False`.

update_datetime If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```

```
salt.states.esxi.password_present(name, password)
```

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password

is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

name Name of the state.

password The new password to change on the host.

Example:

```
configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'
```

`salt.states.esxi.ssh_configured`(*name*, *service_running*, *ssh_key=None*, *ssh_key_file=None*, *service_policy=None*, *service_restart=False*, *certificate_verify=False*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

name Name of the state.

service_running Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

ssh_key Public SSH key to added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

ssh_key_file File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

certificate_verify If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```
configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True
```

`salt.states.esxi.syslog_configured`(*name*, *syslog_configs*, *firewall=True*, *reset_service=True*, *reset_syslog_config=False*, *reset_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

name Name of the state.

syslog_configs Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

reset_syslog_config Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

reset_configs A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```
configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
        loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
        default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout
```

`salt.states.esxi.vmotion_configured`(*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device `VirtualNic` that VMotion will use.

name Name of the state.

enabled Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

device The device that uniquely identifies the `VirtualNic` that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

`salt.states.esxi.vsan_configured`(*name, enabled, add_disks_to_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

name Name of the state.

enabled Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

add_disks_to_vsan If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```

configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True

```

14.16.65 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send`(*name*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, ***kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name.

Example:

```

# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below

```

`salt.states.event.wait`(*name*, *sfun=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```

# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
      new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache

```

14.16.66 salt.states.file

Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the `file.managed` state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempey template, adding a dynamic component to file management. An example of `file.managed` which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - template: jinja
    - defaults:
      custom_var: "default value"
      other_var: 123
{% if grains['os'] == 'Ubuntu' %}
  - context:
    custom_var: "override"
{% endif %}
```

It is also possible to use the `py renderer` as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context]) # Arguments as globals
    return '\n\n'.join(lines)
```

Note: The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. [More information.](#)

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be `override`, otherwise it is the default `default value`

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
```

```
- group: users
- mode: 644
- backup: minion
```

Note: Salt supports backing up managed files via the backup option. For more details on this functionality please review the [backup_mode documentation](#).

The source parameter can also specify a file in another Salt environment. In this example `foo.conf` in the dev environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf?saltenv=dev
    - user: foo
    - group: users
    - mode: '0644'
```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

There is more documentation about this feature in the [Names declaration](#) section of the

[Highstate docs](#).

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and fifo pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
```

- ```
- group: named
- mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
file.mknod:
- ntype: p
- user: named
- group: named
- mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
- recurse:
- user
- group
- mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- file_mode: 744
- dir_mode: 755
- makedirs: True
- recurse:
- user
- group
- mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:
file.symlink:
- target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
 file.recurse:
 - source: salt://code/flask
 - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
 file.recurse:
 - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
 - user: {{ site_user }}
 - dir_mode: 2775
 - file_mode: '0644'
 - template: jinja
 - source: salt://project/templates_dir
 - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
 file.retention_schedule:
 - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
 - retain:
 most_recent: 5
 first_of_hour: 4
 first_of_day: 14
 first_of_week: 6
 first_of_month: 6
 first_of_year: all
```

#### `salt.states.file.absent(name)`

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

**name** The path which should be deleted

#### `salt.states.file.accumulated(name, filename, text, **kwargs)`

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

**name** Accumulator name

**filename** Filename which would receive this accumulator (see file.managed state documentation about `name`)

**text** String or list for adding in accumulator

**require\_in / watch\_in** One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
 file.accumulated:
```

```

- filename: /tmp/animal_file.txt
- text: ' jumps over the lazy dog.'
- require_in:
 - file: animal_file

animal_file:
 file.managed:
 - name: /tmp/animal_file.txt
 - source: salt://animal_file.txt
 - template: jinja

```

One might write a template for `animal_file.txt` like the following:

```

The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↳animal }}{% endfor %}

```

Collectively, the above states and template file will produce:

```

The quick brown fox jumps over the lazy dog.

```

Multiple accumulators can be ``chained" together.

---

**Note:** The `accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

```

salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, tem-
 plate='jinja', sources=None, source_hashes=None, defaults=None, con-
 text=None, ignore_whitespace=True)

```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file. Defaults to `False`.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type            | Length       |
|-----------------|--------------|
| =====<br>sha512 | =====<br>128 |
| sha384          | 96           |
| sha256          | 64           |
| sha224          | 56           |
| sha1            | 40           |
| md5             | 32           |

The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

Debian file type `*.dsc` is supported.

Examples:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /etc/
↳ resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳ tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳ tomdroid-src-0.7.3.tar.gz/+md5
```

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
 file.append:
 - text: |
 Thou hadst better eat salt with the Philosophers of Greece,
```

```
than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
 file.append:
 - text:
 - Trust no one unless you have eaten much salt with him.
 - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
 file:
 - append
 - template: jinja
 - sources:
 - salt://motd/devops-messages.tpl
 - salt://motd/hr-messages.tpl
 - salt://motd/general-messages.tpl
```

New in version 0.9.5.

`salt.states.file.blockreplace` (*name*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *content*='', *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *show\_changes*=True)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits. Note: this function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

**name** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output. Note: you can use `file.accumulated` and target this state. All accumulated data dictionaries content will be added as new lines in the content

**content** The content to be used between the two lines identified by `marker_start` and `marker_end`

**source** The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If `source` is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
 file.managed:
 - source:
 - salt://file_that_does_not_exist
 - salt://file_that_exists
```

#### source\_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| =====  | =====  |
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

**Using a Source Hash File** The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source\_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.hash
```

The following is an example of the supported source\_hash format:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type \*.dsc files are also supported.

**Inserting the Source Hash in the sls Data** Examples:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**template** The named templating engine will be used to render the downloaded file. Defaults to `jinjja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinjja`
- `mako`
- `py`
- `wempy`

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**append\_if\_not\_found** If markers are not found and set to `True` then the markers and content will be appended to the file. Default is `False`

**prepend\_if\_not\_found** If markers are not found and set to `True` then the markers and content will be prepended to the file. Default is `False`

**backup** The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

**dry\_run** Don't make any edits to the file

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
 file.blockreplace:
 - name: /etc/hosts
 - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
 - marker_end: "# END managed zone {{ myvar }} --"
 - content: 'First line of content'
 - append_if_not_found: True
 - backup: '.bak'
 - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: "text 2"
 - require_in:
 - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: |
 text 3
 text 4
 - require_in:
 - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
```

```
END managed zone 42 --
```

`salt.states.file.comment`(*name*, *regex*, *char*='#', *backup*='.bak')

Comment out specified lines in a file.

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you *need* the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

**char** [#] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/fstab:
file.comment:
- regex: ^bind 127.0.0.1
```

New in version 0.9.5.

`salt.states.file.copy`(*name*, *source*, *force*=`False`, *makedirs*=`False`, *preserve*=`False`, *user*=`None`, *group*=`None`, *mode*=`None`, *subdir*=`False`, *\*\*kwargs*)

If the source file exists on the system, copy it to the named file. The named file will not be overwritten if it already exists unless the `force` option is set to `True`.

**name** The location of the file to copy to

**source** The location of the file to copy to the location specified with `name`

**force** If the target location is present then the file will not be moved, specify `force: True` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

**preserve** New in version 2015.5.0.

Set `preserve: True` to preserve user/group ownership and mode after copying. Default is `False`. If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and

*states.file.recurse.*

`salt.states.file.decode`(*name*, *encoded\_data*=None, *contents\_pillar*=None, *encoding\_type*='base64', *checksum*='md5')

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name** Path of the file to be written.

**encoded\_data** The encoded file. Either this option or `contents_pillar` must be specified.

**contents\_pillar** A Pillar path to the encoded file. Uses the same path syntax as `pillar.get`. The `hashutil.base64_encodefile` function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

**encoding\_type** [base64] The type of encoding.

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - contents_pillar: mypillar:thefile

or

write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - encoded_data: |
 Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - encoded_data: |
 {{ salt.pillar.get('path:to:data') | indent(8) }}
```

`salt.states.file.directory`(*name*, *user*=None, *group*=None, *recurse*=None, *max\_depth*=None, *dir\_mode*=None, *file\_mode*=None, *makedirs*=False, *clean*=False, *require*=None, *exclude\_pat*=None, *follow\_symlinks*=False, *force*=False, *backupname*=None, *allow\_symlink*=True, *children\_only*=False, *\*\*kwargs*)

Ensure that a named directory is present and has the right perms

**name** The location to create or manage a directory

**user** The user to own the directory; this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

**recurse** Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If `mode` is defined, will recurse on both `file_mode` and `dir_mode` if they are defined. If `ignore_files` or `ignore_dirs` is included, files or directories will be left unchanged respectively. Example:

```

/var/log/httpd:
 file.directory:
 - user: root
 - group: root
 - dir_mode: 755
 - file_mode: 644
 - recurse:
 - user
 - group
 - mode

```

Leave files or directories unchanged:

```

/var/log/httpd:
 file.directory:
 - user: root
 - group: root
 - dir_mode: 755
 - file_mode: 644
 - recurse:
 - user
 - group
 - mode
 - ignore_dirs

```

New in version 2015.5.0.

**max\_depth** Limit the recursion depth. The default is no limit=None. `max\_depth` and `clean` are mutually exclusive.

New in version 2016.11.0.

**dir\_mode / mode** The permissions mode to set any directories created. Not supported on Windows

**file\_mode** The permissions mode to set any files created if `mode` is run in `recurse`. This defaults to dir\_mode. Not supported on Windows

**makedirs** If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. `clean` and `max\_depth` are mutually exclusive.

**require** Require other resources such as packages or files

**exclude\_pat** When `clean` is set to True, exclude this pattern from removal list and preserve in the destination.

**follow\_symlinks** [False] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

**force** If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

**backupname** If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

**allow\_symlink** [True] If allow\_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow\_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

**children\_only** [False] If `children_only` is `True` the base of a path is excluded when performing a recursive operation. In case of `/path/to/base`, `base` will be ignored while all of `/path/to/base/*` are still operated on.

`salt.states.file.exists`(*name*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

**name** Absolute path which must exist

`salt.states.file.line`(*name, content, match=None, mode=None, location=None, before=None, after=None, show\_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file\_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

**name** Filesystem path to the file to be edited.

**content** Content of the line.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` becomes the `content` value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location** Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

**backup** Create a backup of the original file with the extension: ```Year-Month-Day-Hour-Minutes-Seconds```.

**quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent** Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

#### Parameters

- **create** -- Create an empty file if doesn't exists.

New in version 2016.11.0.

- **user** -- The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

- **group** -- The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.

New in version 2016.11.0.

- **file\_mode** -- The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt.states.file.managed(name, source=None, source_hash='', source_hash_name=None,
 user=None, group=None, mode=None, template=None, makedirs=False,
 dir_mode=None, context=None, replace=True, defaults=None, backup='',
 show_changes=True, create=True, contents=None, tmp_ext='',
 contents_pillar=None, contents_grains=None, contents_newline=True,
 contents_delimiter='!', allow_empty=True, follow_symlinks=True,
 check_cmd=None, skip_verify=False, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name** The location of the file to manage

**source** The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
 file.managed:
 - source:
 - salt://file_that_does_not_exist
 - salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

**Using a Source Hash File** The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the `source_hash` argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

**Inserting the Source Hash in the SLS Data** Examples:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz/+md5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed.

When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
 file.managed:
 - source: https://mydomain.tld/dir2/foo.txt
 - source_hash: https://mydomain.tld/hashes
 - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored

**mode** The mode to set on this file, e.g. 644, 0775, or 4664.

**Note:** This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt files server. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

**template** If this setting is applied, the named templating engine will be used to render the downloaded file.

The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**makedirs** [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

**replace** [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for this specific file.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** [True] If set to `False`, then the file will only be managed if the file already exists on the system.

**contents** Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
 file.managed:
 - contents:
 - This is line 1
 - This is line 2

/path/to/file2:
 file.managed:
 - contents: |
 This is line 1
 This is line 2
```

**contents\_pillar** New in version 0.17.0.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
 file.managed:
 - user: deployer
 - group: deployer
 - mode: 600
 - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
 deployer:
 id_rsa: |
 -----BEGIN RSA PRIVATE KEY-----
 MIIeowIBAAKCAQEAOQiwO3JhBquPAalQF9qP1LLZNxVjYMIswrMe2HcWUVBgh+vY
 U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGl1vgA0bJAnMT623dMXjVKwnEagZPRJixDy
 B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0pqux+UyFbAGLin+
 GpxzZAMaFpZw4sSbIIRuissXZj/sHpQb8p9M5Ie04Z3rjkCP1cxI
 -----END RSA PRIVATE KEY-----
```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the `file_tree external pil-`

`lar` can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

**contents\_grains** New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in `grains.get`. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a ``message of the day" file:

```
write_motd:
 file.managed:
 - name: /etc/motd
 - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

**contents\_newline** [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will omit this final newline.

**contents\_delimiter** New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

**allow\_empty** [True] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow\_symlinks** [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check\_cmd** New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
 file.managed:
 - user: root
 - group: root
 - mode: 0440
 - source: salt://sudoers/files/sudoers.jinja
 - template: jinja
 - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

**tmp\_ext** Suffix for temp file created by `check_cmd`. Useful for checkers dependant on config file extension (e.g. the `init-checkconf` upstart config checker).

```

/etc/init/test.conf:
 file.managed:
 - user: root
 - group: root
 - mode: 0440
 - tmp_ext: '.conf'
 - contents:
 - 'description "Salt Minion"'
 - 'start on started mountall'
 - 'stop on shutdown'
 - 'respawn'
 - 'exec salt-minion'
 - check_cmd: init-checkconf -f

```

**skip\_verify** [False] If True, hash verification of remote file sources (<http://>, <https://>, <ftp://>) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**salt.states.file.missing**(*name*)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

**name** Absolute path which must NOT exist

**salt.states.file.mknod**(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*)

Create a special file similar to the ``nix mknod` command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of ``nix mknod`. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

**name** name of the file

**ntype** node type ``p'` (fifo pipe), ``c'` (character device), or ``b'` (block device)

**major** major number of the device does not apply to a fifo pipe

**minor** minor number of the device does not apply to a fifo pipe

**user** owning user of the device/pipe

**group** owning group of the device/pipe

**mode** permissions on the device/pipe

Usage:

```

/dev/chr:
 file.mknod:
 - ntype: c
 - major: 180
 - minor: 31
 - user: root
 - group: root
 - mode: 660

/dev/blk:
 file.mknod:
 - ntype: b
 - major: 8
 - minor: 999
 - user: root
 - group: root

```

```

- mode: 660

/dev/fifo:
 file.mknod:
 - ntype: p
 - user: root
 - group: root
 - mode: 660

```

New in version 0.17.0.

`salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)`

Execute the check\_cmd logic.

Return a result dict if check\_cmd succeeds (check\_cmd == 0) otherwise return True

`salt.states.file.patch(name, source=None, hash=None, options='', dry_run_first=True, **kwargs)`

Apply a patch to a file or directory.

---

**Note:** A suitable patch executable must be available on the minion when using this state function.

---

**name** The file or directory to which the patch will be applied.

**source** The source patch to download to the minion, this source file must be hosted on the salt master server. If the file is located in the directory named spam, and is called eggs, the source string is salt://spam/eggs. A source is required.

**hash** Hash of the patched file. If the hash of the target file matches this value then the patch is assumed to have been applied. The hash string is the hash algorithm followed by the hash of the file: md5=e138491e9d5b97023cea823fe17bac22

**options** Extra options to pass to patch.

**dry\_run\_first** [True] Run patch with --dry-run first to check if it will apply cleanly.

**saltenv** Specify the environment from which to retrieve the patch file indicated by the source parameter. If not provided, this defaults to the environment from which the state is being executed.

Usage:

```

Equivalent to `patch --forward /opt/file.txt file.patch`
/opt/file.txt:
 file.patch:
 - source: salt://file.patch
 - hash: md5=e138491e9d5b97023cea823fe17bac22

```

`salt.states.file.prepend(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None)`

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

Multi-line example:

```

/etc/motd:
 file.prepend:
 - text: |
 Thou hadst better eat salt with the Philosophers of Greece,
 than sugar with the Courtiers of Italy.
 - Benjamin Franklin

```

Multiple lines of text:

```
/etc/motd:
file.prepend:
- text:
 - Trust no one unless you have eaten much salt with him.
 - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
file.prepend:
- header: True
- text:
 - This will be the very first line in the file.
 - The 2nd line, regardless of duplicates elsewhere in the file.
 - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
file:
- prepend
- template: jinja
- sources:
 - salt://motd/devops-messages.tpl
 - salt://motd/hr-messages.tpl
 - salt://motd/general-messages.tpl
```

New in version 2014.7.0.

`salt.states.file.recurse`(*name*, *source*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir\_mode=None*, *file\_mode=None*, *sym\_mode=None*, *template=None*, *context=None*, *defaults=None*, *include\_empty=False*, *backup=''*, *include\_pat=None*, *exclude\_pat=None*, *maxdepth=None*, *keep\_symlinks=False*, *force\_symlinks=False*, *\*\*kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name** The directory to set the recursion in

**source** The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode** The mode to set on any directories created.

---

**Note:** This option is **not** supported on Windows.

---

**file\_mode** The mode to set on any files created. Windows

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**sym\_mode** The mode to set on any symlink created.

---

**Note:** This option is **not** supported on Windows.

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

---

**Note:** The `template` option is required when recursively applying templates.

---

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**include\_empty** Set this to `True` if empty directories should also be created (default is `False`)

**include\_pat** When copying, include only this pattern from the source. Default is glob match; if prefixed with ``E@'`, then regexp match. Example:

```
- include_pat: hello* :: glob matches 'hello01', 'hello02'
 ... but not 'otherhello'
- include_pat: E@hello :: regexp matches 'otherhello',
 'hello01' ...
```

**exclude\_pat** Exclude this pattern from the source when copying. If both `include_pat` and `exclude_pat` are supplied, then it will apply conditions cumulatively. i.e. first select based on `include_pat`, and then within that result apply `exclude_pat`.

Also, when ``clean=True'`, exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA* :: glob matches APPDATA.01,
 APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
 or TEMPDATA for exclusion
```

**maxdepth** When copying, only copy paths which are of depth `maxdepth` from the source path. Example:

```
- maxdepth: 0 :: Only include files located in the source
 directory
- maxdepth: 1 :: Only include files located in the source
 or immediate subdirectories
```

**keep\_symlinks** Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to `rsync`, then set this to `True`.

**force\_symlinks** Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

**salt.states.file.rename** (*name, source, force=False, makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the `force` option is set to `True`.

**name** The location of the file to rename to  
**source** The location of the file to move to the location specified with name  
**force** If the target location is present then the file will not be moved, specify ``force: True`` to overwrite the target file  
**makedirs** If the target subdirectories don't exist create them

```
salt.states.file.replace(name, pattern, repl, count=0, flags=8, bufsize=1, ap-
 pend_if_not_found=False, prepend_if_not_found=False,
 not_found_content=None, backup='.bak', show_changes=True, ig-
 nore_if_missing=False)
```

Maintain an edit in a file.

New in version 0.17.0.

**name** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.  
**pattern** A regular expression, to be matched using Python's `search()`.  
**repl** The replacement text  
**count** Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.  
**flags** A list of flags defined in the [re module documentation](#). Each list item should be a string that will correlate to the human-friendly flag name. E.g., [ 'IGNORECASE', 'MULTILINE' ]. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to [ 'MULTILINE' ]).

---

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to [ 'MULTILINE' ]. When overriding the default value for `flags`, if 'MULTILINE' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE' to the list of flags.

---

**bufsize** How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.  
**append\_if\_not\_found** [False] If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

**prepend\_if\_not\_found** [False] If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

**not\_found\_content** Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

**backup** The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.  
**show\_changes** [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.  
**ignore\_if\_missing** [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.  
 For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
 file.replace:
 # <...snip...>
```

```
- pattern: |
 CentOS \(2.6.32[^\n]+\n\s+root[^\n]+\n\)+
```

**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

`salt.states.file.retention_schedule` (*name*, *retain*, *strptime\_format=None*, *timezone=None*)  
Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

#### Parameters

- **name** -- The filesystem path to the directory containing backups to be managed.
- **retain** -- Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - most\_recent** `N` Keep the most recent `N` files.
  - first\_of\_hour** `N` For the last `N` hours from now, keep the first file after the hour.
  - first\_of\_day** `N` For the last `N` days from now, keep the first file after midnight. See also `timezone`.
  - first\_of\_week** `N` For the last `N` weeks from now, keep the first file after Sunday midnight.
  - first\_of\_month** `N` For the last `N` months from now, keep the first file after the start of the month.
  - first\_of\_year** `N` For the last `N` years from now, keep the first file after the start of the year.
- **strptime\_format** -- A python strptime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

`salt.states.file.serialize` (*name*, *dataset=None*, *dataset\_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=''*, *makedirs=False*, *show\_diff=True*, *create=True*, *merge\_if\_exists=False*, *\*\*kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name** The location of the file to create

**dataset** The dataset that will be serialized

**dataset\_pillar** Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

**formatter** Write the data as this format. Supported output formats:

- JSON
- YAML
- Python (via pprint.pformat)

**user** The user to own the directory, this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664.

---

**Note:** This option is **not** supported on Windows.

---

**backup** Overrides the default backup mode for this specific file.

**makedirs** Create parent directories for destination file.

New in version 2014.1.3.

**show\_diff** If set to False, the diff will not be shown.

**create** Default is True, if create is set to False then the file will only be managed if the file already exists on the system.

**merge\_if\_exists** Default is False, if merge\_if\_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

For example, this state:

```
/etc/dummy/package.json:
 file.serialize:
 - dataset:
 name: naive
 description: A package using naive versioning
 author: A confused individual <iam@confused.com>
 dependencies:
 express: >= 1.2.0
 optimist: >= 0.1.0
 engine: node 0.4.1
 - formatter: json
```

will manage the file /etc/dummy/package.json:

```
{
 "author": "A confused individual <iam@confused.com>",
 "dependencies": {
 "express": ">= 1.2.0",
 "optimist": ">= 0.1.0"
 },
 "description": "A package using naive versioning",
 "engine": "node 0.4.1",
 "name": "naive"
}
```

`salt.states.file.symlink`(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*,  
*group=None*, *mode=None*, *\*\*kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass *force: True*, if it is to be renamed, pass a *backupname*.

**name** The location of the symlink to create

**target** The location that the symlink points to

**force** If the name of the symlink exists and is not a symlink and *force* is set to False, the state will fail. If *force*

is set to True, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

**backupname** If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows

`salt.states.file.touch` (*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the `nix ``touch` command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
 file.touch
```

New in version 0.9.5.

`salt.states.file.uncomment` (*name*, *regex*, *char='#'*, *backup='.bak'*)

Uncomment specified commented lines in a file

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[t]*`)

**char** [#] The character to remove in order to uncomment a line

**backup** [.bak] The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
 file.uncomment:
 - regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 14.16.67 salt.states.firewall module

State to check firewall configurations .. versionadded:: 2016.3.0

`salt.states.firewall.check`(*name*, *port=None*, *\*\*kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

**name** host name or ip address to test connection to

**port** The port to test the connection on

**\*\*kwargs**

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
 firewall.check:
 - name: 'google.com'
 - port: 80
 - proto: 'tcp'
```

### 14.16.68 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
 firewalld.present:
 - name: public
 - block_icmp:
 - echo-reply
 - echo-request
 - default: False
 - masquerade: True
 - ports:
 - 22/tcp
 - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
 firewalld.present:
 - name: public
 - masquerade: True
 - port_fwd:
 - 22:2222:tcp
 - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
 firewalld.present:
 - name: public
 - interfaces:
```

```
- eth0
- sources:
- 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
 firewalld.service:
 - name: saltmaster
 - ports:
 - 4505/tcp
 - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
 firewalld.present:
 - name: saltzone
 - services:
 - saltmaster
 - sources:
 - 10.0.0.0/8
```

**class salt.states.firewalld.ForwardingMapping**(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

**todict**()

Returns a pretty dictionary meant for command line output.

**salt.states.firewalld.present**(*name, block\_icmp=None, default=None, masquerade=False, ports=None, port\_fwd=None, services=None, prune\_services=True, interfaces=None, sources=None, rich\_rules=None*)

Ensure a zone has specific attributes.

**salt.states.firewalld.service**(*name, ports=None, protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

### 14.16.69 salt.states.gem

#### Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
 gem.installed:
 - user: rvm
 - ruby: jruby@jgemset
```

**salt.states.gem.installed**(*name, ruby=None, gem\_bin=None, user=None, version=None, rdoc=False, ri=False, pre\_releases=False, proxy=None, source=None*)

Make sure that a gem is installed.

**name** The name of the gem to install

**ruby:** **None** Only for RVM or rbenv installations: the ruby version and gemset to target.  
**gem\_bin:** **None** Custom `gem` command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using `rvm` or `rbenv` use the `ruby` argument instead.  
**user:** **None** The user under which to run the `gem` command

New in version 0.17.0.

**version** [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once  
**rdoc** [False] Generate RDoc documentation for the gem(s).  
**ri** [False] Generate RI documentation for the gem(s).  
**pre\_releases** [False] Install pre-release version of gem(s) if available.  
**proxy** [None] Use the specified HTTP proxy server for all outgoing traffic. Format: `http://hostname[{}:port]`  
**source** [None] Use the specified HTTP gem source server to download gem. Format: `http://hostname[{}:port]`

`salt.states.gem.removed`(*name, ruby=None, user=None, gem\_bin=None*)

Make sure that a gem is not installed.

**name** The name of the gem to uninstall  
**gem\_bin** [None] Full path to `gem` binary to use.  
**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.  
**user:** **None** The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_add`(*name, ruby=None, user=None*)

Make sure that a gem source is added.

**name** The URL of the gem source to be added  
**ruby:** **None** For RVM or rbenv installations: the ruby version and gemset to target.  
**user:** **None** The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_remove`(*name, ruby=None, user=None*)

Make sure that a gem source is removed.

**name** The URL of the gem source to be removed  
**ruby:** **None** For RVM or rbenv installations: the ruby version and gemset to target.  
**user:** **None** The user under which to run the `gem` command

New in version 0.17.0.

## 14.16.70 salt.states.git

States to manage git repositories and git configuration

---

**Important:** Before using `git` over `ssh`, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

---

Changed in version 2015.8.8: This state module now requires `git` 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.config_set`(*name, value=None, multivar=None, repo=None, user=None, password=None, \*\*kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name** Name of the git config value to set

**value** Set a single value for the config item  
**multivar** Set multiple values for the config item

---

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

---

New in version 2015.8.0.

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

Changed in version 2015.8.0: Option renamed from `is_global` to `global`. For earlier versions, use `is_global`.

**Local Config Example:**

```
Single value
mylocalrepo:
 git.config_set:
 - name: user.email
 - value: foo@bar.net
 - repo: /path/to/repo

Multiple values
mylocalrepo:
 git.config_set:
 - name: mysection.myattribute
 - multivar:
 - foo
 - bar
 - baz
 - repo: /path/to/repo
```

**Global Config Example (User ``foo``):**

```
mylocalrepo:
 git.config_set:
 - name: user.name
 - value: Foo Bar
 - user: foo
 - global: True
```

`salt.states.git.config_unset`(*name*, *value\_regex=None*, *repo=None*, *user=None*, *password=None*, *\*\*kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

**name** The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

**value\_regex** Regex indicating the values to unset for the matching key(s)

---

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

**all** [False] If `True`, unset all matches

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

**Examples:**

```
Value matching 'baz'
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - value_regex: 'baz'
 - repo: /path/to/repo

Ensure entire multivar is unset
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - all: True

Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
 git.config_unset:
 - name: 'foo\..+'
 - all: True

Ensure that global config value is unset
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - global: True
```

`salt.states.git.detached`(*name*, *ref*, *target=None*, *remote='origin'*, *user=None*, *password=None*, *force\_clone=False*, *force\_checkout=False*, *fetch\_remote=True*, *hard\_reset=False*, *submodules=False*, *identity=None*, *https\_user=None*, *https\_pass=None*, *onlyif=False*, *unless=False*, *\*\*kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `ref`.

**name** Address of the remote repository.

**ref** The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**target** Name of the target directory where repository is about to be cloned.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_checkout** [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**fetch\_remote** [True] If `False` a fetch will not be performed and only local refs will be reachable.

**hard\_reset** [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

---

**Note:** Changes resulting from a hard reset will not trigger requisites.

---

**submodules** [False] Update submodules

**identity** A path on the minion (or a SaltStack fileservers URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

```
salt.states.git.latest(name, rev='HEAD', target=None, branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, depth=None, identity=None, https_user=None, https_pass=None, onlyif=False, unless=False, **kwargs)
```

Make sure the repository is cloned to the given directory and is up-to-date.

**name** Address of the remote repository, as passed to `git clone`

---

**Note:** From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
ssh:// URL
ssh://user@server/project.git

SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh://` URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlasian Stash/BitBucket Server](#). In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

**rev** [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

**target** Name of the target directory where repository is about to be cloned

**branch** Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

---

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
 - rev: dev
 - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
 - rev: dev
 - branch: dev
 - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

**user** Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

---

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

---

New in version 0.17.0.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update\_head** [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force** [False] Deprecated since version 2015.8.0: Use `force_clone` instead. For earlier Salt versions, `force` must be used.

**force\_checkout** [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_fetch** [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force\_reset** [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

**submodules** [False] Update submodules on clone or branch change

**bare** [False] Set to `True` if the repository is to be a bare clone of the remote repository.

**mirror** Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**remote\_name** Deprecated since version 2015.8.0: Use `remote` instead. For earlier Salt versions, `remote_name` must be used.

**fetch\_tags** [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**depth** Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch. This is not compatible with tags or revision IDs.

**identity** Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
Single key
git@github.com:user/repo.git:
 git.latest:
 - user: deployer
 - identity: /home/deployer/.ssh/id_rsa

Two keys
git@github.com:user/repo.git:
 git.latest:
 - user: deployer
 - identity:
 - /home/deployer/.ssh/id_rsa
 - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileservers URL (e.g. `salt://path/to/identity_file`).

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

---

**Note:** Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
 ssh_known_hosts:
 - present
 - user: root
 - enc: ecdsa
 - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
 - rev: gh-pages
 - target: /usr/share/nginx/staging
 - identity: /root/.ssh/website_id_rsa
 - require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com

git-website-staging:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
 - rev: gh-pages
 - target: /usr/share/nginx/staging
 - identity: salt://website/id_rsa
 - require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com

git-website-prod:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
```

```

- rev: gh-pages-prod
- target: /usr/share/nginx/prod
- identity: /root/.ssh/website_id_rsa
- require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com

```

`salt.states.git.mod_run_check`(*cmd\_kwargs*, *onlyif*, *unless*)

Execute the *onlyif* and *unless* logic. Return a result dict if:

- *onlyif* failed (*onlyif* != 0)
- *unless* succeeded (*unless* == 0)

Otherwise, returns True

`salt.states.git.present`(*name*, *force=False*, *bare=True*, *template=None*, *separate\_git\_dir=None*, *shared=None*, *user=None*, *password=None*)

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, *name* points to a [worktree](#), and *force* is set to True, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [False] If True, and if *name* points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [True] If True, and a repository must be initialized, then the repository will be a bare repository.

**Note:** This differs from the default behavior of *git.init*, make sure to set this value to False if a bare repo is not desired.

**template** If a new repository is initialized, this argument will specify an alternate **template directory** \_

New in version 2015.8.0.

**separate\_git\_dir** If a new repository is initialized, this argument will specify an alternate \$GIT\_DIR

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See [git-init\(1\)](#) for more details.

New in version 2015.5.0.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

## 14.16.71 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
 github.present:
 - name: 'Example TestUser1'
 - email: example@domain.com
 - username: 'gitexample'
```

**salt.states.github.absent**(*name*, *profile='github'*, *\*\*kwargs*)  
Ensure a github user is absent

```
ensure user test is absent in github:
 github.absent:
 - name: 'Example TestUser1'
 - email: example@domain.com
 - username: 'gitexample'
```

The following parameters are required:  
**name** Github handle of the user in organization

**salt.states.github.present**(*name*, *profile='github'*, *\*\*kwargs*)  
Ensure a user is present

```
ensure user test is present in github:
 github.present:
 - name: 'gitexample'
```

The following parameters are required:  
**name** This is the github handle of the user in the organization

**salt.states.github.repo\_absent**(*name*, *profile='github'*, *\*\*kwargs*)  
Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
 github.repo_absent:
 - name: 'test'
```

The following parameters are required:  
**name** This is the name of the repository in the organization.  
New in version 2016.11.0.

**salt.states.github.repo\_present**(*name*, *description=None*, *homepage=None*, *private=False*,  
*has\_issues=True*, *has\_wiki=True*, *has\_downloads=True*,  
*auto\_init=False*, *gitignore\_template=None*, *license\_template=None*, *profile='github'*, *\*\*kwargs*)

Ensure a repository is present

**name** This is the name of the repository.  
**description** The description of the repository.  
**homepage** The URL with more information about the repository.  
**private** The visibility of the repository. Note that private repositories require a paid GitHub account.  
**has\_issues** Whether to enable issues for this repository.  
**has\_wiki** Whether to enable the wiki for this repository.  
**has\_downloads** Whether to enable downloads for this repository.  
**auto\_init** Whether to create an initial commit with an empty README.  
**gitignore\_template** The desired language or platform for a .gitignore, e.g ``Haskell``.  
**license\_template** The desired LICENSE template to apply, e.g ``mit`` or ``mozilla``.

Example:

```
Ensure repo my-repo is present in github:
 github.repo_present:
 - name: 'my-repo'
 - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.team_absent`(*name*, *profile*='github', *\*\*kwargs*)  
Ensure a team is absent.

Example:

```
ensure team test is present in github:
 github.team_absent:
 - name: 'test'
```

The following parameters are required:

**name** This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.team_present`(*name*, *description*=None, *repo\_names*=None, *privacy*='secret',  
*permission*='pull', *members*=None, *enforce\_mfa*=False,  
*no\_mfa\_grace\_seconds*=0, *profile*='github', *\*\*kwargs*)

Ensure a team is present

**name** This is the name of the team in the organization.

**description** The description of the team.

**repo\_names** The names of repositories to add the team to.

**privacy** The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.

**permission** The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.

**members** The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce\_mfa\_from' and 'mfa\_exempt'.

**enforce\_mfa** Whether to enforce MFA requirements on members of the team. If True then all members without *mfa\_exempt*: True configured will be removed from the team. Note that *no\_mfa\_grace\_seconds* may be set to allow members a grace period.

**no\_mfa\_grace\_seconds** The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce\_mfa\_from* on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
 github.team_present:
 - name: 'test'
 - members:
 user1: {}
 user2: {}

Ensure team test_mfa is present in github:
 github.team_present:
 - name: 'test_mfa'
 - members:
 user1:
 enforce_mfa_from: 2016/06/15
 - enforce_mfa: True
```

New in version 2016.11.0.

## 14.16.72 salt.states.glance

### Managing Images in OpenStack Glance

`salt.states.glance.image_present` (*name, visibility='public', protected=None, checksum=None, location=None, wait\_for=None, timeout=30*)

Checks if given image is present with properties set as specified.

An image should go through the stages `queued`, `saving` before becoming `active`. The attribute `checksum` can only be checked once the image is active. If you don't specify `wait\_for` but `checksum` the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached `saving`. The default timeout for both is 30 seconds.

#### Supported properties:

- visibility (`public` or `private`)
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)

## 14.16.73 salt.states.glusterfs

Manage GlusterFS pool.

`salt.states.glusterfs.add_volume_bricks` (*name, bricks*)

Add brick(s) to an existing volume

**name** Volume name

**bricks** List of bricks to add to the volume

```
myvolume:
 glusterfs.add_volume_bricks:
 - bricks:
 - host1:/srv/gluster/drive1
 - host2:/srv/gluster/drive2
```

```
Replicated Volume:
 glusterfs.add_volume_bricks:
 - name: volume2
 - bricks:
 - host1:/srv/gluster/drive2
 - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.created` (*\*args, \*\*kwargs*)

Deprecated version of more descriptively named `volume_present`

`salt.states.glusterfs.peered` (*name*)

Check if node is peered.

**name** The remote host with which to peer.

```
peer-cluster:
 glusterfs.peered:
 - name: two

peer-clusters:
 glusterfs.peered:
 - names:
 - one
 - two
```

- ```
- three
- four
```

`salt.states.glusterfs.started(name)`

Check if volume has been started

name name of the volume

```
mycluster:
  glusterfs.started: []
```

`salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False)`

Ensure that the volume exists

name name of the volume

bricks list of brick paths

start ensure that the volume is also started

```
myvolume:
  glusterfs.created:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.created:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True
```

14.16.74 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6
localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true
localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h
```

```
salt.states.gnomedesktop.desktop_interface(name, user=None, auto-  
matic_mnemonics=None,  
buttons_have_icons=None,  
can_change_accels=None,  
clock_format=None, clock_show_date=None,  
clock_show_seconds=None, cur-  
sor_blink=None, cursor_blink_time=None,  
cursor_blink_timeout=None, cur-  
sor_size=None, cursor_theme=None,  
document_font_name=None,  
enable_animations=None,  
font_name=None, gtk_color_palette=None,

show_unicode_menu=None,  
text_scaling_factor=None, tool-  
bar_detachable=None, tool-  
bar_icons_size=None, toolbar_style=None,  
toolkit_accessibility=None, **kwargs)
```

desktop_interface: sets values in the org.gnome.desktop.interface schema

```
salt.states.gnomedesktop.desktop_lockdown(name, user=None, dis-  
able_application_handlers=None,  
disable_command_line=None, dis-  
able_lock_screen=None, dis-  
able_log_out=None, disable_print_setup=None,  
disable_printing=None, dis-  
able_save_to_disk=None, dis-  
able_user_switching=None,  
user_administration_disabled=None, **kwargs)
```

desktop_lockdown: sets values in the org.gnome.desktop.lockdown schema

```

salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None, action_middle_click_titlebar=None, action_right_click_titlebar=None, application_based=None, audible_bell=None, auto_raise=None, auto_raise_delay=None, button_layout=None, disable_workarounds=None, focus_mode=None, focus_new_windows=None, mouse_button_modifier=None, num_workspaces=None, raise_on_click=None, resize_with_right_button=None, theme=None, titlebar_font=None, titlebar_uses_system_font=None, visual_bell=None, visual_bell_type=None, workspace_names=None, **kwargs)

```

wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

14.16.75 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

```

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)

```

Ensure GPG public key is absent in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the user's keychain

gnupghome Override GNUPG Home directory

```

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)

```

Ensure GPG public key is present in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the user's keychain

keyserver The keyserver to retrieve the keys from.

gnupghome Override GNUPG Home directory

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

14.16.76 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify `elasticsearch` hosts directly to the module, or you can use an `elasticsearch` profile via pillars:

```

mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash

```

```
# Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows_from_pillar:
    - systemhealth
    - requests

# Passing hosts in
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows:
    - collapse: false
      editable: true
      height: 150px
      title: System Health
      panels:
        - aliasColors: {}
          id: 200000
          annotate:
            enable: false
          bars: false
          datasource: null
          editable: true
          error: false
          fill: 7
          grid:
            leftMax: 100
            leftMin: null
            rightMax: null
            rightMin: null
            threshold1: 60
            threshold1Color: rgb(216, 27, 27)
            threshold2: null
            threshold2Color: rgba(234, 112, 112, 0.22)
          leftYAxisLabel: ''
          legend:
            avg: false
            current: false
            max: false
            min: false
            show: false
            total: false
            values: false
          lines: true
          linewidth: 1
          nullPointMode: connected
          percentage: false
          pointradius: 5

      to: now
      timezone: browser
  - rows_from_pillars:
    - systemhealth
    - requests
  - profile: mygrafanaprofile

```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana.dashboard_absent (*name, hosts=None, profile='grafana'*)

Ensure the named grafana dashboard is deleted.

name Name of the grafana dashboard.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

salt.states.grafana.dashboard_present (*name, dashboard=None, dashboard_from_pillar=None, rows=None, rows_from_pillar=None, profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

dashboard A dict that defines a dashboard that should be managed.

dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

rows A list of grafana rows.

rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

14.16.77 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
        panels:
          - targets:
              - target: alias(constantLine(50), 'max')
                title: Imaginary
                type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana_dashboard.absent (*name*, *profile*='grafana')

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

profile A pillar key or dict that contains grafana information

salt.states.grafana_dashboard.present (*name*, *base_dashboards_from_pillar*=None, *base_panels_from_pillar*=None, *base_rows_from_pillar*=None, *dashboard*=None, *profile*='grafana')

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from

dashboard A dict that defines a dashboard that should be managed.

profile A pillar key or dict that contains grafana information

14.16.78 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```

Ensure influxdb data source is present:
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true

```

`salt.states.grafana_datasource.absent` (*name*, *profile*='grafana')

Ensure that a data source is present.

name Name of the data source to remove.

`salt.states.grafana_datasource.present` (*name*, *type*, *url*, *access*='proxy', *user*='', *password*='', *database*='', *basic_auth*=False, *basic_auth_user*='', *basic_auth_password*='', *is_default*=False, *json_data*=None, *profile*='grafana')

Ensure that a data source is present.

name Name of the data source.

type Which type of data source it is ('graphite', 'influxdb' etc.).

url The URL to the data source API.

user Optional - user to authenticate with the data source

password Optional - password to authenticate with the data source

basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basic_auth_user Optional - HTTP basic auth username.

basic_auth_password Optional - HTTP basic auth password.

is_default Default: False

14.16.79 salt.states.grains

Manage grains on the minion

This state allows for grains to be set. Grains set or altered this way are stored in the 'grains' file on the minions, by default at: /etc/salt/grains

Note: This does NOT override any grains set in the minion file.

`salt.states.grains.absent` (*name*, *destructive*=False, *delimiter*=':', *force*=False)

New in version 2014.7.0.

Delete a grain from the grains config file

name The grain name

destructive If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent: []
```

`salt.states.grains.append` (*name, value, convert=False, delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

name The grain name

value The value to append

convert If *convert* is True, convert non-list contents into a list. If *convert* is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

`salt.states.grains.list_absent` (*name, value, delimiter=':'*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

name The grain name.

value The value to delete from the grain list.

delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

`salt.states.grains.list_present` (*name, value, delimiter=':'*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in *name* is not present on the system, this new grain will be created with the corresponding provided value.

name The grain name.

value The value is present in the list type grain.

delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.present` (*name*, *value*, *delimiter=':'*, *force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.

name The grain name

value The value to set on the grain

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with_a_custom_delimiter:
  grains.present:
    - value: yay
    - delimiter: ,
```

14.16.80 salt.states.group

Management of user groups

The group module is used to create and manage unix group settings, groups can be either present or absent:

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
```

```

- user1
- users2
- delusers:
  - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2

```

salt.states.group.absent(*name*)

Ensure that the named group is absent

name The name of the group to remove

salt.states.group.present(*name, gid=None, system=False, addusers=None, delusers=None, members=None*)

Ensure that a group is present

name The name of the group to manage

gid The group id to assign to the named group; if left empty, then the next available group id will be assigned

system Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'.

addusers List of additional users to be added as a group members.

delusers Ensure these user are removed from the group membership.

members Replace existing group members with a list of new members.

Note: Options 'members' and 'addusers/delusers' are mutually exclusive and can not be used together.

14.16.81 salt.states.hg

Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known_hosts, and the remote host has this host's public key.

```

https://bitbucket.org/example_user/example_repo:
hg.latest:
  - rev: tip
  - target: /tmp/example_repo

```

salt.states.hg.latest(*name, rev=None, target=None, clean=False, user=None, identity=None, force=False, opts=False*)

Make sure the repository is cloned to the given directory and is up to date

name Address of the remote repository as passed to 'hg clone'

rev The remote branch, tag, or revision hash to clone/pull

target Target destination directory path on minion to clone into

clean Force a clean update with -C (Default: False)

user Name of the user performing repository management operations

New in version 0.17.0.

identity Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

force Force hg to clone into pre-existing directories (deletes contents)

opts Include additional arguments and options to the hg command line

14.16.82 salt.states.hipchat

Send a message to Hipchat

This state is useful for sending messages to Hipchat during state runs.

The property `api_url` is optional. By default will use the public HipChat API at <https://api.hipchat.com>

New in version 2015.5.0.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
```

The api key can be specified in the master or minion configuration like below:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

`salt.states.hipchat.send_message`(*name*, *room_id*, *from_name*, *message*, *api_url=None*, *api_key=None*, *api_version=None*, *message_color='yellow'*, *notify=False*)

Send a message to a Hipchat room.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
    - color: green
    - notify: True
```

The following parameters are required:

name The unique name for this event.

room_id The room to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the ``from" field. If not specified, defaults to.

message The message that is to be sent to the Hipchat room.

The following parameters are optional:

api_url The API URI to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: <https://api.hipchat.com>

api_key The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.

api_version The api version for Hipchat to use, if not specified in the configuration options of master or minion.

color The color the Hipchat message should be displayed in. One of the following, default: yellow ``yellow'', ``red'', ``green'', ``purple'', ``gray'', or ``random''.

notify Should a notification in the room be raised.

14.16.83 salt.states.host

Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

Note: Changing the names in `host.present` does not cause an update to remove the old entry.

```
server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
  host.only:
    - hostnames: []
```

`salt.states.host.absent` (*name*, *ip*)

Ensure that the named host is absent

name The host to remove

ip The ip addr(s) of the host to remove

`salt.states.host.only` (*name*, *hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name The IP address to associate with the given hostnames.

hostnames Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.present`(*name*, *ip*)

Ensures that the named host is present with the given ip

name The host to assign an ip to

ip The ip addr(s) to apply to the host

14.16.84 `salt.states.htpasswd`

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

`salt.states.htpasswd.user_exists`(*name*, *password=None*, *htpasswd_file=None*, *options=''*,
force=False, *runas=None*)

Make sure the user is inside the specified htpasswd file

name User name

password User password

htpasswd_file Path to the htpasswd file

options See `salt.modules.htpasswd.useradd`

force Touch the file even if user already created

runas The system user to run htpasswd command with

14.16.85 `salt.states.http`

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query`(*name*, *match=None*, *match_type='string'*, *status=None*, *wait_for=None*,
***kwargs*)

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

name The name of the query.

match Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

match_type Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcr` to use regular expression matching if a more complex pattern matching is required.

Note: Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

status The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: '200'
```

`salt.states.http.wait_for_successful_query`(*name*, *wait_for=300*, ***kwargs*)

Like `query` but, repeat and wait until `match/match_type` or `status` is fulfilled. State returns result from last `query` state in case of success or if no successful query was made within `wait_for` timeout.

14.16.86 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event`(*name*, *event*, *value1=None*, *value2=None*, *value3=None*)

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that wen want to send.'
```

The following parameters are required:

name The unique name for this event.

event The name of the event to trigger in IFTTT.

The following parameters are optional:

value1 One of the values that we can send to IFTT.

value2 One of the values that we can send to IFTT.

value3 One of the values that we can send to IFTT.

14.16.87 salt.states.incron

Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask:
      - IN_MODIFY
      - IN_ACCESS
    - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

salt.states.incron.absent (*name*, *path*, *mask*, *cmd*, *user*='root')

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry

path The path that should be watched

user The name of the user who's crontab needs to be modified, defaults to the root user

mask The mask of events that should be monitored for

cmd The cmd that should be executed

salt.states.incron.present (*name*, *path*, *mask*, *cmd*, *user*='root')

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

name Unique comment describing the entry

path The path that should be watched

user The name of the user who's crontab needs to be modified, defaults to the root user

mask The mask of events that should be monitored for

cmd The cmd that should be executed

14.16.88 salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent`(*name*, ***client_args*)

Ensure that given database is absent.

name Name of the database to remove.

`salt.states.influxdb_database.present`(*name*, ***client_args*)

Ensure that given database is present.

name Name of the database to create.

14.16.89 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent`(*name*, ***client_args*)

Ensure that given user is absent.

name The name of the user to manage

`salt.states.influxdb_user.present`(*name*, *password*, *admin=False*, ***client_args*)

Ensure that given user is present.

name Name of the user to manage

password Password of the user

admin [False] Whether the user should have cluster administration privileges or not.

14.16.90 salt.states.infoblox module

states for infoblox stuff

ensures a record is either present or absent in an Infoblox DNS system

New in version 2016.3.0.

`salt.states.infoblox.absent`(*name*, *record_type*, *dns_view*, *infoblox_server=None*,
infoblox_user=None, *infoblox_password=None*, *in-*
foblox_api_version='v1.4.2', *sslVerify=True*)

Ensure a record does not exist

name Name of the record

record_type record type (host, a, cname, etc)

dns_view DNS View

infoblox_server infoblox server to connect to (will try pillar if not specified)

infoblox_user username to use to connect to infoblox (will try pillar if not specified)

infoblox_password password to use to connect to infoblox (will try pillar if not specified)

verify_ssl verify SSL certificates

Example:

```
some-state:
  infoblox.absent:
    - name: some.dns.record
    - record_type: host
```

```
- dns_view: MyView
- sslVerify: False
```

`salt.states.infoblox.present`(*name*, *value*, *record_type*, *dns_view*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

Ensure a record exists

name Name of the record

value Value of the record

record_type record type (host, a, cname, etc)

dns_view DNS View

infoblox_server infoblox server to connect to (will try pillar if not specified)

infoblox_user username to use to connect to infoblox (will try pillar if not specified)

infoblox_password password to use to connect to infoblox (will try pillar if not specified)

verify_ssl verify SSL certificates

Example:

```
some-state:
  infoblox.present:
    - name: some.dns.record
    - value: 10.1.1.3
    - record_type: host
    - sslVerify: False
```

14.16.91 salt.states.ini_manage

Manage ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

`salt.states.ini_manage.options_absent`(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
ini.options_absent:
  - separator: '='
  - sections:
    test:
      - testkey
      - secondoption
    test1:
      - testkey1
```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present`(*name*, *sections=None*, *separator='='*)

```

/home/saltminion/api-paste.ini:
ini.options_present:
- separator: '='
- sections:
  test:
    testkey: 'testval'
    secondoption: 'secondvalue'
  test1:
    testkey1: 'testval121'

```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent` (*name, sections=None, separator='='*)

```

/home/saltminion/api-paste.ini:
ini.sections_absent:
- separator: '='
- sections:
  - test
  - test1

```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present` (*name, sections=None, separator='='*)

```

/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
  - section_one
  - section_two

```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

14.16.92 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```

ipmi.config:
api_host: 127.0.0.1
api_user: admin
api_pass: apassword
api_port: 623
api_kg: None

```

Every call can override the config defaults:

```

ensure myipmi system is set to network boot:
  ipmi.boot_device:
    - name: network
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
    - api_kg: None

ensure myipmi system is powered on:
  ipmi.power:
    - name: boot
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword

```

salt.states.ipmi.boot_device (*name='default', **kwargs*)

Request power state change

name = default

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting `safe mode`
- optical -- boot from CD/DVD/BD drive
- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.power (*name='power_on', wait=300, **kwargs*)

Request power state change

name

Ensure power state one of:

- power_on -- system turn on
- power_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then `on`, else `reset`

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.user_absent (*name, channel=14, **kwargs*)

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

`salt.states.ipmi.user_present` (*name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs*)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter `privilege_level`, for both callback and non-callback connections.

True = User Privilege Limit is determined by the `privilege_level` parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in` to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging` refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) `ipmi_msg`

privilege_level

- callback
- user
- operator
- administrator
- proprietary
- no_access

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

14.16.93 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```
setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True
```

```

setname:
  ipset.set_absent:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname_entries:
  ipset.present:
    - set_name: setname
    - entry: 192.168.0.3
    - comment: Hello
    - require:
      - ipset: baz

setname_entries:
  ipset.present:
    - set_name: setname
    - entry:
      - 192.168.0.3
      - 192.168.1.3
    - comment: Hello
    - require:
      - ipset: baz

setname_entries:
  ipset.absent:
    - set_name: setname
    - entry:
      - 192.168.0.3
      - 192.168.1.3
    - comment: Hello
    - require:
      - ipset: baz

setname:
  ipset.flush:

```

`salt.states.ipset.absent` (*name*, *entry=None*, *entries=None*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

family Network family, ipv4 or ipv6.

`salt.states.ipset.flush` (*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Flush current ipset set

family Networking family, either ipv4 or ipv6

`salt.states.ipset.present` (*name*, *entry=None*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Append a entry to a set

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

entry A single entry to add to a set or a list of entries to add to a set

family Network family, ipv4 or ipv6.

`salt.states.ipset.set_absent(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set is absent.

family Networking family, either ipv4 or ipv6

`salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set exists.

name A user-defined set name.

set_type The type for the set.

family Networking family, either ipv4 or ipv6

14.16.94 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
      - state
      - comment
  
```

```
- comment: "Allow HTTP"
- connstate: NEW
- source: '127.0.0.1'

- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
```

```
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
    - chain: INPUT
    - policy: ACCEPT
```

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.append`(*name*, *table*='filter', *family*='ipv4', ***kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain.

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain which should be modified

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for `iptables`, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent`(*name*, *table*='filter', *family*='ipv4')

New in version 2014.1.0.

Verify the chain is absent.

table The table to remove the chain from

family Networking family, either ipv4 or ipv6

`salt.states.iptables.chain_present`(*name*, *table*='filter', *family*='ipv4')

New in version 2014.1.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

`salt.states.iptables.delete` (*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.flush` (*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Flush current iptables state

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

`salt.states.iptables.insert` (*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

position The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.mod_aggregate` (*low*, *chunks*, *running*)

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.set_policy` (*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

policy The requested table policy

14.16.95 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the `jboss-cli.sh` script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a `jboss_config` dictionary with the following properties must be passed:

```

jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'

```

If the controller doesn't require a password, then the `cli_user` and `cli_password` parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

For the sake of brevity, examples for each state assume that `jboss_config` is contained in the pillar.

salt.states.jboss7.bindings_exist (*name, jboss_config, bindings, profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

jboss_config: Dict with connection properties (see state description)

bindings: Dict with bindings to set.

profile: The profile name (domain mode only)

Example:

```

jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
        'java:global/sampleapp/environment': 'DEV'
        'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
↪properties'
    - jboss_config: {{ pillar['jboss'] }}

```

salt.states.jboss7.datasource_exists (*name, jboss_config, datasource_properties, recreate=False, profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

name Datasource property name

jboss_config Dict with connection properties (see state description)

datasource_properties Dict with datasource properties

recreate [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

profile [None] The profile name for this datasource (domain mode only)

Example:

```

sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
        driver-name: mysql
        connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
        jndi-name: 'java:jboss/datasources/sampleDS'
        user-name: sampleuser
        password: secret

```

```

min-pool-size: 3
use-java-context: True
- jboss_config: {{ pillar['jboss'] }}
- profile: full-ha

```

`salt.states.jboss7.deployed` (*name, jboss_config, salt_source=None*)

Ensures that the given application is deployed on server.

jboss_config: Dict with connection properties (see state description)

salt_source:

How to find the artifact to be deployed.

target_file: Where to look in the minion's file system for the artifact to be deployed (e.g. `/tmp/application-web-0.39.war`). When source is specified, also specifies where to save the retrieved file.

source: (optional) File on salt master (e.g. `salt://application-web-0.39.war`). If absent, no files will be retrieved and the artifact in `target_file` will be used for the deployment.

undeploy: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion's local file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

It is assumed that `/tmp/webapp.war` was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}

```

Here, `application-web-0.39.war` file is downloaded from Salt file system to `/tmp/application-web-0.39.war` file on minion. Existing deployments are checked if any of them matches `'application-web-.*'` regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of `salt_source` is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.reloaded` (*name, jboss_config, timeout=60, interval=5*)

Reloads configuration of jboss server.

jboss_config: Dict with connection properties (see state description)

timeout: Time to wait until jboss is back in running state. Default timeout is 60s.

interval: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to `jboss-cli` which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

14.16.96 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.absent`(*name*, ***kwargs*)
Ensure the job is present in the Jenkins configured jobs
name The name of the Jenkins job to remove.

`salt.states.jenkins.present`(*name*, *config=None*, ***kwargs*)
Ensure the job is present in the Jenkins configured jobs
name The unique name for the Jenkins job
config The Salt URL for the file to use for configuring the job.

14.16.97 salt.states.junos module

State modules to interact with Junos devices.

These modules call the corresponding execution modules. Refer to [junos](#) for further information.

`salt.states.junos.cli`(*name*)
Executes the CLI commands and reuturns the text output.

```
show version:
  junos.cli
```

name: the command to be executed on junos CLI.

`salt.states.junos.commit`(*name*)
Commits the changes loaded into the candidate configuration.

```
commit the changes:
  junos.commit
```

name: can be anything

`salt.states.junos.diff`(*name*)
Gets the difference between the candidate and the current configuration.

```
get the diff:
  junos.diff
```

name: can be anything

`salt.states.junos.file_copy`(*name*, *dest=None*)

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
junos:
- file_copy
- dest: info_copy.txt
```

name: source path of the file.

dest: destination path where the file will be placed.

`salt.states.junos.install_config`(*name*, ***kwargs*)

Loads and commits the configuration provided.

```
/home/user/config.set:
junos:
- install_config
- timeout: 100
```

name: path to the configuration file.

keyworded arguments taken by load function of PyEZ

`salt.states.junos.install_os`(*name*, ***kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
/home/user/junos_image.tgz:
junos:
- install_os
- timeout: 100
- reboot: True
```

name: path to the image file.

kwargs: keyworded arguments to be given such as timeout, reboot etc

`salt.states.junos.rollback`(*name*)

Rollbacks the committed changes.

```
rollback the changes:
junos.rollback
```

name: can be anything

`salt.states.junos.rpc`(*name*, *dest=None*, *format='xml'*, *args=None*, ***kwargs*)

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with `dest` as an argument

```
get-interface-information:
junos:
- rpc
- dest: /home/user/rpc.log
- interface_name: lo0
```

name: the rpc to be executed.

args: other arguments as taken by rpc call of PyEZ

kwargs: keyworded arguments taken by rpc call of PyEZ

`salt.states.junos.set_hostname(name, commit_changes=True)`
Changes the hostname of the device.

```
device name:
  junos:
    - set_hostname
    - commit_changes: False
```

name: the name to be given to the device

commit_changes: whether to commit the changes

`salt.states.junos.shutdown(name, time=0)`
Shuts down the device.

```
shut the device:
  junos:
    - shutdown
    - time: 10
```

name: can be anything

time: time after which the system should shutdown(in seconds, default=0)

`salt.states.junos.zeroize(name)`
Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

14.16.98 salt.states.k8s

Manage Kubernetes

New in version 2016.3.0.

```
kube_label_1:
  k8s.label_present:
    - name: mylabel
    - value: myvalue
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080

kube_label_2:
  k8s.label_absent:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080

kube_label_3:
  k8s.label_folder_present:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080
```

`salt.states.k8s.label_absent` (*name*, *node=None*, *apiserver=None*)

Ensure the label doesn't exist on the kube node.

name Name of the label.

node Override node ID.

apiserver K8S apiserver URL.

`salt.states.k8s.label_folder_absent` (*name*, *node=None*, *apiserver=None*)

Ensure the label folder doesn't exist on the kube node.

name Name of the label folder.

node Override node ID.

apiserver K8S apiserver URL.

`salt.states.k8s.label_present` (*name*, *value*, *node=None*, *apiserver=None*)

Ensure the label exists on the kube node.

name Name of the label.

value Value of the label.

node Override node ID.

apiserver K8S apiserver URL.

14.16.99 salt.states.kapacitor module

Kapacitor state module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.task_absent` (*name*)

Ensure that a task is absent from Kapacitor.

name Name of the task.

`salt.states.kapacitor.task_present` (*name*, *tick_script*, *task_type='stream'*, *database=None*, *retention_policy='default'*, *enable=True*)

Ensure that a task is present and up-to-date in Kapacitor.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a `salt://` source.

task_type Task type. Defaults to `'stream'`

database Which database to fetch data from. Defaults to `None`, which will use the default database in InfluxDB.

retention_policy Which retention policy to fetch data from. Defaults to `'default'`.

enable Whether to enable the task or not. Defaults to `True`.

14.16.100 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

`salt.states.keyboard.system(name)`

Set the keyboard layout for the system

name The keyboard layout to use

`salt.states.keyboard.xorg(name)`

Set the keyboard layout for XOrg

layout The keyboard layout to use

14.16.101 salt.states.keystone

Management of Keystone users

depends

- keystoneclient Python module

configuration See *salt.modules.keystone* for setup instructions.

```
Keystone tenants:
keystone.tenant_present:
  - names:
    - admin
    - demo
    - service

Keystone roles:
keystone.role_present:
  - names:
    - admin
    - Member

admin:
keystone.user_present:
  - password: R00T_4CC3SS
  - email: admin@domain.com
  - roles:
    admin: # tenants
      - admin # roles
    service:
      - admin
      - Member
  - require:
    - keystone: Keystone tenants
    - keystone: Keystone roles

nova:
keystone.user_present:
  - password: '$up3rn0v4'
  - email: nova@domain.com
  - tenant: service
  - roles:
    service:
      - admin
```

```

- require:
  - keystone: Keystone tenants
  - keystone: Keystone roles

demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
      demo:
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

```

salt.states.keystone.endpoint_absent (*name*, *profile=None*, ***connection_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

name The name of the service whose endpoints should not exist

salt.states.keystone.endpoint_present (*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region='RegionOne'*, *profile=None*, *url=None*, *interface=None*, ***connection_args*)

Ensure the specified endpoints exists for service

name The Service name

publicurl The public url of service endpoint (for V2 API)

internalurl The internal url of service endpoint (for V2 API)

adminurl The admin url of the service endpoint (for V2 API)

region The region of the endpoint

url The endpoint URL (for V3 API)

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.project_absent (*name*, *profile=None*, ***connection_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project that should not exist

```

delete_nova:
  keystone.project_absent:
    - name: nova

```

salt.states.keystone.project_present (*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone project exists Alias for `tenant_present` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project to manage

description The description to use for this project

enabled Availability state for this project

```
nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'
```

`salt.states.keystone.role_absent`(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone role is absent.

name The name of the role that should not exist

`salt.states.keystone.role_present`(*name*, *profile=None*, ***connection_args*)

Ensures that the keystone role exists

name The name of the role that should be present

`salt.states.keystone.service_absent`(*name*, *profile=None*, ***connection_args*)

Ensure that the service doesn't exist in Keystone catalog

name The name of the service that should not exist

`salt.states.keystone.service_present`(*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)

Ensure service present in Keystone catalog

name The name of the service

service_type The type of Openstack Service

description (optional) Description of the service

`salt.states.keystone.tenant_absent`(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone tenant is absent.

name The name of the tenant that should not exist

`salt.states.keystone.tenant_present`(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone tenant exists

name The name of the tenant to manage

description The description to use for this tenant

enabled Availability state for this tenant

`salt.states.keystone.user_absent`(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone user is absent.

name The name of the user that should not exist

`salt.states.keystone.user_present`(*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password_reset=True*, *project=None*, ***connection_args*)

Ensure that the keystone user is present with the specified properties.

name The name of the user to manage

password The password to use for this user.

Note: If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

password_reset Whether or not to reset password after initial set. Defaults to `True`.

email The email address for this user

tenant The tenant (name) for this user

project The project (name) for this user (overrides tenant in api v3)

enabled Availability state for this user

roles The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```

roles:
  admin: # tenant
    - admin # role
  service:
    - admin
    - Member

```

14.16.102 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```

add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr

```

Multiple modules can be specified for both kmod.present and kmod.absent.

```

add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd

```

salt.states.kmod.absent (*name, persist=False, comment=True, mods=None*)

Verify that the named kernel module is not loaded

name The name of the kernel module to verify is not loaded

persist Remove module from `/etc/modules`

comment Comment out module in `/etc/modules` rather than remove it

mods A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

salt.states.kmod.present (*name, persist=False, mods=None*)

Ensure that the specified kernel module is loaded

name The name of the kernel module to verify is loaded

persist Also add module to `/etc/modules`

mods A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

14.16.103 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```
sunrise:
  layman.present
```

`salt.states.layman.absent(name)`
Verify that the overlay is absent
name The name of the overlay to delete

`salt.states.layman.present(name)`
Verify that the overlay is present
name The name of the overlay to add

14.16.104 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed(name, entries, connect_spec=None)`
Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
  ldap.managed:
    - connect_spec:
        bind:
          method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
          - delete_others: True

      # make sure the entry exists with only the specified
      # attribute values
      - cn=admin,dc=example,dc=com:
          - delete_others: True
          - replace:
              cn:
                - admin
              description:
                - LDAP administrator
              objectClass:
                - simpleSecurityObject
                - organizationalRole
              userPassword:
                - {{pillar.ldap_admin_password}}
```

```

# make sure the entry exists, its olcRootDN attribute
# has only the specified value, the olcRootDN attribute
# doesn't exist, and all other attributes are ignored
- 'olcDatabase={1}hdb,cn=config':
  - replace:
    olcRootDN:
      - cn=admin,dc=example,dc=com
      # the admin entry has its own password attribute
    olcRootPW: []

# note the use of 'default'. also note how you don't
# have to use list syntax if there is only one attribute
# value
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    userPassword: changeme
    shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    sshPublicKey: []
  - replace:
    cn: foo
    uid: foo
    uidNumber: 1000
    gidNumber: 1000
    gecos: Foo Bar
    givenName: Foo
    sn: Bar
    homeDirectory: /home/foo
    loginShell: /bin/bash
    objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount

```

Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```
[{dn1: [{directive1: directive1_state,
        directive2: directive2_state},
        {directive3: directive3_state}],
  dn2: [{directive4: directive4_state,
        directive5: directive5_state}]},
 {dn3: [{directive6: directive6_state}]}]
```

These are the directives:

- **'delete_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.

- **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.

- **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be `None`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect_spec** -- See the description of the `connect_spec` parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the `'url'` entry is not specified, the `'url'` entry is set to the value of the `name` parameter.

Returns

A dict with the following keys:

- **'name'** This is the same object passed to the `name` parameter.
- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
- **'new'** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
         'new': {'attr1': ['val1', 'val2']}}}
```

Example 'changes' dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
         'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
 - `True` if no changes were necessary or if all changes were applied successfully.
 - `False` if at least one change was unable to be applied.
 - `None` if changes would be applied but it is in test mode.

14.16.105 salt.states.linux_acl

Linux File Access Control Lists

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

`salt.states.linux_acl.absent(name, acl_type, acl_name='', perms='', recurse=False)`
 Ensure a Linux ACL does not exist

`salt.states.linux_acl.present`(*name*, *acl_type*, *acl_name*='', *perms*='', *recurse*=False)
Ensure a Linux ACL is present

14.16.106 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

`salt.states.locale.present`(*name*)
Generate a locale if it is not present

New in version 2014.7.0.

name The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.system`(*name*)
Set the locale for the system
name The name of the locale to use

14.16.107 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

`salt.states.lvm.lv_absent`(*name*, *vgname*=None)
Remove a given existing logical volume from a named existing volume group
name The logical volume to remove
vgname The volume group name

`salt.states.lvm.lv_present` (*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=''*, *thinvolume=False*, *thinpool=False*, ***kwargs*)

Create a new logical volume

name The name of the logical volume
vgname The volume group name for this logical volume
size The initial size of the logical volume
extents The number of logical extents to allocate
snapshot The name of the snapshot
pv The physical volume to use
kwargs Any supported options to lvcreate. See *linux_lvm* for more details.
 New in version to_complete.
thinvolume Logical volume is thinly provisioned
thinpool Logical volume is a thin pool

`salt.states.lvm.pv_absent` (*name*)

Ensure that a Physical Device is not being used by lvm
name The device name to initialize.

`salt.states.lvm.pv_present` (*name*, ***kwargs*)

Set a physical device to be used as an LVM physical volume
name The device name to initialize.
kwargs Any supported options to pvcreate. See *linux_lvm* for more details.

`salt.states.lvm.vg_absent` (*name*)

Remove an LVM volume group
name The volume group to remove

`salt.states.lvm.vg_present` (*name*, *devices=None*, ***kwargs*)

Create an LVM volume group
name The volume group name to create
devices A list of devices that will be added to the volume group
kwargs Any supported options to vgcreate. See *linux_lvm* for more details.

14.16.108 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.absent` (*name*, *protocol=None*, *server_address=None*, *service_address=None*)

Ensure the LVS Real Server in specified service is absent.
name The name of the LVS server.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.
server_address The LVS real server address.

`salt.states.lvs_server.present` (*name*, *protocol=None*, *server_address=None*, *service_address=None*, *packet_forward_method='dr'*, *weight=1*)

Ensure that the named service is present.
name The LVS server name
protocol The service protocol
service_address The LVS service address
server_address The real server address.
packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
weight The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

14.16.109 salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent` (*name*, *protocol=None*, *service_address=None*)

Ensure the LVS service is absent.

name The name of the LVS service

protocol The service protocol

service_address The LVS service address

`salt.states.lvs_service.present` (*name*, *protocol=None*, *service_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

name The LVS service name

protocol The service protocol

service_address The LVS service address

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

14.16.110 salt.states.lxc

Manage Linux Containers

`salt.states.lxc.absent` (*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

name Name of the container to destroy

stop stop before destroying default: false

New in version 2015.5.2.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

`salt.states.lxc.edited_conf` (*name*, *lxc_conf=None*, *lxc_conf_unset=None*)

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface). It is slated to be replaced, and as of version 2015.5.0 it is deprecated.

Edit LXC configuration options

Deprecated since version 2015.5.0.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
      - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
      - lxc.utsname
```

salt.states.lxc.frozen (*name, start=True, path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use [lxc.present](#).

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

start [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

salt.states.lxc.present (*name, running=None, clone_from=None, snapshot=False, profile=None, network_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

name The name of the container to be created

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

running [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

clone_from Create named container as a clone of the specified container

snapshot [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

profile Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

network_profile Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

Container Creation Arguments

template The template to use. E.g., `'ubuntu'` or `'fedora'`. Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

options

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to `filesystem` within `/var/lib/lxc`.

fstype Filesystem type to use on LVM logical volume

size Size of the volume to create. Only applicable if `backing` is set to `lvm`.

vgname [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.running` (*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

Note: This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

name The name of the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

restart [False] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass`(*name*, ***kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.stopped`(*name*, *kill=False*, *path=None*)

Ensure that a container is stopped

Note: This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

name The name of the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

kill [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

14.16.111 salt.states.mac_assistive module

Allows you to manage assistive access on OS X minions with 10.9+

Install, enable and disable assistive access on OS X minions

```
/usr/bin/osascript:
  assistive.installed:
    - enabled: True
```

`salt.states.mac_assistive.installed`(*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

name The bundle ID or path to command

enable Should assistive access be enabled on this application?

14.16.112 salt.states.mac_defaults module

Writing/reading defaults from an OS X minion

`salt.states.mac_defaults.absent`(*name, domain, user=None*)

Make sure the defaults value is absent

name The key of the given domain to remove

domain The name of the domain to remove from

user The user to write the defaults to

`salt.states.mac_defaults.write`(*name, domain, value, vtype='string', user=None*)

Write a default to the system

name The key of the given domain to write to

domain The name of the domain to write to

value The value to write to the given key

vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user The user to write the defaults to

14.16.113 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificats to the OS X keychain

```
/mnt/test.p12:
keychain.installed:
- password: test123
```

`salt.states.mac_keychain.default_keychain`(*name, domain='user', user=None*)

Set the default keychain to use

name The chain in which to use as the default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to run as

`salt.states.mac_keychain.installed`(*name, password, keychain='/Library/Keychains/System.keychain', **kwargs*)

Install a p12 certificate file into the OS X keychain

name The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.uninstalled`(*name, password, keychain='/Library/Keychains/System.keychain', keychain_password=None*)

Uninstall a p12 certificate file from the OS X keychain

name The certificate to uninstall, this can be a path for a .p12 or the friendly name

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

cert_name The friendly name of the certificate, this can be used instead of giving a certificate

keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

14.16.114 salt.states.mac_package module

Installing of mac pkg files

Install any kind of pkg, dmg or app file on Mac OS X:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1
```

*7B91b

```
salt.states.mac_package.installed(name, target='LocalSystem', dmg=False, store=False,
                                   app=False, mpkg=False, user=None, onlyif=None, unless=None,
                                   force=False, allow_untrusted=False, version_check=None)
```

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name The pkg or dmg file to install

target The location in which to install the package. This can be a path or LocalSystem

dmg Is the given file a dmg file?

store Should the pkg be installed as if it was from the Mac OS Store?

app Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

user Name of the user performing the unless or onlyif checks

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

force Force the package to be installed even if its already been found installed

allow_untrusted Allow the installation of untrusted packages

version_check The command and version that we want to check against, the version number can use regex.

14.16.115 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assitive access on OS X minions

```
/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111
```

salt.states.mac_xattr.delete(*name, attributes*)

Make sure the given attributes are deleted from the file/directory

name The path to the file/directory

attributes The attributes that should be removed from the file/directory, this is accepted as an array.

salt.states.mac_xattr.exists(*name, attributes*)

Make sure the given attributes exist on the file/directory

name The path to the file/directory

attributes The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

14.16.116 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's `make.conf` file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

salt.states.makeconf.absent(*name*)

Verify that the variable is not in the `make.conf`.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

salt.states.makeconf.present(*name, value=None, contains=None, excludes=None*)

Verify that the variable is in the `make.conf` and has the provided settings. If `value` is set, `contains` and `excludes` will be ignored.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

value Enforce that the value of the variable is set to the provided value

contains Enforce that the value of the variable contains the provided value

excludes Enforce that the value of the variable does not contain the provided value.

14.16.117 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```
my_app:
  marathon_app.config:
    - config:
      cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      cpus: 0.1
      mem: 10
      instances: 3
```

New in version 2015.8.2.

`salt.states.marathon_app.absent(name)`

Ensure that the marathon app with the given id is not present.

Parameters `name` -- The app name/id

Returns A standard Salt changes dictionary

`salt.states.marathon_app.config(name, config)`

Ensure that the marathon app with the given id is present and is configured to match the given config values.

Parameters

- **name** -- The app name/id

- **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

`salt.states.marathon_app.running(name, restart=False, force=True)`

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **name** -- The app name/id

- **restart** -- Restart the app

- **force** -- Override the current deployment

Returns A standard Salt changes dictionary

14.16.118 salt.states.mdadm

Managing software RAID with mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
raid.present:
- level: 5
- devices:
- /dev/xvdd
- /dev/xvde
- /dev/xvdf
- chunk: 256
- run: True
```

`salt.states.mdadm.absent(name)`

Verify that the raid is absent

name The name of raid device to be destroyed

```
/dev/md0:
raid:
- absent
```

`salt.states.mdadm.present(name, level, devices, **kwargs)`

Verify that the raid is present

Changed in version 2014.7.0.

name The name of raid device to be created

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

kwargs Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
raid.present:
- level: 5
- devices:
- /dev/xvdd
- /dev/xvde
- /dev/xvdf
- chunk: 256
- run: True
```

14.16.119 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

name The key

value [None] If specified, only ensure that the key is absent if it matches the specified value.

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

`salt.states.memcached.managed`(*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Manage a memcached key.

name The key to manage

value The value to set for that key

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```

14.16.120 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated`(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
```

```
- app1
- app2
```

`salt.states.modjk.worker_disabled` (*name*, *workers=None*, *profile='default'*)
Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_recover` (*name*, *workers=None*, *profile='default'*)
Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_stopped` (*name*, *workers=None*, *profile='default'*)
Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

14.16.121 salt.states.modjk_worker

Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.*** functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module *documentation*

`salt.states.modjk_worker.activate` (*name*, *lbn*, *target*, *profile='default'*, *expr_form='glob'*)
Activate the named worker from the lbn load balancers at the targeted minions

Example:

```

disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain

```

`salt.states.modjk_worker.disable` (*name, lbn, target, profile='default', expr_form='glob'*)

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```

disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain

```

`salt.states.modjk_worker.stop` (*name, lbn, target, profile='default', expr_form='glob'*)

Stop the named worker from the lbn load balancers at the targeted minions. The worker won't get any traffic from the lbn.

Example:

```

disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - expr_form: grain

```

14.16.122 salt.states.module

Execution of Salt modules from within states

These states allow individual execution module calls to be made via states. To call a single module function use a `module.run` state:

```

mine.send:
  module.run:
    - name: network.interfaces

```

Note that this example is probably unnecessary to use in practice, since the `mine_functions` and `mine_interval` config parameters can be used to schedule updates for the mine (see [here](#) for more info).

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```

mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces

```

All arguments that the `module` state does not consume are passed through to the execution module function being executed:

```
fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'
```

Due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- `fun`
- `name`
- `names`
- `state`
- `saltenv`

For example:

```
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
      interface: eth0
```

```
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
      ssh_username: 'ubuntu',
      image: 'ami-8d6d9daa',
      securitygroup: 'default',
      size: 'c3.large',
      location: 'ap-northeast-1',
      delvol_on_destroy: 'True'
    }
```

`salt.states.module.mod_watch(name, **kwargs)`

This function is an alias of `run`.

Run a single module function

name The module function to execute

returner Specify the returner to send the return of the module execution to

kwargs Pass any arguments needed to execute the function

`salt.states.module.run(name, **kwargs)`

Run a single module function

name The module function to execute

returner Specify the returner to send the return of the module execution to

kwargs Pass any arguments needed to execute the function

`salt.states.module.wait(name, **kwargs)`

Run a single module function only if the watch statement calls it

name The module function to execute

****kwargs** Pass any arguments needed to execute the function

Note: Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
 2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
-

14.16.123 salt.states.mongodb_database

Management of MongoDB databases

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`

`salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None, authdb=None)`

Ensure that the named database is absent

name The name of the database to remove

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

authdb The database in which to authenticate

14.16.124 salt.states.mongodb_user

Management of MongoDB users

Note: This module requires PyMongo to be installed.

`salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)`

Ensure that the named user is absent

name The name of the user to remove

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified by the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database from which to remove the user specified by the `name` parameter

authdb The database in which to authenticate

`salt.states.mongodb_user.present` (*name*, *passwd*, *database='admin'*, *user=None*, *password=None*,
host='localhost', *port=27017*, *authdb=None*)

Ensure that the user is present with the specified properties

name The name of the user to manage

passwd The password of the user to manage

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified with the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database in which to create the user

Note: If the database doesn't exist, it will be created.

authdb The database in which to authenticate

Example:

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
    # Connect as admin:sekrit
    - user: admin
    - password: sekret
```

14.16.125 salt.states.monit

Monit state

Manage monit states

`monit_enable_service_monitoring`:

monit.monitor:

- name: service

`monit_disable_service_monitoring`:

monit.unmonitor:

- name: service

Note: Use of these states require that the *monit* execution module is available.

`salt.states.monit.monitor` (*name*)

Get the summary from module `monit` and try to see if service is being monitored. If not then monitor the service.

`salt.states.monit.unmonitor` (*name*)

Get the summary from module `monit` and try to see if service is being monitored. If it is then stop monitoring the service.

14.16.126 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True
```

salt.states.mount.mod_watch(*name*, *user=None*, ***kwargs*)

The mounted watcher, called to invoke the watch command.

name The name of the mount point

salt.states.mount.mounted(*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match_on='auto'*, *device_name_regex=None*, *extra_mount_invisible_options=None*, *extra_mount_invisible_keys=None*, *extra_mount_ignore_fs_keys=None*, *extra_mount_translate_options=None*, *hidden_opts=None*)

Verify that a device is mounted

name The path to the location where the device is to be mounted

device The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

fstype The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, and `fuse` in the case of fuse mounts

mkmnt If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

opts A list object of options or a comma delimited list

dump The dump value to be passed into the fstab, Default is 0

pass_num The pass value to be passed into the fstab, Default is 0

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be saved in the fstab, Default is `True`

mount Set if the mount should be mounted immediately, Default is `True`

user The user to own the mount; this defaults to the user salt is running as on the minion

match_on A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

device_name_regex A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

extra_mount_invisible_options A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

extra_mount_invisible_keys A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

extra_ignore_fs_keys A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
  'ramfs': ['size']
}
```

extra_mount_translate_options A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

hidden_opts A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

`salt.states.mount.swap` (*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
  mount.swap
```

Note: swap does not currently support LABEL

`salt.states.mount.unmounted` (*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*)
New in version 0.17.0.

Verify that a device is not mounted

name The path to the location where the device is to be unmounted from

device The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be purged from the fstab, Default is `False`

user The user to own the mount; this defaults to the user salt is running as on the minion

14.16.127 salt.states.mysql_database

Management of MySQL databases (schemas)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.absent` (*name*, ***connection_args*)

Ensure that the named database is absent

name The name of the database to remove

`salt.states.mysql_database.present` (*name*, *character_set=None*, *collate=None*, ***connection_args*)

Ensure that the named database is present with the specified properties

name The name of the database to manage

14.16.128 salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in is purely symbolic and does not have anything to do with the grant itself.

The `database` parameter needs to specify a `'priv_level'` in the same specification as defined in the MySQL documentation:

- *

- **
- db_name.*
- db_name.tbl_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exampled:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe
```

`salt.states.mysql_grants.absent` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Ensure that the grant is absent

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, *revoke_first=False*, *ssl_option=False*, ***connection_args*)

Ensure that the grant is present with the specified properties

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

grant_option Adds the WITH GRANT OPTION to the defined grant. Default is `False`

escape Defines if the database value gets escaped or not. Default is `True`

revoke_first By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `revoke_first` options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

ssl_option Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

14.16.129 salt.states.mysql_query

Execution of MySQL queries

New in version 2014.7.0.

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
  - database: my_database
  - query: "SELECT * FROM table;"
  - output: "/tmp/query_id.txt"
```

`salt.states.mysql_query.run`(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, ***connection_args*)

Execute an arbitrary query on the specified database

name Used only as an ID

database The name of the database to execute the query on

query The query to execute

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need `output=grain`)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

14.16.130 salt.states.mysql_user

Management of MySQL users

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

`salt.states.mysql_user.absent` (*name*, *host*='localhost', ***connection_args*)

Ensure that the named user is absent

name The name of the user to remove

`salt.states.mysql_user.present` (*name*, *host*='localhost', *password*=None, *password_hash*=None, *allow_passwordless*=False, *unix_socket*=False, *password_column*=None, ***connection_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

name The name of the user to manage

host Host for which this user/password combo applies

password The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *. A password hash can be obtained from the `mysql` command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

allow_passwordless If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

unix_socket If `True` and `allow_passwordless` is `True`, the `unix_socket` auth plugin will be used.

14.16.131 salt.states.netntp

Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- Requires `netaddr` to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: `pip install dnspython` to resolve the nameserver entities

(in case the user does not configure the peers/servers using their IP addresses) - *NAPALM proxy minion - NTP operational and configuration management module*

`salt.states.netntp.managed`(*name, peers=None, servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36
```

Output example:

```
{
  'edge01.nrt04': {
    'netntp_|-netntp_example_|-netntp_example_|-managed': {
      'comment': 'NTP servers already configured as needed.',
      'name': 'netntp_example',
      'start_time': '12:45:24.056659',
      'duration': 2938.857,
      'changes': {
        'peers': {
          'removed': [
            '192.168.0.2',
            '192.168.0.3'
          ],
          'added': [
            '192.168.0.1',
            '172.17.17.1'
          ]
        }
      }
    },
  },
}
```

```

    'result': None
  }
}

```

14.16.132 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: Prior to version 2014.1.0, only RedHat-based systems (RHEL, CentOS, Scientific Linux, etc.) are supported. Support for Debian/Ubuntu is new in 2014.1.0 and should be considered experimental.

Other platforms are not yet supported.

```

system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1

    - enable_ipv6: true
    - ipaddrs:
      - 127.0.0.1/8
      - 10.1.0.4/32
      - 10.1.0.12/32
    - ipv6addrs:
      - fc00::1/128
      - fc00::100/128
```

```

.. note::
    Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

.. note::
    Use `retain_settings` to retain current network settings that are not
    otherwise specified in the state. Particularly useful if only setting
    the hostname. Default behavior is to delete unspecified network
    settings.

.. versionadded:: 2016.11.0

```

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the `ports` argument is required. Red Hat systems will ignore the argument.

salt.states.network.managed(*name, type, enabled=True, **kwargs*)

Ensure that the named interface is configured properly.

name The name of the interface to manage

type Type of interface and configuration.

enabled Designates the state of this interface.

kwargs The IP parameters for this interface.

salt.states.network.routes(*name, **kwargs*)

Manage network interface static routes.

name Interface name to apply the route to.

kwargs Named routes

salt.states.network.system(*name, **kwargs*)

Ensure that global network settings are configured properly.

name Custom name to represent this configuration change.

kwargs The global parameters for the system.

14.16.133 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```

httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new

```

- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

nftables.append:

- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

nftables.insert:

- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

nftables.insert:

- position: 1
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

nftables.delete:

- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:

```
nftables.delete:
- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
nftables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True
```

salt.states.nftables.append(*name*, *family*='ipv4', ***kwargs*)

New in version 0.17.0.

Append a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.chain_absent(*name*, *table*='filter', *family*='ipv4')

New in version 2014.7.0.

Verify the chain is absent.

family Networking family, either ipv4 or ipv6

salt.states.nftables.chain_present(*name*, *table*='filter', *table_type*=None, *hook*=None, *priority*=None, *family*='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

salt.states.nftables.delete(*name*, *family*='ipv4', ***kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

`salt.states.nftables.flush`(*name*, *family*='ipv4', ***kwargs*)

New in version 2014.7.0.

Flush current nftables state

family Networking family, either ipv4 or ipv6

`salt.states.nftables.insert`(*name*, *family*='ipv4', ***kwargs*)

New in version 2014.7.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

14.16.134 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a `pkg.installed` state for the package which provides npm (simply `npm` in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

`salt.states.npm.bootstrap`(*name*, *user*=None, *silent*=True)

Bootstraps a node.js application.

Will execute ``npm install --json`` on the specified directory.

user The user to run NPM with

New in version 0.17.0.

`salt.states.npm.cache_cleaned`(*name*=None, *user*=None)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or None for all packages

user The user to run NPM with

`salt.states.npm.installed`(*name*, *pkgs*=None, *dir*=None, *user*=None, *force_reinstall*=False, *registry*=None, *env*=None)

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

registry The NPM registry from which to install the package

New in version 2014.7.0.

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

force_reinstall Install the package even if it is already installed

`salt.states.npm.removed` (*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

14.16.135 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.managed` (*name*, *servers=None*)

Manage NTP servers

servers A list of NTP servers

14.16.136 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for [salt.proxy.nxos](#).

`salt.states.nxos.config_absent` (*name*)

Ensure a specific configuration line does not exist in the running config

name config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin
```

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

`salt.states.nxos.config_present(name)`

Ensure a specific configuration line exists in the running config

name config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPSTring use-acl snmp-acl-rw
```

`salt.states.nxos.replace(name, repl, full_match=False)`

Replace all instances of a string or full line in the running config

name String to replace

repl The replacement text

full_match Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, `*` is added around *name* for matching in the `show run` config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

Note: The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

`salt.states.nxos.user_absent(name)`

Ensure a user is not present

name username to remove if it exists

Examples:

```
delete:
  nxos.user_absent:
    - name: daniel
```

`salt.states.nxos.user_present` (*name*, *password=None*, *roles=None*, *encrypted=False*, *crypt_salt=None*, *algorithm='sha256'*)

Ensure a user is present with the specified groups

name Name of user

password Encrypted or Plain Text password for user

roles List of roles the user should be assigned. Any roles not in this list will be removed

encrypted Whether the password is encrypted already or not. Defaults to False

crypt_salt Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

algorithm Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin
```

14.16.137 salt.states.openstack_config

Manage OpenStack configuration file settings.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

`salt.states.openstack_config.absent` (*name*, *filename*, *section*, *parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

filename The full path to the configuration file

section The section in which the parameter will be set

parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.present` (*name, filename, section, value, parameter=None*)
Ensure a value is set in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
value The value to set

14.16.138 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.absent` (*name*)
Ensures that the named bridge does not exist, eventually deletes it.
Parameters **name** -- The name of the bridge.

`salt.states.openvswitch_bridge.present` (*name*)
Ensures that the named bridge exists, eventually creates it.
Parameters **name** -- The name of the bridge.

14.16.139 salt.states.openvswitch_port module

Management of Open vSwitch ports.

`salt.states.openvswitch_port.absent` (*name, bridge=None*)
Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.
Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

`salt.states.openvswitch_port.present` (*name, bridge, type=None, id=None, remote=None, dst_port=None*)
Ensures that the named port exists on bridge, eventually creates it.
Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst_port** -- Port to use when creating tunnelport in the switch.

14.16.140 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

`salt.states.pagerduty.create_event` (*name, details, service_key, profile*)

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

name This is a short description of the event.

details This can be a more detailed description of the event.

service_key This key can be found by using `pagerduty.list_services`.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

14.16.141 salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
  pagerduty_escalation_policy.present:
    - name: bruce test escalation policy
    - escalation_rules:
      - targets:
        - type: schedule
          id: 'bruce test schedule level1'
        - type: user
          id: 'Bruce Sherrrod'
        escalation_delay_in_minutes: 15
      - targets:
        - type: schedule
          id: 'bruce test schedule level2'
        escalation_delay_in_minutes: 15
      - targets:
        - type: user
          id: 'Bruce TestUser1'
        - type: user
          id: 'Bruce TestUser2'
        - type: user
          id: 'Bruce TestUser3'
        - type: user
          id: 'bruce+test4@lyft.com'
        escalation_delay_in_minutes: 15
```

`salt.states.pagerduty_escalation_policy.absent` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that `pagerduty_escalation_policy.present` accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

`pagerduty_escalation_policy.present`:

- name: bruce test escalation policy
- escalation_rules:
 - targets:
 - * type: schedule id: `bruce test schedule level1`
 - * type: user id: `Bruce Sherrod`

In this example, `Bruce Sherrod` will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

14.16.142 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example

ensure test schedule:

`pagerduty_schedule.present`:

- name: `bruce test schedule level1`
- schedule: name: `bruce test schedule level1` time_zone: `Pacific Time (US & Canada)` schedule_layers:
 - name: `Schedule Layer 1` start: `2015-01-01T00:00:00` users:
 - * user: `id: `Bruce TestUser1`
member_order: 1
 - * user: `id: `Bruce TestUser2`
member_order: 2
 - * user: `id: `bruce+test3@lyft.com`
member_order: 3

```
* user: `id: `bruce+test4@lyft.com`
```

```
member_order: 4
```

```
rotation_virtual_start: `2015-01-01T00:00:00` priority: 1 rotation_turn_length_seconds: 604800
```

```
salt.states.pagerduty_schedule.absent(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

```
salt.states.pagerduty_schedule.present(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called ``schedule``.

User id's can be pagerduty id, or name, or email address.

14.16.143 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```

```

```
ensure test service
```

```
pagerduty_service.present:
```

- name: `my service`
- escalation_policy_id: `my escalation policy`
- type: nagios

```
[etc]
```

```
salt.states.pagerduty_service.absent(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

```
salt.states.pagerduty_service.present(profile='pagerduty', subdomain=None, api_key=None,
**kwargs)
```

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the ``type`` argument.

Examples:

```

```

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com ensure generic email service exists:
```

```
pagerduty_service.present:
```

- name: my email service

- **service:** description: ``email service controlled by salt" escalation_policy_id: ``my escalation policy" type: ``generic_email" service_key: ``test-email"

create a pagerduty service using cloudwatch integration ensure my cloudwatch service exists:

pagerduty_service.present:

- name: my cloudwatch service
- **service:** escalation_policy_id: ``my escalation policy" type: aws_cloudwatch description: ``my cloudwatch service controlled by salt"

TODO: aws_cloudwatch type should be integrated with boto_sns

14.16.144 salt.states.pagerduty_user

Manage PagerDuty users.

Example

ensure bruce test user 1:

pagerduty.user_present:

- name: `Bruce TestUser1`
- email: bruce+test1@lyft.com
- requester_id: P1GV5NT

salt.states.pagerduty_user.absent(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.present(*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

14.16.145 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system(PCS)

New in version 2016.11.0.

depends pcs

Walkthrough of a complete pcs cluster setup:

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at ones to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.
→example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

7. Add resources to your cluster:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↳org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

8. Optional: Add constraints (locations, colocations, orders):

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy
```

New in version 2016.3.0.

`salt.states.pcs.auth`(*name, nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None*)

Ensure all nodes are authorized to the cluster

name Irrelevant, not used (recommended: `pcs_auth__auth`)

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with pcs (default: `hacluster`)

pcspasswd password for pcsuser (default: `hacluster`)

extra_args list of extra option for the `pcs cluster auth` command

Example:

```
pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
    - extra_args: []
```

`salt.states.pcs.cib_present`(*name, cibname, scope=None, extra_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `{{formulaname}}__cib_present_{{cibname}}`)

cibname name/path of the file containing the CIB

scope specific section of the CIB (default:

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cib_pushed`(*name, cibname, scope=None, extra_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with `pcs.cib_present`

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `{{formulaname}}__cib_pushed_{{cibname}}`)

cibname name/path of the file containing the CIB

scope specific section of the CIB

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cluster_node_present`(*name, node, extra_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

name Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

node node that should be added

extra_args list of extra option for the `pcs cluster node add` command

Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

salt.states.pcs.cluster_setup (*name, nodes, pcsclustername='pcscluster', extra_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_setup__setup)

nodes a list of nodes which should be set up

pcsclustername Name of the Pacemaker cluster

extra_args list of extra option for the `pcs cluster setup` command

Example:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
```

salt.states.pcs.constraint_present (*name, constraint_id, constraint_type, constraint_options=None, cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__constraint_present_{{constraint_id}})

constraint_id name for the constraint (try first to create manually to find out the autogenerated name)

constraint_type constraint type (location, colocation, order)

constraint_options options for creating the constraint

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy
```

salt.states.pcs.prop_has_value (*name, prop, value, extra_args=None, cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_properties__prop_has_value_{{prop}})

prop name of the property

value value of the property prop

extra_args additional options for the pcs property command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_defaults_to(*name, default, value, extra_args=None, cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_defaults_to_{{default}})

default name of the default resource property

value value of the default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_op_defaults_to(*name, op_default, value, extra_args=None, cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_properties__resource_op_defaults_to_{{op_default}})

op_default name of the operation default resource property

value value of the operation default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_present(*name, resource_id, resource_type, resource_options=None, cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__resource_present_{{resource_id}})

resource_id name for the resource

resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

resource_options additional options for creating the resource

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↳org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present`(*name*, *stonith_id*, *stonith_device_type*,
stonith_device_options=None, *cibname*=None)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: `pcs_stonith__created_{{stonith_id}}`)

stonith_id name for the stonith resource

stonith_device_type name of the stonith agent `fence_eps`, `fence_xvm` f.e.

stonith_device_options additional options for creating the stonith resource

cibname use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

14.16.146 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that `php-pear` must be installed for these states to be available, so pecl states should include a requisite to a `pkg.installed` state for the package which provides pecl (`php-pear` in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.installed`(*name*, *version*=None, *defaults*=False, *force*=False, *pre-*
ferred_state='stable')

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install

version The pecl extension version to install. This option may be ignored to install the latest stable version.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

preferred_state The pecl extension state to install

`salt.states.pecl.removed(name)`

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall

14.16.147 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, repo=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, install_options=None, global_options=None, user=None, no_chown=False, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False)`

Make sure the package is installed

name The name of the python package to install. You can also specify version numbers here using the standard operators ==, >, <=. If requirements is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

requirements Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

user The user under which to run pip

use_wheel [False] Prefer wheel archives (requires pip>=1.4)

no_use_wheel [False] Force to not use wheel archives (requires pip>=1.4)

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

find_links URL to look for packages at

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index

mirrors Specific mirror URL(s) to query (automatically adds --use-mirrors)

build Unpack packages into `build` dir

target Install packages into `target` dir

download Download packages into `download` instead of installing them

download_cache Cache downloaded packages in `download_cache` dir

source Check out `editable` packages into `source` dir

upgrade Upgrade all packages to the newest available version

force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.

ignore_installed Ignore the installed packages (reinstalling instead)

exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

no_deps Ignore package dependencies

no_install Download and unpack all packages, but don't actually install them

no_chown When user is given, do not attempt to copy and chown a requirements file

no_cache_dir: Disable the cache.

cwd Current working directory to run pip from

pre_releases Include pre-releases in the available versions

cert Provide a path to an alternate CA bundle

allow_all_external Allow the installation of all externally hosted files

allow_external Allow the installation of externally hosted files (comma separated list)

allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links Enable the processing of dependency links

bin_env [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.

env_vars Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```
django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True
```

use_vt Use VT terminal emulation (see output while installing)

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip

```

Or

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip

```

Attention

The following arguments are deprecated, do not use.

pip_bin [None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

install_options

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```

django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip

```

global_options Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the `pip` state **needs** an importable `pip` module. This usually means having the system's `pip` package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```
pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i
```

`salt.states.pip_state.removed`(*name*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *use_vt=False*)

Make sure that a package is not installed.

name The name of the package to uninstall

user The user under which to run pip

bin_env [None] the pip executable or virtualenv to use

use_vt Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate`(*name*, *bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*)

New in version 2015.5.0.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

user The user under which to run pip

bin_env the pip executable or virtualenv to use

use_vt Use VT terminal emulation (see output while installing)

14.16.148 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running `systemd` ≥ 205 , as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the `pkg` state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
```

```
logstash:
  pkg.installed
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the `pkgs` state module

```
dotdeb.repo:
  pkgrepo.managed:
    - humanname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

Warning: Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.group_installed` (*name*, *skip=None*, *include=None*, ***kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in *pacman*

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and *pacman* package managers.

skip Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: Because this is essentially a wrapper around *pkg.install*, any argument which can be passed to

`pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

```
salt.states.pkg.installed(name, version=None, refresh=None, fromrepo=None, skip_verify=False,
                           skip_suggestions=False, pkgs=None, sources=None, allow_updates=False,
                           pkg_verify=False, normalize=True, ignore_epoch=False, reinstall=False,
                           update_holds=False, **kwargs)
```

Ensure that the package is installed, and that it is the correct version (if specified).

param str name The name of the package to be installed. This parameter is ignored if either `pkgs` or `sources` is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option detailed below.

param str version Install a specific version of a package. This option is ignored if `sources` is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
  2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs httpd
myminion:
  -----
  base:
    |_
    |_-----
    |_      httpd:
    |_      2.2.15-29.el6.centos
  updates:
    |_
    |_-----
```

```
httpd:
  2.2.15-30.el6.centos
```

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

param bool refresh This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

param str fromrepo Specify a repository from which to install

Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise
↳main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
↳ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
       7:0.10.11-1~precise1 0
          500 http://ppa.launchpad.net/jon-severinsson/
↳ffmpeg/ubuntu/ precise/main amd64 Packages
       4:0.8.10-0ubuntu0.12.04.1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise-updates/main amd64 Packages
          500 http://security.ubuntu.com/ubuntu/ precise-
↳security/main amd64 Packages
       4:0.8.1-0ubuntu1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version `4:0.8.10-0ubuntu0.12.04.1` either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

param bool skip_verify Skip the GPG verification check for the package to be installed

param bool skip_suggestions Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

param bool allow_updates Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have

a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

param bool pkg_verify New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use `pkg.verify` to determine if any of the files installed by the package have been altered. If files have been altered, the `reinstall` option of `pkg.install` is used to force a reinstall. Types to ignore can be passed to `pkg.verify`. Additionally, `verify_options` can be used to modify further the behavior of `pkg.verify`. See examples below. Currently, this option is supported for the following pkg providers: *yumpkg*.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

param list ignore_types List of types to ignore when verifying the package

New in version 2014.7.0.

param list verify_options List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

param bool normalize Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

param bool ignore_epoch When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`), and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

param list pkgs A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
```

```
- bar
- baz
- hold: True
```

NOTE: For *apt*, *ebuild*, *pacman*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, *ebuild*, *pacman* and *zypper* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

NOTE: When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

param list sources A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

param bool hold Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

param bool update_holds If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

This option is currently supported only for YUM/DNF.

New in version 2016.11.0.

param list names A list of packages to install from a software repository. Each package will be installed individually by the package manager.

Warning: Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

param bool install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

param bool only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

Note: If this parameter is set to `True` and the package is not already installed, the state will fail.

Parameters **report_reboot_exit_codes** (*bool*) --

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

return A dictionary containing the state of the software installation

rtype dict

Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

`salt.states.pkg.latest`(*name*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *watch_flags=True*, ***kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if `pkgs` is used.

fromrepo Specify a repository from which to install

skip_verify Skip the GPG verification check for the package to be installed

refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
```

```
- refresh: True
- cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

pkgs A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

Note: If this parameter is set to `True` and the package is not already installed, the state will fail.

report_reboot_exit_codes If the installer exits with a recognized exit code indicating that a reboot is required, the module function

`win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

`salt.states.pkg.mod_aggregate` (*low, chunks, running*)

The `mod_aggregate` function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

`salt.states.pkg.mod_init` (*low*)

Set a flag to tell the install functions to refresh the package database. This ensures that the package database is refreshed only once during a state run significantly improving the speed of package management during a state run.

It sets a flag for a number of reasons, primarily due to timeline logic. When originally setting up the `mod_init` for `pkg` a number of corner cases arose with different package managers and how they refresh package data.

It also runs the `ex_mod_init` from the package manager module that is currently loaded. The `ex_mod_init` is expected to work as a normal `mod_init` function.

See also:

`salt.modules.ebuild.ex_mod_init()`

`salt.states.pkg.mod_watch` (*name, **kwargs*)

Install/reinstall a package based on a watch requisite

`salt.states.pkg.purged` (*name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

name The name of the package to be purged.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
```

```
- version: 7.4.160-1.el7
- ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.removed` (*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

name The name of the package to be removed.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

normalize [`True`] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [`False`] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the

full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, ***kwargs*)

New in version 2014.7.0.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

refresh refresh the package database before checking for new upgrades

Parameters `cache_valid_time` (*str*) -- This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case `cache_valid_time` is set, `refresh` will not take place for amount in seconds since last `apt-get update` executed on the system.

Note: This parameter available only on Debian based distributions, and have no effect on the rest.

kwargs Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

14.16.149 salt.states.pkgbuild

The `pkgbuild` state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
```

```

- tgt: epel-7-x86_64
- sources:
  - salt://pkg/salt/sources/logrotate.salt
  - salt://pkg/salt/sources/README.fedora
  - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
  - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
  - salt://pkg/salt/sources/salt-api
  - salt://pkg/salt/sources/salt-api.service
  - salt://pkg/salt/sources/salt-master
  - salt://pkg/salt/sources/salt-master.service
  - salt://pkg/salt/sources/salt-minion
  - salt://pkg/salt/sources/salt-minion.service
  - salt://pkg/salt/sources/saltpkg.sls
  - salt://pkg/salt/sources/salt-syndic
  - salt://pkg/salt/sources/salt-syndic.service
  - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo

```

`salt.states.pkgbuild.built`(*name*, *runas*, *dest_dir*, *spec*, *sources*, *tgt*, *template=None*, *deps=None*, *env=None*, *results=None*, *force=False*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

name The name to track the build, the name value is otherwise unused

runas The user to run the build process as

dest_dir The directory on the minion to place the built package(s)

spec The location of the spec file (used for rpms)

sources The list of package sources

tgt The target platform to run the build on

template Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

env A dictionary of environment variables to be set prior to execution. Example:

```

- env:
  DEB_BUILD_OPTIONS: 'nocheck'

```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

results The names of the expected rpms that will be built

force [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

saltenv The saltenv to use for files downloaded from the salt fileserver

log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

```
salt.states.pkgbuild.repo(name, keyid=None, env=None, use_passphrase=False,
                          gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0)
```

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRpv/rawukEcNptn
  R50mgHqvYdEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  bYP7t5iwJmQzRMYFIInYRt77wkJBPCpJc9FPNebL9vLzCn4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
  OPTIONS: 'ask-passphrase'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

Note: This parameter is not used for making yum repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `'keyid'`

runas [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

14.16.150 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

14.16.151 salt.states.pkgrepo

Management of APT/YUM package repos

Package repositories for APT-based and YUM-based distros can be managed with these states. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humanname: CentOS- $\$releasever$  - Base
    - mirrorlist: http://mirrorlist.centos.org/?release= $\$releasever$ &arch= $\$basearch$ &
    ->repo=os
    - comments:
      - 'http://mirror.centos.org/centos/ $\$releasever$ /os/ $\$basearch$ /'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
```

```
- dist: precise
- file: /etc/apt/sources.list.d/logstash.list
- keyid: 28B04E4A
- keyserver: keyserver.ubuntu.com
- require_in:
  - pkg: logstash
```

```
pkg.latest:
- name: logstash
- refresh: True
```

```
base:
  pkgrepo.managed:
    - humaname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
  pkgrepo.managed:
    - humaname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True
```

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a [bug](#) in their `python-software-properties` package, a missing dependency on `pycurl`, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-software-properties`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.absent`(*name*, ***kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

name The name of the package repo, as it would be referred to when running the regular package manager commands.

UBUNTU-SPECIFIC OPTIONS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnets/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnets/logstash
    - ppa_auth: username:password
```

keyid If passed, then the GPG key corresponding to the passed KeyID will also be removed.

keyid_ppa [False] If set to True, the GPG key's ID will be looked up from `ppa.launchpad.net` and removed, and the `keyid` argument will be ignored.

Note: This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.managed`(*name*, *ppa=None*, ***kwargs*)

This state manages software package repositories. Currently, *yum*, *apt*, and *zypper* repositories are supported.

YUM OR ZYPPER-BASED SYSTEMS

Note: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

name This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. [foo]) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

humanname This is used as the `name` value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

baseurl The URL to a yum repository

mirrorlist A URL which points to a file containing a collection of baseurls

comments Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

Additional configuration values seen in yum repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

APT-BASED SYSTEMS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The `keyid` will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnets/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnets/logstash
    - ppa_auth: username:password
```

name On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

disabled Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

comps On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

file The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

dist This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

keyid The KeyID of the GPG key to install. This option also requires the `keyserver` option to be set.

keyserver This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

key_url URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

Note: Use either `keyid/keyserver` or `key_url`, but not both.

consolidate If set to true, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

clean_file If set to true, empty file before config repo, dangerous if use multiple sources in one file.

New in version 2015.8.0.

refresh_db If set to false this will skip refreshing the apt package database on debian based systems.

require_in Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg will not work for this.

14.16.152 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
  portage_config.flags:
    - use:
      - openssl
```

`salt.states.portage_config.flags`(*name*, *use=None*, *accept_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)

Enforce the given flags on the given package or DEPEND atom.

Warning: In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name The name of the package or its DEPEND atom

use A list of USE flags

accept_keywords A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords

env A list of environment files

license A list of accepted licenses

properties A list of additional properties

unmask A boolean to unmask the package

mask A boolean to mask the package

`salt.states.portage_config.mod_init`(*low*)

Enforce a nice structure on the configuration files.

14.16.153 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.installed`(*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

options Make sure that the desired non-default options are set

Warning: Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

14.16.154 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
    - name: 'main'
    - version: '9.3'
```

salt.states.postgres_cluster.absent (*version, name*)

Ensure that the named cluster is absent

version Version of the postgresql server of the cluster to remove

name The name of the cluster to remove

New in version 2015.XX.

salt.states.postgres_cluster.present (*version, name, port=None, encoding=None, locale=None, datadir=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

version Version of the postgresql cluster

name The name of the cluster

port Cluster port

encoding The character encoding scheme to be used in this database

locale Locale with which to create cluster

datadir Where the cluster is stored

New in version 2015.XX.

14.16.155 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

salt.states.postgres_database.absent (*name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named database is absent

name The name of the database to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default
db_port Database port if different from config or default
user System user all operations should be performed on behalf of

New in version 0.17.0.

```
salt.states.postgres_database.present(name,          tablespace=None,      encoding=None,
                                       lc_collate=None,  lc_ctype=None,       owner=None,
                                       owner_recurse=False, template=None,  user=None,
                                       maintenance_db=None, db_password=None,
                                       db_host=None, db_port=None, db_user=None)
```

Ensure that the named database is present with the specified properties. For more information about all of these options see `man createdb(1)`

name The name of the database to manage
tablespace Default tablespace for the database
encoding The character encoding scheme to be used in this database
lc_collate The LC_COLLATE setting to be used in this database
lc_ctype The LC_CTYPE setting to be used in this database
owner The username of the database owner
owner_recurse Recurse owner change to all relations in the database
template The template database from which to build this database
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

New in version 0.17.0.

14.16.156 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

```
salt.states.postgres_extension.absent(name, if_exists=None, restrict=None, cascade=None,
                                       user=None, maintenance_db=None, db_user=None,
                                       db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is absent.

name Extension name of the extension to remove
if_exists Add if exist slug
restrict Add restrict slug
cascade Drop on cascade
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

```
salt.states.postgres_extension.present(name, if_not_exists=None, schema=None,
                                         ext_version=None, from_version=None,
                                         user=None, maintenance_db=None, db_user=None,
                                         db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is present.

Note: Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

name The name of the extension to be installed
if_not_exists Add an IF NOT EXISTS parameter to the DDL statement
schema Schema to install the extension into
ext_version Version to install
from_version Old extension version if already installed
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

14.16.157 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

```
salt.states.postgres_group.absent(name, user=None, maintenance_db=None,
                                     db_password=None, db_host=None, db_port=None,
                                     db_user=None)
```

Ensure that the named group is absent

name The groupname of the group to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

```
salt.states.postgres_group.present(name, createdb=None, createroles=None, createuser=None,
                                     encrypted=None, superuser=None, inherit=None, lo-
                                     gin=None, replication=None, password=None, re-
                                     fresh_password=None, groups=None, user=None, main-
                                     tenance_db=None, db_password=None, db_host=None,
                                     db_port=None, db_user=None)
```

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name The name of the group to manage
createdb Is the group allowed to create databases?
createroles Is the group allowed to create other roles/users
createuser Alias to create roles, and history problem, in pgsq normally createuser == superuser
encrypted Should the password be encrypted in the system catalog?
login Should the group have login perm
inherit Should the group inherit permissions
superuser Should the new group be a ``superuser"
replication Should the new group be allowed to initiate streaming replication
password The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is `None` or `True`, the password will be automatically encrypted to the previous format if it is not already done.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the group should be in

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

14.16.158 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The `postgres_initdb` module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

`salt.states.postgres_initdb.present` (*name*, *user=None*, *password=None*, *auth='password'*, *encoding='UTF8'*, *locale=None*, *runas=None*)

Initialize the PostgreSQL data directory

name The name of the directory to initialize

user The database superuser name

password The password to set for the postgres user

auth The default authentication method for local connections
encoding The default encoding for new databases
locale The default locale for new databases
runas The system user the operation should be performed on behalf of

14.16.159 salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```

```
plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

salt.states.postgres_language.absent (*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that a named language is absent in the specified database.

name The name of the language to remove

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

salt.states.postgres_language.present (*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that a named language is present in the specified database.

name The name of the language to install

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

14.16.160 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database

- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.absent` (*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Revoke the requested privilege(s) on the specified object(s)

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when revoking group membership

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_privileges.present` (*name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Grant the requested privilege(s) on the specified object to a role

name Name of the role to which privileges should be granted

object_name Name of the object on which the grant is to be performed. `ALL` may be used for objects of type `table` or `sequence`.

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

privileges List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT

- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when granting group membership

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

14.16.161 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

salt.states.postgres_schema.absent(*dbname*, *name*, *db_user=None*, *db_password=None*,
db_host=None, *db_port=None*)

Ensure that the named schema is absent.

dbname The database's name will work on

name The name of the schema to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

salt.states.postgres_schema.present(*dbname*, *name*, *owner=None*, *db_user=None*,
db_password=None, *db_host=None*, *db_port=None*)

Ensure that the named schema is present in the database.

dbname The database's name will work on

name The name of the schema to manage

owner The database user that will be the owner of the schema

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

14.16.162 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data

```

New in version 2015.8.0.

salt.states.postgres_tablespace.absent(*name*, *user=None*, *maintenance_db=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named tablespace is absent.

name The name of the tablespace to remove

user System user all operations should be performed on behalf of

maintenance_db Database to act on

db_user Database username if different from config or default

db_password User password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

salt.states.postgres_tablespace.present(*name*, *directory*, *options=None*, *owner=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options see `man ``create_tablespace``(7)`.

name The name of the tablespace to create/manage.

directory The directory where the tablespace will be located, must already exist

options A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
        seq_page_cost: 1.0
        random_page_cost: 4.0

```

owner The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)

user System user all operations should be performed on behalf of

maintenance_db Database to act on

db_user Database username if different from config or default

db_password User password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

14.16.163 salt.states.postgres_user

Management of PostgreSQL users (roles)

The `postgres_users` module is used to create and manage Postgres users.

```

frank:
  postgres_user.present

```

`salt.states.postgres_user.absent` (*name*, *user=None*, *maintenance_db=None*, *db_password=None*,
db_host=None, *db_port=None*, *db_user=None*)

Ensure that the named user is absent

name The username of the user to remove

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_user.present` (*name*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *superuser=None*, *replication=None*, *inherit=None*, *login=None*, *password=None*, *default_password=None*, *refresh_password=None*, *groups=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name The name of the system user to manage.

createdb Is the user allowed to create databases?

createroles Is the user allowed to create other users?

createuser Alias to create roles

encrypted Should the password be encrypted in the system catalog?

login Should the group have login perm

inherit Should the group inherit permissions

superuser Should the new user be a ``superuser''

replication Should the new user be allowed to initiate streaming replication

password The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

default_password The password used only when creating the user, unless password is set.

New in version 2016.3.0.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the user should be in

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user Postres database username, if different from config or default.

db_password Postgres user's password, if any password, for a specified db_user.

db_host Postgres database host, if different from config or default.

db_port Postgres database port, if different from config or default.

14.16.164 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

`salt.states.powerpath.license_absent` (*name*)

Ensures that the specified PowerPath license key is absent on the host.

name The license key to ensure is absent

`salt.states.powerpath.license_present` (*name*)

Ensures that the specified PowerPath license key is present on the host.

name The license key to ensure is present

14.16.165 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm probes management module*

`salt.states.probes.managed` (*name, probes, defaults=None*)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

Parameters probes -- Defines the probes as expected to be configured on the device.

In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics. `:param defaults`: Specifies common parameters for the probes.

SLS Example:

```
rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
        probe1_test3:
          target: 8.8.8.8
```

```

        probe_type: http-ping
    probe_name2:
        probe2_test1:
            test_interval: 100
- defaults:
    target: 10.10.10.10
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping

```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- **source:** Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- **target:** Destination IP Address.
- **probe_count:** Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- **probe_interval:** Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- **probe_type:** Probe request type. Available options:
 - icmp-ping
 - tcp-ping
 - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```

probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping
probe_name2:
  probe2_test1:
    target: 10.10.10.10
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping

```

14.16.166 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

`salt.states.process.absent` (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

name The pattern to match.

user The user process belongs

signal Signal to send to the process(es).

14.16.167 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.pushover.post_message` (*name*, *user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api_version=1*, *token=None*)

Send a message to a PushOver channel.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:

name The unique name for this event.

user The user or group of users to send the message to. Must be ID of user, not name or email address.

message The message that is to be sent to the PushOver channel.

The following parameters are optional:

title The title to use for the message.

device The device for the user to send the message to.

priority The priority for the message.

expire The message should expire after specified amount of seconds.

retry The message should be resent this many times.

token The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

14.16.168 salt.states.pyenv

Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps
python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

salt.states.pyenv.absent (*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

name The version of python to uninstall

user: **None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

salt.states.pyenv.install_pyenv (*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful

if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `pyenv.root` configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

user: `None` The user to run pyenv as.

`salt.states.pyenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

name The version of python to install

default [False] Whether to make this python the default.

user: `None` The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

14.16.169 salt.states.pyrax_queues

Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via `package`, or `pip`. This module is greatly inspired by `boto_*` modules from SaltStack code source.

```
myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax
```

`salt.states.pyrax_queues.absent` (*name*, *provider*)

Ensure the named Rackspace queue is deleted.

name Name of the Rackspace queue.

provider Salt Cloud provider

`salt.states.pyrax_queues.present` (*name*, *provider*)

Ensure the RackSpace queue exists.

name Name of the Rackspace queue.

provider Salt Cloud Provider

14.16.170 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.mode`(*name, mode, quotatype*)

Set the quota for the system

name The filesystem to set the quota mode on

mode Whether the quota system is on or off

quotatype Must be user or group

14.16.171 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

`salt.states.rabbitmq_cluster.join`(*name, host, user='rabbit', ram_node=None, runas='root'*)

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node `user@host`

name Irrelevant, not used (recommended: `user@host`)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

`salt.states.rabbitmq_cluster.joined`(*name, host, user='rabbit', ram_node=None, runas='root'*)

Ensure the current node joined to a cluster with node `user@host`

name Irrelevant, not used (recommended: `user@host`)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

14.16.172 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.disabled`(*name, runas=None*)

Ensure the RabbitMQ plugin is disabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

`salt.states.rabbitmq_plugin.enabled`(*name, runas=None*)

Ensure the RabbitMQ plugin is enabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

14.16.173 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer Benn Eichhorn <benn@getlocalmeasure.com>

maturity new

platform all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

salt.states.rabbitmq_policy.absent(*name*, *vhost*='/', *runas*=None)

Ensure the named policy is absent

Reference: <http://www.rabbitmq.com/ha.html>

name The name of the policy to remove

runas Name of the user to run the command as

salt.states.rabbitmq_policy.present(*name*, *pattern*, *definition*, *priority*=0, *vhost*='/', *runas*=None)

Ensure the RabbitMQ policy exists.

Reference: <http://www.rabbitmq.com/ha.html>

name Policy name

pattern A regex of queues to apply the policy to

definition A json dict describing the policy

priority Priority (defaults to 0)

vhost Virtual host to apply to (defaults to '/')

runas Name of the user to run the command as

14.16.174 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

`salt.states.rabbitmq_user.absent` (*name*, *runas=None*)

Ensure the named user is absent

name The name of the user to remove

runas User to run the command

`salt.states.rabbitmq_user.present` (*name*, *password=None*, *force=False*, *tags=None*, *perms=()*,
runas=None)

Ensure the RabbitMQ user exists.

name User name

password User's password, if one needs to be set

force If user exists, forcibly change the password

tags Optional list of tags for the user

perms A list of dicts with vhost keys and 3-tuple values

runas Name of the user to run the command

14.16.175 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

`salt.states.rabbitmq_vhost.absent` (*name*)

Ensure the RabbitMQ Virtual Host is absent

name Name of the Virtual Host to remove

runas User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.present` (*name*)

Ensure the RabbitMQ VHost exists.

name VHost name

user Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

owner Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

conf Initial conf string to apply to the VHost and user. Defaults to *

Deprecated since version 2015.8.0.

write Initial write permissions to apply to the VHost and user. Defaults to *

Deprecated since version 2015.8.0.

read Initial read permissions to apply to the VHost and user. Defaults to *

Deprecated since version 2015.8.0.

runas Name of the user to run the command

Deprecated since version 2015.8.0.

14.16.176 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: <https://github.com/sstephenson/ruby-build/wiki>

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps
```

salt.states.rbenv.absent (*name*, *user=None*)

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to uninstall

user: None The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

salt.states.rbenv.install_rbenv (*name*, *user=None*)

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `rbenv.root` configuration option to set the path for `rbenv` if you want a system wide install that is not in a user home dir.

user: `None` The user to run `rbenv` as.

`salt.states.rbenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with `rbenv`. `rbenv` is installed if necessary.

name The version of ruby to install

default [`False`] Whether to make this ruby the default.

user: `None` The user to run `rbenv` as.

New in version 0.17.0.

New in version 0.16.0.

14.16.177 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.disabled` (*name*)

Disable the RDP service

`salt.states.rdp.enabled` (*name*)

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

14.16.178 salt.states.redismod

Management of Redis server

New in version 2014.7.0.

depends

- `redis` Python module

configuration See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The `redis` server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.absent` (*name*, *keys=None*, ***connection_args*)

Ensure key absent from `redis`

name Key to ensure absent from `redis`

keys list of keys to ensure absent, `name` will be ignored if this is used

`salt.states.redismod.slaveof` (*name*, *sentinel_host=None*, *sentinel_port=None*, *sentinel_password=None*, ***connection_args*)

Set this `redis` instance as a slave.

name Master to make this a slave of
sentinel_host Ip of the sentinel to check for the master
sentinel_port Port of the sentinel to check for the master

`salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)`

Ensure that the key exists in redis with the value specified

name Redis key to manage

value Data to persist in key

expire Sets time to live for key in seconds

expireat Sets expiration time for key via UNIX timestamp, overrides *expire*

14.16.179 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY. - HKEY_CLASSES_ROOT (HKCR)
 - HKEY_CURRENT_USER(HKCU) - HKEY_LOCAL_MACHINE (HKLM) - HKEY_USER (HKU) -
 HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. It is usually `((Default)=(value not set))`. The actual value for the name and the date is Null. The registry editor will display `((Default))` and `((value not set))`.

The following example is taken from the windows startup portion of the registry: `[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run] "RTHD-VCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s" "NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.exe\"" "BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.dll\",TrayApp"` In this example these are the values for each:

Hive: `HKEY_LOCAL_MACHINE`

Key and subkeys: `SOFTWAREMicrosoftWindowsCurrentVersionRun`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.absent(name, vname=None, use_32bit_registry=False)`

Ensure a registry value is removed. To remove a key use `key_absent`.

Parameters **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include:

- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU

Parameters **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

Parameters **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns Returns a dictionary showing the results of the registry operation.

Return type `dict`

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
  - vname: version
```

In the above example the value named `version` will be removed from the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive. If `vname` was not passed, the (Default) value would be deleted.

`salt.states.reg.key_absent` (*name*, *use_32bit_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove a key and all value entries it contains. It will fail if the key contains subkeys.

Parameters **name** (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:

- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU

Parameters **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns Returns a dictionary showing the results of the registry operation.

Return type `dict`

The following example will delete the `SOFTWARE\Salt` key and all subkeys under the `HKEY_CURRENT_USER` hive.

Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.key_absent:
  - force: True
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\Salt is the key

`salt.states.reg.present` (*name*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*)

Ensure a registry key or value is present.

Parameters **name** (*str*) -- A string value representing the full path of the key to

include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include: - HKEY_CURRENT_USER or HKCU - HKEY_LOCAL_MACHINE or HKLM - HKEY_USERS or HKU

Parameters vname (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

Parameters vdata (*str*) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

Parameters vtype (*str*) -- The value type for the data you wish to store in the registry. Valid values are:

- REG_BINARY
- REG_DWORD
- REG_EXPAND_SZ
- REG_MULTI_SZ
- REG_SZ (Default)

Parameters use_32bit_registry (*bool*) -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns Returns a dictionary showing the results of the registry operation.

Return type *dict*

The following example will set the (Default) value for the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 2016.3.1
```

The following example will set the value for the `version` entry under the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1. The value will be reflected in `Wow6432Node`:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

In the above example the path is interpreted as follows: - HKEY_CURRENT_USER is the hive - SOFTWARE\Salt is the key - vname is the value name ('version') that will be created under the key - vdata is the data that will be assigned to 'version'

14.16.180 salt.states.rsyc

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
  rsync.synchronized:
```

- source: /home
- force: True

`salt.states.rsync.synchronized`(*name*, *source*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *prepare=False*, *dryrun=False*)

Guarantees that the source directory is always copied to the target.

name Name of the target directory.

source Source directory.

prepare Create destination directory if it does not exist.

delete Delete extraneous files from the destination dirs (True or False)

force Force deletion of dirs even if not empty

update Skip files that are newer on the receiver (True or False)

passwordfile Read daemon-access password from the file (path)

exclude Exclude files, that matches pattern.

excludefrom Read exclude patterns from the file (path)

dryrun Perform a trial run with no changes made. Is the same as doing `test=True`

New in version 2016.3.1.

14.16.181 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```
rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
```

```
- openssl
- libreadline6
- libreadline6-dev
- curl
- git-core
- zlib1g
- zlib1g-dev
- libssl-dev
- libyaml-dev
- libsqlite3-0
- libsqlite3-dev
- sqlite3
- libxml2-dev
- libxslt1-dev
- autoconf
- libc6-dev
- libncurses5-dev
- automake
- libtool
- bison
- subversion
- ruby

jruby-deps:
  pkg.installed:
    - pkgs:
      - curl
      - g++
      - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: mri-deps
      - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
    - user: rvm
```

```
- require:
  - rvm: ruby-1.9.2
```

`salt.states.rvm.gemset_present` (*name*, *ruby='default'*, *user=None*)

Verify that the gemset is present.

name The name of the gemset.

ruby: default The ruby version this gemset belongs to.

user: None The user to run rvm as.

New in version 0.17.0.

`salt.states.rvm.installed` (*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: None The user to run rvm as.

New in version 0.17.0.

14.16.182 salt.states.salt_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

This state will configure the salt proxy settings within `/etc/salt/proxy` (if `/etc/salt/proxy` doesn't exist) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.configure_proxy` (*name*, *proxyname='p8000'*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **name** -- The name of this state
- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started

Example:

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

14.16.183 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [The Orchestrate runner](#)

`salt.states.saltmod.function`(*name*, *tgt*, *ssh=False*, *tgt_type=None*, *expr_form=None*, *ret='`*,
expect_minions=False, *fail_minions=None*, *fail_function=None*,
arg=None, *kwarg=None*, *timeout=None*, *batch=None*)

Execute a single module function on a remote minion via salt or salt-ssh

name The name of the function to run, aka `cmd.run` or `pkg.install`

tgt The target specification, aka ``*`` for all minions

tgt_type | **expr_form** The target type, defaults to `glob`

arg The list of arguments to pass into the function

kwarg The dict (not a list) of keyword arguments to pass into the function

ret Optionally set a single or a list of returners to use

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

fail_function An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions

ssh Set to `True` to use the ssh client instead of the standard salt client

`salt.states.saltmod.runner`(*name*, ***kwargs*)

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

```
run-manage-up:
  salt.runner:
    - name: manage.up
```

`salt.states.saltmod.state`(*name*, *tgt*, *ssh=False*, *tgt_type=None*, *expr_form=None*, *ret='`*, *high-state=None*, *sls=None*, *top=None*, *saltenv=None*, *test=False*, *pillar=None*, *expect_minions=False*, *fail_minions=None*, *allow_fail=0*, *concurrent=False*, *timeout=None*, *batch=None*, *queue=False*, *orchestration_jid=None*)

Invoke a state run on a given target

name An arbitrary name used to track the state execution

tgt The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

tgt_type | **expr_form** The target type to resolve, defaults to `glob`

ret Optionally set a single or a list of returners to use

highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions

top Should be the name of a top file. If set state.top is called with this top file instead of state.sls.

sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files

test Pass test=true through to the state function

pillar Pass the pillar kwarg through to the state function

saltenv The default salt environment to pull sls files from

ssh Set to True to use the ssh client instead of the standard salt client

roster In the event of using salt-ssh, a roster system can be set

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False

concurrent Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue Pass queue=true through to the state function

batch Execute the command *in batches*. E.g.: 10%.

New in version 2016.3.0.

Examples:

Run a list of sls files via state.sls on target minions:

```
webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run a full state.highstate on target minions.

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

`salt.states.saltmod.wait_for_event(name, id_list, event_id='id', timeout=300, node='master')`

Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

name An event tag to watch for; supports Reactor-style globbing.

id_list A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for event_id, if found it is removed from id_list. When id_list is empty this function returns success.

event_id [id] The name of a key in the event data. Default is id for the minion ID, another common value is name for use with orchestrating salt-cloud events.

timeout [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
```

```

- name: system.reboot
- tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions

```

`salt.states.saltmod.wheel` (*name*, ***kwargs*)

Execute a wheel module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the wheel function

```

accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank

```

14.16.184 salt.states.schedule

Management of the Salt scheduler

```

job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10

```

This will schedule the command: `test.ping` every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

```

job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
      start: 10
      end: 20

```

This will schedule the command: `test.ping` every 15 seconds splaying the time between 10 and 20 seconds

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:

```

```

- httpd
- job_kwargs:
  test: True
- when:
  - Monday 5:00pm
  - Tuesday 3:00pm
  - Wednesday 5:00pm
  - Thursday 3:00pm
  - Friday 5:00pm

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that `python-dateutil` is installed on the minion.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - cron: '*/5 * * * *'

```

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: `state.sls httpd test=True` to run every 5 minutes. Requires that `python-croniter` is installed on the minion.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - when:
      - Monday 5:00pm
      - Tuesday 3:00pm
      - Wednesday 5:00pm
      - Thursday 3:00pm
      - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
      recipient: user@domain.com

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the `xmpp` returner to return the results of the scheduled job, with the alternative configuration options found in the `xmpp_state_run` section.

`salt.states.schedule.absent`(*name*, ***kwargs*)

Ensure a job is absent from the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.disabled`(*name*, ***kwargs*)

Ensure a job is disabled in the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.enabled(name, **kwargs)`

Ensure a job is enabled in the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.present(name, **kwargs)`

Ensure a job is present in the schedule

name The unique name that is given to the scheduled job.

seconds The scheduled job will be executed after the specified number of seconds have passed.

minutes The scheduled job will be executed after the specified number of minutes have passed.

hours The scheduled job will be executed after the specified number of hours have passed.

days The scheduled job will be executed after the specified number of days have passed.

when This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.

cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.

run_on_start Whether the job will run when Salt minion start. Value should be a boolean.

function The function that should be executed by the scheduled job.

job_args The arguments that will be used by the scheduled job.

job_kwargs The keyword arguments that will be used by the scheduled job.

maxrunning Ensure that there are no more than N copies of a particular job running.

jid_include Include the job into the job cache.

splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.

range This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

once This will schedule a job to run once on the specified date.

once_fmt The default date format is ISO 8601 but can be overridden by also specifying the once_fmt option.

enabled Whether the job should be enabled or disabled. Value should be a boolean.

return_job Whether to return information to the Salt master upon job completion.

metadata Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.

returner The returner to use to return the results of the scheduled job.

return_config The alternative configuration to use for returner configuration options.

return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.

persist Whether the job should persist between minion restarts, defaults to True.

14.16.185 salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
  selinux.mode

samba_create_home_dirs:
  selinux.boolean:
    - value: True
    - persist: True

nginx:
```

```
selinux.module:  
- enabled: False
```

Note: Use of these states require that the *selinux* execution module is available.

`salt.states.selinux.boolean`(*name*, *value*, *persist=False*)

Set up an SELinux boolean

name The name of the boolean to set

value The value to set on the boolean

persist Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.mode`(*name*)

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.module`(*name*, *module_state='Enabled'*, *version='any'*)

Enable/Disable and optionally force a specific version for an SELinux module

name The name of the module to control

module_state Should the module be enabled or disabled?

version Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

New in version 2016.3.0.

14.16.186 salt.states.serverdensity_device

Monitor Server with Server Density

New in version 2014.7.0.

Server Density Is a hosted monitoring service.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:  
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"  
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:  
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"  
  account_name: "your-account"
```

Note: Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

```
salt.states.serverdensity_device.monitored(name, group=None, salt_name=True,
                                           salt_params=True, agent_version=1,
                                           **params)
```

Device is monitored with Server Density.

name Device name in Server Density.

salt_name If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.

group Group name under which device will appear in Server Density dashboard. Default - `None`.

agent_version The agent version you want to use. Valid values are 1 or 2. Default - 1.

salt_params If `True` (default), needed config parameters will be sourced from grains and from `status.all_status`.

params Add parameters that you want to appear in the Server Density dashboard. Will overwrite the `salt_params` parameters. For more info, see the [API docs](#).

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

14.16.187 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons typically started with system init or rc scripts. The service state uses whichever service module that is loaded on the minion with the virtualname of `service`. Services can be defined as running or dead.

If you need to know if your init system is supported, see the list of supported `service` modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the [Overriding Virtual Module Providers](#) section of Salt's module documentation to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```
httpd:
  service.running: []
```

The service can also be set to be started at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is by default restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

Note: More details regarding watch can be found in the [Requisites](#) documentation.

salt.states.service.dead(*name*, *enable=None*, *sig=None*, ***kwargs*)

Ensure that the named service is dead by stopping the service if it is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

salt.states.service.disabled(*name*, ***kwargs*)

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the `enable: False` option for the running or dead function.

name The name of the init or rc script used to manage the service

salt.states.service.enabled(*name*, ***kwargs*)

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the `enable: True` option for the running or dead function.

name The name of the init or rc script used to manage the service

salt.states.service.mod_watch(*name*, *sfun=None*, *sig=None*, *reload=False*, *full_restart=False*, *init_delay=None*, *force=False*, ***kwargs*)

The service watcher, called to invoke the watch command.

name The name of the init or rc script used to manage the service

sfun The original function which triggered the mod_watch call (*service.running*, for example).

sig The string to search for when looking for the service process with ps

reload Use reload instead of the default restart (exclusive option with `full_restart`, defaults to reload if both are used)

full_restart Use `service.full_restart` instead of restart (exclusive option with reload)

force Use `service.force_reload` instead of reload (needs reload to be set to True)

init_delay Add a sleep command (in seconds) before the service is restarted/reloaded

`salt.states.service.running` (*name*, *enable=None*, *sig=None*, *init_delay=None*, ***kwargs*)

Ensure that the service is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

init_delay Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an `'init_delay'` to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

Note:

watch can be used with `service.running` to restart a service when another state changes (example: a `file.managed` state that creates the service's config file). More details regarding `watch` can be found in the [Requisites](#) documentation.

14.16.188 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.post_message` (*name*, *channel*, *from_name*, *message*, *api_key=None*, *icon=None*)

Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

name The unique name for this event.

channel The channel to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the `'from'` field.

message The message that is to be sent to the Slack channel.

The following parameters are optional:

api_key The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

icon URL to an image to use as the icon for this message

14.16.189 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends vmadm, imgadm

platform smartos

New in version 2016.3.0.

```
vmtest.example.org:
  smartos.vm_present:
    - config:
      reprovision: true
    - vmconfig:
      image_uuid: c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
      brand: joyent
      alias: vmtest
      quota: 5
      max_physical_memory: 512
      tags:
        label: 'test vm'
        owner: 'sjorge'
      nics:
        "82:1b:8e:49:e9:12":
          nic_tag: trunk
          mtu: 1500
          ips:
            - 172.16.1.123/16
            - 192.168.2.123/24
          vlan_id: 10
        "82:1b:8e:49:e9:13":
          nic_tag: trunk
          mtu: 1500
          ips:
            - dhcp
          vlan_id: 30
      filesystems:
        "/bigdata":
          source: "/bulk/data"
          type: lofs
          options:
            - ro
            - nodevices

kvmtest.example.org:
  smartos.vm_present:
    - vmconfig:
      brand: kvm
      alias: kvmtest
      cpu_type: host
      ram: 512
      vnc_port: 9
```

```

tags:
  label: 'test kvm'
  owner: 'sjorge'
disks:
  disk0
    size: 2048
    model: virtio
    compression: lz4
    boot: true
nics:
  "82:1b:8e:49:e9:15"
  nic_tag: trunk
  mtu: 1500
  ips:
    - dhcp
  vlan_id: 30

cleanup_images:
  smartos.image_vacuum

```

Note: Keep in mind that when removing properties from `vmconfig` they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via `add_*`, `set_*`, `update_*`, and `remove_*`. Properties must be manually reset to their default value. The same behavior as when using ``vmadm update'`.

salt.states.smartos.config_absent(*name*)
 Ensure configuration property is absent in `/usbkey/config`
name [string] name of property

salt.states.smartos.config_present(*name, value*)
 Ensure configuration property is set to value in `/usbkey/config`
name [string] name of property
value [string] value of property

salt.states.smartos.image_absent(*name*)
 Ensure image is absent on the computenode
name [string] uuid of image

Note: `computenode.image_absent` will only remove the image if it is not used by a vm.

salt.states.smartos.image_present(*name*)
 Ensure image is present on the computenode
name [string] uuid of image

salt.states.smartos.image_vacuum(*name*)
 Delete images not in use or installed via `image_present`

salt.states.smartos.vm_absent(*name, archive=False*)
 Ensure vm is absent on the computenode
name [string] hostname of vm
archive [boolean] toggle archiving of vm on removal

Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_present(*name, vmconfig, config=None*)

Ensure vm is present on the computenode
name [string] hostname of vm
vmconfig [dict] options to set for the vm
config [dict] fine grain control over vm_present

Note:

The following configuration properties can be toggled in the config parameter.

- **kvm_reboot** (true) - reboots of kvm zones if needed for a config update
 - **auto_import** (false) - automatic importing of missing images
 - **reprovision** (false) - reprovision on image_uuid changes
-

Note: State ID is used as hostname. Hostnames must be unique.

Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

Note:

The following instances should have a unique ID.

- **nic** : mac
- **filesystem**: target
- **disk** : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

`salt.states.smartos.vm_running(name)`

Ensure vm is in the running state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.vm_stopped(name)`

Ensure vm is in the stopped state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

14.16.190 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
```

```
- profile: my-smtp-account
- recipient: admins@example.com
```

`salt.states.smtp.send_msg` (*name, recipient, subject, sender, profile, use_ssl='True'*)
Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
```

name The message to send via SMTP

14.16.191 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
  splunk.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
```

`salt.states.splunk.absent` (*email, profile='splunk', **kwargs*)
Ensure a splunk user is absent

```
ensure example test user 1:
  splunk.absent:
    - email: 'example@domain.com'
    - name: 'exampleuser'
```

The following parameters are required:

email This is the email of the user in splunk

name This is the splunk username used to identify the user.

`salt.states.splunk.present` (*email, profile='splunk', **kwargs*)
Ensure a user is present

```
ensure example test user 1:
  splunk.user_present:
    - realname: 'Example TestUser1'
    - name: 'exampleuser'
    - email: 'example@domain.com'
    - roles: ['user']
```

The following parameters are required:

email This is the email of the user in splunk

14.16.192 salt.states.splunk_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```
server-warning-message:
  splunk_search.present:
    - name: This is the splunk search name
    - search: index=main sourcetype=
```

`salt.states.splunk_search.absent` (*name*, *profile='splunk'*)

Ensure a search is absent

```
API Error Search:
  splunk_search.absent
```

The following parameters are required:

name This is the name of the search in splunk

`salt.states.splunk_search.present` (*name*, *profile='splunk'*, ***kwargs*)

Ensure a search is present

```
API Error Search:
  splunk_search.present:
    search: index=main sourcetype=blah
    template: alert_5min
```

The following parameters are required:

name This is the name of the search in splunk

14.16.193 salt.states.sqlite3

Management of SQLite3 databases

depends

- SQLite3 Python Module

configuration See `salt.modules.sqlite3` for setup instructions

New in version 2016.3.0.

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT
↵NULL, `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```

users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
      - email TEXT COLLATE NOCASE UNIQUE NOT NULL
      - firstname TEXT NOT NULL
      - lastname TEXT NOT NULL
      - company TEXT NOT NULL
      - password BLOB NOT NULL
      - salt BLOB NOT NULL

```

Here is an example of making sure a table is absent:

```

badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite

```

Sometimes you would have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```

user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
    - data:
      email: john.doe@companyxyz.com
      lastname: doe
      firstname: john
      company: companyxyz.com
      password: abcdef012934125
      salt: abcdef012934125
    - require:
      - sqlite3: users

```

Here is an example of removing a row from a table:

```

user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users

```

`salt.states.sqlite3.row_absent` (*name*, *db*, *table*, *where_sql*, *where_args=None*)

Makes sure the specified row is absent in db. If multiple rows match *where_sql*, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check

where_sql The sql to select the row to check

where_args The list parameters to substitute in *where_sql*

`salt.states.sqlite3.row_present` (*name*, *db*, *table*, *data*, *where_sql*, *where_args=None*, *update=False*)

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data. Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn't match

`data_check` the state will fail. If the row doesn't exist then it will insert data into the table. If more than one row matches, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check the data

data The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

where_sql The sql to select the row to check

where_args The list parameters to substitute in `where_sql`

update True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

`salt.states.sqlite3.table_absent`(*name*, *db*)

Make sure the specified table does not exist

name The name of the table

db The name of the database file

`salt.states.sqlite3.table_present`(*name*, *db*, *schema*, *force=False*)

Make sure the specified table exists with the specified schema

name The name of the table

db The name of the database file

schema The dictionary containing the schema information

force If the name of the table exists and `force` is set to False, the state will fail. If `force` is set to True, the existing table will be replaced with the new table

14.16.194 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user's SSH authorized key file can be easily controlled via the `ssh_auth` state. Defaults can be set by the `enc`, `options`, and `comment` keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
```

```

- option1="value1"
- option2="value2 flag2"
- comment: myuser
- names:
- AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
- ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
- option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
- AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

```

`salt.states.ssh_auth.absent` (*name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys'*)

Verifies that the specified SSH key is absent

name The SSH key to manage

user The user who owns the SSH authorized keys file to modify

enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

comment The comment to be placed with the SSH public key

options The options passed to the key, pass a list object

source The source file for the key(s). Can contain any number of public keys, in standard ``authorized_keys`` format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

`salt.states.ssh_auth.present` (*name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', **kwargs*)

Verifies that the specified SSH key is present for the specified user

name The SSH key to manage

user The user who owns the SSH authorized keys file to modify

enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss

comment The comment to be placed with the SSH public key

source The source file for the key(s). Can contain any number of public keys, in standard ``authorized_keys`` format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
 2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
 3. Paste it into a new file.
-

options The options passed to the key, pass a list object

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

14.16.195 salt.states.ssh_known_hosts

Control of SSH known_hosts entries

Manage the information stored in the known_hosts files.

```

github.com:
  ssh_known_hosts:

```

```

- present
- user: root
- fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48

```

```

example.com:
  ssh_known_hosts:
    - absent
    - user: root

```

`salt.states.ssh_known_hosts.absent` (*name*, *user=None*, *config=None*)

Verifies that the specified host is not known by the given user

name The host name

user The user who owns the ssh authorized keys file to modify

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to ``/etc/ssh/ssh_known_hosts``. If present, must be an absolute path when a user is not specified.

`salt.states.ssh_known_hosts.present` (*name*, *user=None*, *fingerprint=None*,
key=None, *port=None*, *enc=None*, *config=None*,
hash_known_hosts=True, *timeout=5*)

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

name The name of the remote host (e.g. ``github.com``)

user The user who owns the ssh authorized keys file to modify

fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key The public key which must be present in the known_hosts file (optional if fingerprint specified)

port optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to ``/etc/ssh/ssh_known_hosts``. If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

14.16.196 salt.states.stateconf

Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

`salt.states.stateconf.context` (*name*, ***kwargs*)

No-op state to support state config via the stateconf renderer.

`salt.states.stateconf.set` (*name*, ***kwargs*)

No-op state to support state config via the stateconf renderer.

14.16.197 salt.states.status

Minion status monitoring

Maps to the *status* execution module.

salt.states.status.loadavg(*name*, *maximum=None*, *minimum=None*)

Return the current load average for the specified minion. Available values for *name* are *1-min*, *5-min* and *15-min*. *minimum* and *maximum* values should be passed in as strings.

salt.states.status.process(*name*)

Return whether the specified signature is found in the process tree. This differs slightly from the *services* states, in that it may refer to a process that is not managed via the *init* system.

14.16.198 salt.states.stormpath_account

Support for Stormpath.

New in version 2015.8.0.

salt.states.stormpath_account.absent(*name*, *directory_id=None*)

Ensure that an account associated with the given email address is absent. Will search all directories for the account, unless a *directory_id* is specified.

name The email address of the account to delete.

directory_id Optional. The ID of the directory that the account is expected to belong to. If not specified, then a list of directories will be retrieved, and each will be scanned for the account. Specifying a *directory_id* will therefore cut down on the number of requests to Stormpath, and increase performance of this state.

salt.states.stormpath_account.present(*name*, ***kwargs*)

Ensure that an account is present and properly configured

name The email address associated with the Stormpath account

directory_id The ID of a directory which the account belongs to. Required.

password Required when creating a new account. If specified, it is advisable to reference the password in another database using an *sdb://* URL. Will NOT update the password if an account already exists.

givenName Required when creating a new account.

surname Required when creating a new account.

username Optional. Must be unique across the owning directory. If not specified, the username will default to the email field.

middleName Optional.

status *enabled* accounts are able to login to their assigned applications, *disabled* accounts may not login to applications, *unverified* accounts are disabled and have not verified their email address.

customData. Optional. Must be specified as a dict.

14.16.199 salt.states.supervisord

Interaction with the Supervisor daemon

```
wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

`salt.states.supervisord.dead`(*name*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is dead (not running).

name Service name as defined in the supervisor configuration file

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.running`(*name*, *restart=False*, *update=False*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is running.

name Service name as defined in the supervisor configuration file

restart Whether to force a restart

update Whether to update the supervisor configuration.

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

14.16.200 salt.states.svn

Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:

```
subversion:
  pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
  svn.latest:
    - target: /tmp/swallow
```

`salt.states.svn.dirty`(*name*, *target*, *user=None*, *username=None*, *password=None*, *ignore_unversioned=False*)

Determine if the working directory has been changed.

`salt.states.svn.export`(*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *overwrite=False*, *externals=True*, *trust=False*)

Export a file or directory from an SVN repository

name Address and path to the file or directory to be exported.

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable ``force`` if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

overwrite [False] Overwrite existing target

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's --trust-server-cert

`salt.states.svn.latest` (*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *externals=True*, *trust=False*)

Checkout or update the working directory to the latest revision from the remote repository.

name Address of the name repository as passed to ``svn checkout``

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable ``force`` if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's --trust-server-cert

14.16.201 salt.states.sysctl

Configuration of the Linux kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

`salt.states.sysctl.present` (*name*, *value*, *config=None*)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is `/etc/sysctl.conf`

name The name of the sysctl value to edit

value The sysctl value to apply

config The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

14.16.202 salt.states.syslog_ng

State module for syslog_ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd, ps, syslog_ng

platform all

Users can generate `syslog-ng` configuration files from YAML format or use plain ones and reload, start, or stop their `syslog-ng` by using this module.

Details

The service module is not available on all system, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see syslog-ng state usage.

Syslog-ng configuration file format

The syntax of a configuration snippet in `syslog-ng.conf`:

```
object_type object_id {<options>;
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: <http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5>

`salt.states.syslog_ng.config`(*name*, *config*, *write=True*)

Builds syslog-ng configuration.

name : the id of the Salt document *config* : the parsed YAML code *write* : if True, it writes the config into the configuration file, otherwise just returns it

`salt.states.syslog_ng.reloaded`(*name*)

Reloads syslog-ng.

`salt.states.syslog_ng.started`(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*, **args*, ***kwargs*)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

`salt.states.syslog_ng.stopped`(*name=None*)

Kills syslog-ng.

14.16.203 salt.states.sysrc

`salt.states.sysrc.absent`(*name*, ***kwargs*)

Ensure a sysrc variable is absent.

name The variable name to set

file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

`salt.states.sysrc.managed`(*name*, *value*, ***kwargs*)

Ensure a sysrc variable is set to a specific value.

name The variable name to set

value Value to set the variable to

file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

Example:

```
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

14.16.204 salt.states.telemetry_alert

New in version 2016.3.0..

Manage Telemetry alert configurations

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
  telemetry_alert.present:
    - deployment_id: "rs-XXXXXX"
    - metric_name: "testMetric"
    - alert_config:
      max: 1
      filter: SERVER_ROLE_MONGOD_PRIMARY
      escalate_to: "example@pagerduty.com"
    - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

salt.states.telemetry_alert.absent(*name*, *deployment_id*, *metric_name*, *api_key=None*, *profile='telemetry'*)

Ensure the telemetry alert config is deleted

name An optional description of the alarms (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

api_key Telemetry api key for the user

profile A dict with telemetry config data. If present, will be used instead of *api_key*.

salt.states.telemetry_alert.present(*name*, *deployment_id*, *metric_name*, *alert_config*, *api_key=None*, *profile='telemetry'*)

Ensure the telemetry alert exists.

name An optional description of the alarm (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

alert_config: Is a list of dictionaries where each dict contains the following fields:

filter By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.

min the smallest ``ok`` value the metric may take on; if missing or null, no minimum is enforced.

max the largest ``ok`` value the metric may take on; if missing or null, no maximum is enforced.

notify_all Used to indicate if you want to alert both onCallEngineer and apiNotifications

api_key Telemetry api key for the user

profile A dict of telemetry config information. If present, will be used instead of *api_key*.

14.16.205 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```

always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

```

salt.states.test.check_pillar(*name*, *present=None*, *boolean=None*, *integer=None*, *string=None*, *listing=None*, *dictionary=None*, *verbose=False*)

Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

```

salt.states.test.configurable_test_state(*name*, *changes=True*, *result=True*, *comment=''*)

A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.

name: A unique string.

changes: Do we return anything in the changes field? Accepts True, False, and `Random` Default is True

result: Do we return successfully or not? Accepts True, False, and `Random` Default is True If test is True and changes is True, this will be None. If test is True and changes is False, this will be True.

comment: String to fill the comment field with. Default is ``

`salt.states.test.fail_with_changes(name)`

Returns failure and changes is not empty.

New in version 2014.7.0.

name: A unique string.

`salt.states.test.fail_without_changes(name)`

Returns failure.

New in version 2014.7.0.

name: A unique string.

`salt.states.test.mod_watch(name, sfun=None, **kwargs)`

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```

this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes

```

`salt.states.test.nop(name, **kwargs)`

A no-op state that does nothing. Useful in conjunction with the `use` requisite, or in templates which could otherwise be empty due to jinja rendering

New in version 2015.8.1.

`salt.states.test.show_notification(name, text=None, **kwargs)`

Simple notification using text argument.

New in version 2015.8.0.

name A unique string.

text Text to return in the comment.

`salt.states.test.succeed_with_changes(name)`

Returns successful and changes is not empty

New in version 2014.7.0.

name: A unique string.

`salt.states.test.succeed_without_changes(name)`

Returns successful.

New in version 2014.7.0.

name A unique string.

14.16.206 salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

salt.states.timezone.system(*name*, *utc=True*)

Set the timezone for the system.

name The name of the timezone to use (e.g.: America/Denver)

utc Whether or not to set the hardware clock to UTC (default is True)

14.16.207 salt.states.tls

Enforce state for SSL/TLS

salt.states.tls.valid_certificate(*name*, *weeks=0*, *days=0*, *hours=0*, *minutes=0*, *seconds=0*)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

14.16.208 salt.states.tomcat

Manage Apache Tomcat web applications

Note: This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```

Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 14.1: `conf/tomcat-users.xml`

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- **Last tested on:**

Tomcat Version: Apache Tomcat/7.0.54

JVM Vendor: Oracle Corporation

JVM Version: 1.8.0_101-b13

OS Architecture: amd64

OS Name: Linux

OS Version: 3.10.0-327.22.2.el7.x86_64

`salt.states.tomcat.mod_watch` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)
The tomcat watcher function. When called it will reload the webapp in question

`salt.states.tomcat.undeployed` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)
Enforce that the WAR will be undeployed from the server
name The context path to undeploy.
url [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.
timeout [180] Timeout for HTTP request to the Tomcat Manager.
Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

`salt.states.tomcat.wait` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)
Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the `tomcat.war_deployed` state to make sure tomcat is running and that the manager is running as well and ready for deployment.

url [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

`salt.states.tomcat.war_deployed`(*name*, *war*, *force=False*, *url='http://localhost:8080/manager'*, *timeout=180*, *temp_war_location=None*, *version=''*)

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

Note: For more info about Tomcats file paths and context naming, please see <http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming>

name The context path to deploy (incl. forward slash) the WAR to.

war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

force [False] Force deployment even if the version strings are the same. Disabled by default.

url [<http://localhost:8080/manager>] The URL of the Tomcat Web Application Manager.

timeout [180] Timeout for HTTP requests to the Tomcat Manager.

temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

version [``] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` to prevent guessing the version and keeping it blank.

New in version 2016.PLEASE_LET_ME_KNOW.

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```

Note: Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context

path jenkins##1.2.4. To avoid this either specify a version yourself, or set version to `False`.

14.16.209 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

`salt.states.trafficserver.bounce_cluster(name)`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

`salt.states.trafficserver.bounce_local(name, drain=False)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

`salt.states.trafficserver.clear_cluster(name)`

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
  trafficserver.clear_cluster
```

`salt.states.trafficserver.clear_node(name)`

Clears accumulated statistics on the local node.

```
clear_ats_node:
  trafficserver.clear_node
```

`salt.states.trafficserver.config(name, value)`

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
  trafficserver.config:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

`salt.states.trafficserver.offline`(*name*, *path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache
```

`salt.states.trafficserver.refresh`(*name*)

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
refresh_ats:
  trafficserver.refresh
```

`salt.states.trafficserver.restart_cluster`(*name*)

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
restart_ats_cluster:
  trafficserver.restart_cluster
```

`salt.states.trafficserver.restart_local`(*name*, *drain=False*)

Restart the `traffic_manager` and `traffic_server` processes on the local node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
restart_ats_local:
  trafficserver.restart_local

restart_ats_local_drain:
  trafficserver.restart_local
    - drain: True
```

`salt.states.trafficserver.set_var`(*name*, *value*)

Set Traffic Server configuration variable values.

Deprecated since version Oxygen: Use `trafficserver.config` instead.

```
proxy.config.proxy_name:
  trafficserver.set_var:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
  trafficserver.set_var:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

`salt.states.trafficserver.shutdown`(*name*)

Shut down Traffic Server on the local node.

```
shutdown_ats:
  trafficserver.shutdown
```

`salt.states.trafficserver.startup(name)`

Start Traffic Server on the local node.

```
startup_ats:
  trafficserver.startup
```

`salt.states.trafficserver.zero_cluster(name)`

Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

`salt.states.trafficserver.zero_node(name)`

Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

14.16.210 salt.states.tuned

Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>

maturity new

depends cmd.run

platform Linux

`salt.states.tuned.off(name=None)`

Turns `tuned` off. Example tuned.sls file for turning tuned off:

```
tuned: tuned.off: []
```

To see a valid list of states call execution module: `tuned.list`

`salt.states.tuned.profile(name)`

This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest

```
tuned:
```

```
  tuned:
```

- profile
- name: virtual-guest

name tuned profile name to set the system to

To see a valid list of states call execution module: `tuned.list`

14.16.211 salt.states.uptime

Monitor Web Server with Uptime

[Uptime](#) is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

`salt.states.uptime.monitored`(*name*, ***params*)
Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

14.16.212 salt.states.user

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

`salt.states.user.absent`(*name*, *purge=False*, *force=False*)
Ensure that the named user is absent
name The name of the user to remove
purge Set purge to True to delete all of the user's files as well as the user, Default is False.
force If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is False.

`salt.states.user.present`(*name*, *uid=None*, *gid=None*, *gid_from_name=False*, *groups=None*, *optional_groups=None*, *remove_groups=True*, *home=None*, *createhome=True*, *password=None*, *hash_password=False*, *enforce_password=True*, *empty_password=False*, *shell=None*, *unique=True*, *system=False*, *fullname=None*, *roomnumber=None*, *workphone=None*, *homephone=None*, *loginclass=None*, *date=None*, *mindays=None*, *maxdays=None*, *inactdays=None*, *warndays=None*, *expire=None*, *win_homedrive=None*, *win_profile=None*, *win_logonscript=None*, *win_description=None*)

Ensure that the named user is present with the specified properties

name The name of the user to manage

uid The user id to assign, if left empty then the next available user id will be assigned

gid The default group id. Also accepts group name.

gid_from_name If True, the default group id will be set to the id of the group with the same name as the user, Default is `False`.

groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

optional_groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both ``groups`` and ``optional_groups``, then it will be assumed to be required and not optional.

remove_groups Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

home The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if `createhome` is set to `True`.

createhome [`True`] If set to `False`, the home directory will not be created if it doesn't already exist.

Warning: Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for home must already exist.

password A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

Changed in version 0.16.0: BSD support added.

hash_password Set to `True` to hash the clear text password. Default is `False`.

enforce_password Set to `False` to keep the password from being changed if it has already been set and the password hash differs from what is specified in the ``password`` field. This option will be ignored if ``password`` is not specified, Default is `True`.

empty_password Set to `True` to enable password-less login for user, Default is `False`.

shell The login shell, defaults to the system default shell

unique Require a unique UID, Default is `True`.

system Choose UID in the range of `FIRST_SYSTEM_UID` and `LAST_SYSTEM_UID`, Default is `False`.

loginclass The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname The user's full name

roomnumber The user's room number (not supported in MacOS)

workphone The user's work phone number (not supported in MacOS)

homephone The user's home phone number (not supported in MacOS)
Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date Date of last change of password, represented in days since epoch (January 1, 1970).

mindays The minimum number of days between password changes.

maxdays The maximum number of days between password changes.

inactdays The number of days after a password expires before an account is locked.

warndays Number of days prior to maxdays to warn users.

expire Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

win_homedrive (Windows Only) The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie:
- win_homedrive: `U`:

Changed in version 2015.8.0.

win_profile (Windows Only) The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only) The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only) A brief description of the purpose of the users account.

Changed in version 2015.8.0.

14.16.213 salt.states.vbox_guest

VirtualBox Guest Additions installer state

salt.states.vbox_guest.additions_installed(*name*, *reboot=False*, *upgrade_os=False*)

Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

name The name has no functional value and is only used as a tracking reference.

reboot [False] Restart OS to complete installation.

upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

salt.states.vbox_guest.additions_removed(*name*, *force=False*)

Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).

name The name has no functional value and is only used as a tracking reference.

force Force VirtualBox Guest Additions removing.

salt.states.vbox_guest.grant_access_to_shared_folders_to(*name*, *users=None*)

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*.

name Name of the user to grant access to auto-mounted shared folders to.

users List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

14.16.214 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'
```

`salt.states.victorops.create_event` (*name*, *message_type*, *routing_key*='everyone', ***kwargs*)
Create an event on the VictorOps service

```
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver diskspace is low.'

database-server-warning-message:
  victorops.create_event:
    - message_type: 'WARNING'
    - entity_id: 'db_server/load'
    - state_message: 'Database Server load is high.'
    - entity_is_host: True
    - entity_display_name: 'dbdserver.example.com'
```

The following parameters are required:

name This is a short description of the event.

message_type One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

routing_key The key for where messages should be routed. By default, sent to `everyone` route.

entity_id The name of alerting entity. If not provided, a random name will be assigned.

timestamp Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

timestamp_fmt The date format for the timestamp parameter. Defaults to `'%Y-%m-%dT%H:%M:%S'`.

state_start_time The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

state_start_time_fmt The date format for the timestamp parameter. Defaults to `'%Y-%m-%dT%H:%M:%S'`.

state_message Any additional status information from the alert item.

entity_is_host Used within VictorOps to select the appropriate display format for the incident.

entity_display_name Used within VictorOps to display a human-readable name for the entity.

ack_message A user entered comment for the acknowledgment.

ack_author The user that acknowledged the incident.

14.16.215 salt.states.virt module

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```
libvirt_keys:
  virt.keys
```

salt.states.virt.keys(*name*, *basepath*='/etc/pki')

Manage libvirt keys.

name The name variable used to track the execution

basepath Defaults to /etc/pki, this is the root location used for libvirt keys on the hypervisor

salt.states.virt.powered_off(*name*)

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

salt.states.virt.rebooted(*name*)

Reboots VMs

New in version 2016.3.0.

Parameters **name** --

Returns

salt.states.virt.reverted(*name*, *snapshot*=None, *cleanup*=False)

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
  virt.reverted:
    - cleanup: True

domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False
```

salt.states.virt.running(*name*, ***kwargs*)

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

```
domain_name:
  virt.running
```

```
domain_name:
  virt.running:
    - cpu: 2
    - mem: 2048
    - eth0_mac: 00:00:6a:53:00:e3
```

`salt.states.virt.saved`(*name*, *suffix=None*)

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic
```

`salt.states.virt.snapshot`(*name*, *suffix=None*)

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic
```

`salt.states.virt.stopped`(*name*)

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.unpowered`(*name*)

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

14.16.216 `salt.states.virtualenv`

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

```

salt.states.virtualenv_mod.managed(name,          venv_bin=None,          requirements=None,
                                   system_site_packages=False,        distribute=False,
                                   use_wheel=False,  clear=False,        python=None,  ex-
                                   tra_search_dir=None,                never_download=None,
                                   prompt=None,      user=None,          no_chown=False,
                                   cwd=None,        index_url=None,        extra_index_url=None,
                                   pre_releases=False, no_deps=False, pip_download=None,
                                   pip_download_cache=None, pip_exists_action=None,
                                   pip_ignore_installed=False, proxy=None, use_vt=False,
                                   env_vars=None, no_use_wheel=False, pip_upgrade=False,
                                   pip_pkgs=None)

```

Create a virtualenv and optionally manage it with pip

name Path to the virtualenv.

requirements: None Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

use_wheel: False Prefer wheel archives (requires pip >= 1.4).

python [None] Python executable used to build the virtualenv

user: None The user under which to run virtualenv and pip.

no_chown: False When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)

cwd: None Path to the working directory where `pip install` is executed.

no_deps: False Pass `--no-deps` to `pip install`.

pip_exists_action: None Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

proxy: None Proxy address which is passed to `pip install`.

env_vars: None Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling.

no_use_wheel: False Force to not use wheel archives (requires pip >= 1.4)

pip_upgrade: False Pass `--upgrade` to `pip install`.

pip_pkgs: None As an alternative to `requirements`, pass a list of pip packages that should be installed.

Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `-distribute: True`.

```

/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt

```

14.16.217 salt.states.win_certutil module

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```

salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher

```

```

salt.states.win_certutil.add_store(name, store, saltenv='base')

```

Store a certificate to the given store

name The certificate to store, this can use local paths or `salt://` paths

store The store to add the certificate to

saltenv The salt environment to use, this is ignored if a local path is specified

`salt.states.win_certutil.del_store(name, store, saltenv='base')`

Remove a certificate in the given store

name The certificate to remove, this can use local paths or salt:// paths

store The store to remove the certificate from

saltenv The salt environment to use, this is ignored if a local path is specified

14.16.218 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

parameters: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

parameters: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
removeAcl:
```

```
  win_dacl.absent:
```

- name: HKEY_LOCAL_MACHINESOFTWAREmykey
- objectType: Registry
- user: FakeUser
- permission: FullControl
- acetype: ALLOW
- propagation: KEY&SUBKEYS

Ensure an object is inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```
eInherit:
```

```
  win_dacl.enableinheritance:
```

- name: HKEY_LOCAL_MACHINESOFTWAREmykey
- objectType: Registry
- clear_existing_acl: True

Ensure an object is not inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

dInherit:

win_dacl.disableinheritance:

- name: HKEY_LOCAL_MACHINESOFTWAREmykey
- objectType: Registry
- copy_inherited_acl: False

salt.states.win_dacl.absent(*name, objectType, user, permission, acetype, propagation*)
Ensure a Linux ACL does not exist

salt.states.win_dacl.disinherit(*name, objectType, copy_inherited_acl=True*)
Ensure an object is not inheriting ACLs from its parent

salt.states.win_dacl.inherit(*name, objectType, clear_existing_acl=False*)
Ensure an object is inheriting ACLs from its parent

salt.states.win_dacl.present(*name, objectType, user, permission, acetype, propagation*)
Ensure an ACE is present

14.16.219 salt.states.win_dism module

Installing of Windows features using DISM

Install windows features/capabilities with DISM

```
Language.Basic~~~en-US~0.0.1.0:
  dism.capability_installed
```

```
NetFx3:
  dism.feature_installed
```

salt.states.win_dism.capability_installed(*name, source=None, limit_access=False, image=None, restart=False*)

Install a DISM capability

Parameters

- **name** (*str*) -- The capability to install
- **source** (*str*) -- The optional source of the capability
- **limit_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.capability_removed` (*name, image=None, restart=False*)

Uninstall a DISM capability

Parameters

- **name** (*str*) -- The capability to uninstall
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.feature_installed` (*name, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False*)

Install a DISM feature

Parameters

- **name** (*str*) -- The feature in which to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) -- The optional source of the feature
- **limit_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **enable_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None,
                                     restart=False)
```

Disables a feature.

Parameters

- **name** (*str*) -- The feature to disable
- **remove_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

```
salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False,
                                       image=None, restart=False)
```

Install a package.

Parameters

- **name** (*str*) -- The package to install. Can be a *.cab* file, a *.msu* file, or a folder
- **ignore_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.package_removed`(*name*, *image=None*, *restart=False*)

Uninstall a package

Parameters

- **name** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from `dism.installed_packages`
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

14.16.220 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.dns_dhcp`(*name*, *interface='Local Area Connection'*)

Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.dns_exists`(*name*, *servers=None*, *interface='Local Area Connection'*, *replace=False*)

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list, default is False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

`salt.states.win_dns_client.primary_suffix`(*name*, *suffix=None*, *updates=False*)

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

suffix [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

updates [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
  win_dns_client.primary_suffix:
```

- ```
- suffix: sub.domain.tld
- updates: True
```

### 14.16.221 salt.states.win\_firewall

State for configuring Windows Firewall

**salt.states.win\_firewall.add\_rule**(*name, localport, protocol='tcp', action='allow', dir='in'*)  
Add a new firewall rule (Windows only)

**salt.states.win\_firewall.disabled**(*name='allprofiles'*)  
Disable all the firewall profiles (Windows only)

**salt.states.win\_firewall.enabled**(*name='allprofiles'*)  
Enable all the firewall profiles (Windows only)

### 14.16.222 salt.states.win\_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

**salt.states.win\_iis.container\_setting**(*name, container, settings=None*)  
Set the value of the setting for an IIS container.

#### Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values.

Example of usage for the AppPools container:

```
site0-appool-setting:
 win_iis.container_setting:
 - name: site0
 - container: AppPools
 - settings:
 managedPipelineMode: Integrated
 processModel.maxProcesses: 1
 processModel.userName: TestUser
 processModel.password: TestPassword
```

Example of usage for the Sites container:

```
site0-site-setting:
 win_iis.container_setting:
 - name: site0
 - container: Sites
 - settings:
 logFile.logFormat: W3C
 logFile.period: Daily
 limits.maxUrlSegments: 32
```

`salt.states.win_iis.create_app(name, site, sourcepath, apppool=None)`

Create an IIS application.

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Example of usage with only the required arguments:

```
site0-v1-app:
 win_iis.create_app:
 - name: v1
 - site: site0
 - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```
site0-v1-app:
 win_iis.create_app:
 - name: v1
 - site: site0
 - sourcepath: C:\inetpub\site0\v1
 - apppool: site0
```

`salt.states.win_iis.create_apppool(name)`

Create an IIS application pool.

**Parameters** **name** (*str*) -- The name of the IIS application pool.

Usage:

```
site0-apppool:
 win_iis.create_apppool:
 - name: site0
```

`salt.states.win_iis.create_binding(name, site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=0)`

Create an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
 win_iis.create_binding:
 - site: site0
```

Example of usage specifying all available arguments:

```

site0-https-binding:
 win_iis.create_binding:
 - site: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
 - protocol: https
 - sslflags: 0

```

`salt.states.win_iis.create_cert_binding`(*name*, *site*, *hostheader*='', *ipaddress*='\*', *port*=443, *sslflags*=0)

Assign a certificate to an IIS binding.

#### Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```

site0-cert-binding:
 win_iis.create_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0

```

Example of usage specifying all available arguments:

```

site0-cert-binding:
 win_iis.create_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
 - hostheader: site0.local
 - ipaddress: 192.168.1.199
 - port: 443
 - sslflags: 1

```

New in version 2016.11.0.

`salt.states.win_iis.create_vdir`(*name*, *site*, *sourcepath*, *app*='/')

Create an IIS virtual directory.

#### Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```

site0-foo-vdir:
 win_iis.create_vdir:

```

```
- name: foo
- site: site0
- sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
 win_iis.create_vdir:
 - name: foo
 - site: site0
 - sourcepath: C:\inetpub\vdirs\foo
 - app: v1
```

`salt.states.win_iis.deployed(name, sourcepath, apppool='', hostheader='', ipaddress='*', port=80, protocol='http')`

Ensure the website has been deployed.

#### Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
 win_iis.deployed:
 - name: site0
 - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
 win_iis.deployed:
 - name: site0
 - sourcepath: C:\inetpub\site0
 - apppool: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
 - protocol: https
```

`salt.states.win_iis.remove_app(name, site)`

Remove an IIS application.

#### Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Usage:

```
site0-v1-app-remove:
 win_iis.remove_app:
 - name: v1
 - site: site0
```

`salt.states.win_iis.remove_appool(name)`

Remove an IIS application pool.

**Parameters** `name (str)` -- The name of the IIS application pool.

Usage:

```
defaultappool-remove:
 win_iis.remove_appool:
 - name: DefaultAppPool
```

`salt.states.win_iis.remove_binding(name, site, hostheader='', ipaddress='*', port=80)`

Remove an IIS binding.

**Parameters**

- **site** (`str`) -- The IIS site name.
- **hostheader** (`str`) -- The host header of the binding.
- **ipaddress** (`str`) -- The IP address of the binding.
- **port** (`str`) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
 win_iis.remove_binding:
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
 win_iis.remove_binding:
 - site: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
```

`salt.states.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='*', port=443)`

Remove a certificate from an IIS binding.

**Parameters**

- **name** (`str`) -- The thumbprint of the certificate.
- **site** (`str`) -- The IIS site name.
- **hostheader** (`str`) -- The host header of the binding.
- **ipaddress** (`str`) -- The IP address of the binding.
- **port** (`str`) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
 win_iis.remove_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
 win_iis.remove_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
 - hostheader: site0.local
 - ipaddress: 192.168.1.199
 - port: 443
```

New in version 2016.11.0.

**salt.states.win\_iis.remove\_site**(*name*)

Delete a website from IIS.

**Parameters** **name** (*str*) -- The IIS site name.

Usage:

```
defaultwebsite-remove:
 win_iis.remove_site:
 - name: Default Web Site
```

**salt.states.win\_iis.remove\_vdir**(*name, site, app=''*)

Remove an IIS virtual directory.

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
 win_iis.remove_vdir:
 - name: foo
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
 win_iis.remove_vdir:
 - name: foo
 - site: site0
 - app: v1
```

### 14.16.223 salt.states.win\_license module

#### Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
 license.activate
```

**salt.states.win\_license.activate**(*name*)

Install and activate the given product key

**name** The 5x5 product key given to you by Microsoft

### 14.16.224 salt.states.win\_network

#### Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the network state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
network.managed:
 - dns_proto: dhcp
 - ip_proto: dhcp
```

---

**Note:** Both the `dns_proto` and `ip_proto` arguments are required.

---

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
network.managed:
 - dns_proto: static
 - dns_servers:
 - 8.8.8.8
 - 8.8.4.4
 - ip_proto: static
 - ip_addrs:
 - 10.2.3.4/24
```

---

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

---

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
network.managed:
 - dns_proto: static
 - dns_servers:
 - 8.8.8.8
 - 8.8.4.4
 - ip_proto: static
 - ip_addrs:
 - 10.2.3.4/24
 - gateway: 10.2.3.1
```

`salt.states.win_network.managed`(*name*, *dns\_proto*=None, *dns\_servers*=None, *ip\_proto*=None, *ip\_addrs*=None, *gateway*=None, *enabled*=True, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**dns\_proto** [None] Set to `static` and use the `dns_servers` parameter to provide a list of DNS name-servers. set to `dhcp` to use DHCP to get the DNS servers.

**dns\_servers** [None] A list of static DNS servers.

**ip\_proto** [None] Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.

**ip\_addrs** [None] A list of static IP addresses.

**gateway** [None] A list of static IP addresses.

**enabled** [True] Set to `False` to ensure that this interface is disabled.

### 14.16.225 salt.states.win\_path

Manage the Windows System PATH

`salt.states.win_path.absent`(*name*)

Remove the directory from the SYSTEM path

index: where the directory should be placed in the PATH (default: 0)

Example:

```
'C:\sysinternals':
 win_path.absent
```

`salt.states.win_path.exists`(*name*, *index=None*)

Add the directory to the system PATH at index location

index: where the directory should be placed in the PATH (default: None) [Note: Providing no index will append directory to PATH and will not enforce its location within the PATH.]

Example:

```
'C:\python27':
 win_path.exists

'C:\sysinternals':
 win_path.exists:
 - index: 0
```

### 14.16.226 salt.states.win\_powercfg

This module allows you to control the power settings of a windows minion via `powercfg`.

New in version 2015.8.0.

```
monitor:
 powercfg.set_timeout:
 - value: 30
 - power: dc
```

`salt.states.win_powercfg.set_timeout`(*name*, *value*, *power='ac'*)

Set the sleep timeouts of specific items such as disk, monitor.

CLI Example:

```
monitor:
 powercfg.set_timeout:
 - value: 30
 - power: dc

disk:
```

```
powercfg.set_timeout:
- value: 12
- power: ac
```

**name** The setting to change, can be one of the following: monitor, disk, standby, hibernate

**timeout** The amount of time in minutes before the item will timeout i.e the monitor

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

### 14.16.227 salt.states.win\_servermanager

Manage Windows features via the ServerManager powershell module

```
salt.states.win_servermanager.installed(name, recurse=False, force=False, restart=False,
 source=None, exclude=None)
```

Install the windows feature

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in win\_servermanager.list\_available)
- **recurse** (*Optional[bool]*) -- install all sub-features as well
- **force** (*Optional[bool]*) -- if the feature is installed but one of its sub-features are not installed set this to True to force the installation of the sub-features
- **source** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature.

**restart:** Restarts the computer when installation is complete, if restarting is required by the role feature installed.

---

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

---

#### Example

Run `salt MinionName win_servermanager.list_available` to get a list of available roles and features. Use the name in the right column. Do not use the role or feature names mentioned in the PKGMGR documentation. In this example for IIS-WebServerRole the name to be used is Web-Server.

```
ISWebserverRole:
 win_servermanager.installed:
 - force: True
 - recurse: True
 - name: Web-Server
```

```
salt.states.win_servermanager.removed(name, remove_payload=False, restart=False)
```

Remove the windows feature

### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`)
- **remove\_payload** (*Optional[bool]*) -- True will case the feature to be removed from the side-by-side store
- **restart** (*Optional[bool]*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

---

**Note:** Some features require a reboot after uninstallation. If so the feature will not be completely uninstalled until the server is restarted.

---

### Example

Run `salt MinionName win_servermanager.list_installed` to get a list of all features installed. Use the top name listed for each feature, not the indented one. Do not use the role or feature names mentioned in the PKGMGR documentation.

```
ISWebserverRole:
 win_servermanager.removed:
 - name: Web-Server
```

## 14.16.228 salt.states.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.active_log_format` (*name*, *log\_format*, *server='SmtpSvc/1'*)

Manage the active log format for the SMTP server.

### Parameters

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-log-format:
 win_smtp_server.active_log_format:
 - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.connection_ip_list` (*name*, *addresses=None*, *grant\_by\_default=False*, *server='SmtpSvc/1'*)

Manage IP list for SMTP connections.

### Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
 win_smtp_server.connection_ip_list:
 - addresses:
 127.0.0.1: 255.255.255.255
 172.16.1.98: 255.255.255.255
 172.16.1.99: 255.255.255.255
 - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses:
 172.16.1.100: 255.255.255.255
 172.16.1.101: 255.255.255.255
 - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses: {}
 - grant_by_default: True
```

`salt.states.win_smtp_server.relay_ip_list` (*name*, *addresses=None*, *server='SmtSvc/1'*)

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting `127.0.0.1` as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

---

**Note:** Setting the list to None corresponds to the restrictive `Only the list below` GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive `All except the list below` GUI parameter.

---

#### Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses:
 - 24.0.0.128
 - 32.0.0.128
 - 60.0.0.128
 - 1.0.0.0
```

```

- 76.0.0.0
- 0.0.0.0
- 0.0.0.0
- 1.0.0.0
- 1.0.0.0
- 2.0.0.0
- 2.0.0.0
- 4.0.0.0
- 0.0.0.0
- 76.0.0.128
- 0.0.0.0
- 0.0.0.0
- 0.0.0.0
- 0.0.0.0
- 255.255.255.255
- 127.0.0.1

```

Example of usage for disabling relaying:

```

smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: None

```

Example of usage for allowing relaying from any source:

```

smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: []

```

`salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtSvc/1')`  
 Ensure the value is set for the specified setting.

---

**Note:** The setting names are case-sensitive.

---

#### Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```

smtp-settings:
 win_smtp_server.server_setting:
 - settings:
 LogType: 1
 LogFilePeriod: 1
 MaxMessageSize: 16777216
 MaxRecipients: 10000
 MaxSessionSize: 16777216

```

### 14.16.229 salt.states.win\_system

#### Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
 system.computer_name: []

This is Erik's computer, don't touch!:
 system.computer_desc: []
```

`salt.states.win_system.computer_desc`(*name*)

Manage the computer's description field

**name** The desired computer description

`salt.states.win_system.computer_name`(*name*)

Manage the computer's name

**name** The desired computer name

`salt.states.win_system.hostname`(*name*)

New in version 2016.3.0.

Manage the hostname of the computer

**name** The hostname to set

`salt.states.win_system.join_domain`(*name*, *username=None*, *password=None*, *account\_ou=None*, *account\_exists=False*, *restart=False*)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

**name:** The name of the Domain.

**username:** Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply user.

**password:** Password of the account to add the computer to the Domain.

**account\_ou:** The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`.

**account\_exists:** Needs to be set to True to allow re-using an existing computer account.

**restart:** Needs to be set to True to restart the computer after a successful join.

### 14.16.230 salt.states.win\_update

#### Management of the windows update agent

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete.

Optionally set `category` to a category of your choice to only install certain updates. Default is to set to install all available updates.

The following example will install all Security and Critical Updates, and download but not install standard updates.

```
updates:
 win_update.installed:
 - categories:
 - 'Critical Updates'
 - 'Security Updates'
 - skips:
 - downloaded
 win_update.downloaded:
 - categories:
 - 'Updates'
```

- ```
- skips:
  - downloaded
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, included by default
'present' - Present on computer, skipped by default
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - Skip updates that have been hidden, skipped by default
'software' - Software updates, included by default
'driver' - driver updates, included by default
```

The following example installs all driver updates that don't require a reboot: .. code-block:: yaml

```
gryffindor:
  win_update.installed:
    - skips: - driver: True - software: False - reboot: False
```

To just update your windows machine, add this your sls:

```
updates:
  win_update.installed
```

salt.states.win_update.downloaded (*name, categories=None, skips=None, retries=10*)

Cache updates for later install.

name: if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

categories: the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

skips: a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

retries Number of retries to make before giving up. This is total, not per step.

salt.states.win_update.installed (*name, categories=None, skips=None, retries=10*)

Install specified windows updates.

name: if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

categories: the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

```
Updates
Windows 7
Critical Updates
Security Updates
Update Rollups
```

skips: a list of features of the updates to cull by. Available features:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, skipped by default (downloading)
'present' - Present on computer, included by default (installing)
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - skip those updates that have been hidden.
'software' - Software updates, included by default
'driver' - driver updates, skipped by default
```

retries Number of retries to make before giving up. This is total, not per step.

14.16.231 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.genrepo` (*name*, *force=False*, *allow_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If *force* is True no checks will be made and the repository will be generated if *allow_empty* is True then the state will not return an error if there are 0 packages,

Note: This state only loads on minions that have the `roles: salt-master` grain set.

Example:

```
winrepo:
  winrepo.genrepo
```

14.16.232 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

depends M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CA's, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

`/etc/salt/master.d/peer.conf`

```
peer:
  .*:
    - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory: []

/etc/pki/issued_certs:
  file.directory: []

/etc/pki/ca.key:
  x509.private_key_managed:
    - bits: 4096
    - backup: True
    - require:
      - file: /etc/pki

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - require:
      - x509: /etc/pki/ca.key
```

```
mine.send:
  module.run:
    - func: x509.get_pem_entries
    - kwargs:
      glob_path: /etc/pki/ca.crt
    - onchanges:
      - x509: /etc/pki/ca.crt
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/signing_policies.conf

```
x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered yml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```
/usr/local/share/ca-certificates:
  file.directory: []

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
    →']|replace('\n', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
```

```
salt.states.x509.certificate_managed(name, days_remaining=90, backup=False, **kwargs)
```

Manage a Certificate

name: Path to the certificate

days_remaining: The minimum number of days remaining when the certificate should be recreated. Default is 90. A value of 0 disables automatic renewal.

backup: When replacing an existing file, backup the old file on the minion. Default is False.

kwargs: Any arguments supported by `x509.create_certificate` are supported.

Examples:

```
/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

```
/etc/ssl/www.crt:
  x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True
```

```
salt.states.x509.crl_managed(name, signing_private_key, signing_cert=None,
                             revoked=None, days_valid=100, digest='sha1', days_remaining=30,
                             include_expired=False, backup=False)
```

Manage a Certificate Revocation List

name: Path to the certificate

signing_private_key: The private key that will be used to sign this crl. This is usually your CA's private key.

signing_cert: The certificate of the authority that will be used to sign this crl. This is usually your CA's certificate.

revoked: A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

days_valid: The number of days the certificate should be valid for. Default is 100.

digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

days_remaining: The crl should be automatically recreated if there are less than `days_remaining` days until the crl expires. Set to 0 to disable automatic renewal. Default is 30.

include_expired: Include expired certificates in the CRL. Default is `False`.

backup: When replacing an existing file, backup the old file on the minion. Default is False.

Example:

```

/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromised_Web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation

```

`salt.states.x509.csr_managed(name, backup=False, **kwargs)`

Manage a Certificate Signing Request

name: Path to the CSR

properties: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

Example:

```

/etc/pki/mycert.csr:
  x509.csr_managed:
    - private_key: /etc/pki/mycert.key
    - CN: www.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - keyUsage: 'critical dataEncipherment'

```

`salt.states.x509.pem_managed(name, text, backup=False)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

name: The path to the file to manage

text: The PEM formatted text to write.

backup: When replacing an existing file, backup the old file on the minion. Default is False.

`salt.states.x509.private_key_managed(name, bits=2048, new=False, backup=False, verbose=True)`

Manage a private key's existence.

name: Path to the private key

bits: Key length in bits. Default 2048.

new: Always create a new key. Defaults to False. Combining new with `prereq` can allow key rotation whenever a new certificate is generated.

backup: When replacing an existing file, backup the old file on the minion. Default is False.

verbose: Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

Example:

The jinja templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```

/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True

```

```
{% if salt['file.file_exists']('/etc/pki/ca.key') -%}
- prereq:
  - x509: /etc/pki/www.crt
{%- endif %}
```

14.16.233 salt.states.xmpp

Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.send_msg`(*name*, *recipient*, *profile*)

Send a message to an XMPP user

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

name The message to send to the XMPP user

`salt.states.xmpp.send_msg_multi`(*name*, *profile*, *recipients=None*, *rooms=None*)

Send a message to an list of recipients or rooms

```
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
      - admins@xmpp.example.com/salt
    - rooms:
      - qa@conference.xmpp.example.com
```

name The message to send to the XMPP user

14.16.234 salt.states.zabbix_host module

Management of Zabbix hosts.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_host.absent`(*name*)

Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

Param name: technical name of the host

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
TestHostWithInterfaces:
  zabbix_host.absent
```

`salt.states.zabbix_host.present` (*host, groups, interfaces, **kwargs*)

Ensures that the host exists, eventually creates new host. NOTE: please use argument `visible_name` instead of `name` to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- Optional - string with visible name of the host, use `visible_name` instead of `name` parameter to not mess with value supplied from Salt sls file.

```
create_test_host:
  zabbix_host.present:
    - host: TestHostWithInterfaces
    - groups:
      - 5
      - 6
      - 7
    - interfaces:
      - test1.example.com:
        - ip: '192.168.1.8'
        - type: 'Agent'
        - port: 92
      - testing2_create:
        - ip: '192.168.1.9'
        - dns: 'test2.example.com'
        - type: 'agent'
        - main: false
      - testovaci1_ipmi:
        - ip: '192.168.100.111'
        - type: 'ipmi'
```

14.16.235 salt.states.zabbix_hostgroup module

Management of Zabbix host groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_hostgroup.absent(*name*)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_testing_host_group:
  zabbix_hostgroup.absent:
    - name: 'My hostgroup name'
```

salt.states.zabbix_hostgroup.present(*name*)

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
create_testing_host_group:
  zabbix_hostgroup.present:
    - name: 'My hostgroup name'
```

14.16.236 salt.states.zabbix_user module

Management of Zabbix users.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_user.absent(*name*)

Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

Parameters

- **name** -- user alias

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
George:
  zabbix_user.absent
```

`salt.states.zabbix_user.present` (*alias, passwd, usrgrps, medias, password_reset=False, **kwargs*)
Ensures that the user exists, eventually creates new user. NOTE: use argument `firstname` instead of `name` to not mess values with `name` from salt sls.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **medias** -- user's medias to create
- **password_reset** -- whether or not to reset password at update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use `'firstname'` instead of `'name'` parameter to not mess with value supplied from Salt sls file.

```
make_user:
  zabbix_user.present:
    - alias: George
    - passwd: donottellanyonE@456x
    - password_reset: True
    - usrgrps:
      - 13
      - 7
    - medias:
      - me@example.com:
          - mediatype: mail
          - period: '1-7,00:00-24:00'
          - severity: NIWAHD
      - make_jabber:
          - active: true
          - mediatype: jabber
          - period: '1-5,08:00-19:00'
          - sendto: jabbera@example.com
    - text_me_morning_disabled:
      - active: false
      - mediatype: sms
```

```
- period: '1-5,09:30-10:00'
- severity: D
- sendto: '+42032132588568'
```

14.16.237 salt.states.zabbix_usergroup module

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.absent(*name*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_thai_monks_usrgrp:
  zabbix_usergroup.absent:
    - name: 'Thai monks'
```

salt.states.zabbix_usergroup.present(*name*, ***kwargs*)

Creates new user. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_thai_monks_usergroup:
  zabbix_usergroup.present:
    - name: 'Thai monks'
    - gui_access: 1
    - debug_mode: 0
    - users_status: 0
```

14.16.238 salt.states.zcbuildout

Management of zc.buildout

This module is inspired from minitage's buildout maker (<https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py>)

New in version 2016.3.0.

Note: This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

Available Functions

- built

```

installed1
  buildout.installed:
    - name: /path/to/buildout

installed2
  buildout.installed:
    - name: /path/to/buildout
    - parts:
      - a
      - b
    - python: /path/to/pythonpath/bin/python
    - unless: /bin/test_something_installed
    - onlyif: /bin/test_else_installed

```

`salt.states.zcbuildout.installed`(*name*, *config*='buildout.cfg', *quiet*=False, *parts*=None, *user*=None, *env*=(), *buildout_ver*=None, *test_release*=False, *distribute*=None, *new_st*=None, *offline*=False, *newest*=False, *python*='/usr/bin/python', *debug*=False, *verbose*=False, *unless*=None, *onlyif*=None, *use_vt*=False, *loglevel*='debug', ***kwargs*)

Install buildout in a specific directory

It is a thin wrapper to `modules.buildout.buildout`

name directory to execute in

quiet

do not output console & logs

config buildout config to use (default: buildout.cfg)

parts specific buildout parts to run

user user used to run buildout as

New in version 2014.1.4.

env environment variables to set when running

buildout_ver force a specific buildout version (1 | 2)

test_release buildout accept test release

new_st Forcing use of setuptools >= 0.7

distribute use distribute over setuptools if possible

offline does buildout run offline

python python to use

debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
loglevel loglevel for buildout commands

14.16.239 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the `zenoss` Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x is supported.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

salt.states.zenoss.monitored(*name*, *device_class*=None, *collector*='localhost', *prod_state*=None)

Ensure a device is monitored. The `name` given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

14.16.240 salt.states.zk_concurrency

Control concurrency of steps within state execution using zookeeper

This module allows you to ``wrap`` a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than `max_concurrency` steps are executing with a single path.

```
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficeserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficserver

trafficserver:
```

```
service.running:
  - watch:
    - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficserver
    - require:
      - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

`salt.states.zk_concurrency.lock`(*name*, *zk_hosts*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*)

Block state execution until you are able to get the lock (or hit the timeout)

`salt.states.zk_concurrency.min_party`(*name*, *zk_hosts*, *min_nodes*, *blocking=False*)

Ensure that there are *min_nodes* in the party at *name*, optionally blocking if not available.

`salt.states.zk_concurrency.unlock`(*name*, *zk_hosts=None*, *identifier=None*, *max_concurrency=1*, *ephemeral_lease=False*)

Remove lease from semaphore.

14.16.241 salt.states.zfs

Management zfs datasets

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends zfs

platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```
test/shares/yuki:
  zfs.filesystem_present:
    - create_parent: true
    - properties:
      quota: 16G

test/iscsi/haruhi:
  zfs.volume_present:
    - create_parent: true
    - volume_size: 16M
    - sparse: true
    - properties:
      readonly: on

test/shares/yuki@frozen:
  zfs.snapshot_present
```

```

moka_origin:
  zfs.hold_present
    - snapshot: test/shares/yuki@frozen

test/shares/moka:
  zfs.filesystem_present:
    - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
  zfs.snapshot_absent

```

salt.states.zfs.bookmark_absent (*name*, *force=False*, *recursive=False*)

ensure bookmark is absent on the system

name [string] name of snapshot

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.bookmark_present (*name*, *snapshot*)

ensure bookmark exists

name [string] name of bookmark

snapshot [string] name of snapshot

salt.states.zfs.filesystem_absent (*name*, *force=False*, *recursive=False*)

ensure filesystem is absent on the system

name [string] name of filesystem

force [boolean] try harder to destroy the dataset (zfs destroy -f)

recursive [boolean] also destroy all the child datasets (zfs destroy -r)

..warning:

If a volume with **name** exists, this state will succeed without destroying the volume specified by **name**. This module is dataset type sensitive.

salt.states.zfs.filesystem_present (*name*, *create_parent=False*, *properties=None*, *cloned_from=None*)

ensure filesystem exists and has properties set

name [string] name of filesystem

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

cloned_from [string] name of snapshot to clone

properties [dict] additional zfs properties (-o)

Note: **cloned_from** is only use if the filesystem does not exist yet, when **cloned_from** is set after the filesystem exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

salt.states.zfs.hold_absent (*name*, *snapshot*, *recursive=False*)

ensure hold is absent on the system

name [string] name of holdt

snapshot [string] name of snapshot

recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.hold_present (*name*, *snapshot*, *recursive=False*)

ensure hold is present on the system
name [string] name of holdt
snapshot [string] name of snapshot
recursive [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.promoted(*name*)

ensure a dataset is not a clone
name [string] name of fileset or volume
..warning:

only one dataset can be the origin,
if you promote a clone the original will now point to the promoted dataset

salt.states.zfs.scheduled_snapshot(*name, prefix, recursive=True, schedule=None*)

maintain a set of snapshots based on a schedule
name [string] name of filesystem or volume
prefix [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-YYYYMMDD_HHMM'
recursive [boolean] create snapshots for all children also
schedule [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.
..warning:

snapshots will only be created and pruned every time the state runs.
a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

salt.states.zfs.snapshot_absent(*name, force=False, recursive=False*)

ensure snapshot is absent on the system
name [string] name of snapshot
force [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.snapshot_present(*name, recursive=False, properties=None*)

ensure snapshot exists and has properties set
name [string] name of snapshot
recursive [boolean] recursively create snapshots of all descendent datasets
properties [dict] additional zfs properties (-o)

salt.states.zfs.volume_absent(*name, force=False, recursive=False*)

ensure volume is absent on the system
name [string] name of volume
force [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive [boolean] also destroy all the child datasets (zfs destroy -r)
..warning:

If a filesystem with **name** exists, this state will succeed without destroying the filesystem specified by **name**. This module is dataset type sensitive.

salt.states.zfs.volume_present(*name, volume_size, sparse=False, create_parent=False, properties=None, cloned_from=None*)

ensure volume exists and has properties set
name [string] name of volume
volume_size [string] size of volume
sparse [boolean] create sparse volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
cloned_from [string] name of snapshot to clone

properties [dict] additional zfs properties (-o)

Note: `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The `sparse` parameter is ignored when using `cloned_from`.

14.16.242 salt.states.zpool

Management zpool

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends zpool

platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```

oldpool:
  zpool.absent:
    - export: true

newpool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: salty storage pool
    - layout:
        mirror-0:
          /dev/disk0
          /dev/disk1
        mirror-1:
          /dev/disk2
          /dev/disk3

simplepool:
  zpool.present:
    - config:
        import: false
        force: true
    - properties:
        comment: another salty storage pool
    - layout:
        - /dev/disk0
        - /dev/disk1
  
```

Warning: The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, ... this is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

`salt.states.zpool.absent` (*name*, *export=False*, *force=False*)

ensure storage pool is absent on the system

name [string] name of storage pool

export [boolean] export instread of destroy the zpool if present

force [boolean] force destroy or export

`salt.states.zpool.present` (*name*, *properties=None*, *filesystem_properties=None*, *layout=None*, *config=None*)

ensure storage pool is present on the system

name [string] name of storage pool

properties [dict] optional set of properties to set for the storage pool

filesystem_properties [dict] optional set of filesystem properties to set for the storage pool (creation only)

layout: dict disk layout to use if the pool does not exist (creation only)

config [dict] fine grain control over this state

Note:

The following configuration properties can be toggled in the config parameter.

- `import` (true) - try to import the pool before creating it if absent
 - `import_dirs` (None) - specify additional locations to scan for devices on import
 - `device_dir` (None, SunOS=/dev/rdisk) - specify device directory to use if not absolute path
 - `force` (false) - try to force the import or creation
-

Note: Because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
  /tmp/vdisk3
  /tmp/vdisk2
mirror-1:
  /tmp/vdisk0
  /tmp/vdisk1
```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

Warning: Pay attention to the order of your dict!

```
mirror-0:
  /tmp/vdisk0
  /tmp/vdisk1
/tmp/vdisk2:
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! Why you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

14.17 thorium modules

<i>check</i>	The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.
<i>file</i>	Writes matches to disk to verify activity, helpful when testing
<i>local</i>	Run remote execution commands via the local client
<i>reg</i>	Used to manage the thorium register.
<i>timer</i>	Allow for flow based timers.

14.17.1 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.contains`(*name*, *value*)

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.eq`(*name*, *value*)

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
```

```
- require:  
- check: foo
```

`salt.thorium.check.event`(*name*)

Checks for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:  
  check.event  
  
run_remote_ex:  
  local.cmd:  
    - tgt: '*'  
    - func: test.ping  
    - require:  
      - check: salt/foo/*/bar
```

`salt.thorium.check.gt`(*name*, *value*)

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:  
  check.gt:  
    - value: 42  
  
run_remote_ex:  
  local.cmd:  
    - tgt: '*'  
    - func: test.ping  
    - require:  
      - check: foo
```

`salt.thorium.check.gte`(*name*, *value*)

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:  
  check.gte:  
    - value: 42  
  
run_remote_ex:  
  local.cmd:  
    - tgt: '*'  
    - func: test.ping  
    - require:  
      - check: foo
```

`salt.thorium.check.lt`(*name*, *value*)

Only succeed if the value in the given register location is less than the given value

USAGE:

```
foo:  
  check.lt:  
    - value: 42
```

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.lte`(*name*, *value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.ne`(*name*, *value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

14.17.2 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

Then the file will be saved to:

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
  file.save
```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.save`(*name*, *filter=False*)

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

USAGE:

```
foo:
  file.save

/tmp/foo:
  file.save
```

14.17.3 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.cmd`(*name*, *tgt*, *func*, *arg=()*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, ***kwargs*)

Execute a remote execution command

USAGE:

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg:
      - 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30
```

14.17.4 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.clear`(*name*)

Clear the namespace from the register

USAGE:

```
clearns:
  reg.clear:
    - name: myregister
```

`salt.thorium.reg.delete(name)`
Delete the namespace from the register

USAGE:

```
deletens:
  reg.delete:
    - name: myregister
```

`salt.thorium.reg.list(name, add, match, stamp=False, prune=0)`
Add the specified values to the named list

If `stamp` is `True`, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last `prune` values will be kept in the list.

USAGE:

```
foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```

`salt.thorium.reg.mean(name, add, match)`
Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

`salt.thorium.reg.set(name, add, match)`
Add a value to the named set

USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

14.17.5 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.hold(name, seconds)`
Wait for a given period of time, then fire a result of `True`, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
  timer.hold:
    - seconds: 30
```

14.18 master tops modules

<code>cobbler</code>	Cobbler Tops
<code>ext_nodes</code>	External Nodes Classifier
<code>mongo</code>	Read tops data from a mongodb collection
<code>reclass_adapter</code>	Read tops data from a reclass database
<code>varstack</code>	Use <code>Varstack</code> < https://github.com/conversis/varstack > to provide tops data

14.18.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

`salt.tops.cobbler.top(**kwargs)`
Look up top data in Cobbler for a minion.

14.18.2 salt.tops.ext_nodes

External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to ``cobbler-ext-nodes'` above, but currently the data must be formatted in the same way that the standard ``cobbler-ext-nodes'` does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
  '*':
    - basepackages
    - database

base:
  '*':
    - basepackages
    - database
```

```
salt.tops.ext_nodes.top(**kwargs)
    Run the command configured
```

14.18.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as *salt.returners.mongo_return*. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ""
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment
```

Module Documentation

`salt.tops.mongo.top` (**kwargs)

Connect to a mongo database and read per-node tops data.

Parameters

- **collection** (*) -- The mongodb collection to read data from. Defaults to 'tops'.
- **id_field** (*) -- The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If None, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to None.
- **re_replace** (*) -- Use as the replacement value in node ids matched with *re_pattern*. Defaults to ''. Feel free to use backreferences here.
- **states_field** (*) -- The name of the field providing a list of states.
- **environment_field** (*) -- The name of the field providing the environment. Defaults to `environment`.

14.18.4 salt.tops.reclass_adapter

Read tops data from a reclass database

This *master_tops* plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHON-PATH environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
    Query reclass for the top data (states of the minions).
```

14.18.5 salt.tops.varstack

Use *Varstack* <<https://github.com/conversis/varstack>> to provide tops data

This *master_tops* plugin provides access to the **varstack** hierarchical yaml files, so you can use **varstack** as a full external node classifier and store state information (top data) in it.

Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use /path/to/the/config/file/varstack.yaml (usually /etc/varstack.yaml) to determine which configuration data to return as adapter information. From there you can take a look at the *README* <<https://github.com/conversis/varstack/blob/master/README.md>> of varstack to learn how this file is evaluated. The ENC part will just return the `states` dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as {'base': ['sudo', `openssh`, `apache`, `salt.minion`]} and managed by salt as if given from a top.sls file.

```
salt.tops.varstack.top(**kwargs)
    Query varstack for the top data (states of the minions).
```

14.19 wheel modules

<i>config</i>	Manage the master configuration file
<i>error</i>	Error generator to enable integration testing of salt wheel error handling
<i>file_roots</i>	Read in files from the file_root and save files to the file root
<i>key</i>	Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.
<i>minions</i>	Wheel system wrapper for connected minions
<i>pillar_roots</i>	The <i>pillar_roots</i> wheel module is used to manage files under the pillar roots directories on the master server.

14.19.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.apply(key, value)`
Set a single key

Note: This will strip comments from your config file

`salt.wheel.config.update_config(file_name, yaml_contents)`
Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
  'username': 'salt',
  'password': 'salt',
  'fun': 'config.update_config',
  'file_name': 'gui',
  'yaml_contents': {'id': 1},
  'client': 'wheel',
  'eauth': 'pam',
}
```

`salt.wheel.config.values()`
Return the raw values of the config file

14.19.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.error(name=None, message='')`
If name is None Then return empty dict
Otherwise raise an exception with `__name__` from name, message from message
CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

14.19.3 salt.wheel.file_roots

Read in files from the `file_root` and save files to the file root

`salt.wheel.file_roots.find(path, saltenv='base')`
Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.list_env(saltenv='base')`
Return all of the file paths found in an environment

`salt.wheel.file_roots.list_roots()`
Return all of the files names in all available environments

`salt.wheel.file_roots.read(path, saltenv='base')`
 Read the contents of a text file, if the file is binary then

`salt.wheel.file_roots.write(data, path, saltenv='base', index=0)`
 Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

14.19.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a `WheelClient` is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the `WheelClient` must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless `external_auth` is configured and the user is authorized to execute wheel functions.

The function documentation starts with the `wheel` reference from the code sample above and use the `WheelClient` functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a `salt` command at the CLI using the `saltutil` execution module.

`salt.wheel.key.accept(match, include_rejected=False, include_denied=False)`
 Accept keys based on a glob match. Returns a dictionary.
match The glob match of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.
include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)`
 Accept keys based on a dict of keys. Returns a dictionary.
match The dictionary of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('accept_dict',
{
  'minions_pre': [
    'jerry',
    'stuart',
```

```

        'bob',
    ],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

salt.wheel.key.delete (*match*)

Delete keys based on a glob match. Returns a dictionary.

match The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.delete_dict (*match*)

Delete keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.finger (*match*)

Return the matching key fingerprints. Returns a dictionary.

match The key for with to retrieve the fingerprint.

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

salt.wheel.key.gen (*id_=None, keysize=2048*)

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the pub and priv keys with their generated values.

id_ Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BbPfamX9gGPQTpN9e8HwcZjXQnm8OrcUl10WHw09SDWLOlnW+
```

```
iQIDAQAB
```

```
-----END PUBLIC KEY-----`, `priv': `-----BEGIN RSA PRIVATE KEY-----
```

```
MIIEpAIBAACAQEA42Kf+w9XeZWgguzv ... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
```

```
-----END RSA PRIVATE KEY-----`}
```

salt.wheel.key.gen_accept (*id_, keysize=2048, force=False*)

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

id_ The name of the minion for which to generate a key pair.

keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

force If a public key has already been accepted for the given minion on the master, then the `gen_accept` function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTpN9e8HwcZjXQnm8OrcUl10WHw09SDWLOlnW+
iQIDAQAB
```

```
-----END PUBLIC KEY-----`, `priv': `-----BEGIN RSA PRIVATE KEY-----
```

```
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
```

```
... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==
```

```
-----END RSA PRIVATE KEY-----`}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.gen_keys` (*keydir=None, keyname=None, keysize=None, user=None*)

Generate minion RSA public keypair

`salt.wheel.key.gen_signature` (*priv, pub, signature_path, auto_create=False, keysize=None*)

Generate master public-key-signature

`salt.wheel.key.print` (*match*)

Return information about the key. Returns a dictionary.

match The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----
```

```
MIIBIjANBgkqhkiG9w0B ... TWugEQpPt
```

```
iQIDAQAB -----END PUBLIC KEY-----`}}
```

`salt.wheel.key.list` (*match*)

List all the keys under a named status. Returns a dictionary.

match The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.list_all` ()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.name_match(match)`

List all the keys based on a glob match

`salt.wheel.key.reject(match, include_accepted=False, include_denied=False)`

Reject keys based on a glob match. Returns a dictionary.

match The glob match of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.reject_dict(match, include_accepted=False, include_denied=False)`

Reject keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

14.19.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.connected()`

List all connected minions on a salt-master

14.19.6 salt.wheel.pillar_roots

The `pillar_roots` wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.find(path, saltenv='base')`

Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.list_env(saltenv='base')`

Return all of the file paths found in an environment

`salt.wheel.pillar_roots.list_roots()`

Return all of the files names in all available environments

`salt.wheel.pillar_roots.read(path, saltenv='base')`

Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

15.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's [*outputter system*](#) to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the [*state.event*](#) runner to utilize Salt's event bus from shell scripts.

Salt's [*netapi module*](#) provides access to Salt externally via a REST interface. Review the [*netapi module*](#) documentation for more information.

15.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the [*master*](#) or [*minion*](#) config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like [*LocalClient*](#).

```
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None,
                        cache_minion_id=False, ignore_config_errors=True, minion_id=None)
```

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the *Caller* class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

15.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the *mine*, *publish*, and *peer* execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the *Caller* class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False,
                      loaded_base_name=None, notify=False, static_modules=None, proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in `__context__`
- **utils** (*dict*) -- Utility functions which should be made available to Salt modules in `__utils__`. See *utils_dir* in `salt.config` for additional information about configuration.
- **whitelist** (*list*) -- A list of modules which should be whitelisted.
- **initial_load** (*bool*) -- Deprecated flag! Unused.
- **loaded_base_name** (*str*) -- A string marker for the loaded base name.
- **notify** (*bool*) -- Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

```
salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.states`(*opts, functions, utils, serializers, whitelist=None*)

Returns the state modules

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **functions** (*dict*) -- A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.grains`(*opts, force_refresh=False, proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have `__salt__` or `__proxy__` available. At proxy-minion startup, this function is called with the proxymodule `LazyLoader` object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.grain_funcs`(*opts, proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

15.1.3 Salt's Client Interfaces

LocalClient

```
class salt.client.LocalClient(c_path='/etc/salt/master', mopts=None, skip_perm_errors=False,
                             io_loop=None, keep_loop=False, auto_reconnect=False)
```

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute execution modules and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless `external_auth` is configured and authentication credentials are included in the execution).

Note: The `LocalClient` uses a Tornado `IOLoop`, this can create issues when using the `LocalClient` inside an existing `IOLoop`. If creating the `LocalClient` in partnership with another `IOLoop` either create the `IOLoop` before creating the `LocalClient`, or when creating the `IOLoop` use `ioloop.current()` which will return the `ioloop` created by `LocalClient`.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

cmd(*tgt*, *fun*, *arg*=(), *timeout*=None, *expr_form*='glob', *ret*='', *jid*='', *kwarg*=None, ***kwargs*)
Synchronously execute a command on targeted minions

The `cmd` method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
    'grains.items',
    'sys.doc',
    'cmd.run',
],
[
    [],
    [],
    ['uptime'],
])
```

Parameters

- **tgt** (*string or list*) -- Which minions to target for the execution. Default is shell glob. Modified by the `expr_form` option.
- **fun** (*string or list of strings*) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

Compound commands Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take arguments must still have a corresponding empty list at the expected index.

- **arg** (*list or list-of-lists*) -- A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except when executing a compound command.
- **timeout** -- Seconds to wait after the last minion returns but before all minions return.
- **expr_form** -- The type of `tgt`. Allowed values:
 - `glob` - Bash glob completion - Default
 - `pcre` - Perl style regular expression
 - `list` - Python list of hosts
 - `grain` - Match based on a grain comparison
 - `grain_pcre` - Grain comparison with a regex
 - `pillar` - Pillar data comparison
 - `pillar_pcre` - Pillar data comparison with a regex
 - `nodegroup` - Match on nodegroup
 - `range` - Use a Range server for matching
 - `compound` - Pass a compound match string
- **ret** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** -- A dictionary with keyword arguments for the function.
- **kwargs** -- Optional keyword arguments. Authentication credentials may be passed when using [external_auth](#).

For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev')`
 Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

Returns A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

cmd_async (*tgt, fun, arg=(), expr_form='glob', ret=',', jid=',', kwarg=None, **kwargs*)
 Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

Returns A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

cmd_batch (*tgt, fun, arg=(), expr_form='glob', ret=',', kwarg=None, batch='10%', **kwargs*)
 Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

Parameters batch -- The batch identifier of systems to execute on

Returns A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

cmd_iter(*tgt, fun, arg=(), timeout=None, expr_form='glob', ret='', kwarg=None, **kwargs*)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

Returns A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

cmd_iter_no_block(*tgt, fun, arg=(), timeout=None, expr_form='glob', ret='', kwarg=None, show_jid=False, verbose=False, **kwargs*)

Yields the individual minion returns as they come in, or `None` when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

Returns A generator yielding the individual minion returns, or `None` when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

cmd_subset(*tgt, fun, arg=(), expr_form='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, **kwargs*)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

Parameters `sub` -- The number of systems to execute on

```
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

get_cli_returns(*jid, minions, timeout=None, tgt='*', tgt_type='glob', verbose=False, show_jid=False, **kwargs*)

Starts a watcher looking at the return data for a specified JID

Returns all of the information for the JID

get_event_iter_returns(*jid, minions, timeout=None*)

Gather the return data from the event system, break hard when timeout is reached.

run_job(*tgt, fun, arg=(), expr_form='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, **kwargs*)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

Returns A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

Salt Caller

class `salt.client.Caller` (`c_path='/etc/salt/minion'`, `mopts=None`)

Caller is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

cmd (`fun`, `*args`, `**kwargs`)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
          data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

RunnerClient

class `salt.runner.RunnerClient` (`opts`)

The interface used by the **salt-run** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's `external_auth` can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (@runner). Only the `master_call()` below supports eauth.

async (*fun*, *low*, *user*='UNKNOWN', *pub*=None)

Execute the function in a multiprocess and return the event tag to use to watch for the return

cmd (*fun*, *arg*=None, *pub_data*=None, *kwarg*=None, *print_event*=True, *full_return*=False)

Execute a function

cmd_async (*low*)

Execute a runner function asynchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

cmd_sync (*low*, *timeout*=None)

Execute a runner function synchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

WheelClient

class `salt.wheel.WheelClient` (*opts*=None)

An interface to Salt's wheel modules

Wheel modules interact with various parts of the Salt Master.

Importing and using `WheelClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless `external_auth` is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

async (*fun*, *low*, *user*='UNKNOWN', *pub*=None)

Execute the function in a multiprocess and return the event tag to use to watch for the return

cmd (*fun*, *arg*=None, *pub_data*=None, *kwarg*=None, *print_event*=True, *full_return*=False)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

cmd_async (*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

cmd_sync (*low, timeout=None*)

Execute a wheel function synchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized to execute runner functions: (@wheel).

```
>>> wheel.cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

CloudClient

class salt.cloud.**CloudClient** (*path=None, opts=None, config_dir=None, pillars=None*)

The client class to wrap cloud interactions

action (*fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'})
)
```

create (*provider, names, **kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(names=['myinstance'], provider='my-ec2-config',
    kwargs={'image': 'ami-1624987f', 'size': 't1.micro',
        'ssh_username': 'ec2-user', 'securitygroup': 'default',
        'delvol_on_destroy': True})
```

destroy (*names*)

Destroy the named VMs

extra_action (*names, provider, action, **kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
                    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000}
)
client.extra_action(names=['salt-net'], action='network_create',
                    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'}
)
```

full_query (*query_type='list_nodes_full'*)

Query all instance information

list_images (*provider=None*)

List all available images in configured cloud systems

list_locations (*provider=None*)

List all available locations in configured cloud systems

list_sizes (*provider=None*)

List all available sizes in configured cloud systems

low (*fun, low*)

Pass the cloud function and low data structure to run

map_run (*path, **kwargs*)

Pass in a location for a map to execute

min_query (*query_type='list_nodes_min'*)

Query select instance information

profile (*profile, names, vm_overrides=None, **kwargs*)

Pass in a profile to create, names is a list of vm names to allocate

vm_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
              u'created_at': '2014-09-04T18:10:15Z',
              u'droplet': {'event_id': 31000502,
                           u'id': 2530006,
                           u'image_id': 5140006,
                           u'name': u'minion01',
                           u'size_id': 66},
              u'id': '2530006',
              u'image_id': '5140006',
              u'ip_address': '107.XXX.XXX.XXX',
              u'locked': 'True',
              u'name': 'minion01',
              u'private_ip_address': None,
              u'region_id': '4',
              u'size_id': '66',
              u'status': 'new'}}
```

query (*query_type='list_nodes'*)
Query basic instance information

select_query (*query_type='list_nodes_select'*)
Query select instance information

SSHClient

class `salt.client.ssh.client.SSHClient` (*c_path='/etc/salt/master', mopts=None*)
Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

cmd (*tgt, fun, arg=(), timeout=None, expr_form='glob', kwarg=None, **kwargs*)
Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

cmd_iter (*tgt, fun, arg=(), timeout=None, expr_form='glob', ret='', kwarg=None, **kwargs*)
Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

15.2 netapi modules

15.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **salt-api** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

See also:

The full list of netapi modules

15.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

class `salt.netapi.NetapiClient`(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

local(**args, **kwargs*)

Run execution modules synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

Returns Returns the result from the execution module

local_async(**args, **kwargs*)

Run execution modules asynchronously

Wraps `salt.client.LocalClient.run_job()`.

Returns job ID

local_batch(**args, **kwargs*)

Run execution modules against batches of minions

Wraps `salt.client.LocalClient.cmd_batch()`

Returns Returns the result from the execution module for each batch of returns

local_subset(**args, **kwargs*)

Run execution modules against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

runner(*fun, timeout=None, **kwargs*)

Run *runner* modules <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the runner module

runner_async(*fun, **kwargs*)

Run *runner* modules <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns event data and a job ID for the executed function.

ssh(**args, **kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

Returns Returns the result from the salt-ssh command

wheel(*fun, **kwargs*)

Run *wheel* modules synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the wheel module

wheel_async (*fun*, ***kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the wheel module

HTTP Modules

This tutorial demonstrates using the various HTTP modules available in Salt. These modules wrap the Python `tornado`, `urllib2`, and `requests` libraries, extending them in a manner that is more consistent with Salt workflows.

The `salt.utils.http` Library

This library forms the core of the HTTP modules. Since it is designed to be used from the minion as an execution module, in addition to the master as a runner, it was abstracted into this multi-use library. This library can also be imported by 3rd-party programs wishing to take advantage of its extended functionality.

Core functionality of the execution, state, and runner modules is derived from this library, so common usages between them are described here. Documentation specific to each module is described below.

This library can be imported with:

```
import salt.utils.http
```

Configuring Libraries

This library can make use of either `tornado`, which is required by Salt, `urllib2`, which ships with Python, or `requests`, which can be installed separately. By default, `tornado` will be used. In order to switch to `urllib2`, set the following variable:

```
backend: urllib2
```

In order to switch to `requests`, set the following variable:

```
backend: requests
```

This can be set in the master or minion configuration file, or passed as an option directly to any `http.query()` functions.

`salt.utils.http.query()`

This function forms a basic query, but with some add-ons not present in the `tornado`, `urllib2`, and `requests` libraries. Not all functionality currently available in these libraries has been added, but can be in future iterations.

HTTPS Request Methods

A basic query can be performed by calling this function with no more than a single URL:

```
salt.utils.http.query('http://example.com')
```

By default the query will be performed with a GET method. The method can be overridden with the `method` argument:

```
salt.utils.http.query('http://example.com/delete/url', 'DELETE')
```

When using the POST method (and others, such as PUT), extra data is usually sent as well. This data can be sent directly, in whatever format is required by the remote server (XML, JSON, plain text, etc).

```
salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    data=json.loads(mydict)
)
```

Data Formatting and Templating

Bear in mind that the data must be sent pre-formatted; this function will not format it for you. However, a templated file stored on the local system may be passed through, along with variables to populate it with. To pass through only the file (untemplated):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.xml'
)
```

To pass through a file that contains jinja + yaml templating (the default):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

To pass through a file that contains mako templating:

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.mako',
    data_render=True,
    data_renderer='mako',
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

Because this function uses Salt's own rendering system, any Salt renderer can be used. Because Salt's renderer requires `__opts__` to be set, an `opts` dictionary should be passed in. If it is not, then the default `__opts__`

values for the node type (master or minion) will be used. Because this library is intended primarily for use by minions, the default node type is `minion`. However, this can be changed to `master` if necessary.

```

salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    opts=__opts__
)

salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    node='master'
)

```

Headers

Headers may also be passed through, either as a `header_list`, a `header_dict`, or as a `header_file`. As with the `data_file`, the `header_file` may also be templated. Take note that because HTTP headers are normally syntactically-correct YAML, they will automatically be imported as an a Python dict.

```

salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    header_file='/srv/salt/headers.jinja',
    header_render=True,
    header_renderer='jinja',
    template_data={'key1': 'value1', 'key2': 'value2'}
)

```

Because much of the data that would be templated between headers and data may be the same, the `template_data` is the same for both. Correcting possible variable name collisions is up to the user.

Authentication

The `query()` function supports basic HTTP authentication. A username and password may be passed in as `username` and `password`, respectively.

```

salt.utils.http.query(
    'http://example.com',
    username='larry',
    password='5700g3543v4r',
)

```

Cookies and Sessions

Cookies are also supported, using Python's built-in `cookieclib`. However, they are turned off by default. To turn cookies on, set `cookies` to `True`.

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True  
)
```

By default cookies are stored in Salt's cache directory, normally `/var/cache/salt`, as a file called `cookies.txt`. However, this location may be changed with the `cookie_jar` argument:

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True,  
    cookie_jar='/path/to/cookie_jar.txt'  
)
```

By default, the format of the cookie jar is LWP (aka, lib-www-perl). This default was chosen because it is a human-readable text file. If desired, the format of the cookie jar can be set to Mozilla:

```
salt.utils.http.query(  
    'http://example.com',  
    cookies=True,  
    cookie_jar='/path/to/cookie_jar.txt',  
    cookie_format='mozilla'  
)
```

Because Salt commands are normally one-off commands that are piped together, this library cannot normally behave as a normal browser, with session cookies that persist across multiple HTTP requests. However, the session can be persisted in a separate cookie jar. The default filename for this file, inside Salt's cache directory, is `cookies.session.p`. This can also be changed.

```
salt.utils.http.query(  
    'http://example.com',  
    persist_session=True,  
    session_cookie_jar='/path/to/jar.p'  
)
```

The format of this file is `msgpack`, which is consistent with much of the rest of Salt's internal structure. Historically, the extension for this file is `.p`. There are no current plans to make this configurable.

Proxy

If the `tornado` backend is used (`tornado` is the default), proxy information configured in `proxy_host`, `proxy_port`, `proxy_username`, and `proxy_password` from the `__opts__` dictionary will be used. Normally these are set in the minion configuration file.

```
proxy_host: proxy.my-domain  
proxy_port: 31337  
proxy_username: charon  
proxy_password: obolus
```

```

salt.utils.http.query(
    'http://example.com',
    opts=__opts__,
    backend='tornado'
)

```

Return Data

Note: Return data encoding

If `decode` is set to `True`, `query()` will attempt to decode the return data. `decode_type` defaults to `auto`. Set it to a specific encoding, `xml`, for example, to override autodetection.

Because Salt's `http` library was designed to be used with REST interfaces, `query()` will attempt to decode the data received from the remote server when `decode` is set to `True`. First it will check the `Content-type` header to try and find references to XML. If it does not find any, it will look for references to JSON. If it does not find any, it will fall back to plain text, which will not be decoded.

JSON data is translated into a dict using Python's built-in `json` library. XML is translated using `salt.utils.xml_util`, which will use Python's built-in XML libraries to attempt to convert the XML into a dict. In order to force either JSON or XML decoding, the `decode_type` may be set:

```

salt.utils.http.query(
    'http://example.com',
    decode_type='xml'
)

```

Once translated, the return dict from `query()` will include a dict called `dict`.

If the data is not to be translated using one of these methods, decoding may be turned off.

```

salt.utils.http.query(
    'http://example.com',
    decode=False
)

```

If decoding is turned on, and references to JSON or XML cannot be found, then this module will default to plain text, and return the undecoded data as `text` (even if `text` is set to `False`; see below).

The `query()` function can return the HTTP status code, headers, and/or text as required. However, each must individually be turned on.

```

salt.utils.http.query(
    'http://example.com',
    status=True,
    headers=True,
    text=True
)

```

The return from these will be found in the return dict as `status`, `headers` and `text`, respectively.

Writing Return Data to Files

It is possible to write either the return data or headers to files, as soon as the response is received from the server, but specifying file locations via the `text_out` or `headers_out` arguments. `text` and `headers` do not need to be returned to the user in order to do this.

```
salt.utils.http.query(  
    'http://example.com',  
    text=False,  
    headers=False,  
    text_out='/path/to/url_download.txt',  
    headers_out='/path/to/headers_download.txt',  
)
```

SSL Verification

By default, this function will verify SSL certificates. However, for testing or debugging purposes, SSL verification can be turned off.

```
salt.utils.http.query(  
    'https://example.com',  
    verify_ssl=False,  
)
```

CA Bundles

The `requests` library has its own method of detecting which CA (certificate authority) bundle file to use. Usually this is implemented by the packager for the specific operating system distribution that you are using. However, `urllib2` requires a little more work under the hood. By default, Salt will try to auto-detect the location of this file. However, if it is not in an expected location, or a different path needs to be specified, it may be done so using the `ca_bundle` variable.

```
salt.utils.http.query(  
    'https://example.com',  
    ca_bundle='/path/to/ca_bundle.pem',  
)
```

The `update_ca_bundle()` function can be used to update the bundle file at a specified location. If the target location is not specified, then it will attempt to auto-detect the location of the bundle file. If the URL to download the bundle from does not exist, a bundle will be downloaded from the cURL website.

CAUTION: The `target` and the `source` should always be specified! Failure to specify the `target` may result in the file being written to the wrong location on the local system. Failure to specify the `source` may cause the upstream URL to receive excess unnecessary traffic, and may cause a file to be download which is hazardous or does not meet the needs of the user.

```
salt.utils.http.update_ca_bundle(  
    target='/path/to/ca-bundle.crt',  
    source='https://example.com/path/to/ca-bundle.crt',  
    opts=__opts__,  
)
```

The `opts` parameter should also always be specified. If it is, then the `target` and the `source` may be specified in the relevant configuration file (master or minion) as `ca_bundle` and `ca_bundle_url`, respectively.

```
ca_bundle: /path/to/ca-bundle.crt
ca_bundle_url: https://example.com/path/to/ca-bundle.crt
```

If Salt is unable to auto-detect the location of the CA bundle, it will raise an error.

The `update_ca_bundle()` function can also be passed a string or a list of strings which represent files on the local system, which should be appended (in the specified order) to the end of the CA bundle file. This is useful in environments where private certs need to be made available, and are not otherwise reasonable to add to the bundle file.

```
salt.utils.http.update_ca_bundle(
    opts=__opts__,
    merge_files=[
        '/etc/ssl/private_cert_1.pem',
        '/etc/ssl/private_cert_2.pem',
        '/etc/ssl/private_cert_3.pem',
    ]
)
```

Test Mode

This function may be run in test mode. This mode will perform all work up until the actual HTTP request. By default, instead of performing the request, an empty dict will be returned. Using this function with TRACE logging turned on will reveal the contents of the headers and POST data to be sent.

Rather than returning an empty dict, an alternate `test_url` may be passed in. If this is detected, then test mode will replace the `url` with the `test_url`, set `test` to `True` in the return data, and perform the rest of the requested operations as usual. This allows a custom, non-destructive URL to be used for testing when necessary.

Execution Module

The `http` execution module is a very thin wrapper around the `salt.utils.http` library. The `opts` can be passed through as well, but if they are not specified, the minion defaults will be used as necessary.

Because passing complete data structures from the command line can be tricky at best and dangerous (in terms of execution injection attacks) at worse, the `data_file`, and `header_file` are likely to see more use here.

All methods for the library are available in the execution module, as kwargs.

```
salt myminion http.query http://example.com/restapi method=POST \
    username='larry' password='5700g3543v4r' headers=True text=True \
    status=True decode_type=xml data_render=True \
    header_file=/tmp/headers.txt data_file=/tmp/data.txt \
    header_render=True cookies=True persist_session=True
```

Runner Module

Like the execution module, the `http` runner module is a very thin wrapper around the `salt.utils.http` library. The only significant difference is that because runners execute on the master instead of a minion, a target is not required, and default `opts` will be derived from the master config, rather than the minion config.

All methods for the library are available in the runner module, as kwargs.

```
salt-run http.query http://example.com/restapi method=POST \
  username='larry' password='5700g3543v4r' headers=True text=True \
  status=True decode_type=xml data_renderer=True \
  header_file=/tmp/headers.txt data_file=/tmp/data.txt \
  header_renderer=True cookies=True persist_session=True
```

State Module

The state module is a wrapper around the runner module, which applies stateful logic to a query. All kwargs as listed above are specified as usual in state files, but two more kwargs are available to apply stateful logic. A required parameter is `match`, which specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text. In Python terms this looks like:

```
if match in html_text:
    return True
```

If more complex pattern matching is required, a regular expression can be used by specifying a `match_type`. By default this is set to `string`, but it can be manually set to `pcre` instead. Please note that despite the name, this will use Python's `re.search()` rather than `re.match()`.

Therefore, the following states are valid:

```
http://example.com/restapi:
  http.query:
    - match: 'SUCCESS'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_renderer: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_renderer: True
    - cookies: True
    - persist_session: True

http://example.com/restapi:
  http.query:
    - match_type: pcre
    - match: '(?i)succe[ss|ed]'
    - username: 'larry'
    - password: '5700g3543v4r'
    - data_renderer: True
    - header_file: /tmp/headers.txt
    - data_file: /tmp/data.txt
    - header_renderer: True
    - cookies: True
    - persist_session: True
```

In addition to, or instead of a match pattern, the status code for a URL can be checked. This is done using the `status` argument:

```
http://example.com/:
  http.query:
    - status: '200'
```

If both are specified, both will be checked, but if only one is `True` and the other is `False`, then `False` will be returned. In this case, the comments in the return data will contain information for troubleshooting.

Because this is a monitoring state, it will return extra data to code that expects it. This data will always include `text` and `status`. Optionally, `headers` and `dict` may also be requested by setting the `headers` and `decode` arguments to `True`, respectively.

Writing netapi modules

`netapi` modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

The full list of netapi modules

Configuration

All `netapi` configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherry.py:
  port: 8000
  debug: True
  ssl_cert: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

The __virtual__ function

Like all module types in Salt, `netapi` modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

The start function

The `start()` function will be called for each `netapi` module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

`rest_cherry.py` and `rest_tornado` support running multiple instances by copying and renaming entire directory of those. To start the copied multiple `netapi` modules, add configuration blocks for the copied `netapi` modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied `netapi` module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your `netapi` module.

Loader “magic” methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

Architecture

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

16.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in Configuration file examples.

16.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are ``hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of *file_roots* and *pillar_roots* need to be kept in sync with processes external to Salt as well

A tutorial on setting up multimaster with ``hot" masters is here:

[Multimaster Tutorial](#)

16.1.2 Multimaster with Failover

Changing the *master_type* parameter from *str* to *failover* will cause minions to connect to the first responding master in the list of masters. Every *master_alive_interval* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *master_alive_interval* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in [this tutorial](#)

`master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

16.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in [Salt Syndic](#).

16.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in [Salt Syndic](#).

16.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

16.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1 # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
# on the Syndic node
id: my_syndic
```

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

Note: Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

16.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

16.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.ping
minion_1:
  True
minion_2:
  True
minion_4:
  True
minion_3:
  True
```

16.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

16.2.5 Syndic wait

Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

16.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node `ret_port`
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

16.3 Using Salt at scale

The focus of this tutorial will be building a Salt infrastructure for handling large numbers of minions. This will include tuning, topology, and best practices.

For how to install the Salt Master please go here: [Installing saltstack](#)

Note: This tutorial is intended for large installations, although these same settings won't hurt, it may not be worth the complexity to smaller installations.

When used with minions, the term 'many' refers to at least a thousand and 'a few' always means 500.

For simplicity reasons, this tutorial will default to the standard ports used by Salt.

16.3.1 The Master

The most common problems on the Salt Master are:

1. too many minions authenticating at once
2. too many minions re-authenticating at once
3. too many minions re-connecting at once
4. too many minions returning at once
5. too few resources (CPU/HDD)

The first three are all ``thundering herd" problems. To mitigate these issues we must configure the minions to back-off appropriately when the Master is under heavy load.

The fourth is caused by masters with little hardware resources in combination with a possible bug in ZeroMQ. At least that's what it looks like till today ([Issue 118651](#), [Issue 5948](#), [Mail thread](#))

To fully understand each problem, it is important to understand, how Salt works.

Very briefly, the Salt Master offers two services to the minions.

- a job publisher on port 4505
- an open port 4506 to receive the minions returns

All minions are always connected to the publisher on port 4505 and only connect to the open return port 4506 if necessary. On an idle Master, there will only be connections on port 4505.

Too many minions authing

When the Minion service is first started up, it will connect to its Master's publisher on port 4505. If too many minions are started at once, this can cause a ``thundering herd". This can be avoided by not starting too many minions at once.

The connection itself usually isn't the culprit, the more likely cause of master-side issues is the authentication that the Minion must do with the Master. If the Master is too heavily loaded to handle the auth request it will time it out. The Minion will then wait `acceptance_wait_time` to retry. If `acceptance_wait_time_max` is set then the Minion will increase its wait time by the `acceptance_wait_time` each subsequent retry until reaching `acceptance_wait_time_max`.

Too many minions re-authing

This is most likely to happen in the testing phase of a Salt deployment, when all Minion keys have already been accepted, but the framework is being tested and parameters are frequently changed in the Salt Master's configuration file(s).

The Salt Master generates a new AES key to encrypt its publications at certain events such as a Master restart or the removal of a Minion key. If you are encountering this problem of too many minions re-authing against the Master, you will need to recalibrate your setup to reduce the rate of events like a Master restart or Minion key removal (`salt-key -d`).

When the Master generates a new AES key, the minions aren't notified of this but will discover it on the next pub job they receive. When the Minion receives such a job it will then re-auth with the Master. Since Salt does minion-side filtering this means that all the minions will re-auth on the next command published on the master-- causing another ``thundering herd". This can be avoided by setting the

```
random_reauth_delay: 60
```

in the minions configuration file to a higher value and stagger the amount of re-auth attempts. Increasing this value will of course increase the time it takes until all minions are reachable via Salt commands.

Too many minions re-connecting

By default the zmq socket will re-connect every 100ms which for some larger installations may be too quick. This will control how quickly the TCP session is re-established, but has no bearing on the auth load.

To tune the minions sockets reconnect attempts, there are a few values in the sample configuration file (default values)

```
recon_default: 1000
recon_max: 5000
recon_randomize: True
```

- `recon_default`: the default value the socket should use, i.e. 1000. This value is in milliseconds. (1000ms = 1 second)
- `recon_max`: the max value that the socket should use as a delay before trying to reconnect This value is in milliseconds. (5000ms = 5 seconds)
- `recon_randomize`: enables randomization between `recon_default` and `recon_max`

To tune this values to an existing environment, a few decision have to be made.

1. How long can one wait, before the minions should be online and reachable via Salt?
2. How many reconnects can the Master handle without a syn flood?

These questions can not be answered generally. Their answers depend on the hardware and the administrators requirements.

Here is an example scenario with the goal, to have all minions reconnect within a 60 second time-frame on a Salt Master service restart.

```
recon_default: 1000
recon_max: 59000
recon_randomize: True
```

Each Minion will have a randomized reconnect value between ``recon_default'` and ``recon_default + recon_max'`, which in this example means between 1000ms and 60000ms (or between 1 and 60 seconds). The generated random-value will be doubled after each attempt to reconnect (ZeroMQ default behavior).

Lets say the generated random value is 11 seconds (or 11000ms).

```
reconnect 1: wait 11 seconds
reconnect 2: wait 22 seconds
reconnect 3: wait 33 seconds
reconnect 4: wait 44 seconds
reconnect 5: wait 55 seconds
reconnect 6: wait time is bigger than 60 seconds (recon_default + recon_max)
reconnect 7: wait 11 seconds
reconnect 8: wait 22 seconds
reconnect 9: wait 33 seconds
reconnect x: etc.
```

With a thousand minions this will mean

```
1000/60 = ~16
```

round about 16 connection attempts a second. These values should be altered to values that match your environment. Keep in mind though, that it may grow over time and that more minions might raise the problem again.

Too many minions returning at once

This can also happen during the testing phase, if all minions are addressed at once with

```
$ salt * disk.usage
```

it may cause thousands of minions trying to return their data to the Salt Master open port 4506. Also causing a flood of syn-flood if the Master can't handle that many returns at once.

This can be easily avoided with Salt's batch mode:

```
$ salt * disk.usage -b 50
```

This will only address 50 minions at once while looping through all addressed minions.

16.3.2 Too few resources

The masters resources always have to match the environment. There is no way to give good advise without knowing the environment the Master is supposed to run in. But here are some general tuning tips for different situations:

The Master is CPU bound

Salt uses RSA-Key-Pairs on the masters and minions end. Both generate 4096 bit key-pairs on first start. While the key-size for the Master is currently not configurable, the minions keysize can be configured with different key-sizes. For example with a 2048 bit key:

```
keysize: 2048
```

With thousands of decryptions, the amount of time that can be saved on the masters end should not be neglected. See here for reference: [Pull Request 9235](#) how much influence the key-size can have.

Downsizing the Salt Master's key is not that important, because the minions do not encrypt as many messages as the Master does.

In installations with large or with complex pillar files, it is possible for the master to exhibit poor performance as a result of having to render many pillar files at once. This exhibit itself in a number of ways, both as high load on the master and on minions which block on waiting for their pillar to be delivered to them.

To reduce pillar rendering times, it is possible to cache pillars on the master. To do this, see the set of master configuration options which are prefixed with *pillar_cache*.

Note: Caching pillars on the master may introduce security considerations. Be certain to read caveats outlined in the master configuration file to understand how pillar caching may affect a master's ability to protect sensitive data!

The Master is disk IO bound

By default, the Master saves every Minion's return for every job in its job-cache. The cache can then be used later, to lookup results for previous jobs. The default directory for this is:

```
cachedir: /var/cache/salt
```

and then in the `/proc` directory.

Each job return for every Minion is saved in a single file. Over time this directory can grow quite large, depending on the number of published jobs. The amount of files and directories will scale with the number of jobs published and the retention time defined by

```
keep_jobs: 24
```

```
250 jobs/day * 2000 minions returns = 500,000 files a day
```

If no job history is needed, the job cache can be disabled:

```
job_cache: False
```

If the job cache is necessary there are (currently) 2 options:

- `ext_job_cache`: this will have the minions store their return data directly into a returner (not sent through the Master)
- `master_job_cache` (New in 2014.7.0): this will make the Master store the job data using a returner (instead of the local job cache on disk).

If a master has many accepted keys, it may take a long time to publish a job because the master must first determine the matching minions and deliver that information back to the waiting client before the job can be published.

To mitigate this, a key cache may be enabled. This will reduce the load on the master to a single file open instead of thousands or tens of thousands.

This cache is updated by the maintenance process, however, which means that minions with keys that are accepted may not be targeted by the master for up to sixty seconds by default.

To enable the master key cache, set `key_cache: `sched`` in the master configuration file.

16.4 Multi Master Tutorial

As of Salt 0.16.0, the ability to connect minions to multiple masters has been made available. The multi-master system allows for redundancy of Salt masters and facilitates multiple points of communication out to minions. When using a multi-master setup, all masters are running hot, and any active master can be used to send commands out to the minions.

Note: If you need failover capabilities with multiple masters, there is also a MultiMaster-PKI setup available, that uses a different topology [MultiMaster-PKI with Failover Tutorial](#)

In 0.16.0, the masters do not share any information, keys need to be accepted on both masters, and shared files need to be shared manually or use tools like the git fileserver backend to ensure that the `file_roots` are kept consistent.

16.4.1 Summary of Steps

1. Create a redundant master server
2. Copy primary master key to redundant master
3. Start redundant master
4. Configure minions to connect to redundant master
5. Restart minions
6. Accept keys on redundant master

16.4.2 Prepping a Redundant Master

The first task is to prepare the redundant master. If the redundant master is already running, stop it. There is only one requirement when preparing a redundant master, which is that masters share the same private key. When the first master was created, the master's identifying key pair was generated and placed in the master's `pki_dir`. The default location of the master's key pair is `/etc/salt/pki/master/`. Take the private key, `master.pem`, and copy it to the same location on the redundant master. Do the same for the master's public key, `master.pub`. Assuming that no minions have yet been connected to the new redundant master, it is safe to delete any existing key in this location and replace it.

Note: There is no logical limit to the number of redundant masters that can be used.

Once the new key is in place, the redundant master can be safely started.

16.4.3 Configure Minions

Since minions need to be master-aware, the new master needs to be added to the minion configurations. Simply update the minion configurations to list all connected masters:

```
master:
- saltmaster1.example.com
- saltmaster2.example.com
```

Now the minion can be safely restarted.

Note: If the `ipc_mode` for the minion is set to TCP (default in Windows), then each minion in the multi-minion setup (one per master) needs its own `tcp_pub_port` and `tcp_pull_port`.

If these settings are left as the default 4510/4511, each minion object will receive a port 2 higher than the previous. Thus the first minion will get 4510/4511, the second will get 4512/4513, and so on. If these port decisions are unacceptable, you must configure `tcp_pub_port` and `tcp_pull_port` with lists of ports for each master. The length of these lists should match the number of masters, and there should not be overlap in the lists.

Now the minions will check into the original master and also check into the new redundant master. Both masters are first-class and have rights to the minions.

Note: Minions can automatically detect failed masters and attempt to reconnect to them quickly. To enable this functionality, set `master_alive_interval` in the minion config and specify a number of seconds to poll the masters for connection status.

If this option is not set, minions will still reconnect to failed masters but the first command sent after a master comes back up may be lost while the minion authenticates.

16.4.4 Sharing Files Between Masters

Salt does not automatically share files between multiple masters. A number of files should be shared or sharing of these files should be strongly considered.

Minion Keys

Minion keys can be accepted the normal way using `salt-key` on both masters. Keys accepted, deleted, or rejected on one master will NOT be automatically managed on redundant masters; this needs to be taken care of by running `salt-key` on both masters or sharing the `/etc/salt/pki/master/{minions,minions_pre,minions_rejected}` directories between masters.

Note: While sharing the `/etc/salt/pki/master` directory will work, it is strongly discouraged, since allowing access to the `master.pem` key outside of Salt creates a *SERIOUS* security risk.

File_Roots

The `file_roots` contents should be kept consistent between masters. Otherwise state runs will not always be consistent on minions since instructions managed by one master will not agree with other masters.

The recommended way to sync these is to use a fileserver backend like `gitfs` or to keep these files on shared storage.

Important: If using `gitfs/git_pillar` with the `cachedir` shared between masters using `GlusterFS`, `nfs`, or another network filesystem, and the masters are running Salt 2015.5.9 or later, it is strongly recommended not to turn off `gitfs_global_lock/git_pillar_global_lock` as doing so will cause lock files to be removed if they were created by a different master.

Pillar_Roots

Pillar roots should be given the same considerations as `file_roots`.

Master Configurations

While reasons may exist to maintain separate master configurations, it is wise to remember that each master maintains independent control over minions. Therefore, access controls should be in sync between masters unless a valid reason otherwise exists to keep them inconsistent.

These access control options include but are not limited to:

- `external_auth`
- `publisher_acl`
- `peer`
- `peer_run`

16.5 Multi-Master-PKI Tutorial With Failover

This tutorial will explain, how to run a salt-environment where a single minion can have multiple masters and fail-over between them if its current master fails.

The individual steps are

- setup the master(s) to sign its auth-replies

- setup minion(s) to verify master-public-keys
- enable multiple masters on minion(s)
- enable master-check on minion(s)

Please note, that it is advised to have good knowledge of the salt- authentication and communication-process to understand this tutorial. All of the settings described here, go on top of the default authentication/communication process.

16.5.1 Motivation

The default behaviour of a salt-minion is to connect to a master and accept the masters public key. With each publication, the master sends his public-key for the minion to check and if this public-key ever changes, the minion complains and exits. Practically this means, that there can only be a single master at any given time.

Would it not be much nicer, if the minion could have any number of masters (1:n) and jump to the next master if its current master died because of a network or hardware failure?

Note: There is also a MultiMaster-Tutorial with a different approach and topology than this one, that might also suite your needs or might even be better suited [Multi-Master Tutorial](#)

It is also desirable, to add some sort of authenticity-check to the very first public key a minion receives from a master. Currently a minions takes the first masters public key for granted.

16.5.2 The Goal

Setup the master to sign the public key it sends to the minions and enable the minions to verify this signature for authenticity.

16.5.3 Prepping the master to sign its public key

For signing to work, both master and minion must have the signing and/or verification settings enabled. If the master signs the public key but the minion does not verify it, the minion will complain and exit. The same happens, when the master does not sign but the minion tries to verify.

The easiest way to have the master sign its public key is to set

```
master_sign_pubkey: True
```

After restarting the salt-master service, the master will automatically generate a new key-pair

```
master_sign.pem
master_sign.pub
```

A custom name can be set for the signing key-pair by setting

```
master_sign_key_name: <name_without_suffix>
```

The master will then generate that key-pair upon restart and use it for creating the public keys signature attached to the auth-reply.

The computation is done for every auth-request of a minion. If many minions auth very often, it is advised to use `conf_master:master_pubkey_signature` and `conf_master:master_use_pubkey_signature` settings described below.

If multiple masters are in use and should sign their auth-replies, the signing key-pair `master_sign.*` has to be copied to each master. Otherwise a minion will fail to verify the masters public when connecting to a different master than it did initially. That is because the public keys signature was created with a different signing key-pair.

16.5.4 Prepping the minion to verify received public keys

The minion must have the public key (and only that one!) available to be able to verify a signature it receives. That public key (defaults to `master_sign.pub`) must be copied from the master to the minions pki-directory.

```
/etc/salt/pki/minion/master_sign.pub
```

```
DO NOT COPY THE master_sign.pem FILE. IT MUST STAY ON THE MASTER AND ONLY THERE!
```

When that is done, enable the signature checking in the minions configuration

```
verify_master_pubkey_sign: True
```

and restart the minion. For the first try, the minion should be run in manual debug mode.

```
salt-minion -l debug
```

Upon connecting to the master, the following lines should appear on the output:

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
→public key master_sign.pub
[INFO ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

If the signature verification fails, something went wrong and it will look like this

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Failed to verify signature of public key
[CRITICAL] The Salt Master server's public key did not authenticate!
```

In a case like this, it should be checked, that the verification pubkey (`master_sign.pub`) on the minion is the same as the one on the master.

Once the verification is successful, the minion can be started in daemon mode again.

For the paranoid among us, its also possible to verify the publication whenever it is received from the master. That is, for every single auth-attempt which can be quite frequent. For example just the start of the minion will force the signature to be checked 6 times for various things like auth, mine, *highstate*, etc.

If that is desired, enable the setting

```
always_verify_signature: True
```

16.5.5 Multiple Masters For A Minion

Configuring multiple masters on a minion is done by specifying two settings:

- a list of masters addresses
- what type of master is defined

```
master:  
  - 172.16.0.10  
  - 172.16.0.11  
  - 172.16.0.12
```

```
master_type: failover
```

This tells the minion that all the master above are available for it to connect to. When started with this configuration, it will try the master in the order they are defined. To randomize that order, set

```
master_shuffle: True
```

The master-list will then be shuffled before the first connection attempt.

The first master that accepts the minion, is used by the minion. If the master does not yet know the minion, that counts as accepted and the minion stays on that master.

For the minion to be able to detect if its still connected to its current master enable the check for it

```
master_alive_interval: <seconds>
```

If the loss of the connection is detected, the minion will temporarily remove the failed master from the list and try one of the other masters defined (again shuffled if that is enabled).

16.5.6 Testing the setup

At least two running masters are needed to test the failover setup.

Both masters should be running and the minion should be running on the command line in debug mode

```
salt-minion -l debug
```

The minion will connect to the first master from its master list

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10  
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem  
[DEBUG ] salt.crypt.verify_signature: Loading public key  
[DEBUG ] salt.crypt.verify_signature: Verifying signature  
[DEBUG ] Successfully verified signature of master public key with verification  
→public key master_sign.pub  
[INFO ] Received signed and verified master pubkey from master 172.16.0.10  
[DEBUG ] Decrypting the current master AES key
```

A test.ping on the master the minion is currently connected to should be run to test connectivity.

If successful, that master should be turned off. A firewall-rule denying the minions packets will also do the trick.

Depending on the configured `conf_minion:master_alive_interval`, the minion will notice the loss of the connection and log it to its logfile.

```
[INFO ] Connection to master 172.16.0.10 lost
[INFO ] Trying to tune in to next master from master-list
```

The minion will then remove the current master from the list and try connecting to the next master

```
[INFO ] Removing possibly failed master 172.16.0.10 from list of masters
[WARNING ] Master ip address changed from 172.16.0.10 to 172.16.0.11
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.11
```

If everything is configured correctly, the new masters public key will be verified successfully

```
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
->public key master_sign.pub
```

the authentication with the new master is successful

```
[INFO ] Received signed and verified master pubkey from master 172.16.0.11
[DEBUG ] Decrypting the current master AES key
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[INFO ] Authentication with master successful!
```

and the minion can be pinged again from its new master.

16.5.7 Performance Tuning

With the setup described above, the master computes a signature for every auth-request of a minion. With many minions and many auth-requests, that can chew up quite a bit of CPU-Power.

To avoid that, the master can use a pre-created signature of its public-key. The signature is saved as a base64 encoded string which the master reads once when starting and attaches only that string to auth-replies.

Enabling this also gives paranoid users the possibility, to have the signing key-pair on a different system than the actual salt-master and create the public keys signature there. Probably on a system with more restrictive firewall rules, without internet access, less users, etc.

That signature can be created with

```
salt-key --gen-signature
```

This will create a default signature file in the master pki-directory

```
/etc/salt/pki/master/master_pubkey_signature
```

It is a simple text-file with the binary-signature converted to base64.

If no signing-pair is present yet, this will auto-create the signing pair and the signature file in one call

```
salt-key --gen-signature --auto-create
```

Telling the master to use the pre-created signature is done with

```
master_use_pubkey_signature: True
```

That requires the file `master_pubkey_signature` to be present in the masters pki-directory with the correct signature.

If the signature file is named differently, its name can be set with

```
master_pubkey_signature: <filename>
```

With many masters and many public-keys (default and signing), it is advised to use the salt-masters hostname for the signature-files name. Signatures can be easily confused because they do not provide any information about the key the signature was created from.

Verifying that everything works is done the same way as above.

16.5.8 How the signing and verification works

The default key-pair of the salt-master is

```
/etc/salt/pki/master/master.pem  
/etc/salt/pki/master/master.pub
```

To be able to create a signature of a message (in this case a public-key), another key-pair has to be added to the setup. Its default name is:

```
master_sign.pem  
master_sign.pub
```

The combination of the master.* and master_sign.* key-pairs give the possibility of generating signatures. The signature of a given message is unique and can be verified, if the public-key of the signing-key-pair is available to the recipient (the minion).

The signature of the masters public-key in master.pub is computed with

```
master_sign.pem  
master.pub  
M2Crypto.EVP.sign_update()
```

This results in a binary signature which is converted to base64 and attached to the auth-reply send to the minion.

With the signing-pairs public-key available to the minion, the attached signature can be verified with

```
master_sign.pub  
master.pub  
M2Crypto.EVP.verify_update().
```

When running multiple masters, either the signing key-pair has to be present on all of them, or the master_pubkey_signature has to be pre-computed for each master individually (because they all have different public-keys).

DO NOT PUT THE SAME master.pub ON ALL MASTERS FOR EASE OF USE.

Windows

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

17.1 Windows Software Repository

Note: In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.install` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

17.1.1 Configuration

Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```

Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

17.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.available_version firefox
{'firefox': {'15.0.1': 'Mozilla Firefox 15.0.1 (x86 en-US)',
             '16.0.2': 'Mozilla Firefox 16.0.2 (x86 en-US)',
             '17.0.1': 'Mozilla Firefox 17.0.1 (x86 en-US)'}}
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

17.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```

Note: `pkg.purge` just executes `pkg.remove` on Windows. At some point in the future `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

17.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: <https://github.com/saltstack/salt-winrepo-ng>
- Earlier releases: <https://github.com/saltstack/salt-winrepo>

By default, these repositories are mirrored to `/srv/salt/win/repo_ng` and `/srv/salt/win/repo`.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

17.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: [salt-winrepo](#) [salt-winrepo-ng](#)

Note: The newer software definition files are run through the salt's parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

Important: `winrepo_remotes` was called `win_git_repos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (`salt-winrepo`) and new minions (`salt-winrepo-ng`). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

Important: If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the msgpack file.

The next step (if you have older minions) is to create the msgpack file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

Note: If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

On older minions (older than 2015.8.0) this will copy the `winrepo.p` file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (`.sls`) down to the minion and then create the msgpack file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

Important: Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

Note: If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the msgpack file to be created successfully.

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotest` set the following in the master config file:

```
winrepo_remotest: []
```

17.1.6 Creating a Package Definition SLS File

The package definition file is a yaml file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
    full_name: Mozilla Firefox 17.0.1 (x86 en-US)
    locale: en_US
    reboot: False
```

```

install_flags: '-ms'
uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
uninstall_flags: '/S'
'16.0.2':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
  full_name: Mozilla Firefox 16.0.2 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'
'15.0.1':
  installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
  full_name: Mozilla Firefox 15.0.1 (x86 en-US)
  locale: en_US
  reboot: False
  install_flags: '-ms'
  uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
  uninstall_flags: '/S'

```

Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

Warning: The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

Warning: The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

Note: There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome. (<https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi>) When a new version is released, the url just points to the new version. To handle situations such as these, set the version to `latest`. Salt will install the version of Chrome at the URL and report that version. Here's an example:

```

chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    locale: en_US
    reboot: False

```

Available parameters are as follows:

param str full_name The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
-----
7-Zip 9.20 (x64 edition):
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.8.76
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository the `full_name` will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```
test-2008:
-----
7zip:
  9.20.00.0

```

Important: The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the

status can be verified when running `highstate`.

Note: It is still possible to successfully install packages using `pkg.install` even if they don't match. This can make troubleshooting difficult so be careful.

param str installer The path to the `.exe` or `.msi` to use to install the package. This can be a path or a URL. If it is a URL or a salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

param str install_flags Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the installer is waiting for user input so these are important.

param str uninstaller The path to the program used to uninstall this software. This can be the path to the same `exe` or `msi` used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- `Software\Microsoft\Windows\CurrentVersion\Uninstall`
- `Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall`

param str uninstall_flags Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

Salt will not return if the uninstaller is waiting for user input so these are important.

Here are some examples of installer and uninstaller settings:

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
    uninstall_flags: '/qn /norestart'
```

Alternatively the `uninstaller` can also simply repeat the URL of the `msi` file.

```
7zip:
  '9.20.00.0':
    installer: salt://win/repo/7zip/7z920-x64.msi
    full_name: 7-Zip 9.20 (x64 edition)
    reboot: False
    install_flags: '/qn /norestart'
    msiexec: True
    uninstaller: salt://win/repo/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
```

param bool msiexec This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations.

param bool allusers This parameter is specific to *.msi* installations. It tells *msiexec* to install the software for all users. The default is True.

param bool cache_dir If true, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

Note: Only applies to salt: installer URLs.

Here's an example for a software package that has dependent files:

```
sqlexpress:
  '12.0.2000.8':
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

param bool use_scheduler If true, windows will use the task scheduler to run the installation. This is useful for running the salt installation itself as the installation process kills any currently running instances of salt.

param str source_hash This tells salt to compare a hash sum of the installer

to the provided hash sum before execution. The value can be formatted as `hash_algorithm=hash_sum`, or it can be a URI to a file containing the hash sum. For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example of `source_hash` usage:

```
messageanalyzer:
  '4.0.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

param bool reboot Not implemented

param str local Not implemented

Examples can be found at <https://github.com/saltstack/salt-winrepo-ng>

17.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an *execution module* exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

Custom Location for Repository SLS Files

If *file_roots* has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The *winrepo.genrepo* function from the *winrepo* execution module will by default look for the filename specified by *winrepo_cache_file* within `C:\salt\srv\salt\win\repo`.

If the *file_roots* parameter has been modified, then *winrepo_dir* must be modified to fall within that path, at the proper relative path. For example, if the base environment in *file_roots* points to `D:\foo`, and *winrepo_source_dir* is `salt://win/repo`, then *winrepo_dir* must be set to `D:\foo\win\repo` to ensure that *winrepo.genrepo* puts the cache file into right location.

17.1.8 Config Options for Minions 2015.8.0 and Later

The *winrepo_source_dir* config parameter (default: `salt://win/repo`) controls where *pkg.refresh_db* looks for the cache file (default: `winrepo.p`). This means that the default location for the winrepo cache file would be `salt://win/repo/winrepo.p`. Both *winrepo_source_dir* and *winrepo_cache_file* can be adjusted to match the actual location of this file on the Salt files server.

17.1.9 Config Options for Minions Before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cache file (the file generated by the *winrepo.genrepo runner*) at `salt://win/repo/winrepo.p`. If the cache file is in a different path on the salt files server, then *win_repo_cache_file* will need to be updated to reflect the proper location.

17.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

On the master, the *winrepo.update_git_repos* runner has been updated to use either *pygit2* or *GitPython* to checkout the git repositories containing repo data. If *pygit2* or *GitPython* is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running *winrepo.update_git_repos*.

If neither *GitPython* nor *pygit2* are installed, then Salt will fall back to the pre-existing behavior for *winrepo.update_git_repos*, and a warning will be logged in the master log.

Note: Standalone Windows minions do not support the new *GitPython/pygit2* functionality, and will instead use the *git.latest* state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

Config Parameters Renamed

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

Master Config

Old Name	New Name
win_repo	<i>winrepo_dir</i>
win_repo_mastercachefile	<i>winrepo_cachefile</i>
win_gitrepos	<i>winrepo_remotes</i>

Note: *winrepo_cachefile* is no longer used by 2015.8.0 and later minions, and the *winrepo_dir* setting is replaced by *winrepo_dir_ng* for 2015.8.0 and later minions.

See [here](#) for detailed information on all master config options for the Windows Repo.

Minion Config

Old Name	New Name
win_repo	<i>winrepo_dir</i>
win_repo_cachefile	<i>winrepo_cachefile</i>
win_gitrepos	<i>winrepo_remotes</i>

See [here](#) for detailed information on all minion config options for the Windows Repo.

pygit2/GitPython Support for Maintaining Git Repos

The *winrepo.update_git_repos* runner (and the corresponding *remote execution function* for standalone minions) now makes use of the same underlying code used by the *Git Fileserver Backend* and *Git External Pillar* to maintain and update its local clones of git repositories. If a compatible version of either *pygit2* (0.20.3 and later) or *GitPython* (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the *git.latest* state).

Note: If compatible versions of both *pygit2* and *GitPython* are installed, then Salt will prefer *pygit2*, to override this behavior use the *winrepo_provider* configuration parameter:

```
winrepo_provider: gitpython
```

The *winrepo execution module* (discussed above in the *Managing Windows Software on a Standalone Windows Minion* section) does not yet officially support the new *pygit2/GitPython* functionality, but if either *pygit2* or *GitPython* is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run *winrepo.update_git_repos* to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (**NOTE: pygit2 only**), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:  
- https://github.com/saltstack/salt-winrepo.git  
- git@github.com:myuser/myrepo.git:
```

- pubkey: /path/to/key.pub
- privkey: /path/to/key
- passphrase: myaw3s0m3pa\$\$phr4\$3
- https://github.com/myuser/privaterepo.git:
 - user: mygithubuser
 - password: CorrectHorseBatteryStaple

Note: Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using `pygit2/GitPython`. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git
- https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git:
  - name: baz_junior
- https://github.com/foobar/baz:
  - name: baz_the_third
```

17.1.11 Troubleshooting

Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi windows installer provider" to have full list of installed packages. If you don't have this, salt-minion can't report some installed software.

How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

17.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

17.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a `primary group` property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the `primary group` property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

17.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow [issue 11801](#) for any changes to this behavior.

17.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. `username`, `mydomain\username`, `username@mydomain.tld` can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow [issue 11801](#) for any changes to this behavior.

17.2.4 Specifying the None group

Each Windows system has built-in `_None_` group. This is the default `primary group` for files for users not on a domain environment.

Unfortunately, the word `_None_` has special meaning in Python - it is a special value indicating `nothing`, similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chgrp C:\path\to\file "'None'"`.

17.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

17.2.6 Modifying security properties (ACLs) on files

There is no support in Salt for modifying ACLs, and therefore no support for changing file permissions, besides modifying the owner/user.

Developing Salt

18.1 Overview

In its most typical use, Salt is a software application in which clients, called ``minions" can be commanded and controlled from a central command server called a ``master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, `salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

18.2 Salt Client

18.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called `LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

18.3 Salt Master

18.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the `salt' CLI.

18.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

18.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

18.3.4 EventPublisher

The EventPublisher publishes events onto the event bus. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

18.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

18.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

18.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

- 1) A command is issued on the CLI. For example, ``salt my_minion test.ping``.
- 2) The ``salt`` command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in `ClearFuncs.publish()`.
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (`master_event_pull.ipc`) where the EventPublisher picks it up and distributes it to all connected event listeners on `master_event_pub.ipc`.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on `publish_pull.ipc`.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over `publish_pull`, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across `workers.ipc` to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (`master_event_pull.ipc`). (Again for the curious, this happens in `AESFuncs._return()`.)
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on `master_event_pub.ipc`). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

18.4 Salt Minion

18.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via ``salt-call`` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect `_back_` to a master defined in the minion config file. The connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

18.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_<unique_id>_pub.ipc` and `minion_event_<unique_id>_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

18.4.3 Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `'salt-call'` script run by a local user on the salt minion or they can come directly from a master.

18.4.4 Master Job Flow

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
 5. The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

18.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
 2. AESFuncs is used everywhere else.

18.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review [Writing Salt Documentation](#).

18.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the [Salt Coding Style](#) documentation for information about Salt's particular coding patterns.

Within the [Salt Coding Style](#) documentation, there is a section about running Salt's `.pylintrc` file. SaltStack recommends running the `.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository. Please see the [Linting](#) documentation for more information.

Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors [GitHub's own guide](#) and is well worth reading.

1. Fork [saltstack/salt](#) on GitHub.
2. Make a local clone of your fork.

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add [saltstack/salt](#) as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

4. Create a new branch in your clone.

Note: A branch should have one purpose. For example, ``Fix bug X," or ``Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.

If you're working on a bug or documentation fix, create your branch from the oldest release branch that contains the bug or requires the documentation update. See [Which Salt Branch?](#).

```
git fetch upstream
git checkout -b fix-broken-thing upstream/2016.3
```

If you're working on a feature, create your branch from the develop branch.

```
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary.

Note: If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

```
Fix broken things in file1 and file2

Fixes #31337

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:   path/to/file1
#   modified:   path/to/file2
```

If you get stuck, there are many introductory Git resources on <http://help.github.com>.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

Note: You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/2016.3 fix-broken-thing
git push -u origin fix-broken-thing
```

or

```
git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
(use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do NOT perform a `git pull` or `git merge` here. Instead, add `--force` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-

forward issue, will likely add extra commits to the pull request which were not part of your changes.

7. Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

8. Open a new pull request.

Click on `Pull Request` on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

- (a) If your branch is a fix for a release branch, choose that as the base branch (e.g. 2016.3),

<https://github.com/my-account/salt/compare/saltstack:2016.3...fix-broken-thing>

If your branch is a feature, choose `develop` as the base branch,

<https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature>

- (b) Review that the proposed changes are what you expect.
- (c) Write a descriptive comment. Include links to related issues (e.g. 'Fixes #31337!') in the comment field.
- (d) Click `Create pull request`.

9. Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

- (a) Make the new changes in your local clone on the same local branch.
- (b) Push the branch to GitHub again using the same commands as before.
- (c) New and updated commits will be added to the pull request automatically.
- (d) Feel free to add a comment to the discussion.

Note: Jenkins

Pull request against [saltstack/salt](#) are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <http://jenkins.saltstack.com/>.

Which Salt branch?

GitHub will open pull requests against Salt's main branch, `develop`, by default. Ideally, features should go into `develop` and bug fixes and documentation changes should go into the oldest supported release branch affected by the bug or documentation update. See *[Sending a GitHub pull request](#)*.

If you have a bug fix or doc change and have already forked your working branch from `develop` and do not know how to rebase your commits against another branch, then submit it to `develop` anyway and we'll be sure to backport it to the correct place.

18.6.2 The current release branch

The current release branch is the most recent stable release. Pull requests containing bug fixes should be made against the release branch.

The branch name will be a date-based name such as 2016.3.

Bug fixes are made on this branch so that minor releases can be cut from this branch without introducing surprises and new features. This approach maximizes stability.

The Salt development team will ``merge-forward" any fixes made on the release branch to the `develop` branch once the pull request has been accepted. This keeps the fix in isolation on the release branch and also keeps the `develop` branch up-to-date.

Note: Closing GitHub issues from commits

This ``merge-forward" strategy requires that [the magic keywords to close a GitHub issue](#) appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the *commit* containing the magic text is merged into the default branch (`develop`). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request.

18.6.3 The `develop` branch

The `develop` branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the `develop` branch.

The Salt development team will back-port bug fixes made to `develop` to the current release branch if the contributor cannot create the pull request against that branch.

Keeping Salt Forks in Sync

Salt is advancing quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
# For ssh github
git remote add upstream git@github.com:saltstack/salt.git

# For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin develop
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the [salt-users](#) mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

Backporting Pull Requests

If a bug is fixed on `develop` and the bug is also present on a currently-supported release branch it will need to be back-ported to all applicable branches.

Note: Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into `develop` (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into `develop`. And `upstream` is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.
2. Create a new branch for the back-port by reusing the same branch from the original pull request.
Name the branch `bp-<NNNN>` and use the number of the original pull request.

```
git fetch upstream refs/pull/1234/head:bp-1234
git checkout bp-1234
```

3. Find the parent commit of the original pull request.

The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending `~1` to the end.

4. Rebase the new branch on top of the release branch.

- `<release-branch>` is the branch identified in step #1.
- `<orig-base>` is the SHA identified in step #3 -- don't forget to add `~1` to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to 2016.3 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

18.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage

is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.warn_until(
            'Aluminum',
            'The \'foo\' argument has been deprecated and its '
            'functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

18.8 Dunder Dictionaries

Salt provides several special ``dunder`` dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

18.8.1 `__opts__`

Available in

- All loader modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the `__opts__` dict, configuration data should be pulled from the salt `get` functions such as `config.get`, aka - `__salt__['config.get']('foo:bar')` The `get` functions also allow for dict traversal via the `:` delimiter. Consider using `get` functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

18.8.2 `__salt__`

Available in

- Execution Modules
- State Modules
- Returners
- Runners

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

Note: When used in runners, `__salt__` references other runner modules, and not execution modules.

18.8.3 `__grains__`

Available in

- Execution Modules
- State Modules
- Returners
- External Pillar

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

18.8.4 `__pillar__`

Available in

- Execution Modules
- State Modules
- Returners

The `__pillar__` dictionary contains the pillar for the respective minion.

18.8.5 `__context__`

`__context__` exists in state modules and execution modules.

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

Note: Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

18.9 External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

18.9.1 Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

18.9.2 Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
- example_a: some argument
- example_b:
  - argumentA
  - argumentB
- example_c:
  keyA: valueA
  keyB: valueB
```

18.9.3 The Module

18.9.4 Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

18.9.5 Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `module-name.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

18.9.6 Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__( __opts__ ):
    # Do init work here
```

Note: The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

18.9.7 `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

18.9.8 ext_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )           # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' ) # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' } ) # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note:** this function is called once for each minion that fetches its pillar data.

```
def ext_pillar( minion_id, pillar, *args, **kwargs ):

    my_pillar = {'external_pillar': {}}

    my_pillar['external_pillar'] = get_external_pillar_dictionary()

    return my_pillar
```

You can call `pillar` with the dictionary's top name to retrieve its data. From above example, `'external_pillar'` is the top dictionary name. Therefore:

```
salt-call '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__` A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__` A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']('ls -l')` **Note**, runs on the *master*
- `__grains__` A dictionary of the grains of the minion making this pillar call.

18.9.9 Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {"arg":"value"}'
```

18.9.10 Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

18.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

Note: tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git `fetch` utility:

```
git fetch --tags upstream
```

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable `pkg` and `portage_config` functionality

Note: Using system Python modules in the `virtualenv`

To use already-installed python modules in `virtualenv` (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system `PYTHONPATH` at the time of `virtualenv` creation.

Note: Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

Activate the `virtualenv`:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install M2Crypto # Don't install on Debian/Ubuntu (see below)
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt # the path to the salt git clone from above
```

Note: Installing M2Crypto

swig and libssl-dev are required to build M2Crypto. To fix the error command 'swig' failed with exit status 1 while installing M2Crypto, try installing it with the following command:

```
env SWIG_FEATURES="-cpperraswarn -includeall -D__uname -m`__ -I/usr/include/openssl"
→pip install M2Crypto
```

Debian and Ubuntu systems have modified openssl libraries and mandate that a patched version of M2Crypto to be installed. This means that M2Crypto needs to be installed via apt:

```
apt-get install python-m2crypto
```

This also means that pulling in the M2Crypto installed using apt requires using `--system-site-packages` when creating the virtualenv.

If you're using a platform other than Debian or Ubuntu, and you are installing M2Crypto via pip instead of a system package, then you will also need the gcc compiler.

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on OS X.

You can install needed dependencies on OS X using homebrew or macports. See [OS X Installation](#)

Warning: Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

18.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
4. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
3. Uncomment and change the `master: salt` value to point at `localhost`.
4. Uncomment and change the `id:` value to something descriptive like ```saltdev```. This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
5. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

Note: Using `salt-call` with a *Standalone Minion*

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.ping
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

Note: Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcfd7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.

2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

NOTE: The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

Note: File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on OSX, refer to the *OS X Installation* instructions.

Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/
↳virtualenv/' \
  -e ./salt # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

Additional Options

In case you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-
↳dir=/path/to/your/virtualenv/' \
  -e ./salt # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/
↳virtualenv/' \
  -e ./salt # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

18.10.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a `USE_SETUPTOOLS` environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

18.10.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The docs use `reStructuredText` for markup. See a live demo at <http://rst.ninjs.org/>.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

18.10.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See [here](#) for more information regarding the test suite.

18.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

18.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

18.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

Approved The issue has been validated and has all necessary information.

Blocked The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

Under Review The issue is having further validation done by a SaltStack engineer.

<Sprint> The issue is being actively worked on by a SaltStack engineer. Sprint milestone names are constructed from the chemical symbol of the next release's codename and the number of sprints until that release is made. For example, if the next release codename is `NEON` and there are five sprints until that release, the corresponding sprint milestone will be called `Ne 5`. See [<topics/releases/version_numbers>](#) for a discussion of Salt's release codenames.

18.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

Feature The issue is a request for new functionality including changes, enhancements, refactors, etc.

Bug The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.

Duplicate The issue is a duplicate of another feature request or bug report.

Upstream Bug The issue is a result of an upstream issue.

Question The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.

Expected Behavior The issue is a bug report of intended functionality.

Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a **P1** label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

P1 The issue will be seen by all users.

P2 The issue will be seen by most users.

P3 The issue will be seen by about half of users.

P4 The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled **Bug**.

Blocker The issue is blocking an impending release.

Critical The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.

High Severity The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.

Medium Severity The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- Execution Module
- File Servers
- Grains
- Multi-Master
- Packaging Related to packaging of Salt, not Salt's support for package management.
- Pillar
- RAET
- Returners
- Runners
- SPM
- Salt-API
- Salt-Cloud
- Salt-SSH

- Salt-Syndic
- State Module
- Tests
- Transport
- Windows
- ZMQ

Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

Core The issue or pull request relates to code that is central or existential to Salt itself.

Platform The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.

RIoT The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.

Console The issue or pull request relates to the SaltStack enterprise console.

Documentation The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the `Blocked` milestone, it is very likely that it will only have a status label.

Bugfix -back-port The pull request needs to be back-ported to an older release branch. This is done by *recreating the pull request* against that branch. Once the back-port is completed, this label is replaced with a `Bugfix - [Done] back-ported` label. Normally, new features should go into the `develop` and bug fixes into the oldest supported release branch, see `<which-salt-branch>`.

Bugfix -[Done] back-ported The pull request has been back-ported to an older branch.

Cannot Reproduce The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

Confirmed The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.

Fixed Pending Verification The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

Info Needed The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

Pending Changes The pull request needs additional changes before it can be merged.

Pending Discussion The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a `Pending Changes` label.

Won't Fix for Now The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

Minor Change

- Less than 64 lines changed, or
- Less than 8 core lines changed

Medium Change

- Less than 256 lines changed, or
- Less than 64 core lines changed

Master Change

- More than 256 lines changed, or
- More than 64 core lines changed

Expert Change

- Needs specialized, in-depth review

Test Status

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

Lint The pull request has passed all tests except for the code lint checker.

Tests Passed The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

Awesome The pull request implements an especially well crafted solution, or a very difficult but necessary change.

Help Wanted The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.

Needs Testcase The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.

Regression The issue is a bug that breaks functionality known to work in previous releases.

Story The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.

Stretch The issue is an optional goal for the current sprint but may not be delivered.

ZD The issue is related to a Zendesk customer support ticket.

<Release> The issue is scheduled to be implemented by <Release>. See <topics/releases/version_numbers> for a discussion of Salt's release codenames.

18.12 Logging Internals

TODO

18.13 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

18.13.1 Execution Modules

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

For a list of all built in execution modules, click [here](#)

For information on writing execution modules, see [this page](#).

18.13.2 Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

18.13.3 State Modules

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

Note: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

18.13.4 Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the *pam* module as an example.

18.13.5 Fileserver

The fileserver module system is used to create fileserver backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example.

18.13.6 Grains

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

18.13.7 Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the `output` function to execute. The default system outputter is the `nested` module.

18.13.8 Pillar

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

18.13.9 Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the `py` renderer and as complex as `stateconf` and `pydsl`.

18.13.10 Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

18.13.11 Runners

Runners are purely master-side execution sequences.

18.13.12 Tops

Tops modules are used to convert external data sources into top file data for the state system.

18.13.13 Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

18.14 Package Providers

This page contains guidelines for writing package providers.

18.14.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

list_pkgs

This function should declare an empty dict, and then add packages to it by calling *pkg_resource.add_pkg*, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute *pkg_resource.sort_pkglist*. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',  
 'bar': '5.6.7-8'}
```

latest_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept ***kwargs*, in order to receive the `fromrepo` and `repo` keyword arguments from *pkg* states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

version

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

upgrade_available

Deprecated and destined to be removed. For now, should just do the following:

```
return __salt__['pkg.latest_version'](name) != ''
```

install

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call `pkg_resource.parse_targets` (see below). This function will convert the SLS input into a more easily parsed data structure. `pkg_resource.parse_targets` may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name,
                                                            pkgs,
                                                            sources)
```

Two values will be returned to the `install` function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If **name** was provided (and **pkgs** was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the **version** keyword argument was provided, then it should replace the `None` value in the dictionary.
- If **pkgs** was provided, then **name** is ignored, and the dictionary will contain one entry for each package in the **pkgs** list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the `pkg.installed` state for more info.
- If **sources** was provided, then **name** is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The `install` function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run `list_pkgs` to obtain a list of the installed packages. You should then return the output of `salt.utils.compare_dicts()`

```
return salt.utils.compare_dicts(old, new)
```

remove

Removes the passed package and return a list of the packages removed.

18.14.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

list_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

get_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as `list_repos`, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

del_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

18.14.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkgs`, but `lowpkg` must never make calls to `pkg`. This affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
                                  'type': 'config'}}
```

file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the `file_list` function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],
 'files': ['/etc/httpd',
           '/etc/httpd/conf',
           '/etc/httpd/conf.d',
           '...SNIP...']}
```

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike *file_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file_list*.

```
{'errors': ['package apache is not installed'],
 'packages': {'httpd': ['/etc/httpd',
                       '/etc/httpd/conf',
                       '...SNIP...'],
              'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',
                        '/boot/System.map-2.6.32-279.el6.x86_64',
                        '...SNIP...']}}
```

18.15 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the [new issue page for the Salt project](#).

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!

18.16 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

18.16.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.

18.16.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

18.16.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

18.17 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the [Transifex](#) website and [signup](#) for an account.

Once registered, head over to the [Salt Translation Project](#), and either click on **Request Language** if you can't find yours, or, select the language for which you wish to contribute and click **Join Team**.

[Transifex](#) provides some useful reading resources on their [support domain](#), namely, some useful articles [directed to translators](#).

18.17.1 Building A Localized Version of the Documentation

While you're working on your translation on [Transifex](#), you might want to have a look at how it's rendering.

Install The Transifex Client

To interact with the [Transifex](#) web service you will need to install the [transifex-client](#):

```
pip install transifex-client
```

Configure The Transifex Client

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
./scripts/setup-transifex-config
```

Download Remote Translations

There's a little script which simplifies the download process of the translations(which isn't that complicated in the first place). So, let's assume you're translating pt_PT, Portuguese(Portugal). To download the translations, execute from the doc/ directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download pt_PT, Portuguese(Portugal), and nl, Dutch, you can use the helper script directly:

```
./scripts/download-translation-catalog pt_PT nl
```

Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the pt_PT example above:

```
make html SPHINXLANG=pt_PT
```

View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you've just build.

18.18 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my_account>)
- a command line (CLI)
- git
- a text editor

18.18.1 Fork

In your browser, navigate to the [saltstack/salt](https://github.com/saltstack/salt) GitHub repository.

Click on Fork (<https://github.com/saltstack/salt/#fork-destination-box>).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

18.18.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where <my_account> is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `develop` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/develop` so that we will get all upstream changes when they happen.

```
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

18.18.3 Fetch

Fetch any upstream changes on the `develop` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

Note: For an explanation on `pull vs pull --rebase` and other excellent points, see [this article](#) by Mislav Marohnić.

18.18.4 Branch

Now we are ready to get to work. Consult the [sprint beginner bug list](#) and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `develop`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

18.18.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     '''
         if os.path.isdir('/etc/alternatives'):
             return True
-         return False
+         return (False, 'Cannot load alternatives module: /etc/alternatives dir not
-,found')
```

```
def _get_cmd():
```

18.18.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

18.18.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

Note: If authentication over https does not work, you can alternatively setup [ssh keys](#). Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

18.18.8 Merge

In your browser, navigate to the [new pull request](#) page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `develop` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

Note: Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, https://github.com/<my_account>/salt, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
 - I find it easiest to edit the following URL:
https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret
-

18.18.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

<https://help.github.com/>

There are many topics covered by the Salt Developer documentation:

<https://docs.saltstack.com/en/latest/topics/development/index.html>

The contributing documentation presents more details on specific contributing topics:

<https://docs.saltstack.com/en/latest/topics/development/contributing.html>

18.19 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

18.19.1 Command line usage

See `salt-extend`

18.19.2 Choosing a template

The following templates are available:

module

Creates a new execution module within `salt/modules/{{module_name}}.py`

module_unit

Creates a new execution module unit test suite within `tests/unit/modules/{{module_name}}_test.py`

state

Creates a new state module within `salt/states/{{module_name}}.py`

state_unit

Creates a new state module unit test suite within tests/unit/states/{{module_name}}_test.py

18.19.3 Adding templates

1. Create a directory under <src>/templates
2. Create a file `template.yml` containing properties for
 - `description` - a description of the template
 - `questions` - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
 - `question` - The question to ask the user, as a string
 - `default` - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

Example template.yml

```
description: "Execution module"
questions:
  depending_libraries:
    question: "What libraries does this module depend upon?"
  virtual_name:
    question: "What module virtual name to use?"
    default: "{{module_name}}"
```

3. Create the files within <src>/templates/<your template> to match the target

Note: File names can contain Jinja 2 template syntax, e.g. `('{{module_name}}.py)'`

Example file in the template directory

```
print('Hello {{module_name}}')
__virtual__ = '{{__virtual_name__}}'
```

Default context properties

The default context provides the following properties

- `description` - A description of the template
- `short_description` - A short description of the module as entered by the user
- `version` - The version name of the next release
- `module_name` - The module name as entered by the user
- `release_date` - The current date in the format `YYYY-MM-DD`
- `year` - The current year in the format `YYYY`

As well as any additional properties entered from the questions section of `template.yml`

18.19.4 API

SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using `salt-extend`

`codeauthor` :email: `Anthony Shaw <anthonyshaw@apache.org>`

`salt.utils.extend.apply_template` (*template_dir*, *output_dir*, *context*)

Apply the template from the template directory to the output using the supplied context dict.

Parameters

- **src** (*str*) -- The source path
- **dst** (*str*) -- The destination path
- **context** (*dict*) -- The dictionary to inject into the Jinja template as context

`salt.utils.extend.run` (*extension=None*, *name=None*, *description=None*, *salt_dir=None*, *merge=False*, *temp_dir=None*)

A template factory for extending the salt ecosystem

Parameters

- **extension** (*str*) -- The extension type, e.g. `'module'`, `'state'`, if omitted, user will be prompted
- **name** (*str*) -- Python-friendly name for the module, if omitted, user will be prompted
- **description** (*str*) -- A description of the extension, if omitted, user will be prompted
- **salt_dir** (*str*) -- The targeted Salt source directory
- **merge** (*bool*) -- Merge with salt directory, `False` to keep separate, `True` to merge trees.
- **temp_dir** (*str*) -- The directory for generated code, if omitted, system temp will be used

18.20 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt's test suite works, be sure to check out the [Salt's Test Suite: An Introduction](#) tutorial.

18.20.1 Test Directory Structure

Salt's test suite is located in the `tests` directory in the root of Salt's codebase. The test suite is divided into two main groups:

- Integration Tests

- Unit Tests

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- Integration Test Documentation

Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

18.20.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

Note: In Salt 0.17, testing libraries were migrated into their own repo. To install them:

```
pip install git+https://github.com/saltstack/salt-testing.git#egg=SaltTesting
```

Failure to install SaltTesting will result in import errors similar to the following:

```
ImportError: No module named salttesting
```

Once all requirements are installed, use `tests/runtests.py` to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run unit tests only: `./tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `./tests/runtests.py --state`
- Run integration tests for an individual module: `./tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `./tests/runtests.py -n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `./tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the [Test Selection Options](#) documentation or the [Running Specific Tests](#) section of the *Salt's Test Suite: An Introduction* tutorial.

Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply remove the `/tests` portion of the `runtests.py` command:

```
./runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

Note: Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the `--run-destructive` flag:

```
./tests/runtests.py --run-destructive
```

Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digital_ocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digital_ocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
  location: New York 1
```

Note: When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

Running The Tests In A Docker Container

The test suite can be executed under a `docker` container using the `--docked` option flag. The `docker` container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
tests/runtests.py --docked=ubuntu-12.04 -v
```

The full `docker` container repository can also be provided:

```
tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt's [docker repository](#).

Custom [docker](#) containers can be provided by submitting a pull request against Salt's [docker Salt test containers repository](#).

18.20.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then be merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to <http://jenkins.saltstack.com>.

Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: <https://github.com/saltstack/salt/blob/develop/tests/jenkins.py>

18.20.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `develop` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `develop` branch, then the tests should be added there as well. However, if the feature was added to `develop` some time ago and is already present in one or more release branches, please refer to the [Tests for Entire Files or Functions](#) section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the [Which Salt Branch?](#) documentation in Salt's [Contributing](#) guide.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `develop` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

Note: If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

18.21 raet

RAET # Reliable Asynchronous Event Transport Protocol

See also:

RAET Overview

18.21.1 Protocol

Layering:

OSI Layers

7: Application: Format: Data (Stack to Application interface buffering etc) 6: Presentation: Format: Data (Encrypt-Decrypt convert to machine independent format) 5: Session: Format: Data (Interhost communications. Authentication. Groups) 4: Transport: Format: Segments (Reliable delivery of Message, Transactions, Segmentation, Error checking) 3: Network: Format: Packets/Datagrams (Addressing Routing) 2: Link: Format: Frames (Reliable per frame communications connection, Media access controller) 1: Physical: Bits (Transceiver communication connection not reliable)

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking, Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

18.21.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for ``packed" binary body

18.21.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n
10 13 10 13 ADAD 1010 1101 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header

Finally is an optional tail block for error checking or encryption details

18.21.4 Header Fields

In UDP header

sh = source host sp = source port dh = destination host dp = destination port

In RAET Header

hk = header kind hl = header length

vn = version number

sd = Source Device ID dd = Destination Device ID cf = Corresponder Flag mf = Multicast Flag

si = Session ID ti = Transaction ID

sk = Service Kind pk = Packet Kind bf = Burst Flag (Send all Segments or Ordered packets without interleaved acks)

oi = Order Index dt = DateTime Stamp

sn = Segment Number sc = Segment Count

pf = Pending Segment Flag af = All Flag (Resent all Segments not just one)

nk = Auth header kind nl = Auth header length

bk = body kind bl = body length

tk = tail kind tl = tail length

fg = flags packed (Flags) Default `00' hex string 2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD flags

18.21.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

18.21.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID sid

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

18.21.7 Service Types or Modular Services

Four Service Types

1. One or more maybe (unacknowledged repeat) maybe means no guarantee
2. **Exactly one at most (ack with retries) (duplicate detection idempotent)** at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay

3. **Exactly one of sequence at most (sequence numbered)** Receiver requests retry of missing packet with same B1 or B2 retry type
4. **End to End (Application layer Request Response)** This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1. **Maybe one or more**
 - (a) **Fire and forget** no transaction either side
 - (b) **Repeat, no ack, no dupdet** repeat counter send side, no transaction on receive side
 - (c) **Repeat, no Ack, dupdet** repeat counter send side, dup detection transaction receive side
2. **More or Less Once**
 - (a) **retry finite, ack no dupdet** retry timer send side, finite number of retries ack receive side no dupdet
3. **At most Once**
 - (a) **retry finite, ack, dupdet** retry timer send side, finite number of retries ack receive side dupdet
4. **Exactly once**
 - (a) **ack retry** retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff
5. **Sequential sequence number**
 - (a) reorder escrow
 - (b) Segmented packets
6. request response to application layer

Service Features

1. repeats
2. ack retry transaction id
3. sequence number duplicate detection out of order detection sequencing
4. rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End

A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive

B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected

B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retries so no duplicates.

C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.

D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response.

Little advantage to B1 vs B2 not having duplicates.

So 4 service types

1. Maybe one or more (unacknowledged repeat)
2. Exactly One (At most one) (ack with retry) (duplicate detection idempotent)
3. One of Sequence (sequence numbered)
4. End to End

Also multicast or unicast

Modular Transaction Table

Sender Side: Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter
Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence)
Segmentation

Receiver Side: Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection
Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout
Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend
Unsegmentation (request resends of missing segment)

18.22 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

18.22.1 New Code Entry

All new SaltStack code should be submitted against either the `develop` branch or a point release branch, depending on the nature of the submission. Please see the *Which Salt Branch?* section of Salt's *Contributing* documentation or the Release Branching section section below for more information.

18.22.2 Release Branching

SaltStack maintains two types of releases, **Feature Releases** and **Point Releases** (also commonly referred to as **Bugfix Releases**). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on `develop`. All file changes relevant to the feature release will be completed in the `develop` branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature

release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the develop branch
# git push origin 2015.8
```

Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the *Which Salt Branch?* section of Salt's *Contributing* documentation.

Determining when a point release is going to be made is up to the project leader (Thomas Hatch). Generally point releases are made every 2-4 weeks or if there is a security fix they can be made sooner.

The point release is only designated by tagging the commit on the release branch with a release number using the existing convention (version 2015.8.1 is tagged with v2015.8.1). From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

18.23 Salt Conventions

18.23.1 Writing Salt Documentation

Salt's documentation is built using the [Sphinx](#) documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the <https://github.com/saltstack/salt/blob/develop/doc> subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the [IEEE style guide](#) as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The [NCBI style guide](#) is another very approachable resource.

Point-of-view

Use third-person perspective and avoid ``I'', ``we'', ``you'' forms of address. Identify the addressee specifically e.g., ``users should'', ``the compiler does'', etc.

Active voice

Use active voice and present-tense. Avoid filler words.

Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

```
This is a main heading
```

```
=====
```

Paragraph.

```
This is an exciting sub-heading!
```

```
-----
```

Paragraph.

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually ``and'', ``or'', or ``nor'') in a series of three or more terms. For example, a list of three countries might be punctuated either as ``France, Italy, and Spain" (with the serial comma), or as ``France, Italy and Spain" (without the serial comma)."

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```
def my_function(value):  
    '''  
    Upper-case the given value  
  
    Usage:  
  
    .. code-block:: python  
  
    val = 'a string'  
    new_val = myfunction(val)  
    print(new_val) # 'A STRING'
```

```

:param value: a string
:return: a copy of ``value`` that has been upper-cased
'''
return value.upper()

```

Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```

def my_function(value):
    '''
    Upper-case the given value

    .. versionadded:: 2014.7.0

    <...snip...>
    '''
    return value.upper()

```

For changes to a function:

```

def my_function(value, strip=False):
    '''
    Upper-case the given value

    .. versionchanged:: 2016.3.0
       Added a flag to also strip whitespace from the string.

    <...snip...>
    '''
    if strip:
        return value.upper().strip()
    return value.upper()

```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: `all-salt.modules`, *state modules*, *renderer modules*. New modules must be added to the index manually.

1. Edit the file for the module type: `execution modules`, `state modules`, `renderer modules`, etc.
2. Add the new module to the alphabetized list.
3. *Build the documentation* which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

Glossary entries

Link to [glossary entries](#) using the `term` role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a
custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```

Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index directive` above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
   see: Reactor; Event
```

Another method is to use the `index role` inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
-----
```

Paragraph.

Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:
```

```
My page
=====
```

Paragraph.

Unique labels can be linked using the `ref` role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should *not* be used to link documents together.

Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the
:py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful
functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the
:py:func:`file.managed <salt.states.file.managed>` function.
```

Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master`, and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a
single minion.
```

Documentation Changes and Fixes

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt's main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt's *Contributing* page. You can read more about how to choose where to submit documentation fixes by reading the *Which Salt branch?* section.

For an explanation of how to submit changes against various branches, see the *Sending a GitHub pull request* section. Specifically, see the section describing how to `Create a new branch` and the steps that follow.

Building the documentation

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.
2. Build the documentation using the provided Makefile or `.bat` file on Windows.

```
cd /path/to/salt/doc
make html
```

3. The generated documentation will be written to the `doc/_build/<format>` directory.
4. A useful method of viewing the HTML documentation locally is to start Python's built-in HTTP server:

```
cd /path/to/salt/doc/_build/html
python -m SimpleHTTPServer
```

Then pull up the documentation in a web browser at <http://localhost:8000/>.

18.23.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the ``saltstack-formulas" organization on GitHub:

<https://github.com/saltstack-formulas>

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```
base:
  'web*':
    - apache
```

Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install and configure GitFS.*
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
gitfs_remotes:
  - https://github.com/saltstack-formulas/apache-formula
  - https://github.com/saltstack-formulas/memcached-formula
```

We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

# or

mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
```

```
'storage-*':  
  - openstack.swift
```

Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using *extend*, they can be made to watch other states with *The _in versions of requisites*.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.  
include:  
  - apache  
  
# Use the watch_in requisite to cause the apache service state to reload  
# apache whenever the my-example-com-vhost state changes.  
my-example-com-vhost:  
  file:  
    - managed  
    - name: /etc/apache2/sites-available/my-example-com  
    - watch_in:  
      - service: apache
```

Don't be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the `saltstack-formulas` organization on GitHub.

Note: Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the contributors team on the `saltstack-formulas` organization and help you transfer the repository over. Ping a SaltStack employee on IRC (`#salt` on Freenode) or send an email to the `salt-users` mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: <https://github.com/watching>.

Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in *requisites*. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

Use `module.function` notation

So-called ```short-declaration``` notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform ```short-decs``` into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

Specify the `name` parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
        touch /path/to/file_last_updated
        sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```
# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}
```

Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *renderer* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt's state system finally starts and executes on each ``chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the ``running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}
{# or #}
{% import_yaml 'path/to/file.yaml' as some_data %}
{# or #}
```

```
{% import_json 'path/to/file.json' as some_data %}

{# or #}

{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

{# or #}

{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt.pillar.get('list_of_users', []) %}

{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```
{# ---- Bad example ---- #}

apache:
  pkg.installed:
    {% if grains.os_family == 'RedHat' %}
    - name: httpd
    {% elif grains.os_family == 'Debian' %}
    - name: apache2
    {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

apache:
```

```

pkg.installed:
  - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
  'RedHat': 'httpd',
  'Debian': 'apache2',
}.get(grains.os_family) %}

apache:
  pkg.installed:
    - name: {{ name }}

```

Dictionaries are useful to effectively ``namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```

{# ---- Bad example ---- #}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
    - context:
      {% if 'external_loadbalancer' in grains.roles %}
      ssl_termination: True
      {% elif 'internal_loadbalancer' in grains.roles %}
      ssl_termination: False
      {% endif %}

{# ---- Better example ---- #}

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}

```

```
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}
```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's ``she-bang" syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

/srv/salt/common_configuration.sls:

```
common_users:
  user.present:
    - names: [larry, curly, moe]
```

/srv/salt/roles_configuration:

```
#!/py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']
```

```

list_of_roles.add(app)

if app == 'web' and environment == 'dev':
    list_of_roles.add('primary')
    list_of_roles.add('secondary')
elif app == 'web' and environment == 'staging':
    if instance_number == 0:
        list_of_roles.add('primary')
    else:
        list_of_roles.add('secondary')

# Easily cross-call Salt execution modules:
if __salt__['myutils.query_valid_ec2_instance']():
    list_of_roles.add('is_ec2_instance')

return {
    'set_roles_grains': {
        'grains.present': [
            {'name': 'roles'},
            {'value': list(list_of_roles)},
        ],
    },
}

```

Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```

{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}

```

Macros are also useful for creating one-off ``serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

/srv/salt/php.sls:

```

php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
        php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}

```

/srv/pillar/php.sls:

```
php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

/srv/salt/php.ini.tpl:

```
{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increase the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

map.jinja:

```
{% set mysql = salt['grains.filter_by']({
  'Debian': {
    'server': 'mysql-server',
    'client': 'mysql-client',
    'service': 'mysql',
    'config': '/etc/mysql/my.cnf',
    'python': 'python-mysqldb',
  },
  'RedHat': {
    'server': 'mysql-server',
    'client': 'mysql',
```

```

    'service': 'mysqld',
    'config': '/etc/my.cnf',
    'python': 'MySQL-python',
  },
  'Gentoo': {
    'server': 'dev-db/mysql',
    'client': 'dev-db/mysql',
    'service': 'mysql',
    'config': '/etc/mysql/my.cnf',
    'python': 'dev-python/mysql-python',
  },
}, merge=salt['pillar.get']('mysql:lookup')) %}

```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```

{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}

```

Organizing Pillar data

It is considered a best practice to make formulas expect **all** formula-related parameters to be placed under second-level lookup key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```

mysql:
  lookup:
    version: 5.7.11

```

Collecting common values

Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

map.jinja:

```

{% set mysql = salt['grains.filter_by']({
  'default': {
    'server': 'mysql-server',
    'client': 'mysql-client',
    'service': 'mysql',
    'config': '/etc/mysql/my.cnf',
    'python': 'python-mysqldb',
  },
  'Debian': {
  },
  'RedHat': {
    'client': 'mysql',
    'service': 'mysqld',
  },
})

```

```

    'config': '/etc/my.cnf',
    'python': 'MySQL-python',
  },
  'Gentoo': {
    'server': 'dev-db/mysql',
    'client': 'dev-db/mysql',
    'python': 'dev-python/mysql-python',
  },
},
merge=salt['pillar.get']('mysql:lookup'), base='default') %}

```

Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in `filter_by` specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```

mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf

```

Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```

{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty".' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}

```

The above will be rendered as below:

```

foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""

```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml:`

```
Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
  GlobalNamingResources:
    Resource:
      '@auth': Container
      '@description': User database that can be updated and saved
      '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
      '@name': UserDatabase
      '@pathname': conf/tomcat-users.xml
      '@type': org.apache.catalina.UserDatabase
  # <...snip...>
```

`/srv/pillar/tomcat.sls:`

```
appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
```

```
'@redirectPort': '8443'
# <...snip...>
```

```
/srv/salt/tomcat/server_xml.sls:
```

```
{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True)
%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish
```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off “serializers” (often as Jinja macros) that reformat a data structure to a specific config file format. For example, `‘Nginx vhosts’` or the `‘php.ini’`

`__`: https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts_config.sls `__`: <https://github.com/saltstack-formulas/php-formula/blob/82e2cd3a/php/ng/files/php.ini>

Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

```
/srv/salt/app/deploy.sls:
```

```
{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
  machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt.grains.get('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
  table. #}
{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
        version: {{ app.version }}
    - onchanges:
        - git: deploy_application
```

/srv/salt/app/defaults.yaml:

```
appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master
appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can `include` and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full `apache-formula` for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
  - require:
    - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
  - watch_in:
    - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The `mod_wsgi` state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

Formulas should be reusable. Avoid coupling unrelated actions together.

Parameterization

Parameterization is a key feature of Salt Formulas and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
    {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
{{ user.name }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

Scripting

Remember that both State files and Pillar files can easily call out to Salt execution modules and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
|   |-- map.jinja
|   |-- init.sls
|   `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

[template-formula](#)

The `template-formula` repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

README.rst

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===

Install and configure the F00 service.

.. note::

    See the full `Salt Formulas installation and usage instructions
    <http://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>
    → `_.

Available states
=====

.. contents::
   :local:

``foo``
-----

Install the ``foo`` package and enable the service.

``foo.bar``
-----

Install the ``bar`` package.
```

CHANGELOG.rst

The `CHANGELOG.rst` file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the `CHANGELOG.rst` file:

`CHANGELOG.rst`:

```
foo formula
=====

0.0.2 (2013-01-01)

- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

Versioning

Formula are versioned according to Semantic Versioning, <http://semver.org/>.

Note: Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.

Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

18.23.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the `master.d` or `minion.d` directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The *salt-common* or *salt* package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a `doc` package is preferred. Since `salt-call` is the entry point to utilize the libs and is useful for all salt packages it is included in the *salt-common* package.

Name

- *salt* OR *salt-common*

Files

- *salt/**
- *man/salt.7*
- *scripts/salt-call*
- *tests/**
- *man/salt-call.1*

Depends

- *Python 2.6-2.7*
- *PyYAML*
- *Jinja2*

Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

Name

- *salt-master*

Files

- *scripts/salt-master*
- *scripts/salt*

- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*
- *pkg/<master init data>*
- *man/salt.1*
- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- *salt-syndic*

Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

Name

- *salt-minion*

Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- *salt-ssh*

Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud**

Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- *salt-cloud*

Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

Name

- *salt-doc*

Files

- *doc/**

Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

18.23.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every four to six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 0.16 release as an example):

1. All open issues on the release milestone should be moved to the next release milestone. (e.g. from the 0.16 milestone to the 0.17 milestone)
2. Release notes should be created documenting the major new features and bugfixes in the release.
3. Create an annotated tag with only the major and minor version numbers, preceded by the letter v. (e.g. v0.16) This tag will reside on the `develop` branch.
4. Create a branch for the new release, using only the major and minor version numbers. (e.g. 0.16)
5. On this new branch, create an annotated tag for the first revision release, which is generally a release candidate. It should be preceded by the letter v. (e.g. v0.16.0rc1)
6. The release should be packaged from this annotated tag and uploaded to PyPI as well as the GitHub releases page for this tag.
7. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems. (note that release candidates should go in the testing repositories)
8. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.
9. Log into RTD and add the new release there. (Have to do it manually)

Maintenance and Bugfix Releases

Once a feature release branch has been cut from `develop`, the branch moves into a "feature freeze" state. The new release branch enters the `merge-forward` chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. On the release branch (i.e. 0.16), create an annotated tag for the revision release. It should be preceded by the letter v. (e.g. v0.16.2) Release candidates are unnecessary for bugfix releases.
2. The release should be packaged from this annotated tag and uploaded to PyPI.
3. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems.
4. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.

For more information about the difference between the `develop` branch and bugfix release branches, please refer to the *Which Salt Branch?* section of Salt's *Contributing* documentation.

18.23.5 Salt Coding Style

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be ``Salty``.

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

Linting

Most Salt style conventions are codified in Salt's `.pylintrc` file. Salt's `pylint` file has two dependencies: `pylint` and `saltpylint`. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the `pylint` program as follows:

```
pylint --rcfile=/path/to/salt/.pylintrc salt/dir/to/lint
```

Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Strings

Salt follows a few rules when formatting strings:

Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```
def foo():
    """
    A function that does things
    """
    name = 'A name'
    return name
```

Formatting Strings

All strings which require formatting should use the `.format` string method:

```
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6.

Please do NOT use `printf` formatting.

Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```
def bar():
    """
    Here lies a docstring with a newline after the quotes and is the salty
    way to handle it! Vertical code is the way to go!
    """
    return
```

BAD:

```
def baz():
    '''This is not ok!'''
    return
```

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```
def new_func(msg=''):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed.
    """
    print msg
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your *pull request* and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg='', signature=''):
    """
```

```

.. versionadded:: 0.16.0

Prints what was passed to the function.

msg : None
    The string to be printed. Will be prepended with 'Greetings! '.

.. versionchanged:: 0.17.1

signature : None
    An optional signature.

.. versionadded 0.17.0
'''
print 'Greetings! {0}\n\n{1}'.format(msg, signature)

```

Dictionaries

Dictionaries should be initialized using `{}` instead of `dict()`.

See [here](#) for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```

import os

def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path

```

This on the other hand is *DISCOURAGED*:

```

from os.path import join

def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path

```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```

from salt.exceptions import CommandExecutionError

```

Absolute Imports

Although `absolute imports` seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried

example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

Note: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```
import os

os.chmod(
    os.path.join(self.opts['sock_dir'],
                  'minion_event_pub.ipc'),
    448
)
```

Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```
def managed(name,
            source=None,
            source_hash='',
            user=None,
            group=None,
            mode=None,
            template=None,
            makedirs=False,
            context=None,
            replace=True,
            defaults=None,
            saltenv=None,
            backup='',
            **kwargs):
```

Note: Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

Line Length

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line.

Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don't break it. Still, try to avoid passing that 120 characters limit and remember, **vertical is better... unless it isn't**

Indenting

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn't differentiate from a new indent level.

Right:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

WRONG:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

Lining up the indent is also correct:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a **known conflict** between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in `~/ .config/flake8`:

```
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper -- just replace all instances of `'flake8'` with `'pep8'`, including the filename.

Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (<http://legacy.python.org/dev/peps/pep-0008/>) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

18.24 Salt code and internals

Reference documentation on Salt's internal code.

18.24.1 Contents

salt.aggregation

salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

Note: The following examples will be expressed in YAML for convenience's sake:

- `!aggr-scalar` will refer to Scalar python function
 - `!aggr-map` will refer to Map python object
 - `!aggr-seq` will refer for Sequence python object
-

How to instructs merging

This yaml document has duplicate keys:

```
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

Introspection

TODO: write this part

```
salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=<class
    `salt.utils.aggregation.Map`>, sequence_class=<class
    `salt.utils.aggregation.Sequence`>)
```

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

```
class salt.utils.aggregation.Aggregate
```

Aggregation base.

```
class salt.utils.aggregation.Map(*args, **kws)
```

Map aggregation.

```
salt.utils.aggregation.Scalar(obj)
```

Shortcut for Sequence creation

```
>>> Scalar('foo') == Sequence(['foo'])
True
```

```
class salt.utils.aggregation.Sequence
```

Sequence aggregation.

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

*salt.exceptions*This module is a central location for all salt exceptions

salt.exceptions

This module is a central location for all salt exceptions

exception salt.exceptions.AuthenticationError (*message=''*)

If sha256 signature fails during decryption

exception salt.exceptions.AuthorizationError (*message=''*)

Thrown when runner or wheel execution fails due to permissions

exception salt.exceptions.CommandExecutionError (*message='', info=None*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.CommandNotFoundError (*message=''*)

Used in modules or grains when a required binary is not available

exception salt.exceptions.EauthAuthenticationError (*message=''*)

Thrown when eauth authentication fails

exception salt.exceptions.FileLockError (*msg, time_start=None, *args, **kwargs*)

Used when an error occurs obtaining a file lock

exception salt.exceptions.FileserverConfigError (*message=''*)

Used when invalid fileserver settings are detected

exception salt.exceptions.GitLockError (*errno, strerror, *args, **kwargs*)

Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the errno param similar to an OSError, this exception class is *not* as subclass of OSError. This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.

exception salt.exceptions.LoaderError (*message=''*)

Problems loading the right renderer

exception salt.exceptions.MasterExit

Rise when the master exits

exception salt.exceptions.MinionError (*message=''*)

Minion problems reading uris such as salt:// or http://

exception salt.exceptions.NotImplemented (*message=''*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.PkgParseError (*message=''*)

Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude, etc)

exception salt.exceptions.PublishError (*message=''*)

Problems encountered when trying to publish a command

- exception** `salt.exceptions.SaltCacheError` (*message*=`''`)
 Thrown when a problem was encountered trying to read or write from the salt cache
- exception** `salt.exceptions.SaltClientError` (*message*=`''`)
 Problem reading the master root key
- exception** `salt.exceptions.SaltClientTimeout` (*msg*, *jid=None*, **args*, ***kwargs*)
 Thrown when a job sent through one of the Client interfaces times out
 Takes the *jid* as a parameter
- exception** `salt.exceptions.SaltCloudConfigError` (*message*=`''`)
 Raised when a configuration setting is not found and should exist.
- exception** `salt.exceptions.SaltCloudException` (*message*=`''`)
 Generic Salt Cloud Exception
- exception** `salt.exceptions.SaltCloudExecutionFailure` (*message*=`''`)
 Raised when too much failures have occurred while querying/waiting for data.
- exception** `salt.exceptions.SaltCloudExecutionTimeout` (*message*=`''`)
 Raised when too much time has passed while querying/waiting for data.
- exception** `salt.exceptions.SaltCloudNotFound` (*message*=`''`)
 Raised when some cloud provider function cannot find what's being searched.
- exception** `salt.exceptions.SaltCloudPasswordError` (*message*=`''`)
 Raise when virtual terminal password input failed
- exception** `salt.exceptions.SaltCloudSystemExit` (*message*, *exit_code=1*)
 This exception is raised when the execution should be stopped.
- exception** `salt.exceptions.SaltConfigurationError` (*message*=`''`)
 Configuration error
- exception** `salt.exceptions.SaltDaemonNotRunning` (*message*=`''`)
 Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).
- exception** `salt.exceptions.SaltException` (*message*=`''`)
 Base exception class; all Salt-specific exceptions should subclass this
- pack** (`()`)
 Pack this exception into a serializable dictionary that is safe for transport via msgpack
- exception** `salt.exceptions.SaltInvocationError` (*message*=`''`)
 Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line
- exception** `salt.exceptions.SaltMasterError` (*message*=`''`)
 Problem reading the master root key
- exception** `salt.exceptions.SaltNoMinionsFound` (*message*=`''`)
 An attempt to retrieve a list of minions failed
- exception** `salt.exceptions.SaltRenderError` (*message*, *line_num=None*, *buf=''*, *marker='<====='*, *trace=None*)
 Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, `get_context` will be invoked to get the location of the error.
- exception** `salt.exceptions.SaltReqTimeoutError` (*message*=`''`)
 Thrown when a salt master request call fails to return within the timeout

`exception salt.exceptions.SaltRunnerError (message='')`

Problem in runner

`exception salt.exceptions.SaltSyndicMasterError (message='')`

Problem while proxying a request in the syndication master

`exception salt.exceptions.SaltSystemExit (code=0, msg=None)`

This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

`exception salt.exceptions.SaltWheelError (message='')`

Problem in wheel

`exception salt.exceptions.TimedProcTimeoutError (message='')`

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

`exception salt.exceptions.TokenAuthenticationError (message='')`

Thrown when token authentication fails

`exception salt.exceptions.VMwareApiError (message='', info=None)`

Used when a VMware object cannot be retrieved

`exception salt.exceptions.VMwareConnectionError (message='', info=None)`

Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

`exception salt.exceptions.VMwareSaltError (message='', info=None)`

Used when a VMware object cannot be retrieved

`salt.exceptions.get_error_message (error)`

Get human readable message from Python Exception

Salt opts dictionary

It is very common in the Salt codebase to see *opts* referred to in a number of contexts.

For example, it can be seen as `__opts__` in certain cases, or simply as *opts* as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of *opts* from scratch in order to have it available for a given function.

To do so, use the utility functions available in *salt.config*.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display *opts* for a master, the process is similar:

```
import salt.config
opts = salt.config.master_config('/etc/salt/master')
print(opts)
```

Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's *excellent introduction to the topic* <<http://nedbatchelder.com/text/unipain/unipain.html>>.

Salt's basic workflow for Unicode handling is as follows:

- 1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.
 2. Modules and various Salt pluggable systems use incoming data assuming Unicode.
 - 2.1) For Salt modules that query an API; the module should convert the data received from the API into Unicode.
 - 2.2) For Salt modules that shell out to get output; the module should convert data received into Unicode. (This does not apply if using the *cmd* execution module, which should handle this for you.
 - 2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.
 3. When a function in a Salt module returns, it should return Unicode.
- 4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

18.25 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

18.25.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

<http://hubblestack.io/>

18.25.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

<https://github.com/zulily/alkali>

18.25.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

<https://github.com/zulily/buoyant>

18.25.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

<https://github.com/elasticdog/salt-sandbox>

18.25.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

<https://github.com/UtahDave/salt-vagrant-demo>

18.26 Salt's Test Suite: An Introduction

Note: This tutorial makes a couple of assumptions. The first assumption is that you have a basic knowledge of Salt. To get up to speed, check out the Salt Walkthrough.

The second assumption is that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

Salt comes with a powerful integration and unit test suite. The test suite allows for the fully automated run of integration and/or unit tests from a single interface.

Salt's test suite is located under the `tests` directory in the root of Salt's code base and is divided into two main types of tests: *unit tests* and *integration tests*. The `unit` and `integration` sub-test-suites are located in the `tests` directory, which is where the majority of Salt's test cases are housed.

18.26.1 Getting Set Up For Tests

There are a couple of requirements, in addition to Salt's requirements, that need to be installed in order to run Salt's test suite. You can install these additional requirements using the files located in the `salt/requirements` directory, depending on your relevant version of Python:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

18.26.2 Test Directory Structure

As noted in the introduction to this tutorial, Salt's test suite is located in the `tests` directory in the root of Salt's code base. From there, the tests are divided into two groups `integration` and `unit`. Within each of these directories, the directory structure roughly mirrors the directory structure of Salt's own codebase. For example, the files inside `tests/integration/modules` contains tests for the files located within `salt/modules`.

Note: `tests/integration` and `tests/unit` are the only directories discussed in this tutorial. With the exception of the `tests/runtests.py` file, which is used below in the *Running the Test Suite* section, the other directories and files located in `tests` are outside the scope of this tutorial.

Integration vs. Unit

Given that Salt's test suite contains two powerful, though very different, testing approaches, when should you write integration tests and when should you write unit tests?

Integration tests use Salt masters, minions, and a syndic to test salt functionality directly and focus on testing the interaction of these components. Salt's integration test runner includes functionality to run Salt execution modules, runners, states, shell commands, salt-ssh commands, salt-api commands, and more. This provides a tremendous ability to use Salt to test itself and makes writing such tests a breeze. Integration tests are the preferred method of testing Salt functionality when possible.

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic. Unit tests should be used to test a function's exit point(s) such as any `return` or `raises` statements.

Unit tests are also useful in cases where writing an integration test might not be possible. While the integration test suite is extremely powerful, unfortunately at this time, it does not cover all functional areas of Salt's ecosystem. For example, at the time of this writing, there is not a way to write integration tests for Proxy Minions. Since the test runner will need to be adjusted to account for Proxy Minion processes, unit tests can still provide some testing support in the interim by testing the logic contained inside Proxy Minion functions.

18.26.3 Running the Test Suite

Once all of the *requirements* are installed, the `runtests.py` file in the `salt/tests` directory is used to instantiate Salt's test suite:

```
python tests/runtests.py [OPTIONS]
```

The command above, if executed without any options, will run the entire suite of integration and unit tests. Some tests require certain flags to run, such as destructive tests. If these flags are not included, then the test suite will only perform the tests that don't require special attention.

At the end of the test run, you will see a summary output of the tests that passed, failed, or were skipped.

The test runner also includes a `--help` option that lists all of the various command line options:

```
python tests/runtests.py --help
```

You can also call the test runner as an executable:

```
./tests/runtests.py --help
```

Running Integration Tests

Salt's set of integration tests use Salt to test itself. The integration portion of the test suite includes some built-in Salt daemons that will spin up in preparation of the test run. This list of Salt daemon processes includes:

- 2 Salt Masters
- 2 Salt Minions
- 1 Salt Syndic

These various daemons are used to execute Salt commands and functionality within the test suite, allowing you to write tests to assert against expected or unexpected behaviors.

A simple example of a test utilizing a typical master/minion execution module command is the test for the `test_ping` function in the `tests/integration/modules/test.py` file:

```
def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function('test.ping'))
```

The test above is a very simple example where the `test.ping` function is executed by Salt's test suite runner and is asserting that the minion returned with a `True` response.

Test Selection Options

If you look in the output of the `--help` command of the test runner, you will see a section called `Tests Selection Options`. The options under this section contain various subsections of the integration test suite such as `--modules`, `--ssh`, or `--states`. By selecting any one of these options, the test daemons will spin up and the integration tests in the named subsection will run.

```
./tests/runtests.py --modules
```

Note: The testing subsections listed in the `Tests Selection Options` of the `--help` output *only* apply to the integration tests. They do not run unit tests.

Running Unit Tests

While `./tests/runtests.py` executes the *entire* test suite (barring any tests requiring special flags), the `--unit` flag can be used to run *only* Salt's unit tests. Salt's unit tests include the tests located in the `tests/unit` directory.

The unit tests do not spin up any Salt testing daemons as the integration tests do and execute very quickly compared to the integration tests.

```
./tests/runtests.py --unit
```

Running Specific Tests

There are times when a specific test file, test class, or even a single, individual test need to be executed, such as when writing new tests. In these situations, the `--name` option should be used.

For running a single test file, such as the pillar module test file in the integration test directory, you must provide the file path using `.` instead of `/` as separators and no file extension:

```
./tests/runtests.py --name=integration.modules.pillar
./tests/runtests.py -n integration.modules.pillar
```

Some test files contain only one test class while other test files contain multiple test classes. To run a specific test class within the file, append the name of the test class to the end of the file path:

```
./tests/runtests.py --name=integration.modules.pillar.PillarModuleTest
./tests/runtests.py -n integration.modules.pillar.PillarModuleTest
```

To run a single test within a file, append both the name of the test class the individual test belongs to, as well as the name of the test itself:

```
./tests/runtests.py --name=integration.modules.pillar.PillarModuleTest.test_data
./tests/runtests.py -n integration.modules.pillar.PillarModuleTest.test_data
```

The `--name` and `-n` options can be used for unit tests as well as integration tests. The following command is an example of how to execute a single test found in the `tests/unit/modules/cp_test.py` file:

```
./tests/runtests.py -n unit.modules.cp_test.CpTestCase.test_get_template_success
```

18.26.4 Writing Tests for Salt

Once you're comfortable running tests, you can now start writing them! Be sure to review the [Integration vs. Unit](#) section of this tutorial to determine what type of test makes the most sense for the code you're testing.

Note: There are many decorators, naming conventions, and code specifications required for Salt test files. We will not be covering all of these specifics in this tutorial. Please refer to the testing documentation links listed below in the [Additional Testing Documentation](#) section to learn more about these requirements.

In the following sections, the test examples assume the `new` test is added to a test file that is already present and regularly running in the test suite and is written with the correct requirements.

Writing Integration Tests

Since integration tests validate against a running environment, as explained in the [Running Integration Tests](#) section of this tutorial, integration tests are very easy to write and are generally the preferred method of writing Salt tests.

The following integration test is an example taken from the `test.py` file in the `tests/integration/modules` directory. This test uses the `run_function` method to test the functionality of a traditional execution module command.

The `run_function` method uses the integration test daemons to execute a `module.function` command as you would with Salt. The minion runs the function and returns. The test also uses [Python's Assert Functions](#) to test that the minion's return is expected.

```
def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function('test.ping'))
```

Args can be passed in to the `run_function` method as well:

```
def test_echo(self):
    """
    test.echo
    """
    self.assertEqual(self.run_function('test.echo', ['text']), 'text')
```

The next example is taken from the `tests/integration/modules/aliases.py` file and demonstrates how to pass kwargs to the `run_function` call. Also note that this test uses another salt function to ensure the correct data is present (via the `aliases.set_target` call) before attempting to assert what the `aliases.get_target` call should return.

```
def test_set_target(self):
    """
    aliases.set_target and aliases.get_target
    """
    set_ret = self.run_function(
        'aliases.set_target',
        alias='fred',
        target='bob')
    self.assertTrue(set_ret)
    tgt_ret = self.run_function(
        'aliases.get_target',
        alias='fred')
    self.assertEqual(tgt_ret, 'bob')
```

Using multiple Salt commands in this manner provides two useful benefits. The first is that it provides some additional coverage for the `aliases.set_target` function. The second benefit is the call to `aliases.get_target` is not dependent on the presence of any aliases set outside of this test. Tests should not be dependent on the previous execution, success, or failure of other tests. They should be isolated from other tests as much as possible.

While it might be tempting to build out a test file where tests depend on one another before running, this should be avoided. SaltStack recommends that each test should test a single functionality and not rely on other tests. Therefore, when possible, individual tests should also be broken up into singular pieces. These are not hard-and-fast rules, but serve more as recommendations to keep the test suite simple. This helps with debugging code and related tests when failures occur and problems are exposed. There may be instances where large tests use many asserts to set up a use case that protects against potential regressions.

Note: The examples above all use the `run_function` option to test execution module functions in a traditional master/minion environment. To see examples of how to test other common Salt components such as runners, salt-api, and more, please refer to the [Integration Test Class Examples](#) documentation.

Destructive vs Non-destructive Tests

Since Salt is used to change the settings and behavior of systems, often, the best approach to run tests is to make actual changes to an underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

To write a destructive test, import and use the `destructiveTest` decorator for the test method:

```
import integration
from salttesting.helpers import destructiveTest
```

```

class PkgTest(integration.ModuleCase):
    @destructiveTest
    def test_pkg_install(self):
        ret = self.run_function('pkg.install', name='finch')
        self.assertSaltTrueReturn(ret)
        ret = self.run_function('pkg.purge', name='finch')
        self.assertSaltTrueReturn(ret)

```

Writing Unit Tests

As explained in the *Integration vs. Unit* section above, unit tests should be written to test the *logic* of a function. This includes focusing on testing `return` and `raises` statements. Substantial effort should be made to mock external resources that are used in the code being tested.

External resources that should be mocked include, but are not limited to, APIs, function calls, external data either globally available or passed in through function arguments, file data, etc. This practice helps to isolate unit tests to test Salt logic. One handy way to think about writing unit tests is to “block all of the exits”. More information about how to properly mock external resources can be found in Salt’s Unit Test documentation.

Salt’s unit tests utilize Python’s `mock` class as well as `MagicMock`. The `@patch` decorator is also heavily used when “blocking all the exits”.

A simple example of a unit test currently in use in Salt is the `test_get_file_not_found` test in the `tests/unit/modules/cp_test.py` file. This test uses the `@patch` decorator and `MagicMock` to mock the return of the call to Salt’s `cp.hash_file` execution module function. This ensures that we’re testing the `cp.get_file` function directly, instead of inadvertently testing the call to `cp.hash_file`, which is used in `cp.get_file`.

```

@patch('salt.modules.cp.hash_file', MagicMock(return_value=False))
def test_get_file_not_found(self):
    """
    Test if get_file can't find the file.
    """
    path = 'salt://saltines'
    dest = '/srv/salt/cheese'
    ret = ''
    self.assertEqual(cp.get_file(path, dest), ret)

```

Note that Salt’s `cp` module is imported at the top of the file, along with all of the other necessary testing imports. The `get_file` function is then called directly in the testing function, instead of using the `run_function` method as the integration test examples do above.

The call to `cp.get_file` returns an empty string when a `hash_file` isn’t found. Therefore, the example above is a good illustration of a unit test “blocking the exits” via the `@patch` decorator, as well as testing logic via asserting against the `return` statement in the `if` clause.

There are more examples of writing unit tests of varying complexities available in the following docs:

- [Simple Unit Test Example](#)
- [Complete Unit Test Example](#)
- [Complex Unit Test Example](#)

Note: Considerable care should be made to ensure that you’re testing something useful in your test functions. It is very easy to fall into a situation where you have mocked so much of the original function that the test results in

only asserting against the data you have provided. This results in a poor and fragile unit test.

18.26.5 Checking for Log Messages

To test to see if a given log message has been emitted, the following pattern can be used

```
# Import logging handler
from salttesting.helpers import TestsLoggingHandler

# .. inside test
with TestsLoggingHandler() as handler:
    for message in handler.messages:
        if message.startswith('ERROR: This is the error message we seek'):
            break
        else:
            raise AssertionError('Did not find error message')
```

18.26.6 Automated Test Runs

SaltStack maintains a Jenkins server which can be viewed at <https://jenkins.saltstack.com>. The tests executed from this Jenkins server create fresh virtual machines for each test run, then execute the destructive tests on the new, clean virtual machine. This allows for the execution of tests across supported platforms.

18.26.7 Additional Testing Documentation

In addition to this tutorial, there are some other helpful resources and documentation that go into more depth on Salt's test runner, writing tests for Salt code, and general Python testing documentation. Please see the follow references for more information:

- *Salt's Test Suite Documentation*
- Integration Tests
- Unit Tests
- MagicMock
- Python Unittest
- Python's Assert Functions

Release Notes

See the version numbers page for more information about the version numbering scheme.

19.1 Latest Branch Release

Release Candidate

19.2 Previous Releases

19.2.1 Salt 2016.11.0 Release Notes - Codename Carbon

New Features

Docker Introspection and Configuration

Major additions have been made to the Docker support in 2016.11.0. The new addition allows Salt to be executed within a Docker container without a minion running or installed in the container. This allows states to be run inside a container, but also all of Salt's remote execution commands to be run inside docker containers as well. This makes container introspection simple and powerful. See the tutorial on using this new feature here:

See Salt in Docker Containers.

Advanced Ceph Control

Our friends over at SUSE have delivered a powerful new tool to make the deployment of Ceph storage systems using Salt very easy. These new Ceph tools allow for a storage system to be easily defined using the new *ceph.quorum* state.

Thorium Additions and Improvements

The Thorium advanced reactor has undergone extensive testing and updates. These updates include many more Thorium states, a system for automating key management, the ability to use Thorium to easily replace old reactors and a great deal of stability and bug fixes.

State Rollback Using Snapper

Rollback has been one of the most prevalent requests for Salt. We have researched it extensively and concluded that the only way to accomplish truly reliable rollback would be to execute it at the filesystem layer. To accomplish this we have introduced Snapper integration into Salt States.

Snapper is a tool which allows for simple and reliable snapshots of the filesystem to be made. With the new *snap-per_states* option set to *True* in the minion config a snapshot will be made before and after every Salt State run.

These snapshots can be viewed, managed and rolled back to via the *snapper* execution module.

Preserve File Perms in File States

This feature has been requested for years, the ability to set a flag and use the same file permissions for files deployed to a minion as the permissions set to the file on the master. Just set the *keep_mode* option on any file management state to *True*.

Ponies!

We all agreed that cowsay was just not good enough, install the *ponysay* command and the new *pony* outputter will work. Fun for the whole family!

Additional Features

- Minions can run in stand-alone mode to use beacons and engines without having to connect to a master. (Thanks @adelcast!)
- Added a `salt` runner to allow running salt modules via salt-run.

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

- Added SSL support to Cassandra CQL returner. SSL can be enabled by setting `ssl_options` for the returner. Also added support for specifying `protocol_version` when establishing cluster connection.
- The `mode` parameter in the *file.managed* state, and the `file_mode` parameter in the *file.recurse* state, can both now be set to `keep` and the minion will keep the mode of the file from the Salt fileserver. This works only with files coming from sources prefixed with `salt://`, or files local to the minion (i.e. those which are absolute paths, or are prefixed with `file://`). For example:

```
/etc/myapp/myapp.conf:
  file.managed:
    - source: salt://conf/myapp/myapp.conf
    - mode: keep

/var/www/myapp:
  file.recurse:
    - source: salt://path/to/myapp
    - dir_mode: 755
    - file_mode: keep
```

- The `junos` state module is now available. It has all the functions that are present in the `junos` execution module.

- The minion data cache is a pluggable data store now. It's configurable with `cache` option. Default is `localfs`.
- User names in `client_acl` support glob matching now.

New Top File Merging Strategy for States

A new strategy called `merge_all` has been added to provide a new way of merging top file matches when executing a *highstate*. See the `top_file_merging_strategy` documentation for further information.

In addition, the same merging strategy was not functioning as documented. This has now been corrected. While this is technically a bugfix, we decided to hold a change in top file merging until a feature release to minimize user impact.

Improved Archive Extraction Support

The *archive.extracted* state has been overhauled. Notable changes include the following:

- When enforcing ownership (with the `user` and/or `group` arguments), the `if_missing` argument no longer has any connection to which path(s) have ownership enforced. Instead, the paths are determined using the either the newly-added `archive.list` function, or the newly-added `enforce_ownership_on` argument.
- `if_missing` also is no longer required to skip extraction, as Salt is now able to tell which paths would be present if the archive were extracted. It should, in most cases, only be necessary in cases where a semaphore file is used to conditionally skip extraction of the archive.
- Password-protected ZIP archives are now detected before extraction, and the state fails without attempting to extract the archive if no password was specified.
- By default, a single top-level directory is enforced, to guard against 'tar-bombs'. This enforcement can be disabled by setting `enforce_toplevel` to `False`.
- The `tar_options` and `zip_options` arguments have been deprecated in favor of a single `options` argument.
- The `archive_format` argument is now optional. The ending of the `source` argument is used to guess whether it is a tar, zip or rar file. If the `archive_format` cannot be guessed, then it will need to be specified, but in many cases it can now be omitted.
- Ownership enforcement is now performed irrespective of whether or not the archive needed to be extracted. This means that the state can be re-run after the archive has been fully extracted to repair changes to ownership.

A number of new arguments were also added. See the docs `py:func:docs for the archive.extracted state <salt.states.archive.extracted>` for more information.

Additionally, the following changes have been made to the *archive* execution module:

- A new function (`archive.list`) has been added. This function lists the files/directories in an archive file, and supports a `verbose` argument that gives a more detailed breakdown of which paths are files, which are directories, and which paths are at the top level of the archive.
- A new function (`archive.is_encrypted`) has been added. This function will return `True` if the archive is a password-protected ZIP file, `False` if not. If the archive is not a ZIP file, an error will be raised.
- `archive.cmd_unzip` now supports passing a password, bringing it to feature parity with `archive.unzip`. Note that this is still not considered to be secure, and `archive.unzip` is recommended for dealing with password-protected ZIP archives.
- The default value for the `extract_perms` argument to `archive.unzip` has been changed to `True`.

Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

Note: This improved functionality is also available in the 2016.3 (Boron) release cycle, starting with the 2016.3.5 release.

Config Changes

The following default config values were changed:

- `gitfs_ssl_verify`: Changed from `False` to `True`
- `git_pillar_ssl_verify`: Changed from `False` to `True`
- `winrepo_ssl_verify`: Changed from `False` to `True`

Grains Changes

- All core grains containing `VMWare` have been changed to `VMware`, which is the [official capitalization](#). Additionally, all references to `VMWare` in the documentation have been changed to `VMware` [issue 30807](#). Environments using versions of Salt before and after Salt 2016.11.0 should employ case-insensitive grain matching on these grains.

```
{% set on_vmware = grains['virtual'].lower() == 'vmware' %}
```

- On Windows the `cpu_model` grain has been changed to provide the actual cpu model name and not the cpu family.

Old behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
    Intel64 Family 6 Model 58 Stepping 9, GenuineIntel
```

New behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
    Intel(R) Core(TM) i7-3520M CPU @ 2.90GHz
```

Beacons Changes

- The `loadavg` beacon now outputs averages as integers instead of strings. (Via [issue 31124](#).)

Runner Changes

- Runners can now call out to *utility modules* via `__utils__`.
- `ref:Utility modules <writing-utility-modules>` (placed in `salt://_utils/`) are now able to be synced to the master, making it easier to use them in custom runners. A `saltutil.sync_utils` function has been added to the `saltutil runner` to facilitate the syncing of utility modules to the master.

Pillar Changes

- Thanks to the new `saltutil.sync_utils` runner, it is now easier to get `ref:utility modules <writing-utility-modules>` synced to the correct location on the Master so that they are available in execution modules called from Pillar SLS files.

Network Automation: NAPALM

Beginning with 2016.11.0, network automation is included by default in the core of Salt. It is based on a the [NAPALM](#) library and provides facilities to manage the configuration and retrieve data from network devices running widely used operating systems such: JunOS, IOS-XR, eOS, IOS, NX-OS etc. - see [the complete list of supported devices](#).

The connection is established via the *NAPALM proxy*.

In the current release, the following modules were included:

- `NAPALM grains` - Select network devices based on their characteristics
- *NET execution module* - Networking basic features
- *NTP execution module*
- *BGP execution module*
- `Routes execution module`
- `SNMP execution module`
- `Users execution module`
- *Probes execution module*
- *NTP peers management state*
- `SNMP configuration management state`
- `Users management state`

Junos Module Changes

- The following new functionalities were added to the `junos` module
 - `facts` - Displays the facts gathered during the connection.
 - `shutdown` - Shut down or reboot a device running Junos OS.
 - `install_config` - Modify the configuration of a Junos device.

- `install_os` - Install Junos OS software package.
- `zeroize` - Remove all configuration information on the Routing Engines and reset all key values on a device.
- `file_copy` - Copy file from proxy to the Junos device.

Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

Renderer Changes

Added the ability to restrict allowed renderers. Two new config parameters, `renderer_whitelist` and `renderer_blacklist` are introduced for this purpose.

eAuth Changes

- External auth modules' `auth` method can return an ACL list for the given username instead of `True`. This list should be in the same format as described in the [eAuth documentation](#). It will be used for the user instead of one set in master config.

Example of the `auth` method return that allows a user to execute functions in the `test` and `network` modules on the minions that match the `web*` target and allow access to `wheel` and `runner` modules:

```
[{'web*': ['test.*',
          'network.*']},
 '@wheel',
 '@runner']
```

- External auth is supported by `salt-run` and `salt-key` now. Note that master must be started to use them with eAuth.

External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See external module packaging tutorial for more information.

Functionality Changes

- The `onfail` requisite now uses OR logic instead of AND logic. [issue 22370](#)
- The `consul` external pillar now strips leading and trailing whitespace. [issue 31165](#)
- The `win_system.py` state is now case sensitive for computer names. Previously computer names set with a state were converted to all caps. If you have a state setting computer names with lower case letters in the name that has been applied, the computer name will be changed again to apply the case sensitive name.
- The `mac_user.list_groups` function in the `mac_user` execution module now lists all groups for the specified user, including groups beginning with an underscore. In previous releases, groups beginning with an underscore were excluded from the list of groups.
- The `junos.call_rpc` function in the `junos` execution module can now be used to call any valid rpc. Earlier it used to call only `get_software_information`.

- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default `hash_type` is now `sha256` instead of `md5`. You will need to make sure both your master and minion share the same `hash_type`.
- Nodegroups consisting of a simple list of minion IDs can now also be declared as a yml list. The below two examples are equivalent:

```
# Traditional way
nodegroups:
  - group1: L@host1,host2,host3

# New way (optional)
nodegroups:
  - group1:
    - host1
    - host2
    - host3
```

New Azure ARM Cloud Driver

A new cloud driver has been added for Azure ARM, aka, the Azure Resource Manager. The older Azure driver is still required to work with the older Azure API. This new driver works with the newer ARM API, which is managed via the newer Azure Portal website.

New Modules

Beacons

- `salt.beacons.avahi_announce`
- `salt.beacons.bonjour_announce`
- `salt.beacons.haproxy`
- `salt.beacons.status`

Clouds

- `salt.cloud.clouds.azurearm`

Engines

- `salt.engines.hipchat`

Modules

- `salt.modules.boto_cloudwatch_event`
- `salt.modules.celery`

- salt.modules.ceph
- salt.modules.influx08
- salt.modules.inspectlib.entities
- salt.modules.inspectlib.fsdb
- salt.modules.inspectlib.kiwiproc
- salt.modules.inspector
- salt.modules.libcloud_dns
- salt.modules.openstack_mng
- salt.modules.servicenow
- salt.modules.testinframod
- salt.modules.win_lgpo
- salt.modules.win_pki
- salt.modules.win_psget
- salt.modules.win_snmp
- salt.modules.xbpspkg

Outputters

- salt.output.pony

Pillar

- salt.pillar.csvpillar
- salt.pillar.http_json
- salt.pillar.makostack

Returners

- salt.returners.zabbix_return

Runners

- salt.runners.auth
- salt.runners.event
- salt.runners.smartos_vmadm
- salt.runners.vistara

SDB

- salt.sdb.env

States

- `salt.states.boto_cloudwatch_event`
- `salt.states.csf`
- `salt.states.ethtool`
- `salt.states.influxdb08_database`
- `salt.states.influxdb08_user`
- `salt.states.libcloud_dns`
- `salt.states.snapper`
- `salt.states.testinframod`
- `salt.states.win_lgpo`
- `salt.states.win_pki`
- `salt.states.win_snmp`

Thorium

- `salt.thorium.calc`
- `salt.thorium.key`
- `salt.thorium.runner`
- `salt.thorium.status`
- `salt.thorium.wheel`

Deprecations

General Deprecations

- `env` to `saltenv`

All occurrences of `env` and some occurrences of `__env__` marked for deprecation in Salt 2016.11.0 have been removed. The new way to use the salt environment setting is with a variable called `saltenv`:

```
def fcn(msg='', env='base', refresh=True, saltenv='base', **kwargs):
```

has been changed to

```
def fcn(msg='', refresh=True, saltenv='base', **kwargs):
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that also accepts arbitrary keyword arguments, then a new warning informs the user that `env` is no longer used if it is found. This new warning will be removed in Salt Nitrogen.

```
def fcn(msg='', refresh=True, saltenv='base', **kwargs):
```

```
# will result in a warning log message
fcn(msg='add more salt', env='prod', refresh=False)
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that does not accept arbitrary keyword arguments, then python will issue an error.

```
def fcn(msg='', refresh=True, saltenv='base'):
```

```
# will result in a python TypeError  
fcn(msg='add more salt', env='prod', refresh=False)
```

- If `env` (or `__env__`) is supplied as a positional argument to a function, then undefined behavior will occur, as the removal of `env` and `__env__` from the function's argument list changes the function's signature.

```
def fcn(msg='', refresh=True, saltenv='base'):
```

```
# will result in refresh evaluating to True and saltenv likely not being a  
↳string at all  
fcn('add more salt', 'prod', False)
```

- Deprecations in `minion.py`:
 - The `salt.minion.parse_args_and_kwargs` function has been removed. Please use the `salt.minion.load_args_and_kwargs` function instead.

Cloud Deprecations

- The `vsphere` cloud driver has been removed. Please use the `vmware` cloud driver instead.
- The `private_ip` option in the `linode` cloud driver is deprecated and has been removed. Use the `assign_private_ip` option instead.
- The `create_dns_record` and `delete_dns_record` functions are deprecated and have been removed from the `digital_ocean` driver. Use the `post_dns_record` function instead.

Execution Module Deprecations

- The `blockdev` execution module had four functions removed:
 - `dump`
 - `tune`
 - `resize2fs`
 - `wipe`

The `disk` module should be used instead with the same function names.

- The `boto_vpc` execution module had two functions removed, `boto_vpc.associate_new_dhcp_options_to_vpc` and `boto_vpc.associate_new_network_acl_to_subnet` in favor of more concise function names, `boto_vpc.create_dhcp_options` and `boto_vpc.create_network_acl`, respectively.
- The `data` execution module had `getval` and `getvals` functions removed in favor of one function, `get`, which combines the functionality of the removed functions.
- File module deprecations:
 - The `contains_regex_multiline` function was removed. Use `file.search` instead.

- Additional command line options for `file.grep` should be passed one at a time. Please do not pass more than one in a single argument.
- The `lxc` execution module has the following changes:
 - The `run_cmd` function was removed. Use `lxc.run` instead.
 - The `nic` argument was removed from the `lxc.init` function. Use `network_profile` instead.
 - The `clone` argument was removed from the `lxc.init` function. Use `clone_from` instead.
 - passwords passed to the `lxc.init` function will be assumed to be hashed, unless `password_encrypted=False`.
 - The `restart` argument for `lxc.start` was removed. Use `lxc.restart` instead.
 - The old style of defining `lxc` containers has been removed. Please use keys under which LXC profiles should be configured such as `lxc.container_profile.profile_name`.
- The `env` and `activate` keyword arguments have been removed from the `install` function in the `pip` execution module. The use of `bin_env` replaces both of these options.
- `reg` execution module

Functions in the `reg` execution module had misleading and confusing names for dealing with the Windows registry. They failed to clearly differentiate between hives, keys, and name/value pairs. Keys were treated like value names. There was no way to delete a key.

New functions were added in 2015.5 to properly work with the registry. They also made it possible to edit key default values as well as delete an entire key tree recursively. With the new functions in place, the following functions have been deprecated:

- `read_key`
- `set_key`
- `create_key`
- `delete_key`

Use the following functions instead:

- for `read_key` use `read_value`
- for `set_key` use `set_value`
- for `create_key` use `set_value` with no `vname` and no `vdata`
- for `delete_key` use `delete_key_recursive`. To delete a value, use `delete_value`.

- The `hash_hostname` option was removed from the `salt.modules.ssh` execution module. The `hash_known_hosts` option should be used instead.
- The `human_readable` option was removed from the `uptime` function in the `status` execution module. The function was also updated in 2015.8.9 to return a more complete offering of uptime information, formatted as an easy-to-read dictionary. This updated function replaces the need for the `human_readable` option.
- The `persist` kwarg was removed from the `win_useradd` execution module. This option is no longer supported for Windows. `persist` is only supported as part of user management in UNIX/Linux.
- The `zpool_list` function in the `zpool` execution module was removed. Use `list` instead.

Outputter Module Deprecations

- The `compact` outputter has been removed. Set `state_verbose` to `False` instead.

Runner Module Deprecations

- The `grains.cache` runner no longer accepts `outputter` or `minion` as keyword arguments. Users will need to specify an outputter using the `--out` option. `tgt` is replacing the `minion` kwarg.
- The `fileservers` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- The `jobs` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- `virt` runner module:
 - The `hyper` kwarg was removed from the `init`, `list`, and `query` functions. Use the `host` option instead.
 - The `next_hyper` function was removed. Use the `next_host` function instead.
 - The `hyper_info` function was removed. Use the `host_info` function instead.

State Module Deprecations

- The `env` and `activate` keyword arguments were removed from the `installed` function in the `pip` state module. The use of `bin_env` replaces both of these options.
- `reg` state module

The `reg` state module was modified to work with the new functions in the execution module. Some logic was left in the `reg.present` and the `reg.absent` functions to handle existing state files that used the final key in the name as the value name. That logic has been removed so you now must specify value name (`vname`) and, if needed, value data (`vdata`).

For example, a state file that adds the version value/data pair to the `Software\Salt` key in the `HKEY_LOCAL_MACHINE` hive used to look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
  reg.present:
    - value: 2016.3.1
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

A state file for removing the same value added above would have looked like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
  reg.absent:
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
  reg.absent:
    - vname: version
```

This new structure is important as it allows salt to deal with key default values which was not possible before. If `vname` is not passed, salt will work with the default value for that hivekey.

Additionally, since you could only delete a value from a the state module, a new function (`key_absent`) has been added to allow you to delete a registry key and all subkeys and name/value pairs recursively. It uses the new `delete_key_recursive` function.

For additional information see the documentation for the `reg` execution and state modules.

- `lxc` state module: The following functions were removed from the `lxc` state module:
 - `created`: replaced by the `present` state.
 - `started`: replaced by the `running` state.
 - `cloned`: replaced by the `present` state. Use the `clone_from` argument to set the name of the clone source.
- The `hash_hostname` option was removed from the `salt.states.ssh_known_hosts` state. The `hash_known_hosts` option should be used instead.
- The `always` kwarg used in the `built` function of the `pkgbuild` state module was removed. Use `force` instead.

Utils Module Deprecations

- The use of `jid_dir` and `jid_load` were removed from the `salt.utils.jid.jid_dir` functionality for `job_cache` management was moved to the `local_cache` returner. `jid_load` data is now retrieved from the `master_job_cache`.
- `ip_in_subnet` function in `salt.utils.network.py` has been removed. Use the `in_subnet` function instead.
- The `iam` utils module had two functions removed: `salt.utils.iam.get_iam_region` and `salt.utils.iam.get_iam_metadata` in favor of the `aws` utils functions `salt.utils.aws.get_region_from_metadata` and `salt.utils.aws.creds`, respectively.

19.2.2 Salt 2016.11.1 Release Notes

Version 2016.11.1 is a bugfix release for *2016.11.0*.

Changes for v2016.11.0..v2016.11.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Statistics:

- Total Merges: 89
- Total Issue references: 55
- Total PR references: 155

Changes:

- **PR #38182: (rallytime)** [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-09T21:25:47Z
 - **PR #38177: (vutny)** Correct `cp.get_file_str` docstring and add integration tests
 - **PR #38163: (Ch3LL)** enabled ec2 cloud tests
 - **PR #38153: (vutny)** Master config includes may contain errors and be safely skipped

- 23c0393 Merge pull request #38182 from rallytime/merge-2016.11
- 627242a Merge branch `2016.3' into `2016.11'
 - * 65b2ad7 Merge pull request #38163 from Ch3LL/enabled_ec2_cloud
 - be74c45 enabled ec2 cloud tests
 - * b63f74e Merge pull request #38177 from vutny/fix-cp-get-file-str
 - a449980 Correct *cp.get_file_str* docstring and add integration tests
 - * 7596313 Merge pull request #38153 from vutny/master-includes-error-tolerance
 - cd0154e Master config includes may contain errors and be safely skipped
- PR #38158: (*cachedout*) Fix type problem in *grains.filter_by* @ 2016-12-09T21:24:40Z
 - ISSUE #38094: (*bartuss7*) TypeError: object of type `float' has no len() in *grains.filter_by* | refs: #38158
 - 8355adc Merge pull request #38158 from *cachedout/issue_38094*
 - e8196e2 Lint, remove set literal
 - 9f4ebb3 Fix type problem in *grains.filter_by*
- PR #38156: (*terminalmage*) Remove *rtag* when windows minion refreshes early in state @ 2016-12-09T21:15:01Z
 - ISSUE #38090: (*jf*) *pkg.installed* does not seem to refresh the repo database, no matter what | refs: #38113 #38156
 - 31a157d Merge pull request #38156 from *terminalmage/fix-windows-refresh*
 - 258bd4c Remove *rtag* when windows minion refreshes early in state
- PR #38183: (*cro*) Fix bad set operations when setting up securitygroups in AWS. @ 2016-12-09T21:12:10Z
 - ISSUE #37981: (*tazaki*) Salt-cloud ec2 vpc securitygroupid always returning default | refs: #38183
 - PR #37891: (*isbm*) rsync port to 2015.8
 - c638952 Merge pull request #38183 from *cro/fix_37891*
 - 0527d6f Fix bad set operations when setting up securitygroups in AWS. Fixes #37891.
- fc95045 Reset socket default timeout to None (fixes *daemons_tests* failures) (#38181)
 - PR #38181: (*rallytime*) Reset socket default timeout to None (fixes *daemons_tests* failures)
- PR #38148: (*whiteinge*) Remove *ssh_async* from *NetapiClient* clients; it is not implemented @ 2016-12-09T18:49:42Z
 - 7ccbedd Merge pull request #38148 from *whiteinge/no-ssh-async-client*
 - cb58cd4 Remove *ssh_async* from *NetapiClient* clients; it is not implemented
- PR #38160: (*terminalmage*) Update information about *xz-utils* in archive state/module docs @ 2016-12-09T18:34:03Z
 - 8d4e194 Merge pull request #38160 from *terminalmage/update-archive-docs*
 - 8e4ad3c Update information about *xz-utils* in archive state/module docs
- PR #38164: (*techhat*) Add Azure ARM docs for 2016.11.0 @ 2016-12-09T18:00:22Z
 - ISSUE #38024: (*Ch3LL*) 2016.11.0 release notes missing azure arm reference | refs: #38164
 - 05136f0 Merge pull request #38164 from *techhat/azuredocs*
 - 71b787e Add Azure ARM docs for 2016.11.0

- **PR #38173:** (*rallytime*) Bump some win* module deprecations from Nitrogen to Oxygen @ 2016-12-09T16:57:29Z
 - e3c858c Merge pull request #38173 from rallytime/update-win-deprecation-versions
 - 09a50b2 Bump some win* module deprecations from Nitrogen to Oxygen
- **PR #38036:** (*terminalmage*) archive.extracted: fix problems with overwrite arg @ 2016-12-08T19:08:41Z
 - **PR #37889:** (*isbm*) Allow overwrite archives extraction | refs: #38036
 - 827bf59 Merge pull request #38036 from terminalmage/archive-extracted-override
 - a1c70c7 archive.extracted: fix problems with overwrite arg
- **PR #38133:** (*terminalmage*) Fix edge case in creation of trans tar for salt-thin @ 2016-12-08T17:47:26Z
 - 50773a5 Merge pull request #38133 from terminalmage/zd1067
 - 71e0bd0 Fix edge case in creation of trans tar for salt-thin
- **PR #38138:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T20:15:56Z
 - **PR #38134:** (*rallytime*) Skip daemon unit tests when running on Python 2.6
 - 6026cb2 Merge pull request #38138 from rallytime/merge-2016.11
 - 28b56ea Merge branch `2016.3' into `2016.11'
 - 86091db Skip daemon unit tests when running on Python 2.6 (#38134)
- **PR #38130:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T20:11:19Z
 - **ISSUE #38091:** (*tjyang*) [WARNING] salt.loaded.int.module.zenoss.__virtual__() is wrongly returning None. | refs: #38102
 - **ISSUE #36707:** (*do3meli*) slow FreeBSD sysctl module with test=true | refs: #36794
 - **PR #38104:** (*rallytime*) Back-port #36794 to 2016.3
 - **PR #38102:** (*rallytime*) Add False + msg tuple return if requests is missing for zenoss module
 - **PR #36794:** (*do3meli*) FreeBSD sysctl module now handels config_file parameter in show method | refs: #38104
 - 90478ef Merge pull request #38130 from rallytime/merge-2016.11
 - 4d7d9ab Merge branch `2016.3' into `2016.11'
 - * d3d98fd4 Merge pull request #38102 from rallytime/fix-38091
 - 4f79d5a Add False + msg tuple return if requests is missing for zenoss module
 - * 8c8cbc2 Merge pull request #38104 from rallytime/bp-36794
 - c906c8a Pylint fixes
 - da3ebf8 FreeBSD sysctl module now handels config_file parameter in show method
- 1a42e24 Fix beacon index (#38129)
 - **PR #38129:** (*Ch3LL*) Fix beacon index
- bbdfcab Add versionadded tags for network module funcs (#38127)
 - **PR #38127:** (*rallytime*) Add versionadded tags for network module funcs
- **PR #38043:** (*MTecknology*) Debian networking fix @ 2016-12-07T17:32:18Z

- **ISSUE #38042:** (*MTecknology*) [2016.11.0] Invalid interfaces file produced by debian_ip module | refs: #38043
- fd06bab Merge pull request #38043 from MTecknology/2016.11
- 6d5e132 Removing trailing whitespace from previous commit
- f882674 Adding some options that are valid for inet6 blocks.
- 81cb688 Better check for dual stack.
- 525c746 May Cthulhu take mercy on my soul for this commit.
- 300ca60 I guess this makes the previous commit a bit redundant, but I'm not sure if I want to remove it.
- 6e7fc39 This now seems absurdly obvious, but I'm not ruling out that I'll break everything.
- 82d2b89 Rolling back unit test.
- b3edbcf Adding larger and more complete debian_ip unit test.
- 3afd7b6 Adding the valid/documented `slaves' option.
- b6b1adc Typo: missing closing parenthesis
- 756e41c Fixing a typo; line should not be commented
- 32a1374 Corrects expected return value
- 88f9d9f Mostly whitespace & comment changes
- 41ffb8d Removing redundant line
- 3a81686 Ensure iface_dict not being populated will not produce a stacktrace
- 4de2cb2 Corrects regression in debian_ip/debian_eth.jinja
- **PR #38107:** (*cachedout*) Status beacon should raise proper exception @ 2016-12-07T17:21:49Z
 - **PR #38088:** (*dmurphy18*) Updated to match formulas and allow for missing functions | refs: #38107
 - 4b9a7f2 Merge pull request #38107 from cachedout/supercede_38088
 - 73d7248 Change to log.debug per Tom
 - da135b1 Fix docs
 - 792b422 Pylint fix
 - 88e03bb Fix typo
 - a8ce153 Status beacon should raise proper exception
- **PR #38101:** (*loregordon*) Clarifies file.replace behavior on symlinks @ 2016-12-07T13:27:11Z
 - da8f5ac Merge pull request #38101 from lorengordon/file-replace-note
 - 345990f Clarifies file.replace behavior on symlinks
- **PR #38113:** (*terminalmage*) Revert changes to refresh tag for pkg states @ 2016-12-07T13:11:14Z
 - **ISSUE #38090:** (*jf*) pkg.installed does not seem to refresh the repo database, no matter what | refs: #38113 #38156
 - d47761f Merge pull request #38113 from terminalmage/issue38090
 - 9f347df Revert changes to refresh tag for pkg states
- **PR #38120:** (*Da-Juan*) Fix status beacon config default values @ 2016-12-07T13:08:33Z
 - **ISSUE #37976:** (*t0nyhays*) Error when status beacon fires (2016.11.0) | refs: #38120

- d4c34e0 Merge pull request #38120 from Da-Juan/2016.11
- 7e4a35e Fix status beacon config default values
- **PR #38114:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-12-07T12:45:04Z
 - **ISSUE #38037:** (*dmurphy18*) pkg.latest and yumpkg.latest_version return incorrect package versions 2016.3 and 2016.11 | refs: #38045
 - **ISSUE #37939:** (*Talkless*) file.comment always report changes in test=True mode | refs: #38039
 - **ISSUE #35342:** (*morganwillcock*) win_pkg: refresh_db doesn't remove cached items which have been renamed or removed | refs: #38083
 - **PR #38083:** (*twangboy*) Only delete .sls files from winrepo-ng [DO NOT MERGE FORWARD]
 - **PR #38059:** (*rallytime*) Call exec_test for the Syndic daemon in tests.unit.daemons_test.py
 - **PR #38057:** (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38059
 - **PR #38045:** (*terminalmage*) yumpkg.py: don't include non-upgrade versions found by ``yum list available``
 - **PR #38039:** (*rallytime*) Check to see if a line is already commented before moving on
 - **PR #38034:** (*cachedout*) Modify daemons test to use multiprocessing | refs: #38059
 - 6868089 Merge pull request #38114 from rallytime/merge-2016.11
 - fec9dec Merge branch `2016.3` into `2016.11`
 - * fbc8776 Merge pull request #38083 from twangboy/fix_refresh_db
 - 978af6d Remove only .sls files from the cached winrepo-ng
 - * 9dcfdee Merge pull request #38059 from rallytime/daemons-test-fix
 - eb372b2 Add missing ``not`` statement: The last syndic test should assertFalse()
 - 4e10f8e Call exec_test for the Syndic daemon in tests.unit.daemons_test.py
 - * 9cd42b9 Merge pull request #38039 from rallytime/fix-37939
 - 1da7aac Update unit tests to account for additional file.search call
 - 8a685b1 Check to see if a line is already commented before moving on
 - f2c0455 Write an integration test demonstrating the issue
 - * a34a763 Merge pull request #38045 from terminalmage/issue38037
 - 6528950 Simplify logic for matching desired pkg arch with actual pkg arch
 - 3babbcd yumpkg.py: don't include non-upgrade versions found by ``yum list available``
- **PR #38109:** (*gtmanfred*) mode needs to be an integer @ 2016-12-07T11:58:24Z
 - b9920e5 Merge pull request #38109 from gtmanfred/2016.11
 - 7546760 mode needs to be an integer
- **PR #38103:** (*rallytime*) Back-port #37283 to 2016.11 @ 2016-12-06T23:12:59Z
 - **PR #37283:** (*jeanpralo*) Handle docker-compose up to version 1.9.0 | refs: #38103
 - **PR #37215:** (*mschneider82*) removed version check | refs: #37283
 - fd77dcb Merge pull request #38103 from rallytime/bp-37283
 - 11944df handle up to version 1.9.0

- PR #38057: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38059 @ 2016-12-06T23:11:41Z
 - ISSUE #37945: (*gstachowiak*) Missing exception handling in salt.master.Maintenance. Process never completes. | refs: #37961
 - ISSUE #37867: (*tobiasBora*) Bug into lsb_release that crash salt | refs: #37962
 - ISSUE #37737: (*b-harper*) python client api CloudClient multiple calls needed | refs: #37928
 - ISSUE #37059: (*basepi*) Beacon fileserver operations cause scheduled jobs with fileserver operations to hang | refs: #37899
 - ISSUE #35088: (*Modulus*) salt/cloud/ec2.py encoding problems. | refs: #37912
 - PR #38034: (*cachedout*) Modify daemons test to use multiprocessing | refs: #38059
 - PR #38002: (*laleocen*) fix broken yaml code block
 - PR #37995: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
 - PR #37978: (*terminalmage*) Add clarifying language to ext_pillar_first docs
 - PR #37964: (*terminalmage*) Add clarification on expr_form usage and future deprecation
 - PR #37962: (*cachedout*) Catch possible exception from lsb_release
 - PR #37961: (*cachedout*) Handle empty tokens safely
 - PR #37950: (*vutny*) Set default Salt Master address for a Syndic (like for a Minion)
 - PR #37929: (*gtmanfred*) add list_nodes_min to nova driver
 - PR #37928: (*techhat*) Don't modify self.opts directly
 - PR #37926: (*kontrolld*) Fixes no IPv6 functionality in /etc/sysconfig/network
 - PR #37925: (*kontrolld*) Fix missing ipv6 options centos network
 - PR #37924: (*cachedout*) Update test for new gem ver
 - PR #37921: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
 - PR #37918: (*rallytime*) [2015.8] Update version numbers in doc config for 2016.11.0 release
 - PR #37914: (*terminalmage*) Update earlier release channels' docs with Carbon release notes
 - PR #37912: (*attiasr*) fix encoding problem aws responses
 - PR #37899: (*DmitryKuzmenko*) Clear functions context in schedule tasks for ZeroMQ.
 - PR #37272: (*vutny*) Get default logging level and log file from default opts dict
 - 5d9d6b9 Merge pull request #38057 from rallytime/merge-2016.11
 - 3428840 Fix SaltKeyOptionParserTestCase test failures
 - 186e2d0 Don't allow libcloud mock module injection in unit/states/libcloud_dns_test.py either
 - d513a60 Do not allow libcloud to be injected as a mock value in the libcloud_dns_test
 - 74a417e Update the mocked cloud configs to also include master configs
 - f2c8cb1 Better merge conflict resolution from the initial merge
 - 8fd53a4 Merge branch `2016.3' into `2016.11'
 - * 6724fe4 Modify daemons test to use multiprocessing (#38034)
 - * 6942d5d Merge pull request #37995 from rallytime/merge-2016.3
 - b44e179 Merge branch `2015.8' into `2016.3'

- 7a7e367 Merge pull request #37978 from terminalmage/ext_pillar_first-docs
- 61ed9a8 Add clarifying language to ext_pillar_first docs
- * cd66c17 fix broken yaml code block (#38002)
- * 3dd45fb Merge pull request #37912 from attiasr/fix_aws_response_encoding
 - ba4ec4e use Requests result encoding to encode the text
 - abe4eb3 fix encoding problem aws responses
- * 69a74a4 Merge pull request #37950 from vutny/fix-starting-up-syndic
 - 7d9bc9a syndic_master: correct default value, documentation and example config
 - 92a7c7e Set default Salt Master address for a Syndic (like for a Minion)
- * 7f269bc Add clarification on expr_form usage and future deprecation (#37964)
- * 1001987 Catch possible exception from lsb_release (#37962)
- * 330021c Handle empty tokens safely (#37961)
- * ea46639 Merge pull request #37272 from vutny/fix-getting-default-logging-opts
 - e5ce523 Fix description in the Salt Syndic usage info
 - 518a3dd Add unit tests for Salt parsers processing logging options
 - 83d6a44 Add *ssh_log_file* option to master config and documentation
 - c8a0915 Fix configuration example and documentation for *syndic_log_file* option
 - e64dd3e Correct default attributes for various parser classes
 - 82a2e21 Fix default usage string for Salt command line programs
 - 45dff2 Fix readding and updating logfile and pidfile config options for Salt API
 - f47253c Fix reading and applying Salt Cloud default configuration
 - fad5bec Work with a copy of default opts dictionaries
 - b7c2481 Fix *log_level_logfile* config value type
 - 1bd76a1 Fix setting temporary log level if CLI option omitted
 - 121848c Fix obtaining *log_granular_levels* config setting
 - 44cf07f Make CLI options take precedence for setting up logfile_logger
 - 61afaf1 Fix setting option attributes when processing *log_level* and *log_file*
 - 3c60e23 Fix processing of *log_level_logfile* config setting
 - 55a0af5 Use attribute functions for getting/setting options and config values
 - c25f2d0 Fix getting Salt API default logfile option
 - f242237 Remove processing of unused and undocumented *cli_*_log_** config options
 - 2065e83 Get default logging level and file from default opts dict
- * f2f957d Merge pull request #37925 from kontrolld/add-ipv6-centos-network
 - ac2b477 Adding IPv6 functionality for CentOS /etc/sysconfig/network
- * c07ad11 Merge pull request #37899 from DSRCorporation/bugs/37059_schedule_task_hang
 - 9497748 Clear functions context in schedule tasks for ZeroMQ.

- * a55519d Merge pull request #37928 from techhat/issue37737
 - a09a60e Don't modify self.opts directly
- * 9d17f1c Merge pull request #37929 from gtmanfred/2016.3
 - c7d2c73 add list_nodes_min to nova driver
- * 3bb743b Merge pull request #37926 from kontrollld/fix-ipv6-centos-network
 - 3ed42e5 updated
 - 3b3bc4f Fixes no IPv6 functionality in /etc/sysconfig/network
- * 271170a Merge pull request #37921 from rallytime/merge-2016.3
 - 523a67c Merge branch `2015.8' into `2016.3'
 - 4cdc6cf Update earlier release channels' docs with Carbon release notes (#37914)
 - d31491a [2015.8] Update version numbers in doc config for 2016.11.0 release (#37918)
- * 6cd6429 Merge pull request #37924 from cachedout/fix_gem_states
 - 894cca3 Update test for new gem ver
- 9969544 Account for case where vim install already exists and is at an older version (#38112)
 - PR #38112: (*rallytime*) Account for case where vim install already exists and is at an older version
- PR #38021: (*mateiw*) Add master_tops support in salt-ssh @ 2016-12-06T14:26:22Z
 - ISSUE #19502: (*kt97679*) salt-ssh fails to run state.highstate with custom master_tops | refs: #38021
 - f8c67a9 Merge pull request #38021 from mateiw/salt-ssh_master_tops
 - 65a0f10 Add/remove newlines
 - 7037fa1 Add master_tops support in salt-ssh
- 1bb31bb Start release notes file for 2016.11.1 release (#38084)
 - PR #38084: (*rallytime*) Start release notes file for 2016.11.1 release
- PR #37878: (*kstreee*) Makes threads avoid blocking waiting while communicating using Zeromq. @ 2016-12-05T19:50:46Z
 - 7829551 Merge pull request #37878 from kstreee/2016.11
 - 9103878 Fixes blocking waiting through implementing a socket pool class.
- PR #37987: (*rbjorklin*) consul_pillar support for limiting pillar exposure via minion targeting @ 2016-12-05T19:48:20Z
 - PR #37985: (*rbjorklin*) consul_pillar support for limiting pillar exposure via minion targeting | refs: #37987
 - 0809ccd Merge pull request #37987 from rbjorklin/consul-pillar-target
 - 5d0454a Ignore W1401 (anomalous-backslash-in-string)
 - 2e929a5 Linting fixes
 - 171cab1 Fixed possible incorrect behavior if target wasn't on start/end of str
 - 7440582 consul_pillar support for limiting pillar exposure via minion targeting
- PR #38067: (*terminalmage*) Remove virtual funcs for archive state/module @ 2016-12-05T16:37:23Z
 - ISSUE #38062: (*UtahDave*) archive execution module not loading on Windows in 2016.11.0 | refs: #38067

- 83dcfe8 Merge pull request #38067 from terminalmage/issue38062
- 2e0f26a Remove virtual funcs for archive state/module
- PR #38058: (*rallytime*) Remove initdb dependency in postgres module @ 2016-12-04T04:19:02Z
 - ISSUE #38001: (*tomlaredo*) Regression on postgres_group.present ('postgres_group' __virtual__ returned False) | refs: #38023
 - ISSUE #37986: (*marek-obuchowicz*) Module postgres - wrong docs, doesn't work with debian 8.5 | refs: #38023
 - ISSUE #37935: (*ipmb*) Postgres module regression on 2016.11 | refs: #37946 #37993 #38023 #38058
 - PR #38023: (*gtmanfred*) Expand error message for postgres states | refs: #38058
 - PR #37993: (*ticosax*) Remove initdb dependency to consume postgres module. | refs: #38058
 - c993367 Merge pull request #38058 from rallytime/remove-init-db-dep
 - c1ceeca Remove initdb dependency in postgres module
- PR #38004: (*terminalmage*) Fix regression in user/group mgmt for archive.extracted @ 2016-12-02T18:28:49Z
 - ISSUE #37969: (*lordcirth*) Archive.extracted fails if -user: root is specified | refs: #38004
 - 1ac53e5 Merge pull request #38004 from terminalmage/issue37969
 - 23bb90a Add integration test for archive.extracted with user/group set to root
 - e5ee721 Don't use simple boolean check on uid/gid
- PR #38051: (*Ch3LL*) add docs for hash_type change to sha256 @ 2016-12-02T18:11:36Z
 - ISSUE #37941: (*L4rS6*) Outdated documentation for 2016.11.x | refs: #38051
 - e90cbbe Merge pull request #38051 from Ch3LL/fix_hash_docs
 - e95f88f add docs for hash_type change to sha256
- PR #38028: (*terminalmage*) Pass full_return to saltutil.runner @ 2016-12-02T09:49:31Z
 - ISSUE #38000: (*morganwillcock*) 2016.11.0: saltutil.runner returns a different dict structure and breaks template rendering | refs: #38028
 - 1b52289 Merge pull request #38028 from terminalmage/issue38000
 - 9bf13d5 Pass full_return to saltutil.runner
- PR #38044: (*terminalmage*) Remove debugging code @ 2016-12-02T09:43:44Z
 - ISSUE #37980: (*tveastman*) Having `git` in fileserver_backends and no gitfs_remotes defined causes a crash | refs: #38044
 - 41c44ff Merge pull request #38044 from terminalmage/issue37980
 - f70a040 Remove debugging code
- PR #38035: (*dmurphy18*) Updated to return status from make_repo similar to rpmbuild.py @ 2016-12-01T22:30:53Z
 - 9661258 Merge pull request #38035 from dmurphy18/fix_debbuild
 - 3bca96e Updated to return status from make_repo similar to rpmbuild.py
- PR #38023: (*gtmanfred*) Expand error message for postgres states | refs: #38058 @ 2016-12-01T22:05:06Z
 - ISSUE #38001: (*tomlaredo*) Regression on postgres_group.present ('postgres_group' __virtual__ returned False) | refs: #38023

- ISSUE #37986: (*marek-obuchowicz*) Module postgres - wrong docs, doesn't work with debian 8.5 | refs: #38023
- ISSUE #37935: (*ipmb*) Postgres module regression on 2016.11 | refs: #37946 #37993 #38023 #38058
- 141b5c5 Merge pull request #38023 from gtmanfred/2016.11
- 1aa43eb Expand error message for postgres states
- ac72ee6 Revert ``Updated the bins_dir to default to pg_bin #37935``
- PR #38026: (*rallytime*) Back-port #38015 to 2016.11 @ 2016-12-01T19:16:15Z
 - PR #38015: (*morsik*) Typo fix | refs: #38026
 - 7948642 Merge pull request #38026 from rallytime/bp-38015
 - 11becf3 Typo fix
- e51448f Added Carbon release notes. Fixed sphinx errors in the file. (#38022)
 - PR #38022: (*DmitryKuzmenko*) Added Carbon release notes. Fixed sphinx errors in the file.
- 6f34332 Adjust code examples to use the actual bootstrap-salt.sh file name (#38011)
 - PR #38011: (*rallytime*) Adjust code examples to use the actual bootstrap-salt.sh file name
- PR #37954: (*gtmanfred*) use sleep from path for docker.sls_build @ 2016-11-30T18:08:45Z
 - ISSUE #37940: (*alex-zel*) dockerng.sls_build fails on some distributions | refs: #37954
 - 0a04127 Merge pull request #37954 from gtmanfred/2016.11
 - 9caf0b4 use sleep from path for docker.sls_build
- PR #37993: (*ticosax*) Remove initdb dependency to consume postgres module. | refs: #38058 @ 2016-11-30T18:08:13Z
 - ISSUE #37935: (*ipmb*) Postgres module regression on 2016.11 | refs: #37946 #37993 #38023 #38058
 - 4ef5c98 Merge pull request #37993 from ticosax/remove-initdb-requirement
 - c5c7a53 Remove initdb dependency to consume postgres module.
- PR #37997: (*cachedout*) Update gem test for 2016.11 @ 2016-11-30T17:13:45Z
 - 2e55656 Merge pull request #37997 from cachedout/gem_test_carbon
 - 1d221aa Update gem test for 2016.11
- PR #37979: (*terminalmage*) Revert addition of pillar_roots_override_ext_pillar @ 2016-11-30T14:34:24Z
 - ISSUE #36723: (*white-hat*) ext_pillar_first option is broken in 2016.3 | refs: #36807
 - ISSUE #24501: (*astehlik*) Order in top.sls file is not respected for pillar data in local mode | refs: #31316
 - ISSUE #19332: (*QuinnyPig*) Nondeterminism in Pillar | refs: #31316
 - PR #36807: (*terminalmage*) Fix pillar merging when ext_pillar_first is enabled | refs: #37979 #37979
 - PR #31316: (*kraney*) Let ext_pillar_first determine the override order | refs: #37979 #37979
 - ca3a948 Merge pull request #37979 from terminalmage/revert-pillar-change
 - 6135dfa Revert addition of pillar_roots_override_ext_pillar
- 186b3c7 Fix RST link format (#37958) (#37970)
 - PR #37970: (*rallytime*) Back-port #37958 to 2016.11
 - PR #37958: (*mirceaulinic*) Fix RST link format in Carbon release notes | refs: #37970

- 6976be4 Pylint fix (#37971)
 - PR #37971: (*rallytime*) Lint 2016.11 sooner rather than later
 - PR #37955: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #37971
- PR #37946: (*scott-w*) Updated the bins_dir to default to pg_bin @ 2016-11-29T16:48:27Z
 - ISSUE #37935: (*ipmb*) Postgres module regression on 2016.11 | refs: #37946 #37993 #38023 #38058
 - 36f9140 Merge pull request #37946 from scott-w/37935-fix-bin-dir
 - d33d403 Restored missing initdb #37935
 - a041b9f Use Salt deprecation warning #37935
 - a967893 Updated the bins_dir to default to pg_bin #37935
- PR #37889: (*isbm*) Allow overwrite archives extraction | refs: #38036 @ 2016-11-29T16:18:57Z
 - d8650c5 Merge pull request #37889 from isbm/isbm-states-archive-fix
 - e67706b Document the behaviour.
 - 1970814 Prevent crash during externally changed archive permissions
 - 91b4257 Add overwrite option so the extraction of the archive can be always performed.
 - e6958f7 Remove nonsense comment and react on generally absent path name
- PR #37869: (*isbm*) Input sanitation (16.11) @ 2016-11-29T16:17:16Z
 - e2b9e58 Merge pull request #37869 from isbm/isbm-input-sanitation-16.11
 - f9ec5d6 Use six instead of builtins
 - 203dfcb Use American spelling instead
 - 91ed307 Sanitise input for the keys and IDs
 - 86623f9 Add a stub for ID sanitiser (at the moment same as hostname)
 - 637144c Rename ``general.py" to ``sanitisers.py"
 - f2571fc Add hostname sanitiser
 - 3ae086a Add filename sanitiser
 - 816b1d1 Add general sanitisers
- PR #37884: (*isbm*) Do not include ``gpg-pubkey" packages, filtering by their name @ 2016-11-28T21:11:37Z
 - e539a94 Merge pull request #37884 from isbm/isbm-zypper-gpgkey-pkg-filter
 - 038374a Do not include ``gpg-pubkey" packages, filtering by their name
- PR #37882: (*attiasr*) multiple issues in boto_rds state and module @ 2016-11-28T21:09:11Z
 - eb3d81a Merge pull request #37882 from attiasr/fix_missing_tags
 - 73b3c5f Add newline
 - 166c42b fix boto_rds.describe
 - ddd88ba fix boto_rds.describe parameters and subnetgroup_present
 - bfe7f92 fix missing tags in call to boto_rds.exists
- 8f986b2 Remove release candidate doc ref from 2016.11.0 release notes (#37931)
 - PR #37931: (*rallytime*) Remove release candidate doc ref from 2016.11.0 release notes

- PR #37930: (*cachedout*) Remove dictionary comprehension in netusers @ 2016-11-28T20:27:06Z
 - 3d2dabc Merge pull request #37930 from cachedout/fix_comp
 - 670e832 Remove dictionary comprehension in netusers
- PR #37923: (*rallytime*) [2016.11] Merge forward from 2016.3 to 2016.11 @ 2016-11-28T19:55:03Z
 - ISSUE #37870: (*fj40crawler*) salt.states.augeas.change returns None when test=True | refs: #37895
 - ISSUE #37732: (*dhaines*) list_semod() (from modules/selinux.py) incompatible with policycoreutils-2.5 (RHEL 7.3) | refs: #37736
 - ISSUE #37287: (*AaronM-Cloudtek*) salt.states.ddns.present: `NS` record type always returns as changed | refs: #37785

 - PR #37886: (*bdrung*) Fix various spelling mistakes
 - PR #37866: (*meaksh*) Backport #37149 #36938 and #36784 to 2016.3
 - PR #37863: (*rallytime*) Back-port #36893 to 2016.3
 - PR #37857: (*meaksh*) Backport #37149 and #36938 to 2015.8 | refs: #37866
 - PR #37856: (*meaksh*) Backport #36784 to 2015.8 | refs: #37866
 - PR #37847: (*laleocen*) add multiline encryption documentation to nacl
 - PR #37797: (*clan*) check count of columns after split
 - PR #37785: (*AaronM-Cloudtek*) respect trailing dot in ddns name parameter
 - PR #37762: (*twangboy*) Add pre_versions to chocolatey.installed
 - PR #37736: (*dhaines*) handle semodule version >=2.4 (#37732) and fix typo
 - PR #37149: (*dincamihai*) Fix pkg.latest_version when latest already installed | refs: #37866 #37857
 - PR #36938: (*wanparo*) acl.delfacl: fix position of -X option to setfacl | refs: #37866 #37857
 - PR #36893: (*tyhunt99*) add option to force a reauth for a docker registry | refs: #37863
 - PR #36784: (*moio*) OS grains for SLES Expanded Support | refs: #37866 #37856
 - 0f8b187 Merge pull request #37923 from rallytime/merge-2016.11
 - da7f551 Don't let 2016.3 doc config changes overwrite the 2016.11 changes
 - dfedd11 Merge branch `2016.3` into `2016.11`
 - * c35ba1f Merge pull request #37916 from rallytime/doc-update-2016.3
 - bd40592 [2016.3] Update version numbers in doc config for 2016.11.0 release
 - * e13a248 Merge pull request #37785 from Cloudtek/ddns-respect-trailing-dot
 - 262e3b3 respect trailing dot in ddns name parameter
 - * c03b389 Merge pull request #37895 from fj40crawler/fix-augeas-return-for-test

- ddc238d Fixed augeas_test.py to match True v.s. None for test_change_in_test_mode
- ef75c45 Merge branch `2016.3' of github.com:saltstack/salt into fix-augeas-return-for-test
- b0fe0cd Change return value for salt/states/augeas.py to be True instead of None for cases where salt is run with test=True. Fixes #37870
- * fdbc31e Merge pull request #37907 from Talkless/patch-2
 - 072a319 Fix server trust in test run of svn.latest
- * f39fdf4 Merge pull request #37896 from toanju/2016.3
 - c953041 rh networking: add missing values
- * ea935c5 Merge pull request #37886 from bdrung/fix-typos
 - 9a51ba5 Fix various spelling mistakes
- * 371b0a8 Merge pull request #37736 from dhaines/issue-37732
 - 7ef590a Update selinux.py
 - 516a67e fix indexing error
 - 4e49c1e fix typo
 - b16f2d8 handle semodule version >=2.4 (#37732) and fix typo
- * 87aeb66 Merge pull request #37797 from clan/extfs
 - acf0f96 check count of columns after split
- * f7c7109 Merge pull request #37762 from twangboy/fix_chocolatey_state
 - 9696b6d Use keyword args instead of relying on ordering
 - 398eaa0 Add pre_versions to the available arguments
- * 56baa92 Merge pull request #37866 from meaksh/2016.3-bp-37149-36938-36784
 - 9d8d578 Fix pkg.latest_version when latest already installed
 - ffca0d4 - acl.delfacl: fix position of -X option to setfacl
 - 3dfed6b Adjust linux_acl unit test argument ordering
 - f185ecd core.py: quote style fixed
 - 8404d13 Setting up OS grains for SLES Expanded Support (SUSE's Red Hat compatible platform)
- * d0cc7f0 Merge pull request #37863 from rallytime/bp-36893
 - 4c70534 Add versionadded to reauth option in dockerng module
 - 5ca2c38 added documentation for the new reuth option in docker registry configuration
 - 5b0c11a add option to force a reauth for a docker registry
- * b17a118 add multiline encryption documentation to nacl (#37847)
- 1427115 Add a release notes reference to the docker-sls tutorial (#37927)
 - PR #37927: (thatch45) Add a release notes reference to the docker-sls tutorial
- d204099 [2016.11] Update version numbers in doc config for 2016.11.0 release (#37917)
 - PR #37917: (rallytime) [2016.11] Update version numbers in doc config for 2016.11.0 release

- **PR #37890:** (*bbinet*) Fix support for extra_mods='six' to add six module to a thin.tgz tarball @ 2016-11-28T13:53:06Z
 - ee00592 Merge pull request #37890 from bbinet/fix-genthin-six
 - 7fcea3 Fix support for extra_mods='six' to add six module to a thin.tgz tarball
- 47d21d9 Don't skip pillar compilation when master_type=='disable' (#37843)
 - **ISSUE #37713:** (*aboe76*) masterless minion can't call pillar.item from pillar stack (development branch) | refs: #37843
 - **PR #37843:** (*terminalmage*) Don't skip pillar compilation when master_type=='disable'

 - 3835f91 Merge pull request #37773 from rallytime/merge-2016.11
 - c859fc9 Merge branch `2016.3' into `2016.11'
 - c62ff6b Add thorium path to syspaths (#37767)
 - bff949f Merge pull request #37760 from hu-dabao/fix_cb_returner
 - * de372f2 1. returner no need to check whether the jid exists for external job cache setup 2. add full_ret to return doc so that the document will be informative 3. make ttl as a config attribute because salt-minion does not have keep_jobs attribute 4. add password into config attribute 5. update the documents accordingly
 - 1f976ac Merge pull request #37738 from terminalmage/issue36629
 - * da46678 Allow pillar.get to retrieve fresh pillar data when saltenv passed
 - 7aee7fc Switch default filter tag for ONE resources from user only to all resources (#37745)
- PR #37764: (*mirceaulinic*) Doc fixes and *replace* feature @ 2016-11-18T03:15:31Z
 - 6f0f70c Merge pull request #37764 from cloudflare/NET-UPDATE
 - c3f0202 Replace feature and doc fixes

19.2.3 Salt 2016.3.0 Release Notes - Codename Boron

Known Issues

Warning: Some Salt Masters may need to apply a patch for Default Job Cache to prevent a possible crash

An issue exists that prevents the Salt master from cleaning the default job cache. This issue can cause an over-consumption of resources resulting in a crash. 2016.3.0 Salt masters should apply the patch in [:PR:33555`](#). This issue will be addressed in 2016.3.1.

- [issue 33516](#): When upgrading from 2015.8.10 to 2016.3.0 on centos7/redhat7 salt-minion must be restarted twice.
- [issue 33517](#): SPM does not work on amazon linux 2015 in 2016.3.0.

Backwards-incompatible Changes

- The default path for the *extension_modules* master config option has been changed. Prior to this release, the location was a directory named `extmods` in the Salt cachedir. On most platforms, this would put the *extension_modules* directory in `/var/cache/salt/extmods`. It has been moved one directory down, into the master cachedir. On most platforms, this is `/var/cache/salt/master/extmods`. Most users won't have to worry about this, but those who have been manually placing custom runners into `/var/cache/salt/extmods/runners`, or outputters into `/var/cache/salt/extmods/output`, etc. will be affected by this. To transition, it is recommended not to simply move the `extmods` directory into `/var/cache/salt/master`, but to copy the custom modules into the salt fileserver under `salt://_runners`, `salt://_output`, etc. and sync them using the functions in the new *saltutil runner*.
- The `pkg.check_db` function has been removed for yum/dnf.

Core Changes

- The `onchanges` requisite now fires if any watched state changes. [issue 19592](#).
- The `ext_pillar` functions **must** now accept a minion ID as the first argument. This stops the deprecation path started in Salt 0.17.x. Before this minion ID first argument was introduced, the minion ID could be retrieved accessing `__opts__['id']` losing the reference to the master ID initially set in `opts`. This is no longer the case, `__opts__['id']` will be kept as the master ID.
- Custom types can now be synced to the master using the new *saltutil runner*. Before, these needed to manually be placed under the *extension_modules* directory. This allows custom modules to easily be synced to the master to make them available when compiling Pillar data. Just place custom runners into `salt://_runners`, custom outputters into `salt://_output`, etc. and use the functions from the *saltutil runner* to sync them.
- The `client_acl` configuration options were renamed to `publisher_acl`.
- Added a new `--config-dump` option ([issue 26639](#)).
- TCP Transport presence events were updated to work with a NAT ([PR 30629](#)).
- A `minion_pillar_cache` setting was added to save rendered pillar data to cachedir for later use when `file_client` is set to `local` ([PR 30428](#)).
- Added the ability for binary data (such as a license key) to be distributed via pillar using the *file.managed* ([issue 9569](#)).

- Scheduled jobs now include `success` and `retcode` ([issue 24237](#)).
- The `saltversioninfo` grain was changed from a string to a list to enable reading values by index. ([PR 30082](#)).
- A `pillar_merge_lists` option was added to enable recursively merging pillar lists by aggregating them instead of replacing them ([PR 30062](#)).
- Grain values reported by Debian 8 (jessie) when `lsb-release` is installed were updated for consistency ([PR 28649](#)).
- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default directory for deploying the salt-thin tarball has changed for salt-ssh. It is now `/var/tmp` instead of `/tmp`. Users may also wish to delete any directories in `/tmp` ending with `_salt/`. ([issue 32771](#))

External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See external module packaging tutorial for more information.

Cloud Changes

- Refactored the OpenNebula driver and added numerous `--function` and `--action` commands to enhance Salt support for image, template, security group, virtual network and virtual machine management in OpenNebula.
- Added execution/state modules to support the deployment of AWS cognito identity pools ([PR 31094](#)).
- Added ability to set tags and listener policies on a AWS ELB ([PR 27552](#)).

Platform Changes

- Renamed modules related to OS X. The following module filenames were changed. The virtual name remained unchanged.
- [PR #30558](#): renamed `osxdesktop.py` to `mac_desktop.py`
- [PR #30557](#): renamed `macports.py` to `mac_ports.py`
- [PR #30556](#): renamed `darwin_sysctl.py` to `mac_sysctl.py`
- [PR #30555](#): renamed `brew.py` to `mac_brew.py`
- [PR #30552](#): renamed `darwin_pkgutil.py` to `mac_pkgutil.py`

Package Support

- Ubuntu Xenial: Packages for Ubuntu Xenial (16.04) are available for 2016.3.0 and onwards. See repo.saltstack.com for more information. Note that Xenial comes with Debian's packaged version of Salt 2015.8.8 and official repo.saltstack.com packages are available for 2015.8 releases beginning with Salt 2015.8.11.

Proxy Minion Changes

The deprecated config option `enumerate_proxy_minions` has been removed.

As mentioned in earlier documentation, the `add_proxymodule_to_opts` configuration variable defaults to `False` in this release. This means if you have proxymodules or other code looking in `__opts__['proxymodule']` you will need to set this variable in your `/etc/salt/proxy` file, or modify your code to use the `__proxy__` injected variable.

The `__proxyenabled__` directive now only applies to grains and proxy modules themselves. Standard execution modules and state modules are not prevented from loading for proxy minions.

Support has been added to Salt's loader allowing custom proxymodules to be placed in `salt://_proxy`. Proxy minions that need these modules will need to be restarted to pick up any changes. A corresponding utility function, `saltutil.sync_proxymodules`, has been added to sync these modules to minions.

Enhancements in grains processing have made the `__proxyenabled__` directive somewhat redundant in dynamic grains code. It is still required, but best practices for the `__virtual__` function in grains files have changed. It is now recommended that the `__virtual__` functions check to make sure they are being loaded for the correct proxytype, example below:

```
def __virtual__():
    """
    Only work on proxy
    """
    try:
        if salt.utils.is_proxy() and \
            __opts__['proxy']['proxytype'] == 'ssh_sample':
            return __virtualname__
    except KeyError:
        pass

    return False
```

The try/except block above exists because grains are processed very early in the proxy minion startup process, sometimes earlier than the proxy key in the `__opts__` dictionary is populated.

Grains are loaded so early in startup that no dunder dictionaries are present, so `__proxy__`, `__salt__`, etc. are not available. Custom grains located in `/srv/salt/_grains` and in the salt install grains directory can now take a single argument, `proxy`, that is identical to `__proxy__`. This enables patterns like

```
def get_ip(proxy):
    """
    Ask the remote device what IP it has
    """
    return {'ip': proxy['proxymodulename.get_ip']()}
```

Then the grain `ip` will contain the result of calling the `get_ip()` function in the proxymodule called `proxymodulename`.

Proxy modules now benefit from including a function called `initialized()`. This function should return `True` if the proxy's `init()` function has been successfully called. This is needed to make grains processing easier.

Finally, if there is a function called `grains` in the proxymodule, it will be executed on proxy-minion startup and its contents will be merged with the rest of the proxy's grains. Since older proxy-minions might have used other methods to call such a function and add its results to grains, this is config-gated by a new proxy configuration option called `proxy_merge_grains_in_module`. This defaults to `False` in this release. It will default to `True` in the release after next. The next release is codenamed **Carbon**, the following is **Nitrogen**.

The example proxy minions `rest_sample` and `ssh_sample` have been updated to reflect these changes.

Syndic Updates

A major performance and management issue was found and fixed in the syndic. This makes the Salt Syndic substantially more reliable and performant. Please make sure that the syndic and the master of masters which syndics attach to are updated, otherwise the syndic fixes alone can cause minor performance issues with older master of masters. Please update masters first, then syndics. Minions do not need to be updated for this fix to work.

Module Changes

- *file execution module*: `show_diff` is deprecated in favor of `show_changes`. (PR 30988)
- *reg execution module*:
 - Removed the following deprecated functions from the `reg` module (PR 30956):
 - * `read_key`
 - * `set_key`
 - * `create_key`
 - * `delete_key`
 - Removed `force` parameter from `reg state` module
 - Fixed virtual function in `state`
 - Improved error information for `reg.delete_value` function
- *jboss7 execution module*: `deployed` function was decoupled from Artifactory by removing Artifactory-specific functionality. Note that the changes in some of the function arguments break existing state files, see [issue 30515](#) and [PR 3080](#) for details.
- *pkg state module*: The `wait` function was removed, the functionality was replaced with the `onchanges requisite` (PR 30297).
- *firewalld state module*: A `permanent` argument was added `add_port`. Note that `permanent` defaults to `True`, which changes previous behavior (PR 30275). A `bind` function was also added that allows binding zones to interfaces and sources (PR 29497).
- *journald beacon module*: The event string was updated to include a tag. Note this this might impact existing reactors based on this beacon. (PR 30116).
- *postgres_privileges state module*: The default value of the `prepend` argument was changed from `None` to `public`.
- *zenoss execution module*: The `add_device` function was updated with a default value of `1000` for `prod_state` to match the documentation (PR 28924).
- The `etcd` execution module, `state` module, `returner` module, and `util` module were refactor (PR 28599). This refactor changes error returns for several functions (primarily edge cases):
 - `get`: Used to return `` on key-not-found. Now returns `None`.
 - `set`: Used to return `` on issues setting keys. Now returns `None`.
 - `ls`: Used to return `{path: {}}` on key-not-found. Now returns `None`.
 - `Tree`: Used to return `{}` on key-not-found. Now returns `None`.
- *smartos_virt execution module*: Updated to use most of the new `smartos_vmadm` (PR 28284).

- *apache_conf state module*, *apache_module state module*, and *apache_site state module*: the `enable` and `disable` functions were renamed to `enabled` and `disabled`, respectively. In PR 33562, these functions were readded and properly deprecated and will be removed in Salt Nitrogen. This fix will be available in 2016.3.1. As a workaround, try

```
apache_module.enable{{ 'd' if grains.saltversioninfo == [2016, 3, 0] else '' }}
```

New Features

Thorium - Provisional New Reactor

The 2016.3 release introduces the new Thorium Reactor. This reactor is an experimental new feature that implements a flow programming interface using the salt state system as the engine. This means that the Thorium reactor uses a classic state tree approach to create a reactor that can aggregate event data from multiple sources and make aggregate decisions about executing reactions.

This feature is both experimental and provisional, it may be removed and APIs may be changed. This system should be considered as ambitious as the Salt State System in that the scope of adding a programmable logic engine of this scale into the event systems is non trivial.

See Thorium Complex Reactor.

Improved Mac OS Support

Improved Solaris Support

A lot of work was done to improve support for SmartOS. This work also resulted in improvements for Solaris and illumos as SmartOS.

- rewrite of *vmadm module* (SmartOS)
- rewrite of *imgadm module* (SmartOS)
- deprecation of *virt module* in favor of *vmadm* (SmartOS)
- implemented *smartos state* (SmartOS)
- improved *zpool module* add SmartOS, illumos and Solaris support
- improved *zfs module* add SmartOS, illumos and Solaris support
- implemented *zpool state*
- implemented *zfs state* implemented *solaris_system* system module to provide better Solaris support (PR 30519)
- other minor fixes to grains, localmod, ...

Tornado Transport

Important: The Tornado Transport wire protocol was changed in 2016.3, making it incompatible with 2015.8 (PR 29339).

Windows DSC Integration (Experimental)

Dimension Data Cloud Support

A SaltStack Cloud driver for [Dimension Data Public Cloud](#), provides the driver functionality to service automation for any of the Dimension Data Public Cloud locations:

- Deploy new virtual machines
- List and query virtual machine images
- Destroy and query virtual machines

Documentation of the Dimension Data SaltStack integration is found on developer.dimensiondata.com

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Blackouts are enabled using a special pillar key, `minion_blackout` set to `True`.

See *Minion Blackout*.

Splunk Returner

A Splunk Returner that uses HTTP Event Collector is now available ([PR 30718](#)).

SQLCipher Pillar Module

Support was added for retrieving pillar data via queries to SQLCipher databases ([PR 29782](#)).

New Modules

The following list contains a link to the new modules added in this release.

Beacons

- [*beacons.adb*](#)
- [*beacons.glxinfo*](#)
- [*beacons.memusage*](#)
- [*beacons.network_settings*](#)
- [*beacons.proxy_example*](#)
- [*beacons.salt_proxy*](#)

Engines

- `engines.docker_events`
- `engines.redis_sentinel`
- `engines.slack`
- `engines.sqs_events`
- `engines.thorium`

Execution Modules

- `modules.bcache`
- `modules.beacons`
- `modules.boto_cloudtrail`
- `modules.boto_datapipeline`
- `modules.boto_iot`
- `modules.boto_lambda`
- `modules.boto_s3_bucket`
- `modules.chronos`
- `modules.cyttest`
- `modules.dockercompose`
- `modules.dsc`
- `modules.ethtool`
- `modules.github`
- `modules.infoblox`
- `modules.iwtools`
- `modules.jenkins`
- `modules.linux_ip`
- `modules.mac_assistive`
- `modules.mac_brew`
- `modules.mac_defaults`
- `modules.mac_desktop`
- `modules.mac_keychain`
- `modules.mac_pkgutil`
- `modules.mac_ports`
- `modules.mac_power`
- `modules.mac_service`
- `modules.mac_shadow`

- *modules.mac_softwareupdate*
- *modules.mac_sysctl*
- *modules.mac_system*
- *modules.mac_timezone*
- *modules.mac_xattr*
- *modules.marathon*
- *modules.minion*
- *modules.openvswitch*
- *modules.opkg*
- *modules.philips_hue*
- *modules.proxy*
- *modules.pushbullet*
- *modules.restartcheck*
- *modules.s6*
- *modules.salt_proxy*
- *modules.ssh_package*
- *modules.ssh_service*
- *modules.sysfs*
- *modules.vboxmanage*
- *modules.win_certutil*
- *modules.win_dism*
- *modules.win_dism*
- *modules.win_license*
- *modules.win_iis*
- *modules.win_task*
- *modules.zabbix*

Pillar

- *pillar.http_yaml*
- *pillar.stack*

Proxy

- *proxy.chronos*
- *proxy.junos*
- *proxy.marathon*

- `proxy.phillips_hue`
- `proxy.ssh_sample`

Roster

- `roster.range`

States

- `states.apache_conf`
- `states.apache_site`
- `states.boto_cloudtrail`
- `states.boto_datapipeline`
- `states.boto_iot`
- `states.boto_lambda`
- `states.boto_s3_bucket`
- `states.chocolatey`
- `states.chronos_job`
- `states.firewall`
- `states.github`
- `states.gpg`
- `states.grafana_dashboard`
- `states.grafana_datasource`
- `states.infoblox`
- `states.jenkins`
- `states.mac_assistive`
- `states.mac_defaults`
- `states.mac_keychain`
- `states.mac_xattr`
- `states.marathon_app`
- `states.openvswitch_bridge`
- `states.openvswitch_port`
- `states.postgres_cluster`
- `states.proxy`
- `states.salt_proxy`
- `states.virt`
- `states.win_certutil`

- `states.win_dism`
- `states.win_license`
- `states.zabbix_host`
- `states.zabbix_hostgroup`
- `states.zabbix_user`
- `states.zabbix_usergroup`

19.2.4 Salt 2016.3.1 Release Notes

Version 2016.3.1 is a bugfix release for *2016.3.0*.

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

Changes for v2016.3.0..v2016.3.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-06-08T22:43:50Z

Total Merges: 87

Changes:

- PR #33866: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33860: (*cachedout*) Allow socket closes when the socket is disconnected
- b183a36 Set master and cloud to log level warning (#33861)
- PR #33698: (*opdude*) Vsphere fixes
- PR #33771: (*twangboy*) Additional functionality to win_dism.py
- PR #33851: (*ticosax*) [dockerng] Add support for edge case when *Cmd* and *Entrypoint* can't be blanked
- PR #33821: (*cachedout*) Restore default log level to warning
- PR #33767: (*amontalban*) Fix #33604 implementation when 'geom disk list' does not output rotat...
- PR #33806: (*cachedout*) Work around upstream cherry py bug
- PR #33776: (*danslimmon*) Fixed ACL user comparison. Resolves '#33754`_`.
- PR #33763: (*abednarik*) Insert --no-refresh before install in Zypper.
- PR #33764: (*terminalmage*) Merge instead of update pillar overrides
- PR #33772: (*danslimmon*) Fixed spelling of ``through"
- PR #33651: (*cachedout*) Restore grains context to renderers
- PR #33757: (*cachedout*) Reminder not to return non-serializable data from states
- PR #33670: (*rallytime*) Handle non-ascii package names in state.format_log
- PR #33723: (*rallytime*) Back-port #33641 to 2016.3
- PR #33748: (*ticosax*) HostConfig has been introduced by docker api version 1.15

- PR #33745: (*eliasp*) Typo (*privilages* → *privileges*)
- PR #33562: (*jfindlay*) *states.apache_**: readd and deprecate *enable* and *disable*
- PR #33659: (*danslimmon*) Added test mode to *states.dockerng*. Resolves ``#33632`_`.
- PR #33696: (*clburlison*) Update mac native package for upcoming release
- PR #33710: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- e87c310 backport #33599 to 2016.3 (#33682)
- 377556a Undo `__repr__()` and `__str__()` parts of *d5a7dcc* (#33688)
- 778b290 Remove explicit PW column default from *mysql_user* (#33690)
- PR #33680: (*rallytime*) Back-port #32942 to 2016.3
- PR #33677: (*twangboy*) Pass *kwargs* to *cmd.run*
- PR #33648: (*terminalmage*) *salt.modules.pkgng*: Fix incorrect usage of `_pkg()`
- PR #33646: (*jfindlay*) Fix more tmp paths on MacOS
- PR #33656: (*cachedout*) Fix indentation error in *minion.py*
- PR #33637: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- b7230bd Back-port #33613 to 2016.3 (#33638)
- PR #33606: (*danslimmon*) Fixed *ini.options_absent*. Resolves ``#33590`_`.
- PR #33604: (*kev009*) Fix ``#33578`_ disks grain`
- 259529e Use correct state name in *libvirt* formula doc (#33631)
- PR #33603: (*sjorge*) allow *esky* packages to be build on *base64 2015Q4*
- PR #33576: (*tomlaredo*) Fix ``#33565`_ (typo causes invalid syntax)`
- PR #33549: (*thatch45*) Fix for ``#33530`_`
- PR #33538: (*anlutro*) Fix a *KeyError* if *group* is provided but not *user* in *cmd* states
- PR #33550: (*jacobhammons*) Fixes display of *thorium* docs
- PR #33509: (*twangboy*) Detect System Architecture for Mac Build
- PR #33522: (*jfindlay*) rework *modules.mac_brew.latest_version* to work around *brew* version inconsistency
- PR #33519: (*jacobhammons*) New doc site layout, 2016.3.0 release note known issue additions
- PR #33508: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33505: (*twangboy*) Fix build script where *pip* didn't work
- PR #33076: (*cachedout*) Avoid second grains load on windows multiprocessing

19.2.5 Salt 2016.3.2 Release Notes

Version 2016.3.2 is a bugfix release for *2016.3.0*.

Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

Changes for v2016.3.1..2016.3.2

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-07-27T15:47:45Z

Statistics:

- Total Merges: 198

Changes:

- PR #34946: (*anlutro*) Fix virtualenv behavior when requirements files are in subdirectories
- PR #34957: (*sjmh*) Don't fall through to checking auth entries
- PR #34971: (*cachedout*) Increase timeout for grains test
- PR #34951: (*vutny*) Fix #34873
- PR #34935: (*rallytime*) Avoid UnboundLocalError in beacons module
- PR #34956: (*cachedout*) Increase all run_script timeouts to 30s
- PR #34933: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34916: (*cachedout*) Master performance improvement
- PR #34911: (*cachedout*) Backport #34906
- PR #34906: (*cachedout*) Set timeout for run_salt in test suite
- PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list_upgrades
- PR #34915: (*abednarik*) Update service_rh provider to exclude XenServer >= 7.
- PR #34926: (*rallytime*) Lint #34923
- PR #34923: (*eliasp*) Handle exception when no Slack API key was provided
- PR #34910: (*cachedout*) Fix grains error on proxy minions
- PR #34864: (*jmacfar*) Check for version in list of installed versions
- PR #34902: (*rallytime*) Back-port #34878 to 2016.3
- PR #34878: (*abednarik*) Add VirtuozzoLinux is yumpkg enable list.
- PR #34901: (*rallytime*) Add VirtuozzoLinux to the list of enabled distros for rpm.py
- PR #34900: (*rallytime*) Add VirtuozzoLinux to enabled platforms list in rh_service.py
- PR #34887: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force_reset=False
- PR #34862: (*thatch45*) Fix salt-ssh cacheing issue
- PR #34859: (*cachedout*) Fix wheel test
- PR #34632: (*eliasp*) Try to create the log directory when not present yet
- PR #34854: (*rallytime*) Remove string_types import from state compiler
- PR #34865: (*thatch45*) This needs discussion, since this breaks SUSE
- PR #34858: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34847: (*cachedout*) Add an option to skip the verification of client_acl users
- PR #34833: (*rallytime*) Back-port #28521 to 2015.8

- PR #34828: (*thatch45*) Fix #34648
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #34823: (*rallytime*) Back-port #25276 to 2015.8
- PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low
- PR #28521: (*gongled*) SPM: packaging doesn't work in Python 2.6. Fixed.
- PR #25276: (*jacobhammons*) copy spm.1 man page during setup
- PR #34852: (*rallytime*) Skip GCE unit tests - causes test suite to hang
- PR #34844: (*vutny*) Fix getting total available memory without *psutil* installed
- PR #34837: (*thatch45*) Fix #34345
- PR #34838: (*thatch45*) Check if a valid value is passed to `unlyif/unless`
- PR #34840: (*thatch45*) update the state wrapper to include `show_low_sls`
- PR #34842: (*sjorge*) 2016.3 zpool cleanup and fixes
- PR #34770: (*aphor*) zpool state module needs support for disk vdev #34762
- PR #34825: (*thatch45*) keep this beacon from stack tracing at the loader
- PR #34824: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34818: (*jtand*) Skip mysql state test if mysqladmin is not available
- PR #34803: (*junovitch*) salt/state.py: set `'chunk['order'] = 0'` with `'order: first'`; fixes `'#24744'`
- PR #34642: (*jtand*) Check that mysqladmin exists before running mysql integration tests
- PR #34670: (*isbm*) Add `'osmajorrelease'` grain (2016.3)
- PR #34683: (*cachedout*) Fix publisher leak
- PR #34791: (*sjorge*) salt.state.zpool tweaks
- PR #34784: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34773: (*randomed*) Bugfix: Startup states on minions are not being written to mysql returner
- PR #34754: (*cachedout*) Disable test
- PR #34751: (*cachedout*) Remove unneeded config test
- PR #34741: (*rallytime*) Back-port #34726 to 2015.8
- PR #34726: (*martinhoefling*) Always loop over updated keys in non recursive update
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34756: (*jacobhammons*) Rebuild man pages
- PR #34746: (*rallytime*) Update azure lib dep to match the one in `cloud.clouds.msazure`
- PR #34744: (*jtand*) Test valid docs fix
- PR #34740: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34721: (*rallytime*) Add `output_file` option to master config docs
- PR #34607: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34739: (*cachedout*) Remove unneeded config test
- PR #34607: (*isbm*) Bugfix: Exit on configuration read (backport)

- PR #34722: (*rallytime*) Various spelling fixes
- PR #34714: (*sjmh*) Fix ldap auth for function matches
- PR #34720: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34695: (*isbm*) Bugfix: Zypper *pkg.list_products* returns False on some empty values (2015.8)
- PR #34689: (*Azidburn*) fix second run problems with *pkg.installed* using sources
- PR #34682: (*jfindlay*) update 2015.8.11 release notes
- PR #34707: (*rallytime*) Add versionadded to ``special" option in *cron.present* state
- PR #34696: (*isbm*) Bugfix: Zypper *pkg.list_products* returns False on some empty values (2016.3)
- PR #34702: (*farcaller*) Fixed *dockerng.list_tags*
- PR #34681: (*rallytime*) Back-port #34549 to 2016.3
- PR #34549: (*Inveracity*) fixes multiple values in *mof* configuration
- PR #34679: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34676: (*cachedout*) Revert ``Modify *lodaer* global test to use populated dunderers"
- PR #34651: (*rallytime*) Lint 34644
- PR #34647: (*cachedout*) Adjust the *mine* test a little bit to give it a better chance of success
- PR #34644: (*cachedout*) Cleanup loader errors
- PR #34642: (*jtand*) Check that *mysqladmin* exists before running *mysql* integration tests
- PR #34618: (*jtand*) Network state integration test *test=True*
- PR #34601: (*loregordon*) Clarifies the proper way to reference states
- PR #34605: (*gtmanfred*) catch error if no dns domains exist
- PR #34557: (*jacobweinstock*) handle *jboss* cli expression type in the parsing of output
- PR #34652: (*rallytime*) Spelling fixes found in *sqlite3* pillar docs
- PR #34565: (*Ch3LL*) add *num_cpus* grain to *freebsd*
- PR #34621: (*jtand*) Suse Leap doesn't have `man'
- PR #34619: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34617: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34593: (*rallytime*) Back-port #33851 to 2015.8
- PR #34592: (*jtand*) Update github IP for *ssh* state integration tests
- PR #34591: (*jtand*) Gate *docker* unit test to check for *docker*
- PR #34590: (*oeuftete*) [2015.8] *dockerng*: When sorting list *actual_data*, make it a list
- PR #34584: (*rallytime*) [2015.5] Avoid circular imports when calling *salt.utils* functions
- PR #34560: (*terminalmage*) Add a bunch of documentation on getting files from other environments
- PR #34545: (*terminalmage*) Handle cases where *Docker Remote API* returns an empty *ExecutionDriver*
- PR #34531: (*terminalmage*) Support *ignore_epoch* argument in version comparisons
- PR #33851: (*ticosax*) [*dockerng*] Add support for edge case when *Cmd* and *Entrypoint* can't be blanked
- PR #34585: (*rallytime*) [2016.3] Avoid *salt.utils* circular imports when using ``from"

- PR #34616: (*jacobhammons*) Adds a mock required for the network settings beacon
- PR #34553: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34546: (*rallytime*) Rename unit.states.boto_secgroup to unit.states.boto_secgroup_test
- PR #34537: (*rallytime*) Rename tests.unit.simple to tests.unit.simple_test
- PR #34527: (*rallytime*) [2015.8] Update bootstrap script to latest stable
- PR #34521: (*cachedout*) Prevent many errors in the test suite in loader tests
- PR #34518: (*terminalmage*) Fix pkg.latest integration test for non-LTS ubuntu
- PR #34507: (*AAbouZaid*) Fix wrong order of retention_policy_exists.
- PR #34569: (*eliasp*) Minor doc fixes for PostgreSQL states
- PR #34524: (*terminalmage*) yumpkg: Avoid spurious logging in pkg.upgrade
- PR #34490: (*cachedout*) Fix master crash on ctl-c for long-running job
- PR #34520: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34513: (*cachedout*) Lower the log level for modules which cannot be loaded to trace
- PR #34505: (*terminalmage*) Improve top file merging documentation
- PR #34503: (*rallytime*) Rename some unit test files by adding _test
- PR #34498: (*rallytime*) Use -O in the wget example in the bootstrap tutorial for the develop branch
- PR #34492: (*zer0def*) Gracefully handle non-XML output in GlusterFS execution module.
- PR #34489: (*jtand*) Use skipTest for network state integration test
- PR #34488: (*rallytime*) Update dnsmasq.get_config docs to use correct config_file param.
- PR #34499: (*gtmanfred*) remove unnecessary block parsing ip adrs for nova
- PR #34468: (*twangboy*) Use Python 2.7.12 for Windows Build
- PR #34493: (*twangboy*) Use Python 2.7.12 for Mac Build
- PR #34486: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34467: (*rallytime*) Back-port #34457 to 2015.8
- PR #34462: (*terminalmage*) Use --always when available to git describe
- PR #34457: (*ryan-lane*) Only access key metadata if we found key metadata
- PR #34455: (*cro*) Forgot reference to inotify
- PR #34432: (*twangboy*) Fix file.append
- PR #34429: (*terminalmage*) Skip version checking for targeted packages in pkg.latest state
- PR #34459: (*terminalmage*) Ignore retcode when formatting highstate output
- PR #34463: (*terminalmage*) states/git: pass required cwd parameter to git.describe.
- PR #34466: (*rallytime*) Back-port #34436 to 2016.3
- PR #34436: (*artxki*) Fix #34395 Nonfunctional default_password in states.postgres_user.present
- PR #34453: (*jtand*) Arch linux does not have osrelease or osmajorrelease grains
- PR #34456: (*thatch45*) Be more careful when making the SMinion
- PR #34452: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3

- PR #34451: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34435: (*cachedout*) Backport change to integraiton test suite
- PR #34426: (*cro*) Document that inotify is Linux only
- PR #34401: (*terminalmage*) Use rpmdev-vercmp as a fallback for version comparison on RHEL5
- PR #34366: (*steverweber*) Update service.py
- PR #34427: (*twangboy*) Automated signing fixes for Ubuntu 16.04, 14.04, 12.04 (for dmurphy)
- PR #34400: (*cachedout*) Fix uninitialized value
- PR #34404: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34392: (*cro*) Clarify that salt-cloud doesn't get installed by bootstrap
- PR #34377: (*terminalmage*) Optimize pkg integration tests and add a couple new tests
- PR #34373: (*jtand*) Network state integration test
- PR #34292: (*twangboy*) Fix runas function for System Account
- PR #34388: (*rallytime*) Back-port #34378 to 2016.3
- PR #34378: (*adelcast*) network_settings.py: fix documentation
- PR #34352: (*cro*) Esxi dvs
- PR #34386: (*rallytime*) Beacon network docs
- PR #34376: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34368: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34344: (*rallytime*) Back-port #34324 to 2015.8
- PR #34342: (*rallytime*) Back-port #34316 to 2015.8
- PR #34324: (*cachedout*) Test custom grains matcher
- PR #34316: (*edgan*) Making salt-ssh pass proper return codes for jinja rendering errors
- PR #34252: (*gtmanfred*) return list of nodes for lxc driver when called directly
- PR #34365: (*sjorge*) fixes computenode_* grains on SmartOS compute nodes

- PR #34319: (*rallytime*) Back-port #34244 to 2015.8
- PR #34313: (*rallytime*) [2015.5] Update to latest bootstrap script v2016.06.27
- PR #34312: (*rallytime*) [2015.8] Update to latest bootstrap script v2016.06.27
- PR #34307: (*rallytime*) Fix test example in integration testing docs
- PR #34306: (*ghedo*) Fix iptables.flush state: Do not force `filter` table when flushing
- PR #34244: (*the-glu*) Typo in dockerio doc

- PR #34343: (*rallytime*) Back-port #34256 to 2016.3
- PR #34256: (*tmehlinger*) detect running from master in State.event method
- PR #34338: (*themalkolm*) Add listen/listen_in support to stateconf.py
- PR #34283: (*sjorge*) 2016.3 mount vfstab support
- PR #34322: (*Ch3LL*) add osmajorrelease grain for raspbian
- PR #34337: (*clinta*) Change merge-if-exists logic to properly report changes
- PR #34300: (*vutny*) Make apache.configfile state handle the Options list correctly
- PR #34333: (*rallytime*) Back-port #33734 to 2016.3
- PR #34304: (*rallytime*) Back-port #33734 to 2016.3
- PR #33734: (*glomium*) modules/rabbitmq.py version checking had a logical error
- PR #34330: (*clinta*) fix #34329
- PR #34318: (*rallytime*) Back-port #32182 to 2016.3
- PR #32182: (*dongweiming*) Fix psutil.cpu_times unpack error
- PR #34311: (*rallytime*) [2016.3] Update to latest bootstrap script v2016.06.27
- PR #34284: (*rallytime*) Don't require `domain` to be present before checking fqdn_ip* grains
- PR #34296: (*sjorge*) 2016.3 status module now works on Solaris like platforms
- PR #34281: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34274: (*clinta*) Don't escape source before calling managed
- PR #34258: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34257: (*rallytime*) Use `config_dir` setting instead of CONFIG_DIR in gpg renderer
- PR #34233: (*thegoodduke*) ipset: fix the comment containing blank
- PR #34232: (*thegoodduke*) ipset: fix comment containing blank
- PR #34225: (*richardscollin*) Fix win_system.set_system_date_time
- PR #34271: (*opdude*) Fixed symlinks on windows where the slashes don't match
- PR #34254: (*sjorge*) Fix for #14915
- PR #34259: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34136: (*meaksh*) Fixed behavior for SUSE OS grains in 2015.8
- PR #34134: (*meaksh*) Fixed behavior for SUSE OS grains in 2016.3
- PR #34093: (*terminalmage*) Catch CommandExecutionError in pkg states
- PR #33903: (*meaksh*) Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
- PR #34134: (*meaksh*) Fixed behavior for SUSE OS grains in 2016.3
- PR #33903: (*meaksh*) Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
- PR #34159: (*christoe*) Fixes to the win_task module
- PR #34223: (*peterdemin*) Fixed typo in filtering LDAP's potential_ous
- PR #34239: (*vutny*) file.find module: fix handling of broken symlinks
- PR #34229: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3

- PR #34218: (*terminalmage*) Fix a pair of gitfs bugs
- PR #34208: (*lomeroy*) fix regression from #33681 which causes pulling a list of s3 objects ...
- PR #34206: (*terminalmage*) Change target for dockerng assuming default status to Nitrogen release
- PR #34188: (*terminalmage*) Clarify pkg.list_repo_pkgs docstring for held packages
- PR #34182: (*rallytime*) Handle child PIDs differently depending on the availability of psutils
- PR #33942: (*cachedout*) ZD 762
- PR #33681: (*rallytime*) Back-port #33599 to 2015.8
- PR #33599: (*lomeroy*) Fix s3 large file download
- PR #34214: (*rallytime*) Update saltutil.wheel docs to specify remote vs local minion behavior
- PR #34209: (*lomeroy*) fix regression in s3.query from #33682
- PR #33682: (*lomeroy*) backport #33599 to 2016.3
- PR #33599: (*lomeroy*) Fix s3 large file download
- PR #34222: (*cachedout*) Lint 34200
- PR #34200: (*secumod*) Fix parted module set CLI example
- PR #34197: (*eliasp*) Make `module.ssh.recv_known_host()` more resilient against hosts not returning a key
- PR #34201: (*DarkKnightCZ*) Suffix temp file with `.sr1` and add mandatory argument when executing PowerShell script
- PR #34198: (*DarkKnightCZ*) Don't use binary mode for `cmdmod.exec_code`
- PR #34198: (*DarkKnightCZ*) Don't use binary mode for `cmdmod.exec_code`
- PR #34172: (*dmurphy18*) Support for building with local packages on Debian and Ubuntu
- PR #34194: (*vutny*) Correct the docstrings formatting in `pkgbuild` modules and state
- PR #34056: (*vutny*) Make `rpmbuild` module work on non-RPM based GNU/Linux systems
- PR #34186: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34184: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34179: (*terminalmage*) Raise the correct exception when gitfs lockfile is empty
- PR #34178: (*terminalmage*) Remove unnecessary comment
- PR #34176: (*rallytime*) Back-port #34103 to 2015.8
- PR #34175: (*rallytime*) Back-port #34128 to 2015.8
- PR #34174: (*rallytime*) Back-port #34066 to 2015.8
- PR #34165: (*mcalmer*) fix salt --summary to count not responding minions correctly
- PR #34141: (*jtand*) Fixed `boto_vpc_test` failure
- PR #34128: (*bebehei*) doc: add missing dot
- PR #34103: (*morganwillcock*) Fix diskusage beacon
- PR #34077: (*rallytime*) Add some grains targeting tests
- PR #34066: (*complexsplit*) Typo fix
- PR #33474: (*cachedout*) Fix diskusage beacon

- PR #34173: (*rallytime*) Update docs to match log_level default
- PR #34095: (*rallytime*) Back-port #32396 to 2016.3
- PR #32396: (*eradman*) Unbreak cron.file
- PR #34108: (*l2ol33rt*) Make dockerng.absent state honor test=true
- PR #34133: (*rallytime*) Back-port #34057 to 2016.3
- PR #34057: (*ajacoutot*) _active_mounts_openbsd: unbreak output for special filesystems
- PR #34156: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34142: (*isbm*) Move log message from INFO to DEBUG.
- PR #34100: (*terminalmage*) Update documentation on ``refresh" behavior in pkg states
- PR #34072: (*jfindlay*) modules.pkg int tests: skip refresh_db upon error
- PR #34110: (*garethgreenaway*) Fixes to git module & state module related to identity file
- PR #34138: (*rallytime*) Update package dep note to systemd-python for RHEL7 install
- PR #34166: (*vutny*) Fix YAML indentation in Apache state docstrings
- PR #34098: (*terminalmage*) Restore old refresh logic
- PR #34087: (*bbinet*) Encourage to report issues to upstream PillarStack project
- PR #34075: (*jfindlay*) modules.inspectlib.kiwiproc: import gate lxml
- PR #34056: (*vutny*) Make rpmbuild module work on non-RPM based GNU/Linux systems
- PR #34073: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34069: (*rallytime*) Add a test to check for disconnected minion messaging
- PR #34051: (*tegbert*) Fixed a bug in the consul.py module that was preventing services
- PR #34048: (*terminalmage*) RFC: proposed fix for multiple fileserver updates in masterless runs
- PR #34045: (*jacobhammons*) Updated latest release version
- PR #34030: (*vutny*) More YAML indentation fixes in state module examples
- PR #34020: (*twangboy*) Always make changes to minion config if set (2015.8)
- PR #34018: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34011: (*rallytime*) Back-port #33948 and #34009 to 2015.8
- PR #34009: (*rallytime*) Back-port #33948 to 2016.3 + add log message
- PR #34005: (*rallytime*) Lint fix for #34000
- PR #34003: (*vutny*) states.file: fix indentation in YAML examples
- PR #34002: (*lorenegordon*) Remove loader test for pam module
- PR #34000: (*cachedout*) Fix incorrectly written test
- PR #33990: (*jacobhammons*) Adds links to several current Salt-related projects
- PR #33985: (*rallytime*) Write some more simple batch command tests
- PR #33984: (*jfindlay*) Add docs and tests to disk state
- PR #33983: (*twangboy*) Clarify the *account_exists* parameter
- PR #33953: (*whiteinge*) Add loader.utils() example to calling minion_mods

- PR #33951: (*jfindlay*) modules.gem int tests: more fixes
- PR #33948: (*cachedout*) Save an entire minion cache traversal on each master pub
- PR #33904: (*rallytime*) Back-port #33806 to 2015.5
- PR #33880: (*terminalmage*) pkg.uptodate: Pass kwargs to pkg.list_upgrades
- PR #33806: (*cachedout*) Work around upstream cherryppy bug
- PR #33684: (*jfindlay*) add acl unit tests
- PR #34010: (*terminalmage*) Do not cache remote files if they are already cached
- PR #34009: (*rallytime*) Back-port #33948 to 2016.3 + add log message
- PR #33948: (*cachedout*) Save an entire minion cache traversal on each master pub
- PR #33941: (*cachedout*) Don't call os.getppid() on Windows
- PR #34067: (*jacobhammons*) Fixes doc refresh bug on chrome mobile.
- PR #34050: (*rallytime*) Back-port #34026 to 2016.3
- PR #34026: (*bensherman*) removed method that doesn't exist
- PR #33987: (*isbm*) inspectlib cleanup
- PR #34042: (*sjorge*) fix #34038
- PR #34025: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34044: (*jacobhammons*) Updated latest release to 2016.3.1
- PR #34014: (*jnhmcknight*) fix launch config creation params
- PR #34021: (*twangboy*) Always make changes to minion config if set (2016.3)
- PR #34031: (*eliasp*) *states.postgres_privileges* expects a real list, not a comma-separated string
- PR #33995: (*jacobhammons*) Understanding Jinja topic, Jinja doc issues.
- PR #33900: (*amendlik*) Document sudo policy for gitfs post-recieve hook
- PR #33980: (*twangboy*) Use full path to python.exe
- PR #33993: (*s0undt3ch*) Call *sys.exit()* instead of *exit()*
- PR #33976: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33962: (*jacobhammons*) Adds a ``Generated on <timestamp>'' line to the html footer
- PR #33952: (*rallytime*) Add base argument to salt-ssh grains wrapper for filter_by func

- PR #33945: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33936: (*rallytime*) Add *connecting_settings* to *boto_elb* state attributes list
- PR #33917: (*techhat*) Wait for up to a minute for *sync_after_install*
- PR #33888: (*jfindlay*) random.org checks
- PR #33877: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #33833: (*terminalmage*) Support syncing pillar modules to masterless minions
- PR #33829: (*terminalmage*) Update versionchanged directive
- PR #33814: (*terminalmage*) Support extraction of XZ archives in archive.extracted state
- PR #33778: (*sodium-chloride*) Fix minor docstring issues
- PR #33765: (*cachedout*) Correct issue with ping on rotate with minion cache
- PR #33726: (*jtand*) glance.warn_until shouldn't be checked for a doc string
- PR #33611: (*rolffokkens*) 2015.5
- PR #33960: (*mecarus*) Fix mongo get_load to return full mongo record instead of non-existent 'load' key
- PR #33961: (*jacobhammons*) 2016.3.0 known issues update
- PR #33908: (*ticosax*) [boto_lambda] handle omitted Permissions parameter
- PR #33896: (*DmitryKuzmenko*) Don't deep copy context dict values.
- PR #33905: (*rallytime*) Back-port #33847 to 2016.3
- PR #33910: (*cachedout*) Ensure tht pillar have freshest grains
- PR #33870: (*rallytime*) Add note about Xenial packages to 2016.3.0 release notes
- PR #33847: (*whiteinge*) Add docs for arg/kwarg eauth matching
- PR #33076: (*cachedout*) Avoid second grains load on windows multiprocessing
- PR #29153: (*DmitryKuzmenko*) ACL limit args

19.2.6 Salt 2016.3.3 Release Notes

Version 2016.3.3 is a bugfix release for *2016.3.0*.

Known Issues

issue 36055: Salt Cloud events (`salt/cloud`) are not generated on the master event bus when provisioning cloud systems.

Bootstrap Issue #973: `python-futures` is not installed when installing from a git tag on RedHat-based distributions. `python futures` is needed when running Salt with the TCP transport. This is fixed on the `develop` branch of the [salt-bootstrap repo](#) and the fix will be included in the upcoming release of salt-bootstrap, but is a bug in the bootstrap release that ships with this version of Salt. Please see the [salt-bootstrap repo](#) for more information on how to update your bootstrap version.

Changes for v2016.3.2..2016.3.3

Total Merges: 134

Changes:

- PR #35580: (*twangboy*) Fix mac_service attempts to parse non-plist files
- PR #35586: (*hu-dabao*) Fix 35420, add run_on_start in build_schedule_item

- PR #35583: (*terminalmage*) Fix localemod tests
- PR #35579: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35577: (*terminalmage*) Unit file changes for 2015.8.12, 2016.3.3
- PR #35571: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35566: (*rallytime*) Back-port #35545 to 2015.8
- PR #35546: (*whiteinge*) Salt api eauth fail gracefully
- PR #35545: (*hu-dabao*) fix-35384, fix cmd.run unless
- PR #35540: (*rallytime*) Whitespace fix for 2015.8
- PR #35525: (*UtahDave*) add missing glob import
- PR #35510: (*terminalmage*) Better systemd integration
- PR #35492: (*terminalmage*) Clarify config.get docstring
- PR #35483: (*gtmanfred*) use `__utils__` in salt.cloud
- PR #35573: (*rallytime*) Back-port #33337 to 2016.3
- PR #33337: (*mzupan*) adding the () to make changes work
- PR #35572: (*terminalmage*) Fix poor formatting in pkg state docs
- PR #35545: (*hu-dabao*) fix-35384, fix cmd.run unless
- PR #35489: (*rallytime*) Back-port #35463 to 2016.3
- PR #35463: (*skizunov*) Make `auth_timeout` user configurable again
- PR #35538: (*thatch45*) Treat python XML as an optdep
- PR #35526: (*thatch45*) Always deploy the thin to /var/tmp
- PR #35522: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35513: (*cachedout*) Might be a good idea to be able to download the software we make
- PR #35512: (*cachedout*) Fixup 35419
- PR #35508: (*terminalmage*) Add Carbon to versionadded for git.diff
- PR #35497: (*deepakhj*) Fixes spacing in requirements files
- PR #35302: (*Ch3LL*) Add job cache test
- PR #35516: (*rallytime*) Back-port #34441 to 2016.3
- PR #34441: (*markuskramerlgitt*) Copy and delete silently, do not list each file
- PR #35517: (*rallytime*) Back-port #34502 to 2016.3
- PR #34502: (*markuskramerlgitt*) Windows installer build scripts will exit on error
- PR #35429: (*tankywoo*) Fix iptables target options with no arguments
- PR #35495: (*rallytime*) Use correct deprecated notation instead of a warning for `apache_module.enable` state function.
- PR #35498: (*rallytime*) Add supported templates list to all template doc references in file state
- PR #35406: (*rallytime*) Provide links to the renderers in the template docs
- PR #35360: (*rallytime*) Add all template registry templates to file.managed docs

- PR #35487: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35486: (*rallytime*) Update bootstrap script to latest stable (2016.08.16)
- PR #35476: (*cachedout*) Fixup SSH bug where sudo without sudo user would break
- PR #35471: (*terminalmage*) win_pkg: Fix traceback when package is not installed
- PR #35460: (*rallytime*) [2015.8] Update bootstrap script to latest stable (2016.08.15)
- PR #35459: (*thatch45*) Ensure that output for salt-ssh gets back
- PR #35453: (*theothergraham*) fixes #34279 - disk cache ttl expiry
- PR #35451: (*isbm*) Bugfix: zypper mod repo unchanged
- PR #35448: (*isbm*) Add ignore_repo_failure option to suppress zypper's exit code 106 on ...
- PR #35413: (*cachedout*) Resolve path issues with cp.push
- PR #35446: (*cachedout*) Make salt-client aware of edge-case where saltutil might be broken
- PR #35449: (*dkruger*) aptpkg will specify --install-recommends if enabled by the SLS
- PR #35467: (*rallytime*) Back-port #33518 to 2016.3
- PR #35235: (*rallytime*) Back-port #33518 to 2016.3
- PR #33518: (*tonybaloney*) Fix libcloud bug #33367
- PR #35461: (*rallytime*) [2016.3] Update bootstrap script to latest stable (2016.08.15)
- PR #35456: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35442: (*cachedout*) Fix cp.push_dir pushing empty dirs
- PR #35436: (*cachedout*) Minor doc fixup
- PR #35132: (*sjorge*) fixes , causing lots of mayham (onchange) with 2016.3.2 for me
- PR #35447: (*ticosax*) [dockerng] RepoTags can be also be None with docker 1.12
- PR #35308: (*farcaller*) Actually fixed dockerng.list_tags
- PR #34702: (*farcaller*) Fixed dockerng.list_tags
- PR #35427: (*cachedout*) Correct errant call to argspec from master. Fix ext_job_cache.
- PR #35428: (*cachedout*) Resolve stacktrace logged by highstate outputter if sls cannot be found
- PR #35412: (*s0undt3ch*) Only allow one sync read to happen at a time.
- PR #35406: (*rallytime*) Provide links to the renderers in the template docs
- PR #35360: (*rallytime*) Add all template registry templates to file.managed docs
- PR #35393: (*deniszh*) No need to run ddns update every time
- PR #35407: (*hu-dabao*) [Fix-35094] None will not be added to grains which generate [none]
- PR #35411: (*eliasp*) modules.event.send(): Prevent backtrace for masterless Minions
- PR #35395: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35394: (*rallytime*) Back-port #34573 to 2015.8
- PR #35359: (*terminalmage*) Clean up open filehandles
- PR #35357: (*twangboy*) Fix file.recurse with clean: True on Windows (2015.8)
- PR #35339: (*isbm*) Bugfix: Prevent continuous restart, if a dependency wasn't installed

- PR #34573: (*cedwards*) Update freebsd.rst
- PR #35373: (*cachedout*) Raise SaltRenderError on bad requisite
- PR #35352: (*twangboy*) Fix file.recurse with clean: True on Windows (2016.3)
- PR #35356: (*jfindlay*) document log levels and warn on all logging below info
- PR #35358: (*twangboy*) Update libsodium deps
- PR #35360: (*rallytime*) Add all template registry templates to file.managed docs
- PR #35362: (*rallytime*) Correct deprecation version tags
- PR #35361: (*rallytime*) Blockdev deprecations
- PR #25267: (*jfindlay*) Disk module improvements
- PR #24893: (*The-Loeki*) Contribution: Disk module improvements
- PR #35347: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35325: (*kev009*) Fix freebsd netstat route on fbsd 10+
- PR #35323: (*thatch45*) Fix issue with bad error check in salt-vt
- PR #35309: (*terminalmage*) file.recurse: Do not convert octal mode string to int
- PR #35301: (*bobrik*) Pass port to ssh.check_known_host, closes #35264
- PR #35334: (*cachedout*) Restore random_master functionality
- PR #35331: (*hu-dabao*) fix 35165, salt-run jobs.exit_success jid is broken
- PR #35318: (*rallytime*) Remove legacy compat docs in mysql pillar since the code was removed already
- PR #30913: (*jtand*) Deprecated code removed.
- PR #35329: (*hu-dabao*) sys.doc will skip all not connected minions
- PR #35306: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35290: (*terminalmage*) Resolve a couple bugs in orchestration output
- PR #35229: (*lubyou*) Ignore import error for pwd module in mac_shadow
- PR #35227: (*isbm*) Isbm osfinger ubuntu fix
- PR #35286: (*hu-dabao*) fix 34425, a bug that sys.doc cannot output format
- PR #35275: (*rallytime*) Back-port #35213 to 2016.3
- PR #35213: (*gtmanfred*) add identity v3 support to openstack driver
- PR #35278: (*dmurphy18*) Increase timeout for signing to 10 seconds when signing rpm packages
- PR #35276: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35271: (*bobrik*) Default state_output_profile to True everywhere, closes #35166
- PR #35249: (*terminalmage*) Fix regression in git.latest
- PR #35245: (*rallytime*) Back-port #35039 to 2015.8
- PR #35241: (*terminalmage*) Ensure max recursion in gitfs results in no blob object being returned.
- PR #35240: (*derekmaciel*) Backport #35225 to 2015.8
- PR #35236: (*rallytime*) Back-port #35119 to 2015.8
- PR #35233: (*terminalmage*) Do not attempt to get fqdn_ip{4,6} grains when ipv{4,6} grains are empty

- PR #35225: (*derekmaciel*) Add missing documentation for `pkg.installed`
- PR #35211: (*cachedout*) Alternative sudo users for `salt-ssh`
- PR #35202: (*multani*) doc: fix broken links in the test documentation page
- PR #35119: (*derekmaciel*) Assume two EVRs are equal if E and V are equal but one R is missing.
- PR #35039: (*whiteinge*) Add `saltenv` support to `module.run`
- PR #35274: (*rallytime*) Lint fixes for 2016.3 branch
- PR #35232: (*theredcat*) fix `rabbitmq` version detection using a package-agnostic version
- PR #35269: (*meaksh*) Checksum validation for `zypper pkg.download` in 2016.3 and `develop`
- PR #35197: (*vutny*) Make `pkgbuild.repo` state recognize `createrepo` command return code
- PR #35178: (*cro*) Add `append_minionid_config_dirs` option
- PR #35259: (*cachedout*) Fixup 35253
- PR #35253: (*abednarik*) Fix `disk.wipe` missing option.
- PR #35253: (*abednarik*) Fix `disk.wipe` missing option.
- PR #35206: (*hu-dabao*) Make the log level back to warning for unclassified exc
- PR #35196: (*isbm*) Deprecate `status.uptime` one version later
- PR #35207: (*eliasp*) Handle exceptions in `_get_virtual()` and in `_get_virtual()` consumers
- PR #35232: (*theredcat*) fix `rabbitmq` version detection using a package-agnostic version
- PR #35244: (*rallytime*) Back-port #31677 to 2016.3
- PR #31677: (*miihael*) Return correct value for services that must be enabled in `Systemd`
- PR #35182: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35174: (*rallytime*) Back-port #35146 to 2015.8
- PR #35173: (*rallytime*) Back-port #35135 to 2015.8
- PR #35146: (*cachedout*) Don't discard running beacons config when listing beacons
- PR #35145: (*jacobhammons*) doc version update to 2015.8.11, updates to release notes
- PR #35135: (*rallytime*) Add missing CLI Examples to `aws_sqs` module funcs
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #35150: (*rallytime*) Start release notes for 2016.3.3
- PR #35157: (*hu-dabao*) master returned from func should be a string as designed so far
- PR #35147: (*jacobhammons*) doc version updated to 2016.3.2
- PR #35136: (*s0undt3ch*) Don't restart processes if the manager is not set to restart them
- PR #35133: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35114: (*terminalmage*) Add clarification docs on a common `git_pillar` misconfiguration
- PR #35043: (*rallytime*) Start release notes file for 2015.8.12
- PR #34768: (*hrumph*) Fixes #34767
- PR #35120: (*kstreee*) The ``_handle_event_socket_recv'` function in Salt Api is missing first data of stream.
- PR #35131: (*rallytime*) Back-port #35011 to 2016.3

- PR #35011: (*nishigori*) Fix docstring for code-block of rst
- PR #35110: (*hu-dabao*) Do not return job status back to master for master_alive and master_failback schedules
- PR #35104: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35066: (*jfindlay*) returners.postgres_local_cache: do not log in __virtual__
- PR #35050: (*terminalmage*) [orchestration] Properly handle runner/wheel funcs which accept a `saltdev` argument
- PR #35026: (*cachedout*) Expressly deny a minion if a key cannot be found
- PR #35024: (*bobrik*) Cache systemd unit update check per unit, closes #34927
- PR #35105: (*rallytime*) Update 2016.3.0 release notes with repo.saltstack.com Xenial pkg availability
- PR #33870: (*rallytime*) Add note about Xenial packages to 2016.3.0 release notes
- PR #35059: (*vutny*) Add *fun_args* field to events generated by execution of Master modules
- PR #34955: (*lubyu*) force *dism* to always output english text
- PR #35078: (*jacobweinstock*) added missing non-keyword argument *skip_verify* to *__get_artifact* func...
- PR #35008: (*hu-dabao*) Fix multimaster failover on more than two masters and failback behaviour
- PR #35055: (*galet*) #33536 *pkgrepo.managed* does not disable a yum repo with ``disabled: True``
- PR #35039: (*whiteinge*) Add saltenv support to *module.run*
- PR #35046: (*eliasp*) Prevent backtrace in *salt.states.network*
- PR #35054: (*lubyu*) Only fail user lookup if the user parameter is required
- PR #35029: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35000: (*rallytime*) Back-port #33875 and #34999 to 2015.8
- PR #34994: (*rallytime*) Back-port #34835 to 2015.8
- PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in salt-ssh
- PR #33875: (*jmesquita*) Fix naive fileserver map diff algorithm
- PR #35021: (*terminalmage*) Don't add `!` to *strerror* when passed string ends in `?` or `!`
- PR #34983: (*eliasp*) *modules.slack.post_message*: Allow sending messages to direct-message ...
- PR #34996: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34991: (*cachedout*) SSH timeout
- PR #34976: (*cachedout*) Refine errors in client
- PR #34831: (*thatch45*) If the thin does not match, then redeploy, don't error
- PR #34987: (*eliasp*) *salt.states.slack*: check correct result attribute
- PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in salt-ssh
- PR #34988: (*rallytime*) Update release notes with new changes
- PR #34946: (*anlutro*) Fix virtualenv behavior when requirements files are in subdirectories
- PR #34957: (*sjmh*) Don't fall through to checking auth entries
- PR #34971: (*cachedout*) Increase timeout for grains test
- PR #34951: (*vutny*) Fix #34873

- PR #34935: (*rallytime*) Avoid UnboundLocalError in beacons module
- PR #34894: (*rallytime*) [develop] Merge forward from 2016.3 to develop
- PR #34956: (*cachedout*) Increase all run_script timeouts to 30s
- PR #34933: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34916: (*cachedout*) Master performance improvement
- PR #34911: (*cachedout*) Backport #34906
- PR #34906: (*cachedout*) Set timeout for run_salt in test suite
- PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list_upgrades
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34915: (*abednarik*) Update service_rh provider to exclude XenServer >= 7.
- PR #34926: (*rallytime*) Lint #34923
- PR #34923: (*eliasp*) Handle exception when no Slack API key was provided
- PR #34910: (*cachedout*) Fix grains error on proxy minions
- PR #34864: (*jmacfar*) Check for version in list of installed versions
- PR #34902: (*rallytime*) Back-port #34878 to 2016.3
- PR #34878: (*abednarik*) Add VirtuozzoLinux is yumpkg enable list.
- PR #34901: (*rallytime*) Add VirtuozzoLinux to the list of enabled distros for rpm.py
- PR #34900: (*rallytime*) Add VirtuozzoLinux to enabled platforms list in rh_service.py
- PR #34887: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force_reset=False
- PR #34862: (*thatch45*) Fix salt-ssh cacheing issue
- PR #34859: (*cachedout*) Fix wheel test
- PR #34632: (*eliasp*) Try to create the log directory when not present yet
- PR #34854: (*rallytime*) Remove string_types import from state compiler
- PR #34865: (*thatch45*) This needs discussion, since this breaks SUSE
- PR #34858: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34847: (*cachedout*) Add an option to skip the verification of client_acl users
- PR #34833: (*rallytime*) Back-port #28521 to 2015.8
- PR #34828: (*thatch45*) Fix #34648
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #34823: (*rallytime*) Back-port #25276 to 2015.8
- PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low
- PR #28521: (*gongled*) SPM: packaging doesn't work in Python 2.6. Fixed.
- PR #25276: (*jacobhammons*) copy spm.1 man page during setup
- PR #34852: (*rallytime*) Skip GCE unit tests - causes test suite to hang

19.2.7 Salt 2016.3.4 Release Notes

Version 2016.3.4 is a bugfix release for *2016.3.0*.

Known Issues

The Salt Minion does not clean up files in `/tmp` when rendering templates. This potentially results in either running out of disk space or running out of inodes. Please see [Issue #37541](#) for more information. This bug was fixed with [Pull Request #37540](#), which will be available in the `2016.3.5` release of Salt.

The release of the *bootstrap-salt.sh* script that is included with 2016.3.4 release has a bug in it that fails to install salt correctly for git installs using tags in the 2015.5 branch. This bug has not been fixed in the [salt-bootstrap repository](#) yet, but the [previous bootstrap release \(v2016.08.16\)](#) does not contain this bug.

Changes

- The *disk.wipe* execution module function has been modified so that it correctly wipes a disk.
- Add ability to clone from a snapshot to the VMWare salt-cloud driver.
- Add ability to specify disk backing mode in the VMWare salt cloud profile.

Changes for v2016.3.3..v2016.3.4

Total Merges: 274

Changes:

- [PR #37282](#): (*thatch45*) add cpub to raet event for compat
- [PR #37278](#): (*jfindlay*) update 2016.3.4 release notes
- [PR #37252](#): (*vutny*) Set logging level to `'info'` for message about init system detection
- [47290d8](#) Update man pages for the 2016.3 branch ([#37259](#))
- [PR #37257](#): (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- [PR #37254](#): (*DmitryKuzmenko*) Bugs/37191 minion hangs
- [PR #37218](#): (*darkalia*) Issue [`#37187`](#) _ Do not parse first `/proc/1/cmdline` binary if it's not `*b...`
- [PR #37239](#): (*Ch3LL*) Fix cloud tests timeout
- [PR #37244](#): (*rallytime*) Update bootstrap release to 2016.10.25
- [PR #37245](#): (*rallytime*) Back-port [#36334](#) to 2016.3
- [PR #37233](#): (*rallytime*) Back-port [#37154](#) to 2016.3
- [PR #37232](#): (*rallytime*) Back-port [#37153](#) to 2016.3
- [PR #37228](#): (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- [PR #37213](#): (*cachedout*) More salttesting fixes
- [PR #37207](#): (*cachedout*) Correct documentation for `mine_functions`
- [PR #37208](#): (*cachedout*) Give multimion a process manager and its own destroy method

- PR #37206: (*cachedout*) Address transport test hang
- PR #37179: (*isbm*) Fix Salt-API ssh crash (2016.3)
- PR #37183: (*gtmanfred*) load tags should reference the actual load tags
- PR #37188: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- d7e28d2 Pylint fix for 2016.3 (#37186)
- PR #37175: (*cachedout*) Fix test hang
- PR #37144: (*DmitryKuzmenko*) Bugs/36866 salt minion communication broken 2016.3
- PR #37158: (*jfindlay*) add mock for *status.uptime* unit test
- PR #37161: (*rallytime*) Back-port #37098 to 2016.3
- PR #37159: (*rallytime*) Back-port #37107 to 2016.3
- PR #37163: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 2bc5ded Allow the minion test daemons a couple of tries to connect to the master (#37150)
- ec7ad9e Add note about salt-bootstrap known issue for 2016.3.4 (#37152)
- PR #37135: (*AaronM-Cloudtek*) Fix example signing policy in salt.states.x509 docs
- PR #37140: (*vutny*) pkgbuild.repo: fix GPG signing with *use_passphrase=False*
- PR #37071: (*vutny*) pkgbuild.repo: add *timeout* parameter for waiting passphrase prompt
- PR #37115: (*DmitryKuzmenko*) Backport/36720 fix race condition
- PR #37119: (*jfindlay*) log.setup: only assign user if defined
- f22c686 fix digital ocean image name in profile (#37126)
- 4263849 add 2016.3.4 release notes (#37125)
- PR #37120: (*rallytime*) Back-port #36246 to 2016.3
- PR #37103: (*cachedout*) Remove unnecessary sleep from *unit.utils.process_test.TestProcessMana...*
- PR #36823: (*terminalmage*) Update debian systemd unit files to use default KillMode, Type=notify
- PR #37030: (*isbm*) Fix *status.uptime* for Solaris 9, 10 and 11.
- PR #37101: (*rallytime*) [2016.3] Merge forward from 2016.3 to carbon
- PR #36958: (*twangboy*) Fix bug where *cmd.powershell* fails to return
- PR #37086: (*cachedout*) Make salt-call a first-class citizen for multi-master
- PR #36898: (*clinta*) X509 fixes
- PR #37025: (*cro*) Make *salt.utils.minion._check_cmdline* work on OSes without */proc*.
- PR #37050: (*twangboy*) Fix service state for Windows (DO NOT MERGE FORWARD)
- PR #37076: (*jfindlay*) Document proxy settings
- PR #37081: (*terminalmage*) Fix *archive.extracted* remote *source_hash* verification
- PR #37064: (*cachedout*) Unify job check in scheduler
- PR #37072: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37049: (*terminalmage*) Further clarification on new grains docs from #37028
- PR #37057: (*rallytime*) [2016.3] Update *salt.utils.cloud* references to *__utils__* for cache funcs

- PR #36977: (*twangboy*) Remove whitespace from string commands
- PR #37048: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37028: (*damon-atkins*) Update topics/grains doco, about considerations before adding a Grain
- PR #37012: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 519e1dc opkg: Support ignore_epoch argument in version comparisons (#37007)
- PR #36808: (*gtmanfred*) allow for closing stuff in beacons
- a02868b Make helper funcs private (#36993)
- PR #36986: (*jfindlay*) modules.archive.unzip: zipfile is stdlib
- PR #36981: (*rallytime*) Skip pkg.upgrades test on distros other than Suse in 2016.3
- PR #36755: (*terminalmage*) systemd.py: check retcode for service availability in systemd >= 231
- PR #36750: (*terminalmage*) Add the CLI client and pub_data as class attributes
- PR #36241: (*hrumph*) Fixes `#36240`_``
- PR #36950: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36948: (*rallytime*) Back-port #36943 to 2016.3
- PR #36946: (*rallytime*) Back-port #36892 to 2016.3
- PR #36945: (*rallytime*) Back-port #35199 to 2016.3
- 7565ed6 Fix versionadded (#36949)
- 4d8fb03 return opennebula errors to user (#36930)
- PR #36929: (*rallytime*) [yumpkg] Skip test_pkg_upgrade_has_pending_upgrades if there are no upgrades
- 288f437 [2016.3] Remove "Targeting with Executions" section from docs (#36926)
- PR #36915: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 0ebf7a4 modules: debian_ip: override params early to fix diff (#36820)
- a23ce84 states.schedule: splay is not ordereddict (#36894)
- PR #36885: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 1c0ba80 salt-ssh: Try "command -v" before falling back to "which" (#36889)
- 85eea4d fileclient: Change queryarg comparison from None to simple boolean check (#36830)
- PR #36853: (*rallytime*) Back-port #33939 to 2016.3
- PR #36852: (*rallytime*) Back-port #36743 to 2016.3
- PR #36844: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36835: (*jfindlay*) unify and expand beacon documentation
- PR #36789: (*maximeguillet*) Fix behavior of psql -c option with postgresql 9.6
- PR #36797: (*cachedout*) Error on reaction with missing SLS file
- PR #36803: (*gtmanfred*) do not load libvirt pillar if certtool is unavailable
- PR #36815: (*BenoitKnecht*) Fix glance.image_present state
- PR #36754: (*terminalmage*) Base rpmdev-vercmp comparison result on retcode
- PR #36785: (*cachedout*) Fixup merge forward #36728

- PR #36768: (*gtmanfred*) add `__utils__` to vultr cloud provider
- PR #36764: (*cachedout*) Another bit of detection for failed pip tests
- PR #36747: (*jfindlay*) modules.archive integration tests: check for gzip, rar
- PR #36744: (*cachedout*) Fix issue where test suite could hang on shutdown
- PR #36696: (*cro*) pass `__proxy__` in state.sls_id
- PR #36716: (*vutny*) salt.modules.ini_manage: fix creating options in empty file
- PR #36724: (*rallytime*) Back-port #36628 to 2016.3
- PR #36725: (*rallytime*) Back-port #36643 to 2016.3
- PR #36726: (*rallytime*) Back-port #36722 to 2016.3
- 48d2b01 fix python26 archive zip module (#36719)
- PR #36699: (*cachedout*) Fix error in test
- PR #36670: (*jackywu*) fix bug for including loopback addr
- PR #36694: (*loregordon*) Exposes `ignore_if_missing` to file.replace state module
- PR #36686: (*jfindlay*) log levels doc: try long form table
- PR #36690: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36680: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36659: (*terminalmage*) Support dynamic env in new-style git_pillar
- PR #36538: (*clinta*) daemon-reload on call to service.available
- PR #36616: (*cro*) Zypper fix test
- PR #36621: (*terminalmage*) Fix shadowed builtins
- PR #36636: (*rallytime*) Back-port #36618 to 2016.3
- PR #36648: (*jfindlay*) Integration tests for archive execution module
- PR #36650: (*rallytime*) Revert ``Pr 36386``
- PR #36646: (*rallytime*) Provide an error message when invalid transport is set
- PR #36635: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36620: (*rallytime*) Don't allow mercurial states to return True with errors
- PR #36622: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36520: (*twangboy*) Fix cmd.script runas for Windows
- PR #36564: (*DmitryKuzmenko*) Improve and fix `_check_cache_minions`
- PR #36606: (*danlsgiga*) Add support for ACL Tokens in consul_pillar with the option `consul.token`
- PR #36613: (*slinn0*) Remove file.check_managed_changes when not needed (backport of PR #36589 to 2016.3)
- PR #36609: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36595: (*cachedout*) Remove tests which no longer apply
- PR #36594: (*cachedout*) Update bootstrap docs to recent versions of Ubuntu
- PR #36585: (*twangboy*) Add pyOpenSSL to req file for Windows
- f205d5f Fix salt.utils.rm_rf to delete files too (#36572)

- PR #36495: (*cro*) Fix pkg.upgrade for zypper
- PR #36539: (*jfindlay*) Prefer archive.cmd_unzip
- PR #36546: (*rallytime*) Mercurial Module: Pass the identity_path portion as own arg
- PR #36555: (*DmitryKuzmenko*) Bugs/35480 master shutdown
- PR #36542: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 5548ed7 Back-port #36435 to 2016.3 (#36532)
- fe377b3 Be explicit about the salt.utils.templates import (#36535)
- fcc50c9 Wrap the entire GrainsAppendTestCase class with destructiveTest (#36537)
- PR #36529: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36483: (*dmurphy18*) Isolate sun IPv6 fix to Sun OS only
- PR #36280: (*alertedsnake*) Feature/2016.3 better postgresql grants
- PR #36508: (*twangboy*) Fix chocolatey

- PR #36203: (*xiaoanyunfei*) fix owner of MultiprocessingLoggingQueue
- b586ed7 if the backend stack traces when it should return an empty string (#36193)
- PR #36188: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35907: (*rallytime*) Catch CommandExecutionError when the group in group_installed doesn't exist
- PR #36068: (*rallytime*) Remove grains type deprecation warning from 2016.3
- PR #36152: (*cachedout*) Remove unnecessary unpack
- PR #36158: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 3445a33 Remove unclosed backticks in walkthrough doc (#36170)
- PR #36161: (*jacobhammons*) Adds `#36055`_ to release notes
- PR #36139: (*meaksh*) Fixing unit tests for 2016.3
- PR #36143: (*multani*) doc: fix doc formatting for salt.states.mount
- PR #36070: (*rallytime*) Use __utils__ instead of salt.utils.cloud in opennebula driver
- PR #36089: (*terminalmage*) Support running git states / remote exec funcs as a different user in Windows

- PR #35923: (*kstree*) Fixes a bug that Ctrl-c not working on Salt CLI.
- PR #36078: (*thatch45*) Failhard test=True fix
- PR #34529: (*Ch3LL*) Add skip_verify for archive.extracted
- PR #36073: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- a86e36c Add docs for new kwargs added to the wheel key module (#36040)
- 2934fc1 Doc cherryppy deemphasize urlencoded (#36047)
- PR #36039: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 1d90c42 Back-port #35824 to 2016.3 (#36038)
- 65b6734 catch unicode encoding errors in json outputter (#36033)
- 822481e modules.service: Do not default to OpenRC on Gentoo, also allow systemd (#36010)
- b68d293 fix redis_return's clean_old_jobs. (#36014)
- 95591c2 Add documentation about salt_interface to EC2 docs (#36015)
- PR #36019: (*meaksh*) Back-port #36000 to 2016.3
- b9fc51a Fix error when profiling is turned on and minions don't return (#36028)
- 20a361d Add include_* kwargs to the *_dict key functions (#36030)
- PR #36024: (*DmitryKuzmenko*) Don't subscribe to events if not sure it would read them.
- PR #36023: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #36004: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35952: (*twangboy*) Load UserProfile when using RunAs (2016.3)
- PR #35959: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35955: (*jacobhammons*) Version docs to 2016.3.3
- 9910b9c Fix incremental doc builds - OS X, postgres returner, tcp transport doc updates (#35865)
- 24f9d33 Speed up FreeBSD pkg install process for pkg.latest since pkg command by default tries to update repository DB on each search: (#35904)
- b87e4f1 Salt Cloud: add centos default user for official CentOS AMIs (#35931)
- 580e0d4 Mention that docker image names must be given with repository (#35926)
- PR #35868: (*rallytime*) Add more helpful return messages for drac runner
- PR #35903: (*rallytime*) [2016.3] Merge forward from 2015.8 into 2016.3
- PR #35855: (*vutny*) [REGRESSION] salt-cloud: fix path to Salt Master socket dir
- PR #35881: (*whiteinge*) Add fail-safe in case Salt gives us data we can't serialize
- 9679266 Add engines to list of extension module options in master config docs (#35864)
- 40bcb7d Fix IAM roles statement to be boto version specific in sqs_events (#35861)
- ee45a88 Fix doc formatting for sqs_events engine example config (#35860)
- PR #35859: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35849: (*theredcat*) Fix potential infinite loop with no error when using recursive makedirs
- PR #35682: (*vutny*) [BACKPORT] Fix empty fun_agrs field in Reactor generated events

- PR #35792: (*DmitryKuzmenko*) Reconnect syndic to event bus if master disappeared.
- PR #35817: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- b89f455 fix 34241, webutil.useradd_all is deprecated (#35788)
- 2be5daf Bump the deprecation warning in pkgrepo state to Nitrogen (#35810)
- 083d836 Fix misuse of HTTP credentials in modjk execution module (#35796)
- 0247867 Adds mock for tornado.locks (#35807)
- e4dfc21 Trivial documentation spelling fix (#35800)
- PR #35763: (*isbm*) Sphinx crash: documentation config fix
- cd90052 Documentation spelling fixes (#35773)
- PR #35767: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35753: (*rallytime*) Fixup the unit.client_test.LocalClientTestCase.test_cmd_subset from #35720
- dab8428 Add versionadded for enabled function in apache_module state (#35732)
- PR #35737: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35729: (*cachedout*) Remove docs mocks for msgpack and psutils
- PR #35628: (*jf*) Fix user.present state reporting for groups when remove_groups=false
- PR #35696: (*xiaoanyunfei*) fix maximum recursion depth bug
- PR #35720: (*hu-dabao*) fix 20575, make subset really return random subset
- PR #35700: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35634: (*hu-dabao*) fix 34922, StopIteration should not throw exception out
- PR #35679: (*twangboy*) Revert to vcredist 12 (2013)
- PR #35662: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3
- 64974c8 Backport #35627 to 2016.3 (#35661)
- PR #35615: (*hu-dabao*) fix 35591, verify the acl file exist before proceed
- PR #35485: (*cro*) Cassandra returner bugfixes and documentation.
- PR #35520: (*morganwillcock*) Check for all success return codes in win_dism state
- PR #35616: (*xbglowx*) Remove duplicate auth_tries in minion docs
- PR #35552: (*DmitryKuzmenko*) Syndic fix: don't strip `retcode` and `success` from events.
- PR #35559: (*Jlin317*) Fix highstate outputter when it's given multiple results
- PR #35605: (*rallytime*) Back-port #32739 to 2016.3
- PR #35606: (*rallytime*) [2016.3] Merge forward from 2015.8 to 2016.3

19.2.8 Salt 2016.3.5 Release Notes

Version 2016.3.5 is a bugfix release for *2016.3.0*.

Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

19.2.9 Salt 2015.8.0 Release Notes - Codename Beryllium

2015.8.0 Detailed Change List

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>)

Generated at: 2015-09-09T18:15:43Z

This list includes all pull requests merged into the 2015.8 branch between the forking of the branch from develop and the release of 2015.8.0.

Statistics:

- Total Merges: 682
- Total Issue references: 342
- Total PR references: 866

Pull Requests:

- #26993: (*whiteinge*) Backport #26975
- #26970: (*cachedout*) Revert ``better path query parsing in fileserver"
- #26980: (*terminalmage*) Use human-readable cachedirs for gitfs-backed winrepo
- #26969: (*TheBigBear*) URL of salt windows downloads has changed
- #26968: (*TheBigBear*) URL of salt windows downloads has changed
- #26958: (*s0undt3ch*) Bradthurber bootstrap command line help doc update
- #26949: (*rallytime*) Back-port #25148 to 2015.8
- #26914: (*cro*) Add salt-proxy script and manpage to setup.py so they will get installed.
- #26909: (*terminalmage*) Don't try to git clone from /tmp on Windows
- #26910: (*s0undt3ch*) Sometimes the event system is just too fast
- #26905: (*s0undt3ch*) Exit the loop if run_once is true
- #26897: (*msted*) spm file hash part deux
- #26900: (*s0undt3ch*) If no tag is passed, don't actually subscribe to anything.
- #26880: (*s0undt3ch*) Restore backwards compatibility to *salt.utils.event*
- #26896: (*msted*) spm remove: use pkgfiles to calculate file hashes
- #26891: (*jtand*) Fixed an unboundlocalerror
- #26892: (*cachedout*) Make the testing ioloop the current one

- #26886: (*jtand*) Gets the azure version correctly on python-azure 1.0.0
- #26870: (*rallytime*) Back-port #26834 to 2015.8
- #26865: (*dmurphy18*) Fix apt preferences for apts, repos for pbuilder building for Debian
- #26873: (*terminalmage*) Properly handle getting local config values in older git versions
- #26869: (*rallytime*) Fix provider --> driver change for salt-cloud lxc
- #26858: (*terminalmage*) Fix a couple version checks for git state and execution module
- #26853: (*UtahDave*) Fix salt-cloud on windows
- #26852: (*basepi*) [2015.8] Only reference msgpack if it imported successfully
- #26835: (*terminalmage*) Backport #26572 to 2015.8
- #26836: (*jacobhammons*) Added rst source for salt-proxy man page, added build and copy lines ...
- #26818: (*terminalmage*) Support empty repositories in git.latest
- #26819: (*rallytime*) Make sure we're calling `_validate_name` in the correct place in 2015.8 Linode driver
- #26841: (*l2ol33rt*) Fix reference before assignment in sqs engine
- #26822: (*terminalmage*) Add some missing imports for masterless winrepo
- #26831: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26826: (*techhat*) Pass a package name to `unregister_file()`
- #26757: (*cachedout*) Fix various filehandle leaks
- #26816: (*gtmanfred*) rev defaults to HEAD
- #26801: (*jacobhammons*) Added doc for dockerng minion configuration options
- #26808: (*anlutro*) Fix git init argument formatting
- #26807: (*terminalmage*) Move `salt.utils.itersplit()` to `salt.utils.itertools.split()`
- #26796: (*jacobhammons*) Add doc for `__states__`
- #26764: (*sjorge*) `salt.utils.is_proxy()` is no longer always true on SunOS/Illumos/SmartOS
- #26772: (*sjorge*) pull in smartos `virt` module from develop
- #26726: (*terminalmage*) Redact HTTPS Basic Auth in states/funks which deal with git remotes
- #26769: (*terminalmage*) Use `--track` to set tracking branch on older git versions
- #26765: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26761: (*sjorge*) fix SPM paths on smartos/illumos esky
- #26751: (*terminalmage*) Fixes for masterless winrepo
- #26745: (*rallytime*) Make sure pyrax configs are in place before checking for deps
- #26746: (*rallytime*) Make sure nova configs are set before checking for dependencies
- #26750: (*basepi*) [2015.8] Add `__utils__` to state modules
- #26752: (*cro*) Fix typo in some diagram labels
- #26747: (*basepi*) [2015.8] Add `__states__` to state modules, for cross-calling states
- #26744: (*basepi*) [2015.8] Fix issue from #26717
- #26737: (*dmurphy18*) Fix to allow for package naming other than just salt

- #26742: (*rallytime*) Only warn about vsphere deprecation if vsphere is configured
- #26733: (*sjorge*) Refactor of smartos_vmadm module
- #26735: (*s0undt3ch*) Add `.hg` and `.cvs` to `spm_build_exclude`
- #26720: (*UtahDave*) Updates for winrepo in 2015.8 to support jinja, while maintaining backwards compat
- #26719: (*jodv*) Backport 26532 to 2015.8
- #26721: (*rallytime*) Linode Driver Cleanup
- #26707: (*techhat*) Add `top_level_dir` to FORMULAs
- #26723: (*s0undt3ch*) Handle SPM paths in the setup script
- #26717: (*basepi*) [2015.8] Revert loader changes from #26645
- #26712: (*techhat*) Move SPM paths around
- #26680: (*TheBigBear*) add more python libs info in `--versions-report`
- #26716: (*terminalmage*) Allow git identity to be a list
- #26691: (*garthgreenaway*) Fixes to ipset module for 2015.8
- #26701: (*kev009*) Ignore the first element of `kern.disks` split, which is the `sysctl` name (new disks grain)
- #26678: (*terminalmage*) Restructure `git.latest` rewrite to work better when following HEAD
- #26679: (*rallytime*) Back-port #26661 to 2015.8
- #26684: (*techhat*) Add reactor formulas to `spm`
- #26682: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26671: (*rallytime*) Warn users if cloud driver dependencies are missing.
- #26674: (*rallytime*) Back-port #26583 to 2015.8
- #26670: (*techhat*) Set up SPM to install `-conf` packages
- #26657: (*jfindlay*) top file compilation fixes
- #26659: (*TheBigBear*) minor doc edits - spelling
- #26654: (*jfindlay*) merge `#26650` _
- #26567: (*jtand*) Added git version check to git module
- #26649: (*twangboy*) Fixed Lint for real in `win_repo.py`
- #26608: (*jacobhammons*) 2015.8.0 release notes and `doc/conf.py` updates
- #26646: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26645: (*rallytime*) Back-port #26390 to 2015.8
- #26642: (*twangboy*) Added function to render winrepo Jinja
- #26625: (*twangboy*) Correctly detect packages with no version, docs
- #26575: (*mstead*) Update `spm` for integration into `raas`
- #26635: (*cro*) Don't report windows as a proxy.
- #26622: (*rallytime*) [2015.8] Also add `-Z` to script args for cloud tests
- #26619: (*rallytime*) Apply cloud test fixes from 2015.5 to 2015.8
- #26603: (*terminalmage*) Fixes for `git.latest`, `git` module integration tests, etc.

- #26577: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26534: (*cachedout*) Bump required Tornado version to 4.2.1
- #26566: (*cachedout*) Don't stacktrace trying to publish without a master
- #26541: (*terminalmage*) Make winrepo execution module use the same code as the runner
- #26530: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26570: (*cachedout*) Fix haproxy docs to be valid
- #26562: (*cachedout*) Fix suprious error message with systemd-detect
- #26557: (*jfindlay*) add docs to #26550
- #26544: (*nmadhok*) Do not raise KeyError when calling avail_images if VM/template is in disconnected state
- #26501: (*terminalmage*) Update git_pillar docs, add git.list_worktrees function
- #26521: (*terminalmage*) Work around upstream git bug when cloning repo as root
- #26518: (*krak3n*) Fix for [`#25492`_](#)
- #26514: (*evverx*) Unmask a runtime masked services too
- #26529: (*mnalt*) bugfix: fix service.enable for missing rc.conf
- #26516: (*techhat*) Move more path operations into SPM loader
- #26533: (*cachedout*) Fix too aggressive even init check
- #26522: (*cro*) Do not load package provider if its not a proxy
- #26531: (*cachedout*) Fix failing event tests and modify event init
- #26433: (*cro*) Add support for default proxy config options, change default location of proxy config and log to /etc/salt/proxy and /var/log/proxy
- #26504: (*nmadhok*) [Backport] Adding ability to specify the virtual hardware version when creating VM
- #26517: (*cachedout*) Better fix for opensuse tornado httpclient
- #26479: (*rallytime*) Don't allow VMs with duplicate names to be created in EC2/AWS
- #26488: (*cachedout*) Don't pass unsupported kwarg to tornado
- #26451: (*terminalmage*) Use `rpm -qa` instead of repoquery to list installed packages
- #26491: (*jacobhammons*) doc site css fix for tiny fonts that appeared in code or pre tags in ...
- #26442: (*rallytime*) Hide API Key from debug logs for Linode Driver
- #26441: (*rallytime*) Refactor a few linode functions to be useful with salt-cloud command
- #26485: (*s0undt3ch*) One more missed typo
- #26495: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26492: (*cachedout*) Fix schedule test error on py26
- #26489: (*cachedout*) Fixing more tarfile tests on py2.6
- #26475: (*cachedout*) Better object checking on asyncreq cleanup
- #26477: (*cachedout*) Fix integration.modules.git.GitModuleTest.test_archive on py26
- #26469: (*jtand*) --annotate and --message aren't valid options in older versions of git.
- #26439: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- #26464: (*rallytime*) Back-port #26456 to 2015.8
- #26463: (*rallytime*) Back-port #26455 to 2015.8
- #26449: (*s0undt3ch*) The CLI options are not meant to include underscores.
- #26270: (*sjorge*) salt.modules.network now supports SmartOS and SunOS < Solaris 11
- #26436: (*TheBigBear*) minor edits
- #26410: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26427: (*anlutro*) git.latest with no rev: fix concatenation error (NoneType and str)
- #26307: (*cachedout*) Fix bug in top file ordering
- #26428: (*cro*) Update docs to reflect new pillar structure
- #26429: (*cachedout*) Add release note regarding tcp transport on freebsd
- #26418: (*driskell*) Fix forward-merged caching from 2015.5 into 2015.8 to be compatible with the new match_func
- #26252: (*DmitryKuzmenko*) Issues/24048 http client 2015.8
- #26413: (*evverx*) Fix service.{start,restart,reload,force-reload} for masked services
- #26393: (*dmurphy18*) Added option parameters to make_repo to allow for configuration settings
- #26422: (*TheBigBear*) no dots in SLS filename __AND__ any directories (incl git repos)
- #26323: (*0xf10e*) Fix Credentials used in *glance* Exec Module
- #26341: (*terminalmage*) Rewrite git state and execution modules
- #26419: (*terminalmage*) Only use pygit2.errors if it exists
- #26423: (*eliasp*) doc - Correct function name for peer configuration
- #26401: (*cachedout*) Adapt proxy minion to tornado (w/lint)
- #26400: (*rallytime*) Back-port #26318 to 2015.8
- #26397: (*s0undt3ch*) A single *isinstance()* check for all types is enough
- #26385: (*gtmanfred*) don't require volume endpoint in nova driver
- #26287: (*techhat*) Break out SPM components into loaders
- #26384: (*TheBigBear*) Fix shell quoting for cmd.run
- #26391: (*rallytime*) Back-port #26367 to 2015.8
- #26383: (*rallytime*) Allow the creation of a VM without a profile
- #26375: (*s0undt3ch*) [2015.8] Schema DictItem required attribute fixes
- #26363: (*garthgreenaway*) Fixes to mount state 2015.8
- #26347: (*0xf10e*) Load `pkgng` as `pkg` on FreeBSD 9 when *providers:pkg* == `pkgng`
- #26361: (*TronPaul*) sign security token
- #26346: (*TronPaul*) Fix s3 using IAM credentials
- #26331: (*mnalt*) fix bug in sysrc to allow for empty rc variables
- #26334: (*rallytime*) Call salt.utils.cloud.bootstrap in GCE Driver provisioning
- #26308: (*dmurphy18*) Support for environment overrides building packages

- #26279: (*TheScriptSage*) Merge changes for pull`#26083`_ and pull`#25632`_ into 2015.8
- #26224: (*cachedout*) Cleanup of a few cases to move to salt.utils.fopen
- #26260: (*nmadhok*) Correct spelling of integration in docs
- #26226: (*rallytime*) Fix `#25463`_
- #26248: (*nmadhok*) Initial commit of unit tests for vmware cloud driver
- #26228: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26244: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.8 branch
- #26235: (*sjorge*) salt.utils.is_smartos_zone, inverse of is_smartos_globalzone
- #26221: (*sjorge*) SmartOS grain fixes
- #26218: (*terminalmage*) Add warning about file.recurse unicode errors with vim swap files.
- #26214: (*rallytime*) Back-port #24878 to 2015.8
- #26211: (*techhat*) Move SPM to its own directory
- #26197: (*TronPaul*) Fix GitFS when whitelisting base
- #26200: (*anlutro*) Make it possible to run salt-cloud as current user
- #26201: (*kev009*) Avoid VBOX storage emulation bugs in FreeBSD disks grain
- #26188: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26194: (*basepi*) Allow virtual grains to be generated even if virt-what is not available
- #26176: (*rallytime*) Back-port #26165 to 2015.8
- #26169: (*terminalmage*) Fix attribute error in gitfs' find_file functions
- #26170: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it.
- #26143: (*nmadhok*) VMware cloud driver fixes [forward port from 2015.5 into 2015.8]
- #26173: (*jacobhammons*) Updates to cloud docs for the provider > driver change
- #26125: (*evverx*) Use timedatectl set-timezone to tzsetting if available
- #26145: (*sjorge*) smartos_imgadm cleanup
- #26148: (*terminalmage*) Refactor winrepo support
- #26128: (*sjorge*) imgadm.avail should return multiple results
- #26109: (*jfindlay*) fix quote indent
- #26089: (*anlutro*) User state/module: fix coercing of None into string ``None" in GECOS
- #26081: (*cachedout*) Move invocation routine up
- #26086: (*rallytime*) Back-port #26019 to 2015.8
- #26087: (*rallytime*) Back-port #26059 to 2015.8
- #26052: (*jtand*) Rh_ip fix
- #26078: (*cachedout*) Fix missing key in error return
- #26074: (*basepi*) [2015.8] Re-apply #25358 in 2015.8
- #26069: (*jfindlay*) fix win_firewall.delete_rule
- #26066: (*s0undt3ch*) [2015.8] Update to latest bootstrap stable release v2015.06.08

- #26049: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26026: (*anlutro*) Fix httppasswd result false positive in test mode
- #26037: (*rallytime*) Back-port #25489 to 2015.8
- #26004: (*techhat*) Allow updating a single SPM repo at a time
- #26012: (*cachedout*) Merge kwargs into opts for tcp client
- #26007: (*anlutro*) file.managed: wrap os.remove in if isfile, don't remove on success
- #26009: (*terminalmage*) Add winrepo and dockerng information to 2015.8.0 release notes
- #26006: (*basepi*) Revert #25727 in favor of #25645
- #26001: (*cachedout*) Fix failing tests
- #25978: (*anlutro*) Correct service state changes in test mode
- #25982: (*sjorge*) salt.modules.smartos_* limit to global zone only
- #25989: (*rallytime*) Back-port #25832 to 2015.8
- #25988: (*cachedout*) Move #25642 to 2015.8
- #25999: (*s0undt3ch*) Include subschema defaults
- #25997: (*s0undt3ch*) Allow getting a defaults dictionary from schema defaults
- #25979: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25902: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25956: (*anlutro*) Fix user argument to cron functions
- #25946: (*sjorge*) Fix for salt.utils.decorators under esky
- #25957: (*anlutro*) Remove temporary file after file.managed with checkcmd
- #25874: (*rallytime*) Back-port #25668 to 2015.8
- #25929: (*sjorge*) salt.module.pkgin's __virtual__() should not return None if pkg_info is not present
- #25952: (*garthgreenaway*) Log when event.fire and event.fire_master fail 2015.8
- #25944: (*sjorge*) Smartos libcrypto nonesky fix
- #25906: (*dmurphy18*) Cherry-pick of pkgbuild changes from develop branch
- #25925: (*sjorge*) Create default log location in smartos esky buildscript
- #25928: (*cachedout*) Fix stacktrace for non-existent states
- #25922: (*jacksonjtj*) Correct max_wait -> max_auth_wait in MultiMinion
- #25907: (*rallytime*) Back-port #25892 to 2015.8
- #25910: (*terminalmage*) Pass osarch to check_32()
- #25849: (*basepi*) Reprress template error for GPG renderer (can't seek an OrderedDict)
- #25868: (*rallytime*) Back-port #25404 to 2015.8
- #25896: (*cachedout*) Lint
- #25876: (*jacksonjtj*) Fixes for 2015.8
- #25867: (*rallytime*) Back-port #25370 to 2015.8
- #25845: (*jacobhammons*) updated versionadded

- #25836: (*jacksontj*) Keep track of SyncWrapper's IOLoop usage
- #25859: (*0xf10e*) warn_until(Carbon,...) instead of Boron
- #25505: (*0xf10e*) Glance state module for 2015.8 ``Beryllium''
- #25843: (*jtand*) Fixed a lint error in parsers.py
- #25835: (*techhat*) spm update_repo doesn't always require arguments
- #25837: (*jacobhammons*) regenerated man pages
- #25830: (*sjorge*) Loading of libcrypto on smartos esky fixed
- #25808: (*jfindlay*) add highstate opts to config/___init__.py, update docs
- #25820: (*sjorge*) Prerequisite to fix the smartos libcrypto loading
- #25781: (*anlutro*) Fix iptables.build_rule
- #25764: (*gtmanfred*) allow use of cloudnetworks in ssh_interface
- #25736: (*jfindlay*) insert explicit formatter number
- #25742: (*rallytime*) Back-port #25731 to 2015.8
- #25741: (*rallytime*) Back-port #25727 to 2015.8
- #25712: (*cachedout*) Fix outputter for state.apply
- #25698: (*rallytime*) Back-port #25659 to 2015.8
- #25690: (*anlutro*) Fix highstate duration alignment (again)
- #25684: (*davidjb*) Fix doc around Include/Exclude for states
- #25549: (*techhat*) Switch Scaleway to salt.utils.cloud.bootstrap()
- #25667: (*jfindlay*) add 2015.8.0rc2 autogenerated changelog
- #25653: (*anlutro*) Properly align highstate duration sum
- #25663: (*rallytime*) Back-port #25638 to 2015.8
- #25639: (*terminalmage*) Don't do pre-flight check on git_pillar if it is not configured
- #25587: (*cachedout*) Fix prereq in salt.state
- #25628: (*anlutro*) Highstate output: show duration in seconds instead of milliseconds when appropriate
- #25631: (*basepi*) Remove trailing whitespace
- #25627: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25626: (*basepi*) Fix the highstate outputter if `duration' is not present
- #25601: (*terminalmage*) Fix error message when local bin pkg path is not absolute
- #25595: (*terminalmage*) Bring git_pillar up to feature parity with gitfs
- #25619: (*cachedout*) Lint stateconf changes
- #25578: (*davidjb*) Allow parent relative includes in state files
- #25610: (*s0undt3ch*) [2015.8] Update the bootstrap script to latest release v2015.07.22
- #25599: (*jfindlay*) fix transport settings in #25596
- #25596: (*jfindlay*) Tcp test
- #25591: (*garthgreenaway*) Return data for scheduled jobs in 2015.8 default to True.

- #25588: (*basepi*) Fix some of the retcode work from #23105
- #25583: (*jtand*) Fixed lint error where pprint wasn't imported.
- #25572: (*rallytime*) Back-port #25570 to 2015.8
- #25575: (*rallytime*) Make Sure Scaleway driver works with deprecation paths
- #25564: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25566: (*techhat*) Fix download process for SPM repo updates
- #25553: (*techhat*) Switch SoftLayer to salt.utils.cloud.bootstrap()
- #25552: (*techhat*) Update pricing for SoftlayerHW
- #25547: (*techhat*) Switch Parallels to salt.utils.cloud.bootstrap()
- #25548: (*techhat*) Switch Proxmox to salt.utils.cloud.bootstrap()
- #25543: (*techhat*) Switch GCE to salt.utils.cloud.bootstrap()
- #25546: (*techhat*) Switch CloudStack to salt.utils.cloud.bootstrap()
- #25558: (*cachedout*) Lint config_test
- #25515: (*s0undt3ch*) salt.utils.schema fixes
- #25514: (*garthgreenaway*) fixes to schedule.add documentation in 2015.8
- #25508: (*s0undt3ch*) [2015.8] Update bootstrap script to latest stable release, v2015.07.17
- #25501: (*basepi*) Add optional job end time to the local_cache returner
- #25491: (*s0undt3ch*) Let's call it for what it is!
- #25462: (*rallytime*) Wrap is_profile_configured calls in try/except block
- #25439: (*rallytime*) Reduce digital_ocean API call frequency
- #25451: (*s0undt3ch*) Salt-SSH Scan roster bugfixes (And Py3 support)
- #25449: (*ruzarowski*) Exclude dotfiles and directories from minion key lists (Fixes ``#25448``)
- #25421: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25412: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25415: (*bechtoldt*) [docs] declare YAML as code block
- #25407: (*rallytime*) Back-port #23236 to 2015.8
- #25409: (*rallytime*) Back-port #24422 to 2015.8
- #25394: (*rallytime*) Back-port #25355 to 2015.8
- #25393: (*rallytime*) Back-port #25289 to 2015.8
- #25387: (*cachedout*) Lint #25319
- #25319: (*ruzarowski*) [cloud:EC2] Move SourceDest logic to _update_enis and add alias for delete_interface_on_terminate
- #25310: (*anlutro*) Add an `is list` test to the jinja environment
- #25264: (*ruzarowski*) Fix AttributeError in fileserver update_opts
- #25372: (*rallytime*) Don't stacktrace when provisioning instances with softlayer* drivers
- #25315: (*ruzarowski*) [cloud:EC2] Move handling of AssociatePublicIpAddress to associate_eip/allocate_new_eip logic depending on value type

- #25312: (*ruzarowski*) [cloud:EC2] Introduce eni Name property to set name tag value after its creation
- #25311: (*ruzarowski*) [cloud:EC2] Add ability to attach an existing eni
- #25280: (*rallytime*) Remove deprecation warnings for Beryllium
- #25329: (*twangboy*) Fixed some documentation errors
- #25300: (*s0undt3ch*) Fix ordering issue & Added requirements support
- #25283: (*jfindlay*) ensure ret is always defined
- #25252: (*jfindlay*) make args optional with default values in win_firewall.delete_rule
- #25257: (*notpeter*) Document SourceDestCheck added in #25242.
- #25298: (*twangboy*) Continue if profile not found
- #25296: (*twangboy*) Fixed file.comment for windows
- #25254: (*rallytime*) Change versionadded/changed references from Beryllium to 2015.8.0
- #25285: (*thusoy*) Remove error logging of missing victorops keys
- #25266: (*ruzarowski*) cloud: EC2 eni property SourceDestCheck is a AttributeBooleanValue
- #25216: (*jfindlay*) replace shell code with native python code
- #25278: (*rallytime*) Don't require size for all cloud drivers when checking profile configs
- #25271: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25263: (*techhat*) Allow non-standard HTTP requests on tornado
- #25253: (*s0undt3ch*) Remove the deprecation warning. The driver has been renamed.
- #25248: (*techhat*) Do not resize while iterating
- #25244: (*rallytime*) Remove parted deprecations and fix failing tests
- #25242: (*ruzarowski*) Make SourceDestCheck flag available to network interface definition
- #25226: (*nmadhok*) Backporting fix for issue ``#25223`_` on 2015.8 branch
- #25234: (*krak3n*) Fix: Bug in boto_asg state argument passing to boto_asg module
- #25222: (*rallytime*) Back-port #25219 to 2015.8
- #25188: (*rallytime*) Use linode status descriptions instead of ints when logging status to CLI
- #25203: (*s0undt3ch*) Added DictConfig with tests & More tests
- #25189: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25184: (*rallytime*) Back-port #25126 to 2015.8
- #25172: (*s0undt3ch*) Comment out imports while the YAML and RST rendering is not in-place.
- #25158: (*s0undt3ch*) Comment out not implemented code
- #25145: (*s0undt3ch*) Implement *oneOf*, *anyOf*, *allOf* and *not* with unit tests
- #25140: (*s0undt3ch*) Make the detection code work under Python 3.4
- #25131: (*s0undt3ch*) Array support in salt.utils.config
- #25130: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. See the following links for instructions:

- [Red Hat / CentOS 5, 6, 7](#)
- [Debian 8](#)
- [Windows](#)
- [FreeBSD](#)

Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See [fire_event](#).

ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See [spm](#).

Note: The `spm` executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See [The Top File](#).

Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

Note: Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time ([issue 26051](#))
 - TCP transport stacktrace on windows minion: Future exception was never retrieved ([issue 25718](#))
 - [freebsd] TCP transport not working in 2015.8.0rc3 ([issue 26364](#))
-

Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see [Proxy Minion Enhancements](#).

Engines

Salt engines are long-running, external processes that leverage Salt. See [Salt Engines](#).

Core Changes

- Add system version info to `versions_report`, which appears in both `salt --versions-report` and `salt '*' test.versions_report`. Also added is an alias `test.versions` to `test.versions_report`. ([issue 21906](#))
- Add colored console logging support. This is activated by using `%(colorlevel)s`, `%(colorname)s`, `%(colorprocess)s`, `%(colormsg)s` in `log_fmt_console` in the config file for any of `salt-master`, `salt-minion`, and `salt-cloud`.

Git Pillar

The `git` external pillar has been rewritten to bring it up to feature parity with `gitfs`. Support for `pygit2` has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the `git` `ext_pillar` configuration, further details can be found in the [pillar.git_pillar](#) docs.

Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode's native API instead of depending on `apache-libcloud` or `linode-python`.

Salt Cloud Changes

- Changed the default behavior of `rename_on_destroy` to be set to `True` in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the `terminated` state.
- When querying for VMs in `digital_ocean.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to `DigitalOcean.Ocean`.

State and Execution Module Improvements

- New and improved Docker state and execution modules (`state` and `execution module`).

Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other ``force" arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

`git.config_unset` state added

This state allows for configuration values (or entire keys) to be unset. See [here](#) for more information and example SLS.

`git.config` State Renamed to `git.config_set`

To reduce confusion after the addition of `git.config_unset`, the `git.config` state has been renamed to `git.config_set`. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See [here](#) for more information and example SLS.

Initial Support for Git Worktrees in Execution Module

Several functions have been added to the execution module to manage `worktrees` (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

New Functions in Git Execution Module

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

Changes to Functions in Git Execution Module

git.add

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

git.archive

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.
- Trailing slash no longer implied in `prefix` argument, must be included if this argument is passed.

git.checkout

- The `rev` argument is now optional when using `-b` or `-B` in `opts`, allowing for a branch to be created (or reset) using `HEAD` as the starting point.

git.clone

- The `name` argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the `cwd`, instead of at that location.

- The `repository` argument has been deprecated and renamed to `url`.

git.config_get

- The `setting_name` argument has been deprecated and renamed to `key`.
- The `global` argument has been added, to query the global git configuration
- The `all` argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
- The `cwd` argument is now optional if `global` is set to `True`

git.config_set

- The value(s) of the key being set are now returned
- The `setting_name` argument has been deprecated and renamed to `key`.
- The `setting_value` argument has been deprecated and renamed to `value`.
- The `is_global` argument has been deprecated and renamed to `global`.
- The `multivar` argument has been added to specify a list of values to set for the specified key. The `value` argument is not compatible with `multivar`.
- The `add` argument has been added to add a value to a key (this essentially just adds an `--add` to the `git config` command that is run to set the value).

git.fetch

- The `force` argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including `--force` in the `opts` argument, this argument is just for convenience and to match the usage of other functions with `force` arguments.
- The `refspecs` argument has been added to allow for one or more refspecs to be provided which override the one(s) specified by the `remote.remote_name.fetch` git configuration option.

git.ls_remote

- The `repository` argument has been deprecated and renamed to `remote`.
- The `branch` argument has been deprecated and renamed to `ref`.
- The `opts` argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

git.merge

- The `branch` argument has been deprecated and renamed to `rev`.

git.status

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

git.submodule

- Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument `timeout` in `jboss7.status`.
- Deprecate `enabled` argument in `pkgrepo.managed` in favor of `disabled`.
- Archive module changes: In the `archive.tar` and `archive.cmd_unzip` module functions, remove the arbitrary prefixing of the options string with `-`. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme. Also, tar will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the non-`-` format, when really they are using the with-`-` format.
- Added `__states__` to state modules, for cross-calling states. This enables using existing states when writing custom states. See *cross calling states*.

Windows Improvements

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name. See *Silent Installer Options*.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (`win_wua`).
- Turned on multi-processing by default for windows in minion configuration.

Windows Software Repo Changes

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the *Windows Software Repository* documentation for more information.

Changes to legacy Windows repository

If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the *Windows Software Repository* documentation for more information.

Win System Module

The unit of the `timeout` parameter in the `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` functions has been changed from seconds to minutes in order to be consistent with the `linux.timeout` setting. (issue 24411) Optionally, the unit can be reverted to seconds by specifying `in_seconds=True`.

Other Improvements

- Sanitize sensitive fields in `http.query`
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added `rest_timeout` config option and `timeout` argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for `http.request`
- Support `pillarenv` selection as it's done for `saltenv`
- salt was updated to use `python-crypto` version 2.6.1, which removes the dependency on `python-m2crypto`.

Deprecations

- The `digital_ocean.py` Salt Cloud driver was removed in favor of the `digital_ocean_v2.py` driver as DigitalOcean has removed support for APIv1. The `digital_ocean_v2.py` was renamed to `digital_ocean.py` and supports DigitalOcean's APIv2.
- The `vsphere.py` Salt Cloud driver has been deprecated in favor of the `vmware.py` driver.
- The `openstack.py` Salt Cloud driver has been deprecated in favor of the `nova.py` driver.
- The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the Nitrogen release of Salt. Example provider file:

```
my-ec2-cloud-config:
  id: 'HJGRYCILJLKJYG'
  key: 'kdjgfsqm;woormgl/asorigjksjdhasdfgn'
  private_key: /etc/salt/my_test_key.pem
  keyname: my_test_key
```

```
securitygroup: default
driver: ec2
```

- The use of `lock` has been deprecated and from `salt.utils.fopen`. `salt.utils.flopen` should be used instead.
- The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.
- The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.
- Support for output in `mine.get` was removed. `--out` should be used instead.
- The use of `delim` was removed from the following functions in the `match` execution module: `pillar_pcre`, `pillar`, `grain_pcre`,

Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Major Bug Fixes

- Fixed minion failover to next master on DNS errors ([issue 21082](#))
- Fixed memory consumption in SaltEvents ([issue 25557](#))
- Don't lookup outside system path in `which()` util ([issue 24085](#))
- Fixed broken jobs rest api call ([issue 23408](#))
- Fixed stale grains data using in modules ([issue 24073](#))
- Added `ssh_identities_only` config flag for ssh-agent configured environments ([issue 24096](#))
- Fixed ``object has no attribute" errors for Raet transport ([issue 21640](#))
- Flush event returners before master exit ([issue 22814](#))
- Fix `CommandExecutionError` in grains generation with `lspci` missing ([issue 23342](#))
- Fix salt-ssh against CentOS 7 when `python-zmq` not installed ([issue 23503](#))
- Fix salt-ssh issues related to out-of-date `six` module ([issue 20949](#))
- Fix salt-ssh thin generation after previous run was interrupted ([issue 24376](#))
- Use proper line endings on Windows with ``file.managed" w/contents ([issue 25675](#))
- Fixed broken comment/uncomment functions in `file.py` ([issue 24620](#))
- Fixed problem with unicode when changing computer description ([issue 12255](#))
- Fixed problem with `chocolatey` module not loading ([issue 25717](#))
- Fixed problem adding users to groups with spaces in the name ([issue 25144](#))
- Fixed problem adding full name to user account ([issue 25206](#))
- Fixed `gem` module stack trace ([issue 21041](#))

- Fixed problem with file.managed when test=True ([issue 20441](#))
- Fixed problem with powershell hanging while waiting for user input ([issue 13943](#))
- Fixed problem where the salt-minion service would not consistently start ([issue 25272](#))
- Fixed problem where pkg.refresh_db would return True even when winrepo.p was not found ([issue 18919](#))
- Could someone please provide end to end example for Proxy Minion with REST ([issue 25500](#))
- Proxy minions stopped working between 2014.7 and 2015.5 ([issue 25053](#))
- Proxy minion documentation includes outdated code sample ([issue 24018](#))
- Proxy Minion documentation missing grains example ([issue 18273](#))
- Improve process management in proxy minion ([issue 12024](#))
- Proxy minion never comes up with message `I am XXX and I am not supposed to start any proxies!` ([issue 25908](#))
- Fixed an issue that caused an exception when using Salt mine from pillar. ([issue 11509](#))

19.2.10 Salt 2015.8.1 Release Notes

Version 2015.8.1 is a bugfix release for *2015.8.0*.

Security Fixes

CVE-2015-6941 - win_useradd module and salt-cloud display passwords in debug log

Updated the win_useradd module return data to no longer include the password of the newly created user. The password is now replaced with the string XXX-REDACTED-XXX. Updated the Salt Cloud debug output to no longer display win_password and sudo_password authentication credentials. Also updated the Linode driver to no longer display authentication credentials in debug logs. These credentials are now replaced with REDACTED in the debug output.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Major Bug Fixes

- Add support for spm.d/*.conf configuration of SPM ([issue 27010](#))
- Fix proxy grains breakage for non-proxy minions ([issue 27039](#))
- Fix global key management for git state
- Fix passing http auth to util.http from state.file ([issue 21917](#))
- Fix multiprocessing: True in windows (on by default`)
- Add pkg.info to pkg modules
- Fix name of serial grain (this was accidentally renamed in 2015.8.0`)
- Merge config values from master.d/minion.d conf files (rather than flat update`)
- Clean grains cache on grains sync ([issue 19853](#))

- Remove streamed response for fileclient to avoid HTTP redirection problems ([issue 27093](#))
- Fixed incorrect warning about `osrelease` grain ([issue 27065](#))
- Fix authentication via Salt-API with tokens ([issue 27270](#))
- Fix winrepo downloads from https locations ([issue 27081](#))
- Fix potential error with salt-call as non-root user ([issue 26889](#))
- Fix global minion provider overrides ([issue 27209](#))
- Fix backward compatibility issues for pecl modules
- Fix Windows uninstaller to only remove `./bin, salt*, nssm.exe, uninst.exe` ([issue 27383](#))
- Fix misc issues with mongo returner.
- Add sudo option to cloud config files ([issue 27398](#))
- Fix regression in RunnerClient argument handling ([issue 25107](#))
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig ([issue 27265](#))
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig ([issue 27265](#))
- Increased performance on boto asg/elb states due to `__states__` integration
- Windows minion no longer requires powershell to restart ([issue 26629](#))
- Fix x509 module to support recent versions of OpenSSL ([issue 27326](#))
- Some issues with proxy minions were corrected.

Known Issues:

- Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

Changes for v2015.8.0..v2015.8.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Changes:

- [PR #27584](#): ([jacobhammons](#)) added changes list to 2015.8.1 release notes
- [PR #27575](#): ([rallytime](#)) Don't report existing instances as running only if they're actually terminated in EC2
- [PR #27573](#): ([basepi](#)) [2015.8] Use the custom yaml serializer for minion_opts for salt-ssh
- [PR #27514](#): ([clinta](#)) Recent Versions of OpenSSL don't allow importing incomplete PEMs
- [PR #27564](#): ([jacobhammons](#)) Man pages
- [PR #27522](#): ([twangboy](#)) Removed dependency on powershell to restart salt-minion
- [PR #27550](#): ([rallytime](#)) [2015.8] Clean up salt-cloud logging and make it more useful
- [PR #27517](#): ([jacobhammons](#)) Updated install docs
- [PR #27526](#): ([eliasp](#)) Add missing newlines before param listing to fix doc rendering
- [PR #27525](#): ([basepi](#)) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #27513: (*terminalmage*) Fix integration tests for worktree addition in git >= 2.6
- PR #27510: (*rallytime*) Merge #27475 with test fixes
- PR #27451: (*ticosax*) [dockerng] Enforce usage of host_config and require docker-py>=1.4.0
- PR #27461: (*cachedout*) Only clean context if it exists
- PR #27473: (*terminalmage*) salt.utils.gitfs: Don't use close_fds=True on Windows
- PR #27496: (*blueyed*) Fix version reporting of gitpython
- PR #27502: (*ticosax*) Add test to check we don't call inspect_image on absent images.
- PR #27497: (*blueyed*) dockerng: fix image_present for forced, non-existent image
- PR #27411: (*terminalmage*) Fix invocation of git.config_get and git.config_set
- PR #27477: (*terminalmage*) Don't append role to hash_cachedir
- PR #27474: (*whiteinge*) Add fake pymongo version attribute for the docs
- PR #27466: (*blueyed*) Fix version reporting of python-gnupg and mysql-python
- PR #27465: (*ticosax*) Fix usage of dockerng ``cmd" was #27459
- PR #27417: (*whiteinge*) Backport #25243 into 2015.8
- PR #27423: (*dmurphy18*) Changes to support configurable repository for Debian / Ubuntu
- PR #27428: (*rallytime*) Back-port #27398 to 2015.8
- PR #27429: (*rallytime*) Back-port #27344 to 2015.8
- PR #27450: (*ticosax*) [dockerng] Fix typo in docstring
- PR #27430: (*jackson tj*) Fix bug introduced in eee0291ff8b65ff1e22f4dc2447a74aa28a3ce7f
- PR #27418: (*terminalmage*) Don't always remove dest path in salt.utils.files.rename()
- PR #27383: (*twangboy*) Uninstaller only removes specific files and dirs
- PR #27416: (*rallytime*) Back-port #27399 to 2015.8
- PR #27394: (*jackson tj*) Remove streamed response for fileclient to avoid HTTP redirection problems
- PR #27415: (*ryan-lane*) Backwards compat fixes for pecl module
- PR #27407: (*meggiebot*) Adding stretch label definition
- PR #27388: (*basepi*) [2015.8] Fix global provider overrides
- PR #27386: (*rallytime*) Document tty: True usage in salt-ssh roster file
- PR #27380: (*jtand*) Skipping Async tests
- PR #27382: (*terminalmage*) Revert ``fixes `#27217`_ clear_old_remotes clears wrong directory (gitfs)''
- PR #27361: (*cro*) Correct some issues with proxy minions
- PR #27364: (*ruzarowski*) SaltCloud[EC2] Fix missing credentials in modify_eni_properties api call
- PR #27349: (*jfindlay*) add freebsd install docs to release notes
- PR #27343: (*cachedout*) Close io loop before deleting attribute
- PR #27337: (*rallytime*) [2015.8] Fixup salt-cloud logging
- PR #27332: (*terminalmage*) Adjust dockerng/dockerio docstrings
- PR #27353: (*cachedout*) Fix case where var not set in config

- PR #27350: (*rallytime*) Allow IP-forwarding in GCE driver
- PR #27305: (*cachedout*) Re-init logging system on Windows when using multiprocessing
- PR #27331: (*terminalmage*) dockerng: Allow both cmd and command to be used to specify command
- PR #27327: (*isbm*) Fix a typo in the RPM output
- PR #27312: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27303: (*jacobhammons*) Updated module doc index using <https://github.com/saltstack/salt/pull...>
- PR #27301: (*twangboy*) Pass ca_bundle for windows (fixes SSL Error)
- PR #27300: (*rallytime*) Back-port #27287 to 2015.8
- PR #27288: (*rallytime*) Filter on `name`, not `id`, when listing images
- PR #27283: (*jtand*) `__grains__['osrelease']` returns a string
- PR #27276: (*rallytime*) Back-port #27218 to 2015.8
- PR #27275: (*rallytime*) Back-port #27213 to 2015.8
- PR #27274: (*rallytime*) Back-port #27272 to 2015.8
- PR #27271: (*isbm*) Bugfix: crash on token authentication via API
- PR #27251: (*rallytime*) Add support for post_uri in SoftLayer cloud drivers
- PR #27260: (*bechtoldt*) add missing module doc references
- PR #27254: (*jfindlay*) 2015.2,2015.8,Beryllium -> 2015.8.0
- PR #27245: (*rallytime*) If two ssh keynames are found in DigitalOcean, abort and warn the user.
- PR #27241: (*jfindlay*) osrelease is only an integer for fedora
- PR #27234: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27240: (*isbm*) Backport of the fix of `pkg.info*` for Beryllium
- PR #27223: (*pprkut*) Support firewalld per interface zone config on rh7 systems
- PR #27238: (*bechtoldt*) salt.modules.disk.percent() throws KeyError when partition doesn't exist
- PR #27232: (*basepi*) [2015.8] Add stub release notes for 2015.8.1
- PR #27199: (*rallytime*) Avoid RuntimeError (dictionary changed size during iteration) with keys()
- PR #27206: (*rallytime*) Don't repeat GCE setup instructions, and make the use of .json files clearer
- PR #27210: (*rallytime*) Refactor some digital ocean functions
- PR #27197: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27195: (*jacobhammons*) Fixed sphinx / latex build warnings and errors
- PR #27182: (*bernieke*) fix restart_on_error
- PR #27163: (*terminalmage*) Workaround upstream tornado bug affecting redirects
- PR #27177: (*rallytime*) Remove note - incorrect info
- PR #27173: (*rallytime*) Add the ability to specify multiple disks on the SoftLayer driver
- PR #27164: (*rallytime*) Make sure changes from #26824 to digital_ocean_v2.py driver make it to digital_ocean.py in 2015.8
- PR #27143: (*cachedout*) Clean grains cache on grains sync

- PR #27150: (*cachedout*) Merge config values from master.d/minion.d conf files
- PR #27137: (*jfindlay*) revert serial grain regression
- PR #27144: (*rallytime*) Don't stacktrace on softlayer_hw.show_all_prices if a code isn't supplied
- PR #27139: (*jacobhammons*) Updated key instruction on rhel7
- PR #27134: (*isbm*) Backport to 2015.8: ``pkg.info``
- PR #27119: (*l2ol33rt*) Boto dynamodb module should be using layer 2 abstractions
- PR #27092: (*perfinion*) salt/master: chdir to root not homedir
- PR #27131: (*jacobhammons*) Install docs
- PR #27124: (*jfindlay*) Backport #27123
- PR #27111: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27122: (*terminalmage*) Fix broken link to git-config(1) docs
- PR #27115: (*jacobhammons*) Release docs
- PR #27110: (*rallytime*) Make sure -Q output is consistent across salt-cloud drivers
- PR #27050: (*twangboy*) Turned multiprocessing on
- PR #27086: (*techhat*) Document development of SPM loader modules
- PR #26941: (*mstead*) Make elasticsearch work as master job cache
- PR #27080: (*bechtoldt*) [Proposal] Add Github SPM label for issues
- PR #27064: (*twangboy*) Fixed user docs
- PR #27072: (*rallytime*) Back-port #26840 to 2015.8
- PR #27060: (*cro*) Fix grains breakage when hosts are not Linux, Windows, or SunOS
- PR #27051: (*rallytime*) Back-port #26953 to 2015.8
- PR #26864: (*terminalmage*) Only do git_pillar preflight checks on new-style git_pillar configs
- PR #26967: (*TheBigBear*) new URL for windows salt downloads
- PR #26921: (*terminalmage*) Get rid of error in legacy git pillar when using branch mapping notation
- PR #26923: (*rallytime*) Code clean up of cloud drivers and files
- PR #27010: (*rallytime*) Back-port #26988 to 2015.8
- PR #26985: (*rallytime*) Fix versionadded tag

19.2.11 Salt 2015.8.10 Release Notes

Version 2015.8.10 is a bugfix release for *2015.8.0*.

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

Mint Linux: Important Post-Upgrade Instructions

As a result of some upstream changes, the `os` grain on Mint Linux is now being detected as `LinuxMint` (issue 33295). Run the following command **after you upgrade to 2015.8.10** to reset the `os` grain to `Mint` and the `os_family` grain to `Debian`:

```
salt -G 'os:LinuxMint' grains.setvals '{"os': 'Mint', 'os_family': 'Debian'}"
```

Changes for v2015.8.9..v2015.8.10

Salt 2015.8.10 includes fixes for the following known issues in 2015.8.9:

- issue 33376: pip state broken in 2015.8.9 with pip <6.0
- PR 33386: Fix traceback in logging for config validation

Since 2015.8.10 includes only two fixes, the 2015.8.9 changes list is included below for convenience:

Changes for v2015.8.8..v2015.8.9

Total Merges: 145

Changes:

- PR #33293: (*twangboy*) Fix minion start retry on Windows (2015.8)
- 22c4331 linux_acl: Allow ` ` as a separation character in ACL permissions. Fixes `#31270`_ (#33172) (#33305)
- 7a181f2 Handle more ipv6 error as an exception `#33299`_ (#33300)
- eb47a15 Ignore retcode when checking service's status (#33294)
- PR #33274: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 4f3596a Add comment for test=true w/o changes ret and add changes dict example (#33254)
- 2a30c48 Update Git Policy docs to match Contribution guide (#33252)
- 056c273 Fix `#33238`_ (#33239)
- 1cd34ab Properly report on invalid gitfs/git_pillar/winrepo repos (#33245)
- PR #33253: (*rallytime*) Update the release process docs
- 8c2c5b1 update 2015.8.9 release notes (#33251)
- 8ee8ee3 Handle ipv6 error as an exception (#33246)
- 855bed3 Check rendered YAML for invalid keys (#33213)
- 6fb25a8 Make note of files that begin with ` ` in master.d or minion.d dirs (#33224)
- a6dc0d2 Gate jnpr imports in salt.proxy.junos.py (#33150)
- 64a89c4 Add docs for the http state (#33222)
- 0a32163 Don't stacktrace when using --out=highstate at CLI during staterun. (#33215)
- 04d714d propagate opts to salt.util.http call (#33219)
- c8236c0 update 2015.8.9 release notes (#33237)

- **PR #33217:** (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 730bec1 [2015.8] Merge forward from 2015.5 to 2015.8 (#33207)
- 379b151 Add a fetch when compiling git_pillar for masterless minions (#33204)
- b3805d8 cloud.clouds.ec2: cache each named node (#33164)
- 86db5df Properly handle failed git commands when redirect_stderr=True (#33203)
- 8a0950d Don't force use of global ssh_config when git identity file is specified (#33152)
- ce07133 update 2015.8.9 release notes (#33198)
- **PR #33188:** (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- e9108e0 add 2015.8.9 release notes (#33161)
- 2d9919e [2015.8] Update to latest bootstrap script v2016.05.10 (#33156)
- 033bef2 Hash fileclients by opts (#33142)
- f520fa3 Back-port #31769 to 2015.8 (#33139)
- **PR #33144:** (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- **PR #33140:** (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- ad607ef If cache_jobs: True is set, populate the local job cache when running salt-call (#33100)
- 64689a6 Fix broken parsing of usermgmt.conf on OpenBSD (#33135)
- 06a382e Add a check that the cmdline of the found proc matches (#33129)
- 10018e9 salt.utils.gitfs: fix formatting for warning messages (#33064)
- d45b599 Fix 33058 (#33099)
- **PR #33106:** (*abednarik*) Moved _finger_fail method to parent class.
- 20c7e10 clarify docs that map is designed to be run once. is not stateful (#33102)
- 558561d cloud.query needs to define mapper.opts (#33098)
- **PR #33096:** (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 22a327b salt-cloud: fix ipv6-only virtual machines (#32865)
- e788f7e modules.npm: do not log npm --version at info level (#33084)
- **PR #33081:** (*jfindlay*) ssh docs: install py-2.6 for RHEL 5
- **PR #33088:** (*isbm*) Bugfix: Restore boolean values from the repo configuration
- 2c6326f fix tests for file.blockplace to remove newline (#33082)
- **PR #32892:** (*isbm*) Resolve Zypper locks on asynchronous calls
- 3e0bf23 Add fun_args to scheduled return data (part of `#24237`_) (#33039)
- 264c0d4 Don't append a newline when creating new content with blockreplace (#33049)
- 54b783a Pass all data to batch.run() call when using --failhard (#33048)
- 2dbfa55 Display command output when command fails with batch + failhard options (#33050)
- add9199 Allow security_groups kwarg for boto_elb.present to be string or list (#33053)
- 111701c [2015.8] Merge forward from 2015.5 to 2015.8 (#33054)
- 1066063 File and User test fixes for 2015.8 on Fedora23 (#33056)

- f97b5d5 Back-port #33030 to 2015.8 (#33040)
- e90a501 Update the docs for saltutil.find_job to be more clear/accurate (#33017)
- d3d77ce Add saltenv to the cmd.script state function (#33031)
- 3434f44 Fix syndic regression (#33021)
- 4bb3ca5 Compare uid and gid instead of name and group (#32674)
- 9ca5b02 Allow batch mode to use verbose option, as well as show_jid. (#32996)
- 81c0fa4 Fixed glusterfs.peered output (#32955)
- 8c70d7a Clarify some arg docs (#32994)
- 00fbeat Fix boto_secgroup_test (#32986)
- 3362367 fix user cron on solarish operating systems (#32970)
- 07e38bc salt.log.setup: process user args before format (#32796)
- b2d7c81 doc.ref.states.ordering: clarify requisite change (#32934)
- df41d5d mode should default to `text` (#32928)
- f581a82 Remove FileClient class references from docs - it doesn't exist. (#32925)
- 31b96de Update contents_grains option with relevant docs (#32922)
- PR #32926: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 1cd6a45 specify volume tags in profile configuration (#32908)
- 85ca86d Update docs to warn users that -1 isn't valid for iptables insert state (#32906)
- cb68706 Allow profile options to be specified in provider file when using maps (#32900)
- 1a55fcb Clarify service state opening docs - uses `service` virtualname (#32880)
- PR #32884: (*terminalmage*) Fix incorrect deprecation notice
- PR #32878: (*jacobhammons*) added note about updating the bootstrap script in salt-cloud using th...
- PR #32869: (*rallytime*) Use correct config setting in cloud syndic docs
- PR #32844: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- eb8fb6b Back-port #31139 to 2015.8 (#32868)
- 4bb5545 backport PR #32732 for issue `#23714`_ (#32847)
- 5ea003b Add pyvmomi version warning to Getting Started with VMware docs (#32845)
- 44f08d0 Pass None as memory limit. (#32841)
- feebe69 Back-port #32813 to 2015.8 (#32839)
- 3b81031 various improvements on cloud deploy script docs (#32659)
- bf85987 update bootstrap to 2016.04.18 release (#32668)
- 83dee63 Back-port #29322 to 2015.8 (#32785)
- PR #32787: (*rallytime*) Back-port #32722 to 2015.8
- PR #32786: (*rallytime*) Back-port #32703 to 2015.8
- a6a42740 Merge branch `pr-32775` into 2015.8
- cda00f4 Improve documentation on pygit2 versions (#32779)

- 1d6d234 Properly handle minion failback failure. (#32749)
- 3751a27 Document pillar cache options (#32643)
- 35c8af3 modules.win_dacl: consistent case of dacl constants (#32720)
- 2cd0817 Update external auth documentation to list supported matcher. (#32733)
- bba089d Check dependencies type before applying str operations (#32693)
- 3aa0605 Handle when beacon not configured and we try to enable/disable them (#32692)
- PR #32718: (*garethgreenaway*) Fixes to schedule.list in 2015.8
- PR #32684: (*captaininspiration*) Fix routes for redhat < 6
- 7cdd512 Handle a couple of arguments better (Azure) (#32683)
- aaa03bc Fix for issue 32523 (#32672)
- 21081b1 Don't access deprecated Exception.message attribute. (#32556)
- 5d1e9a4 Lower log level for pillar cache (#32655)
- PR #32588: (*anlutro*) Fix salt-ssh module function call argument type juggling by JSON encoding them
- 5e7edfc yumpkg: Ignore epoch in version comparison for explicit versions without an epoch (#32563)
- fea6056 Fixing critical bug to remove only the specified Host instead of the entire Host cluster (#32640)
- 0477f66 align OS grains from older SLES with current one (#32649)
- 8d46244 Prevent crash if pygit2 package is requesting re-compilation of the eâ (#32652)
- PR #32614: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32616: (*rallytime*) Back-port #32547 to 2015.8
- 3047471 Fix comments value in salt.states.pkgrepo example (#32604)
- ab9da90 Revert PR #32480 and apply #32314 with fixes / documentation (#32558)
- c84c921 Better log message on minion restart if master couldn't be reached. (#32576)
- 3c81798 Don't return None from eval_master (#32555)
- PR #32536: (*rallytime*) Back-port #31898 to 2015.8
- d12a1c2 Fix binary search and replace (#32542)
- PR #32539: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32531: (*ticosax*) [dockerng] Fix support of dockerng.volume_present when no volume is on present.
- 5d73d54 Enhance dockerng.wait() to control success on exit_code and on already stopped containers (#32475)
- 214f01e Bugfix: salt-key crashes if tries to generate keys to the directory w/o write access (#32436)
- 288839f Turn on exc_info when logging failed minion startup (#32515)
- 08a8020 Add ignore_epoch option to pkg.installed/removed/purged states (#32520)
- 492ebfc Isbm zypper list products sles11 crash (#32505)
- ae89882 Clear VCS fsbackend and git_pillar locks on master start (#32480)
- a6482a3 Use win32api to get Total System Memory (#32491)
- PR #32487: (*terminalmage*) Add explanation of nonzero epoch requirement to pkg.installed state documentation

- PR #32482: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- f5bd6bd Backport 31164 and 31364 (#32474)
- PR #32450: (*cachedout*) Pass parser options into batch mode
- b299835 Issue `#28706`_: Fix state user.present behavior. (#32448)
- cef33d5 Argument name in docs should match actual arg name (#32445)
- PR #32432: (*ticosax*) [dockerng] Fix Domainname introspection
- PR #32427: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32423: (*jtand*) Update glusterfs_test to be inline with #32312
- PR #32425: (*cachedout*) Fix salt-cloud parallel provisioning
- 51fb2ac FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check `freebsd/pkg`#1409`_` for more info.
- 709410a Improve `git_pillar` documentation/logging
- c53efc3 Update master config docs
- PR #32323: (*mcalmer*) fix sorting by latest version when called with an attribute
- PR #32376: (*amontalban*) Fixes `saltstack/salt`#28262`_`
- 0d9a06b Cleaner deprecation process with decorators
- 6979fda Correcty index glusterfs bricks
- PR #32393: (*jfindlay*) `modules.win_timezone`: don't list all zones in debug log
- PR #32372: (*rallytime*) Back-port #32358 to 2015.8
- PR #32392: (*multani*) Fix documentation on `boto_asg` and `boto_elb` modules and states
- PR #32373: (*cachedout*) Resolve memory leak in authentication
- PR #32126: (*cro*) Add a couple CLI examples for the highstate outputter.
- PR #32353: (*mcalmer*) Prevent metadata download when listing installed products
- PR #32321: (*abednarik*) Better message when minion fail to start
- PR #32345: (*nmadhok*) [2015.8] Check if profile key exists in `vm_` dict
- PR #32343: (*Ferbla*) Fixed `win_wua` example documentation
- PR #32360: (*rallytime*) Make sure `hash_type` is lowercase in master/minion config files
- PR #32361: (*cro*) SDB is no longer experimental
- PR #32336: (*rallytime*) Back-port #28639 to 2015.8
- PR #32332: (*rallytime*) Don't unsubscribe from open events on the CLI too early on long-running commands
- PR #32333: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32289: (*rallytime*) New salt-cloud instances should not use old `hash_type` default.
- PR #32291: (*twangboy*) Fix bad output for `chocolatey.version` (fixes `#14277`_)
- PR #32295: (*rallytime*) Test the contents of `'deploy_scripts_search_path'` in `salt.config.cloud_config`
- PR #32315: (*ahus1*) fixing `file.managed` with requests lib
- PR #32316: (*vutny*) Update Salt Bootstrap tutorial

- PR #32325: (*bdrung*) Re-add shebang to ssh-id-wrapper shell script
- PR #32326: (*bdrung*) Fix typos
- PR #32300: (*twangboy*) Add documentation to disable winrepo/winrepo_ng
- PR #32288: (*terminalmage*) use dictupdate.merge instead of dict.update to merge CLI pillar overrides
- PR #32243: (*isbm*) Ensure latest pkg.info_installed ensure latest
- PR #32268: (*ticosax*) [dockerng] Improve detection for older versions of docker-py
- PR #32258: (*jacobhammons*) Replaces incorrect reference to *master_alive_check*
- PR #32254: (*twangboy*) Fix Display Name with spaces in win_servermanager
- PR #32248: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32230: (*terminalmage*) systemd.py: Support both update-rc.d and chkconfig as managers of sysv services
- PR #32249: (*jacobhammons*) Fixes windows download paths to account for patch
- PR #32221: (*dmurphy18*) Fix version check, fix extracting Major and Minor versions from __ver...
- PR #32227: (*twangboy*) Remove list2cmdline usage from win_service.py
- PR #32239: (*anlutro*) Add state file name to warning log line
- PR #32215: (*DmitryKuzmenko*) rhel oscodename
- PR #32217: (*jacobhammons*) 2015.8.8.2 release notes
- PR #32212: (*rallytime*) Back-port #32197 to 2015.8
- PR #32211: (*rallytime*) Back-port #32210 to 2015.8
- PR #32209: (*rallytime*) Back-port #32208 to 2015.8
- PR #32204: (*ticosax*) [dockerng] Consider labels carried by the image when comparing user defined labels.
- PR #32186: (*rallytime*) Add some ``best practices" information to test documentation
- PR #32176: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32163: (*rallytime*) Update nacl.config docs to use key value instead of `None`
- PR #32166: (*vutny*) *salt.states.file*: correct examples with multiline YAML string
- PR #32168: (*rallytime*) Lint 2015.8
- PR #32165: (*terminalmage*) Make `__virtual__` for *rhservice.py* more robust
- PR #32160: (*cachedout*) Fix beacon tutorial docs
- PR #32145: (*paclat*) fixes 29817
- PR #32133: (*basepi*) Pass eauth user/groups through salt-api to destination functions
- PR #32127: (*rallytime*) Add runners to `__salt__` docs
- PR #32143: (*DmitryKuzmenko*) Set auth retry count to 0 if multimaster mode is failover.
- PR #32134: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32091: (*clarkperkins*) Fixed the regression in 410da78
- PR #32135: (*rallytime*) [2015.8] Support multiple valid option types when performing type checks
- PR #31760: (*sakateka*) SMinion need wait future from `eval_master`
- PR #32106: (*jfindlay*) update suse master service patch

- PR #32130: (*jacobhammons*) Added known issues 32004 and 32044 to 2015.8.8 release notes
- PR #32105: (*clarkperkins*) Fixed invalid `deploy_scripts_search_path`
- PR #32117: (*tomlaredo*) Fixed validation type for `file_ignore_glob`
- PR #32113: (*sakateka*) Fix log message for AsyncAuth initialization
- PR #32116: (*ticosax*) Obtain default value of `memory_swap` from the container.
- PR #32098: (*rallytime*) Back-port #32083 to 2015.8
- PR #32099: (*jacobhammons*) 2015.8.8 release docs
- PR #32088: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32074: (*Xiami2012*) Fix code for proto args in `modules.iptables`
- PR #32053: (*basepi*) [2015.8] Fix `rabbitmq_user.present` tag handling
- PR #32023: (*sbreidba*) Move constant declaration into member variable to avoid issues when m...
- PR #32026: (*techhat*) Don't require the `decode_out` file to already exist
- PR #32019: (*rallytime*) Back-port #32012 to 2015.8
- PR #32015: (*ticosax*) [dockerng] Fix ports exposition when protocol is passed.
- PR #31999: (*jacobhammons*) Fixes a doc build exception caused by missing mocks for `modules.win_dacl`
- PR #31992: (*notpeter*) salt-cloud: add D2 and G2 EC2 instance types
- PR #31981: (*lloydoliver*) include rotational disks in grains under linux
- PR #31970: (*twangboy*) Add `apply_template_on_contents` for windows
- PR #31960: (*aletourneau*) fixed `ec2 get_console_output`
- PR #31958: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 3934c66 Merge branch `2015.5' into `2015.8'
- PR #31935: (*twangboy*) Back port nullsoft build script from 2015.8
- PR #31912: (*jfindlay*) `log.mixins`: remove extermoporaneous `.record`

19.2.12 Salt 2015.8.11 Release Notes

Version 2015.8.11 is a bugfix release for *2015.8.0*.

Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

New Configuration Parameter: `rotate_aes_key`

- `Rotate_aes_key` causes Salt to generate a new AES key whenever a minion key is deleted. This eliminates the chance that a deleted minion could continue to eavesdrop on communications with the master if it continues to run after its key is deleted. See the entry in the documentation for `'rotate_aes_key'.`

Ubuntu 16.04 Packages

SaltStack is now providing official Salt 2015.8 packages for Ubuntu 16.04.

Changes for v2015.8.10..v2015.8.11

Changes:

- PR #34676: (*cachedout*) Revert ``Modify lodaer global test to use populated dunderers``
- PR #34601: (*lorenegordon*) Clarifies the proper way to reference states
- bc63f25 Lint 34644 (#34651)
- 5036026 Adjust the mine test a little bit to give it a better chance of success (#34647)
- PR #34642: (*jtand*) Check that mysqldadmin exists before running mysql integration tests
- PR #34618: (*jtand*) Network state integration test test=True
- PR #34617: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- b90ae40 Add support for edge case when Cmd and Entrypoint can't be blanked (#34593)
- 12b579c When sorting list actual_data, make it a list (#34590)
- 7dd8035 Gate docker unit test to check for docker (#34591)
- ae38c87 Add a bunch of documentation on getting files from other environments (#34560)
- PR #34531: (*terminalmage*) Support ignore_epoch argument in version comparisons
- PR #34545: (*terminalmage*) Handle cases where Docker Remote API returns an empty ExecutionDriver
- PR #34546: (*rallytime*) Rename unit.states.boto_secgroup to unit.states.boto_secgroup_test
- PR #34537: (*rallytime*) Rename tests.unit.simple to tests.unit.simple_test
- fbab2f8 [2015.8] Update bootstrap script to latest stable (#34527)
- 6b8c76a Prevent many errors in the test suite in loader tests (#34521)
- c2f296c Fix wrong order of retention_policy_exists (#34507)
- PR #34518: (*terminalmage*) Fix pkg.latest integration test for non-LTS ubuntu
- PR #34513: (*cachedout*) Lower the log level for modules which cannot be loaded to trace
- PR #34498: (*rallytime*) Use -O in the wget example in the bootstrap tutorial for the develop branch
- 3ebba02 Rename some unit test files by adding _test (#34503)
- 8722257 Improve top file merging documentation (#34505)
- 6ce7cb9 Gracefully handle non-XML output in GlusterFS execution module. (#34492)
- 7529945 Use skipTest for network state integration test (#34489)
- 0f3f87f Update dnsmasq.get_config docs to use correct config_file param. (#34488)
- PR #34462: (*terminalmage*) Use --always when available to git describe

- PR #34467: (*rallytime*) Back-port #34457 to 2015.8
- PR #34432: (*twangboy*) Fix file.append
- PR #34429: (*terminalmage*) Skip version checking for targeted packages in pkg.latest state
- 0a26459 Forgot reference to inotify (#34455)
- PR #34451: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34401: (*terminalmage*) Use rpmdev-vercmp as a fallback for version comparison on RHEL5
- PR #34366: (*steverweber*) Update service.py
- PR #34426: (*cro*) Document that inotify is Linux only
- PR #34392: (*cro*) Clarify that salt-cloud doesn't get installed by bootstrap
- PR #34373: (*jtand*) Network state integration test
- d6af1de Optimize pkg integration tests and add a couple new tests (#34377)
- PR #34368: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 94e0946 Back-port #34324 to 2015.8 (#34344)
- 11dc020 Making salt-ssh pass proper return codes for jinja rendering errors (#34342)
- f6bd1ad Revert py3modernize lint changes (#34339)
- PR #34306: (*ghedo*) Fix iptables.flush state: Do not force `filter` table when flushing
- 0c60fea Doc clarifications to file modules, addition of new *profile* log level to docs, fixed example in dnsmasq (#34323)
- b793426 Remove unnecessarily-disabled sanity check (#34325)
- PR #34335: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- a6d3cc6 Typo in dockerio doc (#34319)
- PR #34312: (*rallytime*) [2015.8] Update to latest bootstrap script v2016.06.27
- PR #34307: (*rallytime*) Fix test example in integration testing docs
- PR #34233: (*thegoodyduke*) ipset: fix the comment containing blank
- PR #34257: (*rallytime*) Use `config_dir` setting instead of CONFIG_DIR in gpg renderer
- PR #34274: (*clinta*) Don't escape source before calling managed
- PR #34258: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34093: (*terminalmage*) Catch CommandExecutionError in pkg states
- PR #34136: (*meaksh*) Fixed behavior for SUSE OS grains in 2015.8
- 56c7267 fix regression from #33681 which causes pulling a list of s3 objects via s3.query to fail (#34208)
- 02eb331 Fix a pair of gitfs bugs (#34218)
- PR #34182: (*rallytime*) Handle child PIDs differently depending on the availability of psutils
- 5d3ec31 Clarify pkg.list_repo_pkgs docstring for held packages (#34188)
- 5bca5c4 Change target for dockerng assuming default status to Nitrogen release (#34206)
- PR #34184: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34176: (*rallytime*) Back-port #34103 to 2015.8

- PR #34179: (*terminalmage*) Raise the correct exception when gitfs lockfile is empty
- PR #34178: (*terminalmage*) Remove unnecessary comment
- 6387d16 fix salt --summary to count not responding minions correctly (#34165)
- e5949ea doc: add missing dot (#34175)
- 47595d6 Typo fix (#34174)
- PR #34077: (*rallytime*) Add some grains targeting tests
- PR #34142: (*isbm*) Move log message from INFO to DEBUG.
- 79a719b Update documentation on ``refresh" behavior in pkg states (#34100)
- 6d0d52f modules.pkg int tests: skip refresh_db upon error (#34072)
- PR #34069: (*rallytime*) Add a test to check for disconnected minion messaging
- PR #34048: (*terminalmage*) RFC: proposed fix for multiple fileserver updates in masterless runs
- PR #34011: (*rallytime*) Back-port #33948 and #34009 to 2015.8
- bca4371 Fixed a bug in the consul.py module that was preventing services (#34051)
- PR #34045: (*jacobhammons*) Updated latest release version
- f9bfcde Always make changes to minion config if set (#34020)
- e25dba4 More YAML indentation fixes in state module examples (#34030)
- PR #34018: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 7d940ae states.file: fix indentation in YAML examples (#34003)
- 4c7fac0 Remove loader test for pam module (#34002)
- PR #33990: (*jacobhammons*) Adds links to several current Salt-related projects
- PR #33983: (*twangboy*) Clarify the *account_exists* parameter
- PR #33951: (*jfindlay*) modules.gem int tests: more fixes
- PR #33984: (*jfindlay*) Add docs and tests to disk state
- PR #33985: (*rallytime*) Write some more simple batch command tests
- 6080846 acl.ClientACL: add unit tests (#33684)
- a74f1b8 ZD 762 (#33942)
- PR #33946: (*rallytime*) Back-port #33698 to 2015.8
- PR #33952: (*rallytime*) Add base argument to salt-ssh grains wrapper for filter_by func
- 4a80649 Adds a ``Generated on <timestamp>" line to the footer of each doc html page in the doc (#33962)
- b3ec39d Correct issue with ping on rotate with minion cache (#33765)
- PR #33888: (*jfindlay*) random.org checks
- 2dc1914 Add connecting_settings to boto_elb state attributes list (#33936)
- 91a2184 Wait for up to a minute for sync_after_install (#33917)
- PR #33877: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33827: (*cachedout*) Fix broken locate.locate function
- PR #33839: (*cachedout*) Fix another unit test stacktrace in pkg_resource

- PR #33840: (*cachedout*) Remove matcher tests
- PR #33836: (*cachedout*) Fixing more stupid unit tests
- PR #33805: (*jfindlay*) states.pkg int tests: skip if pkg mgr unavailable
- PR #33808: (*jfindlay*) fix some problems with the gem module integration tests
- PR #33770: (*jfindlay*) service state integration tests
- PR #33691: (*jtand*) Gem integration test
- PR #33777: (*sodium-chloride*) Fix minor docstring issue of arg being missing
- PR #33759: (*cachedout*) Catch no minions exception in batch mode
- PR #33719: (*cachedout*) Catch oserror for race condition
- PR #33712: (*meaksh*) Fix for groupadd execution module failures in SLES11 systems
- PR #33718: (*rallytime*) Back-port #33700 to 2015.8
- PR #33727: (*terminalmage*) Fix git_pillar edge case for remote repos without a master branch
- PR #33728: (*jfindlay*) Make *configurable_test_state* configurable in test mode
- PR #33729: (*twangboy*) Add exclude option to win_servermanager
- PR #33743: (*vutny*) Debian installation docs: drop section about community-maintained repo
- 56c0a42 Create missing jid dir if it doesn't exist (#33653)
- PR #33654: (*twangboy*) Fix win servermanager
- PR #33679: (*terminalmage*) Only compile the template contents if they evaluate to True
- PR #33685: (*jfindlay*) modules.cp.get_url: add test for <https://>
- PR #33581: (*dincamihai*) Call zypper refresh after adding/modifying a repository
- PR #33681: (*rallytime*) Back-port #33599 to 2015.8
- PR #33396: (*babilen*) Issue 33393
- PR #33652: (*terminalmage*) Lower the log level for failed auths
- PR #33615: (*danslimmon*) Fix crash on unconnectable MySQL server (resolves [`#33582`](#))
- PR #33558: (*twangboy*) Fix win servermanager
- PR #33555: (*cachedout*) Fix crashing Maintenance process
- PR #33501: (*meaksh*) unit tests for rpm.checksum() and zypper.download()
- PR #33513: (*rallytime*) Add a section to the jinja docs about escaping jinja
- PR #33520: (*jacobhammons*) Updated version numbers in the docs for the 2016.3.0 release
- PR #33507: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33503: (*rallytime*) Add docs about minion config file in standalone minion docs
- PR #33474: (*cachedout*) Fix diskusage beacon
- PR #33465: (*meaksh*) jobs.exit_success allow one to check if a job has executed and exit successfully
- PR #33487: (*jtand*) Add docstring examples to glance.py and nova.py [2015.8]
- PR #33481: (*rallytime*) Fix docs about etcd config options and add pillar_opts doc
- PR #33490: (*rallytime*) Document the postgres.psql_query function

- PR #33480: (*jfindlay*) states.service: minor doc updates
- 4f96cc1 Return full pending computer name (#33483)
- a89be5e Use six.string_types in jobs runner (#33499)
- PR #33491: (*BlaineAtAffirm*) fix jobs.list_jobs failing with search_target
- PR #33478: (*rallytime*) Back-port #32484 to 2015.8
- PR #33457: (*rallytime*) Make doc formatting consistent and use correct versionadded
- 1dfa956 Don't allow a ``repo`` kwarg for pkgrepo.managed (#33477)
- b4071b0 Allow for config entry to be a list in a dict for beacons (#33476)
- PR #33469: (*meaksh*) check the RPM signature of zypper pkg.download packages and report errors
- 00f9090 Add docs about PyYAML's 1024 character limitations for simple keys (#33459)
- 3b12f39 Prevent several minion processes on the same machine (#33464)
- c8b4f33 Make --gpg-auto-import-keys a global param when calling zypper (#33432)
- 0c4e38c Fix the saltutil.wheel function and add integration tests (#33414)
- e4f00f9 Make sure the path we're removing is present first - avoid an OSError (#33440)
- 93fd00b Avoid a syntax error by using " instead of escaped ` (#33443)
- ec60b9c Fix virtual function (#33436)
- PR #33438: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- c9d0de4 Documentation update in file.serialize. (#33421)
- f8a90eb Fix LVM parameter devices as a pure list. Comma separated lists are c   (#33398)
- 3989e5b Spelling correction. (#33406)
- 9accb53 Update windows pkg.[install|remove] error logic (#33321)
- 04ac89d Add note about reload_modules functionality for pkg.installed (#33374)
- 637c2af Add note to absolute_imports practice about __future__ import (#33377)
- d35b81d Document how to set the alias file location for alias state (#33380)
- PR #33403: (*jacobhammons*) 2015.8.10 release notes
- PR #33381: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 946d27e Fix traceback in logging for config validation (#33386)
- 38fbcf8 Add note about name parameter in git_pillar docs (#33369)
- 4925199 Add win_pkg to list of modules that support ``version`` in pkg.installed (#33362)
- 7a400a9 Add note to docs about api settings for Hipchat API v2 (#33365)
- 37e1930 Add initscripts, SystemD service units and environment files for Debian (#32857)
- PR #33370: (*jacobhammons*) Update docs version to 2015.8.9
- PR #33366: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- f248003 Remove mentions of windows not supporting pkgs param (#33361)
- 4fdb097 Update job_cache and keep_jobs docs to be more specific to their behavior (#33328)
- 2f06918 Properly detect newer Linux Mint distros (#33359)

- d85096c Fix UnboundLocalError in git.latest (#33340)
- e602446 Describes parameters in register_instances function (#33339)
- 5c29c65 Fix some link errors in the test writing tutorial (#33347)
- e532e58 Fix network.managed for windows (#33312)
- 11a2525 Bp 28467 calm mine (#33327)
- b897f2c import ps from psutil_compat in beacons (#33334)
- 089c1a2 remove redundant, incorrect sudo_runas config documentation (#33318)
- 1f7fda2 Disambiguate non-exact matches when checking if sysv service is enabled (#33324)
- 8c1f19a Allow concurrency mode in state runs if using sudo (#33325)
- ed14ef2 Fix master hanging after a request from minion with removed key. (#33333)
- daafa27 Cleanup comments in smbios.get output (fixes `#33266`_) (#33306)
- bfe12d9 Fix iptables --match-set (`#23643`_) (#33314)
- PR #33308: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8

19.2.13 Salt 2015.8.12 Release Notes

Version 2015.8.12 is a bugfix release for *2015.8.0*.

Changes for v2015.8.11..v2015.8.12

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-08-19T16:06:27Z

Total Merges: 57

Changes:

- PR #35611: (rallytime*) Everything in the sample master config file should be commented out
- PR #35569: (* rallytime) Write test for multiple unless commands where 1st cmd passes and 2nd fails
- PR #35600: (* rallytime) Update release notes for 2015.8.12
- PR #35599: (rallytime) Update release notes for 2015.8.12
- PR #35584: (terminalmage) Update linux_sysctl tests to reflect new context key
- PR #35575: (terminalmage) Add warning about AWS flagging of nmap usage
- PR #35577: (terminalmage) Unit file changes for 2015.8.12, 2016.3.3
- PR #35566: (rallytime) Back-port #35545 to 2015.8
- PR #35545: (hu-dabao) fix-35384, fix cmd.run unless
- PR #35492: (terminalmage) Clarify config.get docstring
- PR #35483: (gtmanfred) use __utils__ in salt.cloud
- PR #35546: (whiteinge) Salt api eauth fail gracefully
- PR #35525: (UtahDave) add missing glob import
- PR #35540: (rallytime) Whitespace fix for 2015.8

- PR #35510: (*terminalmage*) Better systemd integration
- PR #35513: (*cachedout*) Might be a good idea to be able to download the software we make
- PR #35302: (*Ch3LL*) Add job cache test
- PR #35512: (*cachedout*) Fixup 35419
- PR #35497: (*deepakhj*) Fixes spacing in requirements files
- PR #35508: (*terminalmage*) Add Carbon to versionadded for git.diff
- PR #35486: (*rallytime*) Update bootstrap script to latest stable (2016.08.16)
- PR #35413: (*cachedout*) Resolve path issues with cp.push
- PR #35476: (*cachedout*) Fixup SSH bug where sudo without sudo user would break
- PR #35471: (*terminalmage*) win_pkg: Fix traceback when package is not installed
- PR #35448: (*isbm*) Add ignore_repo_failure option to suppress zypper's exit code 106 on ...
- PR #35451: (*isbm*) Bugfix: zypper mod repo unchanged
- PR #35453: (*theothergraham*) fixes #34279 - disk cache ttl expiry
- PR #35459: (*thatch45*) Ensure that output for salt-ssh gets back
- PR #35460: (*rallytime*) [2015.8] Update bootstrap script to latest stable (2016.08.15)
- PR #35442: (*cachedout*) Fix cp.push_dir pushing empty dirs
- PR #35436: (*cachedout*) Minor doc fixup
- PR #35132: (*sjorge*) fixes , causing lots of mayham (onchange) with 2016.3.2 for me
- PR #35394: (*rallytime*) Back-port #34573 to 2015.8
- PR #34573: (*cedwards*) Update freebsd.rst
- PR #35359: (*terminalmage*) Clean up open filehandles
- PR #35339: (*isbm*) Bugfix: Prevent continuous restart, if a dependency wasn't installed
- PR #35357: (*twangboy*) Fix file.recurse with clean: True on Windows (2015.8)
- PR #35323: (*thatch45*) Fix issue with bad error check in salt-vt
- PR #35325: (*kev009*) Fix freebsd netstat route on fbsd 10+
- PR #35301: (*bobrik*) Pass port to ssh.check_known_host, closes #35264
- PR #35309: (*terminalmage*) file.recurse: Do not convert octal mode string to int
- PR #35290: (*terminalmage*) Resolve a couple bugs in orchestration output
- PR #35211: (*cachedout*) Alternative sudo users for salt-ssh
- PR #35271: (*bobrik*) Default state_output_profile to True everywhere, closes #35166
- PR #35233: (*terminalmage*) Do not attempt to get fqdn_ip{4,6} grains when ipv{4,6} grains are empty
- PR #35202: (*multani*) doc: fix broken links in the test documentation page
- PR #35236: (*rallytime*) Back-port #35119 to 2015.8
- PR #35119: (*derekmaciel*) Assume two EVRs are equal if E and V are equal but one R is missing.
- PR #35240: (*derekmaciel*) Backport #35225 to 2015.8
- PR #35225: (*derekmaciel*) Add missing documentation for pkg.installed

- PR #35241: (*terminalmage*) Ensure max recursion in gitfs results in no blob object being returned.
- PR #35245: (*rallytime*) Back-port #35039 to 2015.8
- PR #35039: (*whiteinge*) Add saltenv support to module.run
- PR #35249: (*terminalmage*) Fix regression in git.latest
- PR #35174: (*rallytime*) Back-port #35146 to 2015.8
- PR #35146: (*cachedout*) Don't discard running beacons config when listing beacons
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
- PR #35173: (*rallytime*) Back-port #35135 to 2015.8
- PR #35135: (*rallytime*) Add missing CLI Examples to aws_sqs module funcs
- PR #35145: (*jacobhammons*) doc version update to 2015.8.11, updates to release notes
- PR #35114: (*terminalmage*) Add clarification docs on a common git_pillar misconfiguration
- PR #34768: (*hrumph*) Fixes #34767
- PR #35043: (*rallytime*) Start release notes file for 2015.8.12
- PR #35050: (*terminalmage*) [orchestration] Properly handle runner/wheel funcs which accept a `saltdev` argument
- PR #35066: (*jfindlay*) returners.postgres_local_cache: do not log in __virtual__
- PR #35024: (*bobrik*) Cache systemd unit update check per unit, closes #34927
- PR #35026: (*cachedout*) Expressly deny a minion if a key cannot be found
- PR #35000: (*rallytime*) Back-port #33875 and #34999 to 2015.8
- PR #33875: (*jmesquita*) Fix naive fileservers map diff algorithm
- PR #34994: (*rallytime*) Back-port #34835 to 2015.8
- PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in salt-ssh
- PR #34991: (*cachedout*) SSH timeout
- PR #34976: (*cachedout*) Refine errors in client
- PR #34831: (*thatch45*) If the thin does not match, then redeploy, don't error
- PR #34916: (*cachedout*) Master performance improvement
- PR #34911: (*cachedout*) Backport #34906
- PR #34906: (*cachedout*) Set timeout for run_salt in test suite
- PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list_upgrades
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34862: (*thatch45*) Fix salt-ssh cacheing issue
- PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force_reset=False
- PR #34859: (*cachedout*) Fix wheel test
- PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low
- PR #34847: (*cachedout*) Add an option to skip the verification of client_acl users
- PR #34827: (*thatch45*) fix beacon list to include all beacons being processed

- PR #34833: (*rallytime*) Back-port #28521 to 2015.8
- PR #28521: (*gongled*) SPM: packaging doesn't work in Python 2.6. Fixed.
- PR #34823: (*rallytime*) Back-port #25276 to 2015.8
- PR #25276: (*jacobhammons*) copy spm.1 man page during setup
- PR #34828: (*thatch45*) Fix #34648
- PR #34818: (*jtand*) Skip mysql state test if mysqladmin is not available
- PR #34642: (*jtand*) Check that mysqladmin exists before running mysql integration tests
- PR #34803: (*junovitch*) salt/state.py: set `'chunk['order'] = 0' with 'order: first'; fixes '#24744' _`
- PR #34773: (*randomed*) Bugfix: Startup states on minions are not being written to mysql returner
- PR #34751: (*cachedout*) Remove unneeded config test
- PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)
- PR #34754: (*cachedout*) Disable test
- PR #34741: (*rallytime*) Back-port #34726 to 2015.8
- PR #34726: (*martinhoefling*) Always loop over updated keys in non recursive update
- PR #34721: (*rallytime*) Add output_file option to master config docs
- PR #34689: (*Azidburn*) fix second run problems with pkg.installed using sources
- PR #34695: (*isbm*) Bugfix: Zypper `pkg.list_products` returns False on some empty values (2015.8)

19.2.14 Salt 2015.8.2 Release Notes

Note: A significant orchestrate issue #29110 was discovered during the release process of 2015.8.2, so it has not been officially released. Please use 2015.8.3 instead.

Total Merges: 378

Changes:

- PR #28730: (*garethgreenaway*) Fixes to how return_job is handled in the scheduler for the salt master.
- PR #28848: (*cro*) Lint
- PR #28842: (*cachedout*) Add transport setting to shell test
- PR #28837: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (*jacksonj*) Cleanup virtual_timer in loader
- PR #28836: (*cachedout*) Cast to dict to fix wheel tests in tcp
- PR #28834: (*cachedout*) Fix breakage in tcp server
- PR #28804: (*cachedout*) TCP test fixes
- PR #28826: (*basepi*) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (*jfindlay*) simplify stdin use of stdin in at.present state

- PR #28824: (*rallytime*) Back-port #28778 and #28820 to 2015.8
- PR #28803: (*jfindlay*) decode strings to utf-8
- PR #28782: (*rallytime*) Fixes to rabbitmq user state
- PR #28789: (*nmadhok*) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
- PR #28768: (*mrosedale*) 2015.8
- PR #28772: (*rallytime*) rabbitmq.list_user_permissions returns a dict, not a list. Don't expect a list.
- PR #28774: (*rallytime*) Back-port #28725 to 2015.8
- PR #28775: (*rallytime*) Back-port #28740 to 2015.8
- PR #28755: (*rallytime*) Move most vmware driver list_* functions to use salt.utils.vmware functions
- PR #28744: (*jfindlay*) import gate elementtree
- PR #28758: (*jfindlay*) remove redundant logic in useradd execution module
- PR #28757: (*mbarrien*) Bug fix: pip command to not quote spaces in cmd line args
- PR #28764: (*multani*) Various documentation fixes
- PR #28752: (*aboe76*) Update openSUSE grain for tumbleweed
- PR #28713: (*hexedpackets*) Rename consul.list to consul.list_keys.
- PR #28719: (*jacobhammons*) removed dependencies info from docs
- PR #28709: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28710: (*rallytime*) Pass kwargs correctly to _get_group from get_group_id
- PR #28698: (*rallytime*) Back-port #28530 to 2015.8
- PR #28700: (*rallytime*) Back-port #28679 to 2015.8
- PR #28695: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.09
- PR #28656: (*clarkperkins*) `#28526`_ fixed yumpkg module issue with pkg.installed
- PR #28672: (*jfindlay*) add OS grain support for SuSE Leap
- PR #28673: (*jfindlay*) add hidden_opts to mount.mounted
- PR #28667: (*cro*) saltutil.sync_all should sync proxymodules as well as the rest.
- PR #28665: (*jfindlay*) fixes to windows execution and state modules
- PR #28660: (*techhat*) Don't sign empty regions
- PR #28632: (*terminalmage*) Fixes/improvements to pkgbuild state/modules
- PR #28658: (*techhat*) Remove _pkgdb_fun() references
- PR #28653: (*rallytime*) Provide possible parameters for boto_rds.present engine values
- PR #28649: (*bdrung*) Fix OS related grains on Debian
- PR #28646: (*rallytime*) Back-port #28614 to 2015.8
- PR #28647: (*rallytime*) Back-port #28624 to 2015.8
- PR #28648: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #28638: (*anlutro*) Salt-SSH: Return more concise error when SSH command fails

- PR #28644: (*pass-by-value*) Make sure versionchanged is correct
- PR #28615: (*The-Loeki*) Fixes to FreeBSD pkg
- PR #28613: (*cachedout*) Add facility to deepcopy bound methods in Py2.6 and apply to grains
- PR #28612: (*rallytime*) Remove unsupported storage_type argument for parity with boto_rds module
- PR #28611: (*rallytime*) [2015.8] Be explicit about salt.utils.vmware function calls
- PR #28610: (*pass-by-value*) Lxc config additions
- PR #28602: (*nasenbaer13*) Allow setting of custom dimensions in asg alarm specification
- PR #28596: (*rallytime*) Merge branch `2015.5` into `2015.8`
- PR #28593: (*blueyed*) doc: fix typo with salt.states.file: s/preseve/preserve/
- PR #28578: (*twangboy*) Fixed the script... something got broke...
- PR #28579: (*jfindlay*) fix __virtual__ returns: tls,uptime mods
- PR #28584: (*rallytime*) If AssociatePublicIpAddress is set to True, don't auto-assign eip.
- PR #28576: (*jackson tj*) Only encode the zmq message once
- PR #28587: (*cachedout*) Reset yaml rendering hooks to avoid leaks
- PR #28581: (*basepi*) Revert b4875e585a165482c4c1ddc8987d76b0a71ef1b0
- PR #28573: (*jackson tj*) Add *body* to salt.utils.http.query returns
- PR #28564: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.04
- PR #28561: (*Oro*) Issue [`#28527`](#) _ boto_rds.create does not work
- PR #28560: (*bdrung*) Fix various typos
- PR #28550: (*jfindlay*) check timedatectl errno and return stdout on failure
- PR #28545: (*jfindlay*) pass on concurrent create of jid_dir in local_cache
- PR #28544: (*rallytime*) Start moving some vmware.py cloud funcs to utils/vmware.py
- PR #28543: (*gtmanfred*) clean up changes for pkg.uptodate and supervisord.dead
- PR #28538: (*jfindlay*) decode path and url to utf-8 in url.create
- PR #28533: (*jfindlay*) decode highstate error messages to utf-8
- PR #28547: (*nmadhok*) [Backport] [2015.8] Tasks can be in queued state instead of running
- PR #28535: (*techhat*) Fail gracefully if 169.254* isn't available
- PR #28536: (*cro*) Default configuration file for proxy minions.
- PR #28534: (*rallytime*) Add versionadded directive for vpc_name arg in boto_secgroup.present
- PR #28516: (*rallytime*) Back-port #28489 to 2015.8
- PR #28506: (*basepi*) [2015.8] Log minion list for all rosters, at debug level
- PR #28514: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28502: (*cachedout*) Lint #28427
- PR #28464: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28486: (*rallytime*) Back-port #26945 to 2015.8
- PR #28472: (*gtmanfred*) overwrite more than one value with names

- PR #28493: (*rallytime*) Back-port #28492 to 2015.8
- PR #28494: (*whiteinge*) Fix filter_by passing incorrect parameters to match functions
- PR #28491: (*rallytime*) Back-port #28388 to 2015.8
- PR #28465: (*twangboy*) Fix `#12363`_: Password Expiration in Windows
- PR #28485: (*nasenbaer13*) Fix invalid usage of _get_conn causing `#28484`_
- PR #28454: (*sdm24*) Fixed nodegroup doc formatting to correctly link to pillar_opts in the master config
- PR #28487: (*cachedout*) Lint 28456
- PR #28457: (*sdm24*) Clarified comments for grains/core.py for ip_interfaces, ip4_interfac...
- PR #28473: (*anlutro*) Show check_cmd output on failure
- PR #28460: (*jtand*) Skipped wipefs test if wipefs does not exist on OS
- PR #28426: (*terminalmage*) pkgbuild.built: make template engine optional
- PR #28422: (*cachedout*) Handle windows logging on thread_multi [WIP]
- PR #28425: (*twangboy*) Fix `#13513`_ - Reflection
- PR #28417: (*rallytime*) Add note about azure sdk version to getting started docs
- PR #28410: (*jacksonjtj*) Add retries to the zeromq.AsyncReqMessageClient
- PR #28404: (*rallytime*) Back-port #28395 to 2015.8
- PR #28405: (*opdude*) Detect legacy versions of chocolatey correctly
- PR #28187: (*sjansen*) fix at.present
- PR #28375: (*merll*) Merge pillar includes correctly
- PR #28376: (*ryan-lane*) Support update of route53 records with multiple values
- PR #28377: (*terminalmage*) Deprecate `always` in favor of `force` in pkgbuild.built
- PR #28380: (*cro*) Add missing call for service provider
- PR #28348: (*jfindlay*) salt.utils.alias informs user they are using a renamed function
- PR #28364: (*jtand*) In CentOS 5 the .split() causes a stacktrace.
- PR #28361: (*rallytime*) Back-port #28087 to 2015.8
- PR #28360: (*multani*) Various documentation fixes
- PR #28370: (*rallytime*) Back-port #28276 to 2015.8
- PR #28353: (*merll*) Consider each pillar match only once.
- PR #28334: (*anlutro*) iptables needs -m comment for --comment to work
- PR #28340: (*jfindlay*) sdecode file and dir lists in fileclient
- PR #28344: (*ryan-lane*) Fix iptables state for non-filter tables
- PR #28343: (*rallytime*) Back-port #28342 to 2015.8
- PR #28330: (*rallytime*) Back-port #28305 to 2015.8
- PR #28270: (*rallytime*) Refactor RabbitMQ Plugin State to correctly use test=true and format errors
- PR #28269: (*rallytime*) Refactor rabbitmq_user state to use test=True correctly
- PR #28299: (*rallytime*) Add test for availability_zone check to boto_vpc_tests

- PR #28306: (*sdm24*) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
- PR #28308: (*rallytime*) Firewalld state services should use `--add-service`, not `--new-service`
- PR #28302: (*DmitryKuzmenko*) Always close socket even if there is no stream.
- PR #28282: (*keesbos*) Fix for `__env__` in legacy `git_pillar`
- PR #28258: (*pass-by-value*) Add service module for ssh proxy example
- PR #28294: (*bechtoldt*) correct a bad default value in http utility
- PR #28185: (*jtand*) Added single package return for `latest_version`, fixed other bug.
- PR #28297: (*cachedout*) Lint fix proxy junos
- PR #28210: (*terminalmage*) Fix for `ext_pillar` being compiled twice in legacy `git_pillar` code
- PR #28265: (*jfindlay*) fix blockdev execution and state modules
- PR #28266: (*rallytime*) Back-port #28260 to 2015.8
- PR #28253: (*rallytime*) Back-port #28063 to 2015.8
- PR #28231: (*rallytime*) Make sure we're comparing strings when getting images in the DO driver
- PR #28224: (*techhat*) Optimize `create_repo` for large packages
- PR #28214: (*rallytime*) Don't stacktrace if invalid credentials are passed to `boto_route53` state
- PR #28228: (*rallytime*) Back-port #27562 to 2015.8
- PR #28232: (*rallytime*) Add documentation to supply the `ssh_username`: `freebsd` config to DO docs
- PR #28198: (*jacobhammons*) Added note regarding missing `spm` exe on Debian/Ubuntu
- PR #28182: (*erchn*) Some fixes for nova driver for Rackspace
- PR #28181: (*rallytime*) Revamp firewalld state to be more stateful.
- PR #28176: (*cro*) Add ping function
- PR #28167: (*The-Loeki*) `file.serialize` needs to add a final newline to serialized files
- PR #28168: (*rallytime*) Make sure availability zone gets passed in `boto_vpc` module when creating subnet
- PR #28148: (*basepi*) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
- PR #28155: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28149: (*pass-by-value*) Add clarification to cloud profile doc about host
- PR #28146: (*cachedout*) Lint `dracr.py`
- PR #28141: (*rallytime*) Don't use RAM for root disk size in `linode.py`
- PR #28143: (*jtand*) Removed blank line at end of `chassis.py`
- PR #28021: (*blueyed*) Handle includes in `include_config` recursively
- PR #28095: (*rallytime*) Back-port #28001 to 2015.8
- PR #28096: (*rallytime*) Back-port #28061 to 2015.8
- PR #28139: (*rallytime*) Back-port #28103 to 2015.8
- PR #28098: (*jackson tj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28134: (*bernieke*) fix unicode pillar values ``#3436`_``
- PR #28076: (*redmcg*) Replace option ``i`` with an explicit queryformat

- PR #28119: (*jacksonjtj*) Check if the remote exists before casting to a string.
- PR #28105: (*jfindlay*) add reason for not loading localemod
- PR #28108: (*cachedout*) Set logfile permissions correctly
- PR #27922: (*cro*) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (*pass-by-value*) Add documentation for proxy minion ssh
- PR #28020: (*DmitryKuzmenko*) LazyLoader deepcopy fix.
- PR #27933: (*eliasp*) Provide all git pillar dirs in `opts[pillar_roots]`
- PR #28013: (*rallytime*) Back-port #27891 to 2015.8
- PR #28018: (*rallytime*) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (*cachedout*) #28069 with lint
- PR #28079: (*The-Loeki*) Fix for trace dump on failing imports for win32com & pythoncom 4 win_task
- PR #28081: (*The-Loeki*) fix for glance state trace error on import failure
- PR #28066: (*jacksonjtj*) Use the generic `text` attribute, not `.body` of the handler
- PR #28019: (*rallytime*) Clean up version added and deprecated msgs to be accurate
- PR #28058: (*rallytime*) Back-port #28041 to 2015.8
- PR #28055: (*rallytime*) Back-port #28043 to 2015.8
- PR #28046: (*pass-by-value*) Add pkg install and remove functions
- PR #28050: (*ryan-lane*) Use a better method for checking dynamodb table existence
- PR #28042: (*jfindlay*) fix repo path in ubuntu installation documentation
- PR #28033: (*twangboy*) Fixed win_useradd.py
- PR #28027: (*cro*) Make ssh conn persistent.
- PR #28029: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28022: (*jacobhammons*) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (*rallytime*) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (*twangboy*) Fix for ``#20678`_``
- PR #27997: (*rallytime*) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (*jtand*) Fix schedule_test failure
- PR #27992: (*cachedout*) Make load beacon config into list
- PR #28003: (*twangboy*) Fix ``#26336`_``
- PR #27984: (*rallytime*) Versionadded for clean_file option for pkgrepo
- PR #27989: (*ryan-lane*) Do not try to remove the main route table association
- PR #27982: (*pass-by-value*) Add example for salt-proxy over SSH
- PR #27985: (*jacobhammons*) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (*cachedout*) Fix regression with key whitespace
- PR #27977: (*cachedout*) Decode unicode names in fileclient/server
- PR #27981: (*jtand*) Fixed trailing whitespace lint

- PR #27969: (*jeffreycatang*) fix parse of { on next line
- PR #27978: (*terminalmage*) Add note about `dockerng.inspect_image` usage
- PR #27955: (*pass-by-value*) Bp 27868
- PR #27953: (*The-Loeki*) Fix CloudStack cloud for new `driver' syntax
- PR #27965: (*ryan-lane*) Fail in `boto_asg.present` if alarms fail
- PR #27958: (*twangboy*) Added new functionality to `win_task.py`
- PR #27959: (*techhat*) Change `__opts__` to `self.opts`
- PR #27943: (*rallytime*) Back-port #27910 to 2015.8
- PR #27944: (*rallytime*) Back-port #27909 to 2015.8
- PR #27946: (*jtand*) Changed grain to look at `osmajorrelease` instead of `osrelease`
- PR #27914: (*rallytime*) Use `eipalloc` instead of `eni` in EC2 interface properties example
- PR #27926: (*rallytime*) Back-port #27905 to 2015.8
- PR #27927: (*ryan-lane*) Do not manage ingress or egress rules if set to None
- PR #27928: (*rallytime*) Back-port #27908 to 2015.8
- PR #27676: (*ticosax*) [`dockerng`] WIP No more runtime args passed to `docker.start()`
- PR #27885: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27882: (*twangboy*) Created `win_task.py` module
- PR #27802: (*terminalmage*) Correct warning logging when update lock is present for `git_pillar/winrepo`, add runner function for clearing `git_pillar/winrepo` locks
- PR #27886: (*rallytime*) Handle group lists as well as comma-separated group strings.
- PR #27746: (*anlutro*) `timezone` module: handle `timedatectl` errors
- PR #27816: (*anlutro*) Make `system.reboot` use `shutdown -r` when available
- PR #27874: (*rallytime*) Add mention of Periodic Table naming scheme to deprecation docs
- PR #27883: (*terminalmage*) Work around `--is-ancestor` not being present in `git-merge-base` before git 1.8.0
- PR #27877: (*rallytime*) Back-port #27774 to 2015.8
- PR #27878: (*rallytime*) Use `apache2ctl` binary on SUSE in `apache` module
- PR #27879: (*cro*) Add docs for 2015.8.2+ changes to proxies
- PR #27731: (*cro*) Add `__proxy__` to replace `opts['proxymodule']`
- PR #27745: (*anlutro*) Add `pip_upgrade` arg to `virtualenv.managed` state
- PR #27809: (*ticosax*) [`dockerng`] Remove `dockerng.ps` caching
- PR #27859: (*ticosax*) [`dockerng`] Clarify doc port bindings
- PR #27748: (*multani*) Fix ``#8646`_``
- PR #27850: (*rallytime*) Back-port #27722 to 2015.8
- PR #27851: (*rallytime*) Back-port #27771 to 2015.8
- PR #27833: (*jfindlay*) decode path before string ops in `fileclient`
- PR #27837: (*jfindlay*) reverse truth in `python_shell` documentation

- PR #27860: (*flavio*) Fix OS related grains on openSUSE and SUSE Linux Enterprise
- PR #27768: (*rallytime*) Clean up bootstrap function to be slightly cleaner
- PR #27797: (*isbm*) Zypper module clusterfix
- PR #27849: (*rallytime*) Don't require a size parameter for proxmox profiles
- PR #27827: (*techhat*) Add additional error checking to SPM
- PR #27826: (*martinhoefling*) Fixes ``#27825`_``
- PR #27824: (*techhat*) Update Azure errors
- PR #27795: (*eguwen*) better change reporting for postgres_user groups
- PR #27799: (*terminalmage*) Fix usage of identity file in git.latest
- PR #27717: (*pass-by-value*) Proxy beacon example
- PR #27793: (*anlutro*) update code that changes log level of salt-ssh shim command
- PR #27761: (*terminalmage*) Merge git pillar data instead of using dict.update()
- PR #27741: (*ticosax*) [dockerng] pass filters argument to dockerng.ps
- PR #27760: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27757: (*jfindlay*) fix virtual fcn return doc indentation
- PR #27754: (*rallytime*) Change test.nop version directive to 2015.8.1
- PR #27734: (*jacobhammons*) Updated saltstack2 theme to add SaltConf16 banner
- PR #27727: (*rallytime*) Merge #27719 w/pylint fix
- PR #27724: (*jfindlay*) update `__virtual__` return documentation
- PR #27725: (*basepi*) Fix global injection for state cross calls
- PR #27628: (*ticosax*) [dockerng] Add support of `labels` parameter for dockerng
- PR #27704: (*jacobhammons*) Update compound matcher docs to clarify the usage of alternate delimi...
- PR #27705: (*rallytime*) Merge #27602 with final pylint fix
- PR #27691: (*notpeter*) Faster timeout (3s vs 2min) for instance metadata lookups. ``#13850`_``
- PR #27696: (*blueyed*) loader.proxy: call `_modules_dirs` only once
- PR #27630: (*ticosax*) Expose `container_id` in `mine.get_docker`
- PR #27600: (*blueyed*) dockerng: use `docker.version=auto` by default
- PR #27689: (*rallytime*) Merge #27448 with test fixes
- PR #27693: (*jacobhammons*) initial engines topic, updates to windows repo docs
- PR #27601: (*blueyed*) dockerng: handle None in `container.Names`
- PR #27596: (*blueyed*) gitfs: fix `UnboundLocalError` for ``msg``
- PR #27651: (*eliasp*) Check for existence of ``subnetId`` key in subnet dict
- PR #27639: (*rallytime*) Docement version added for new artifactory options
- PR #27677: (*rallytime*) Back-port #27675 to 2015.8
- PR #27637: (*rallytime*) Back-port #27604 to 2015.8
- PR #27657: (*garthgreenaway*) Fix to pkg state module

- PR #27632: (*rallytime*) Back-port #27539 to 2015.8
- PR #27633: (*rallytime*) Back-port #27559 to 2015.8
- PR #27579: (*rallytime*) Change boto_route53 region default to `universal` to avoid problems with boto library
- PR #27581: (*tkwilliams*) Add support for `vpc_name` tag in boto_secgroup module and state
- PR #27624: (*nasenbaer13*) Wait for sync is not passed to boto_route53 state
- PR #27614: (*blueyed*) doc: minor fixes to doc and comments
- PR #27627: (*eyj*) Fix crash in boto_asg.get_instances if the requested attribute is None
- PR #27616: (*jacobhammons*) Updated windows software repository docs
- PR #27569: (*lomeroy*) boto_vpc.get_subnet_association now returns a dict w/key of vpc_id, a...
- PR #27567: (*whiteinge*) Use getattr to fetch psutil.version_info
- PR #27583: (*tkwilliams*) Fixup zypper module
- PR #27597: (*blueyed*) gitfs: remove unused variable ``bad_per_remote_conf``
- PR #27585: (*ryan-lane*) Fix undefined variable in cron state module

19.2.15 Salt 2015.8.3 Release Notes

Security Fix

CVE-2015-8034: Saving `state.sls` cache data to disk with insecure permissions

This affects users of the `state.sls` function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to @zmalone for bringing this issue to our attention.

Changes

Changes:

- PR #29172: (*basepi*) [2015.8] Backport new philips_hue proxy features from develop
- PR #29167: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29141: (*optix2000*) Add test case for require: sls with only import statements
- PR #29072: (*terminalmage*) Several gitfs/git_pillar fixes
- PR #29118: (*ticosax*) [dockerng] Add networking capabilities
- PR #29145: (*anlutro*) Remove duplicate import of salt.utils.s3
- PR #29148: (*lomeroy*) correcting parameter calls to boto get_zone/create_zone functions in ...
- PR #29108: (*lorenegordon*) Enforce length as an int, fixes [`#29107`](#) _
- PR #29125: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29126: (*fcrozat*) Fix deployment when umask is non-standard

- PR #29124: (*rallytime*) Back-port #28130 to 2015.8
- PR #29076: (*RealKelsar*) We can't query installed use flags for a non installed pkg
- PR #29097: (*rallytime*) Back-port #29070 to 2015.8
- PR #29090: (*gtmanfred*) clean up novaclient module
- PR #29095: (*terminalmage*) Add warning about pygit2 API instability
- PR #28919: (*cro*) Update Philips Hue proxy minion to support `__proxy__` instead of proxymodule stored in `__opts__`
- PR #29065: (*cachedout*) Handle failures inside python's inspect if a module is reloaded
- PR #29057: (*paulnivin*) Add local file support for file.managed source list
- PR #29017: (*jfindlay*) pagerduty runner: add missing salt.utils import
- PR #29039: (*anlutro*) Allow passing list of pip packages to virtualenv.managed
- PR #29047: (*schwing*) Fix salt.modules.gpg.import_key exception: `GPG_1_3_1` referenced before assignment'
- PR #29050: (*terminalmage*) Make git_pillar global config option docs more prominent
- PR #29048: (*nmadhok*) Fix incorrect debug log statement
- PR #29024: (*jfindlay*) cache runner test: add new unit tests
- PR #28967: (*cro*) Fix some issues with password changes
- PR #29020: (*basepi*) [2015.8] Add special list-only nodegroup support to salt-ssh
- PR #28970: (*terminalmage*) Properly handle non-string saltenvs
- PR #28959: (*rallytime*) Add blade password example and make note of timeout
- PR #29000: (*kiorky*) [Mergeable] Fix up LXC
- PR #29014: (*jfindlay*) systemd module: remove unneeded col command
- PR #28983: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28969: (*rallytime*) Back-port #28825 to 2015.8
- PR #28787: (*chrigl*) closes ``#28784`_``
- PR #28944: (*rallytime*) The ret result must contain `name`, not `chassis_name` for the state compiler.
- PR #28957: (*terminalmage*) Fix version number for new state option
- PR #28950: (*DmitryKuzmenko*) PR 28812 which test fix
- PR #28812: (*isbm*) Enhance `which` decorator reliability
- PR #28934: (*terminalmage*) git.latest: Add update_head option to prevent local HEAD from being updated
- PR #28937: (*rallytime*) Update dellchassis state example to use correct jinja syntax
- PR #28889: (*jfindlay*) state compiler: relax aggregate conditional check
- PR #28921: (*rallytime*) Back-port #25470 to 2015.8
- PR #28922: (*rallytime*) Change 2015.8.2 release note title to reflect proper version
- PR #28891: (*jfindlay*) rh_service module: fix logic in `_chkconfig_is_enabled`
- PR #28892: (*jfindlay*) grains.core: correctly identify SLES 11 distrib_id
- PR #28910: (*lorengeordon*) Fix winrepo command in windows pkg mgmt doc

- PR #28896: (*rallytime*) Back-port #28855 to 2015.8
- PR #28895: (*rallytime*) Back-port #28823 to 2015.8
- PR #28885: (*kt97679*) fix for: service.enabled fails on xen server `#28754`_
- PR #28880: (*terminalmage*) Add ``profile" loglevel
- PR #28882: (*basepi*) [2015.8] salt-ssh: Check return type to make sure it's an error
- PR #28867: (*rallytime*) [fx2 grains] Grains functions should return dictionaries
- PR #28863: (*mhoogendoorn*) Fix ebuild.install causing extra refresh_db calls.
- PR #28865: (*jfindlay*) add 2015.8.2 release notes
- PR #28730: (*garethgreenaway*) Fixes to how return_job is handled in the scheduler for the salt master.
- PR #28848: (*cro*) Lint
- PR #28842: (*cachedout*) Add transport setting to shell test
- PR #28837: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (*jacksonjtj*) Cleanup virtual_timer in loader

- PR #28834: (*cachedout*) Fix breakage in tcp server
- PR #28804: (*cachedout*) TCP test fixes
- PR #28826: (*basepi*) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (*jfindlay*) simplify stdin use of stdin in at.present state
- PR #28824: (*rallytime*) Back-port #28778 and #28820 to 2015.8
- PR #28803: (*jfindlay*) decode strings to utf-8
- PR #28782: (*rallytime*) Fixes to rabbitmq user state
- PR #28789: (*nmadhok*) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
- PR #28768: (*mrosedale*) 2015.8
- PR #28772: (*rallytime*) rabbitmq.list_user_permissions returns a dict, not a list. Don't expect a list.
- PR #28774: (*rallytime*) Back-port #28725 to 2015.8
- PR #28775: (*rallytime*) Back-port #28740 to 2015.8
- PR #28755: (*rallytime*) Move most vmware driver list_* functions to use salt.utils.vmware functions
- PR #28744: (*jfindlay*) import gate elementtree
- PR #28758: (*jfindlay*) remove redundant logic in useradd execution module
- PR #28757: (*mbarrien*) Bug fix: pip command to not quote spaces in cmd line args
- PR #28764: (*multani*) Various documentation fixes
- PR #28752: (*aboe76*) Update openSUSE grain for tumbleweed
- PR #28713: (*hexedpackets*) Rename consul.list to consul.list_keys.
- PR #28719: (*jacobhammons*) removed dependencies info from docs
- PR #28709: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #28710: (*rallytime*) Pass kwargs correctly to `_get_group` from `get_group_id`
- PR #28698: (*rallytime*) Back-port #28530 to 2015.8
- PR #28700: (*rallytime*) Back-port #28679 to 2015.8
- PR #28695: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.09
- PR #28656: (*clarkperkins*) `#28526` _ fixed yumpkg module issue with `pkg.installed`
- PR #28672: (*jfindlay*) add OS grain support for SuSE Leap
- PR #28673: (*jfindlay*) add `hidden_opts` to `mount.mounted`
- PR #28667: (*cro*) `saltutil.sync_all` should sync proxymodules as well as the rest.
- PR #28665: (*jfindlay*) fixes to windows execution and state modules
- PR #28660: (*techhat*) Don't sign empty regions
- PR #28632: (*terminalmage*) Fixes/improvements to `pkgbuild` state/modules
- PR #28658: (*techhat*) Remove `_pkgdb_fun()` references
- PR #28653: (*rallytime*) Provide possible parameters for `boto_rds.present` engine values
- PR #28649: (*bdrung*) Fix OS related grains on Debian
- PR #28646: (*rallytime*) Back-port #28614 to 2015.8
- PR #28647: (*rallytime*) Back-port #28624 to 2015.8
- PR #28648: (*rallytime*) Merge branch `2015.5` into `2015.8`
- PR #28638: (*anlutro*) Salt-SSH: Return more concise error when SSH command fails
- PR #28644: (*pass-by-value*) Make sure `versionchanged` is correct
- PR #28615: (*The-Loeki*) Fixes to FreeBSD `pkg`
- PR #28613: (*cachedout*) Add facility to `deepcopy` bound methods in Py2.6 and apply to grains
- PR #28612: (*rallytime*) Remove unsupported `storage_type` argument for parity with `boto_rds` module
- PR #28611: (*rallytime*) [2015.8] Be explicit about `salt.utils.vmware` function calls
- PR #28610: (*pass-by-value*) Lxc config additions
- PR #28602: (*nasenbaer13*) Allow setting of custom dimensions in `asg` alarm specification
- PR #28596: (*rallytime*) Merge branch `2015.5` into `2015.8`
- PR #28593: (*blueyed*) doc: fix typo with `salt.states.file: s/preserve/preserve/`
- PR #28578: (*twangboy*) Fixed the script... something got broke...
- PR #28579: (*jfindlay*) fix `__virtual__` returns: `tls,uptime` mods
- PR #28584: (*rallytime*) If `AssociatePublicIpAddress` is set to `True`, don't auto-assign `eip`.
- PR #28576: (*jacksonjtj*) Only encode the `zmq` message once
- PR #28587: (*cachedout*) Reset `yaml` rendering hooks to avoid leaks
- PR #28581: (*basepi*) Revert `b4875e585a165482c4c1ddc8987d76b0a71ef1b0`
- PR #28573: (*jacksonjtj*) Add `body` to `salt.utils.http.query` returns
- PR #28564: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.04
- PR #28561: (*Oro*) Issue `#28527` _ `boto_rds.create` does not work

- PR #28560: (*bdrung*) Fix various typos
- PR #28550: (*jfindlay*) check timedatectl errno and return stdout on failure
- PR #28545: (*jfindlay*) pass on concurrent create of jid_dir in local_cache
- PR #28544: (*rallytime*) Start moving some vmware.py cloud funcs to utils/vmware.py
- PR #28543: (*gtmanfred*) clean up changes for pkg.uptodate and supervisor.d.dead
- PR #28538: (*jfindlay*) decode path and url to utf-8 in url.create
- PR #28533: (*jfindlay*) decode highstate error messages to utf-8
- PR #28547: (*nmadhok*) [Backport] [2015.8] Tasks can be in queued state instead of running
- PR #28535: (*techhat*) Fail gracefully if 169.254* isn't available
- PR #28536: (*cro*) Default configuration file for proxy minions.
- PR #28534: (*rallytime*) Add versionadded directive for vpc_name arg in boto_secgroup.present
- PR #28516: (*rallytime*) Back-port #28489 to 2015.8
- PR #28506: (*basepi*) [2015.8] Log minion list for all rosters, at debug level
- PR #28514: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28502: (*cachedout*) Lint #28427
- PR #28464: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28486: (*rallytime*) Back-port #26945 to 2015.8
- PR #28472: (*gtmanfred*) overwrite more than one value with names
- PR #28493: (*rallytime*) Back-port #28492 to 2015.8
- PR #28494: (*whiteinge*) Fix filter_by passing incorrect parameters to match functions
- PR #28491: (*rallytime*) Back-port #28388 to 2015.8
- PR #28465: (*twangboy*) Fix `#12363`: Password Expiration in Windows
- PR #28485: (*nasenbaer13*) Fix invalid usage of _get_conn causing `#28484`_
- PR #28454: (*sdm24*) Fixed nodegroup doc formatting to correctly link to pillar_opts in the master config
- PR #28487: (*cachedout*) Lint 28456
- PR #28457: (*sdm24*) Clarified comments for grains/core.py for ip_interfaces, ip4_interfac...
- PR #28473: (*anlutro*) Show check_cmd output on failure
- PR #28460: (*jtand*) Skipped wipefs test if wipefs does not exist on OS
- PR #28426: (*terminalmage*) pkgbuild.built: make template engine optional
- PR #28422: (*cachedout*) Handle windows logging on thread_multi [WIP]
- PR #28425: (*twangboy*) Fix `#13513`_ - Reflection
- PR #28417: (*rallytime*) Add note about azure sdk version to getting started docs
- PR #28410: (*jacksonjtj*) Add retries to the zeromq.AsyncReqMessageClient
- PR #28404: (*rallytime*) Back-port #28395 to 2015.8
- PR #28405: (*opdude*) Detect legacy versions of chocolatey correctly
- PR #28187: (*sjansen*) fix at.present

- PR #28375: (*merll*) Merge pillar includes correctly
- PR #28376: (*ryan-lane*) Support update of route53 records with multiple values
- PR #28377: (*terminalmage*) Deprecate `always` in favor of `force` in pkgbuild.built
- PR #28380: (*cro*) Add missing call for service provider
- PR #28348: (*jfindlay*) salt.utils.alias informs user they are using a renamed function
- PR #28364: (*jtand*) In CentOS 5 the .split() causes a stacktrace.
- PR #28361: (*rallytime*) Back-port #28087 to 2015.8
- PR #28360: (*multani*) Various documentation fixes
- PR #28370: (*rallytime*) Back-port #28276 to 2015.8
- PR #28353: (*merll*) Consider each pillar match only once.
- PR #28334: (*anlutro*) iptables needs -m comment for --comment to work
- PR #28340: (*jfindlay*) sdecode file and dir lists in fileclient
- PR #28344: (*ryan-lane*) Fix iptables state for non-filter tables
- PR #28343: (*rallytime*) Back-port #28342 to 2015.8
- PR #28330: (*rallytime*) Back-port #28305 to 2015.8
- PR #28270: (*rallytime*) Refactor RabbitMQ Plugin State to correctly use test=true and format errors
- PR #28269: (*rallytime*) Refactor rabbitmq_user state to use test=True correctly
- PR #28299: (*rallytime*) Add test for availability_zone check to boto_vpc_tests
- PR #28306: (*sdm24*) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
- PR #28308: (*rallytime*) Firewalld state services should use --add-service, not --new-service
- PR #28302: (*DmitryKuzmenko*) Always close socket even if there is no stream.
- PR #28282: (*keesbos*) Fix for __env__ in legacy git_pillar
- PR #28258: (*pass-by-value*) Add service module for ssh proxy example
- PR #28294: (*bechtoldt*) correct a bad default value in http utility
- PR #28185: (*jtand*) Added single package return for latest_version, fixed other bug.
- PR #28297: (*cachedout*) Lint fix proxy junos
- PR #28210: (*terminalmage*) Fix for ext_pillar being compiled twice in legacy git_pillar code
- PR #28265: (*jfindlay*) fix blockdev execution and state modules
- PR #28266: (*rallytime*) Back-port #28260 to 2015.8
- PR #28253: (*rallytime*) Back-port #28063 to 2015.8
- PR #28231: (*rallytime*) Make sure we're comparing strings when getting images in the DO driver
- PR #28224: (*techhat*) Optimize create_repo for large packages
- PR #28214: (*rallytime*) Don't stacktrace if invalid credentials are passed to boto_route53 state
- PR #28228: (*rallytime*) Back-port #27562 to 2015.8
- PR #28232: (*rallytime*) Add documentation to supply the ssh_username: freebsd config to DO docs
- PR #28198: (*jacobhammons*) Added note regarding missing spm exe on Debian/Ubuntu

- PR #28182: (*erchn*) Some fixes for nova driver for Rackspace
- PR #28181: (*rallytime*) Revamp firewall state to be more stateful.
- PR #28176: (*cro*) Add ping function
- PR #28167: (*The-Loeki*) file.serialize needs to add a final newline to serialized files
- PR #28168: (*rallytime*) Make sure availability zone gets passed in boto_vpc module when creating subnet
- PR #28148: (*basepi*) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
- PR #28155: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28149: (*pass-by-value*) Add clarification to cloud profile doc about host
- PR #28146: (*cachedout*) Lint dracr.py
- PR #28141: (*rallytime*) Don't use RAM for root disk size in linode.py
- PR #28143: (*jtand*) Removed blank line at end of chassis.py
- PR #28021: (*blueyed*) Handle includes in *include_config* recursively
- PR #28095: (*rallytime*) Back-port #28001 to 2015.8
- PR #28096: (*rallytime*) Back-port #28061 to 2015.8
- PR #28139: (*rallytime*) Back-port #28103 to 2015.8
- PR #28098: (*jackson tj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28134: (*bernieke*) fix unicode pillar values ``#3436`_``
- PR #28076: (*redmcg*) Replace option ``i`` with an explicit queryformat
- PR #28119: (*jackson tj*) Check if the remote exists before casting to a string.
- PR #28105: (*jfindlay*) add reason for not loading localemod
- PR #28108: (*cachedout*) Set logfile permissions correctly
- PR #27922: (*cro*) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (*pass-by-value*) Add documentation for proxy minion ssh
- PR #28020: (*DmitryKuzmenko*) LazyLoader deepcopy fix.
- PR #27933: (*eliasp*) Provide all git pillar dirs in *opts[pillar_roots]*
- PR #28013: (*rallytime*) Back-port #27891 to 2015.8
- PR #28018: (*rallytime*) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (*cachedout*) #28069 with lint
- PR #28079: (*The-Loeki*) Fix for trace dump on failing imports for win32com & pythoncom 4 win_task
- PR #28081: (*The-Loeki*) fix for glance state trace error on import failure
- PR #28066: (*jackson tj*) Use the generic *text* attribute, not .body of the handler
- PR #28019: (*rallytime*) Clean up version added and deprecated msgs to be accurate
- PR #28058: (*rallytime*) Back-port #28041 to 2015.8
- PR #28055: (*rallytime*) Back-port #28043 to 2015.8
- PR #28046: (*pass-by-value*) Add pkg install and remove functions
- PR #28050: (*ryan-lane*) Use a better method for checking dynamodb table existence

- PR #28042: (*jfindlay*) fix repo path in ubuntu installation documentation
- PR #28033: (*twangboy*) Fixed win_useradd.py
- PR #28027: (*cro*) Make ssh conn persistent.
- PR #28029: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28022: (*jacobhammons*) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (*rallytime*) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (*twangboy*) Fix for [`#20678`_](#)
- PR #27997: (*rallytime*) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (*jtand*) Fix schedule_test failure
- PR #27992: (*cachedout*) Make load beacon config into list
- PR #28003: (*twangboy*) Fix [`#26336`_](#)
- PR #27984: (*rallytime*) Versionadded for clean_file option for pkgrepo
- PR #27989: (*ryan-lane*) Do not try to remove the main route table association
- PR #27982: (*pass-by-value*) Add example for salt-proxy over SSH
- PR #27985: (*jacobhammons*) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (*cachedout*) Fix regression with key whitespace
- PR #27977: (*cachedout*) Decode unicode names in fileclient/server
- PR #27981: (*jtand*) Fixed trailing whitespace lint
- PR #27969: (*jeffreycatang*) fix parse of { on next line
- PR #27978: (*terminalmage*) Add note about dockerng.inspect_image usage
- PR #27955: (*pass-by-value*) Bp 27868
- PR #27953: (*The-Loeki*) Fix CloudStack cloud for new `driver` syntax
- PR #27965: (*ryan-lane*) Fail in boto_asg.present if alarms fail
- PR #27958: (*twangboy*) Added new functionality to win_task.py
- PR #27959: (*techhat*) Change __opts__ to self.opts
- PR #27943: (*rallytime*) Back-port [#27910](#) to 2015.8
- PR #27944: (*rallytime*) Back-port [#27909](#) to 2015.8
- PR #27946: (*jtand*) Changed grain to look at osmajorrelease instead of osrelease
- PR #27914: (*rallytime*) Use eipalloc instead of eni in EC2 interface properties example
- PR #27926: (*rallytime*) Back-port [#27905](#) to 2015.8
- PR #27927: (*ryan-lane*) Do not manage ingress or egress rules if set to None
- PR #27928: (*rallytime*) Back-port [#27908](#) to 2015.8
- PR #27676: (*ticosax*) [dockerng] WIP No more runtime args passed to docker.start()
- PR #27885: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27882: (*twangboy*) Created win_task.py module

- PR #27802: (*terminalmage*) Correct warning logging when update lock is present for git_pillar/winrepo, add runner function for clearing git_pillar/winrepo locks
- PR #27886: (*rallytime*) Handle group lists as well as comma-separated group strings.
- PR #27746: (*anlutro*) timezone module: handle timedatectl errors
- PR #27816: (*anlutro*) Make system.reboot use *shutdown -r* when available
- PR #27874: (*rallytime*) Add mention of Periodic Table naming scheme to deprecation docs
- PR #27883: (*terminalmage*) Work around --is-ancestor not being present in git-merge-base before git 1.8.0
- PR #27877: (*rallytime*) Back-port #27774 to 2015.8
- PR #27878: (*rallytime*) Use apache2ctl binary on SUSE in apache module
- PR #27879: (*cro*) Add docs for 2015.8.2+ changes to proxies
- PR #27731: (*cro*) Add __proxy__ to replace opts['proxymodule']
- PR #27745: (*anlutro*) Add pip_upgrade arg to virtualenv.managed state
- PR #27809: (*ticosax*) [dockerng] Remove dockerng.ps caching
- PR #27859: (*ticosax*) [dockerng] Clarify doc port bindings
- PR #27748: (*multani*) Fix `#8646`_
- PR #27850: (*rallytime*) Back-port #27722 to 2015.8
- PR #27851: (*rallytime*) Back-port #27771 to 2015.8
- PR #27833: (*jfindlay*) decode path before string ops in fileclient
- PR #27837: (*jfindlay*) reverse truth in python_shell documentation
- PR #27860: (*flavio*) Fix OS related grains on openSUSE and SUSE Linux Enterprise
- PR #27768: (*rallytime*) Clean up bootstrap function to be slightly cleaner
- PR #27797: (*isbm*) Zypper module clusterfix
- PR #27849: (*rallytime*) Don't require a size parameter for proxmox profiles
- PR #27827: (*techhat*) Add additional error checking to SPM
- PR #27826: (*martinhoefling*) Fixes `#27825`_
- PR #27824: (*techhat*) Update Azure errors
- PR #27795: (*eguwen*) better change reporting for postgres_user groups
- PR #27799: (*terminalmage*) Fix usage of identity file in git.latest
- PR #27717: (*pass-by-value*) Proxy beacon example
- PR #27793: (*anlutro*) update code that changes log level of salt-ssh shim command
- PR #27761: (*terminalmage*) Merge git pillar data instead of using dict.update()
- PR #27741: (*ticosax*) [dockerng] pass filters argument to dockerng.ps
- PR #27760: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27757: (*jfindlay*) fix virtual fcn return doc indentation
- PR #27754: (*rallytime*) Change test.nop version directive to 2015.8.1
- PR #27734: (*jacobhammons*) Updated saltstack2 theme to add SaltConf16 banner

- PR #27727: (*rallytime*) Merge #27719 w/pylint fix
- PR #27724: (*jfindlay*) update `__virtual__` return documentation
- PR #27725: (*basepi*) Fix global injection for state cross calls

- PR #27567: (*whiteinge*) Use `getattr` to fetch `psutil.version_info`
- PR #27583: (*tkwilliams*) Fixup `zypper` module
- PR #27597: (*blueyed*) gitfs: remove unused variable ``bad_per_remote_conf``
- PR #27585: (*ryan-lane*) Fix undefined variable in `cron` state module

19.2.16 Salt 2015.8.4 Release Notes

Known Issues

`in_requisites` (issue 30820)

This issue affects all users targeting an explicit `-name: <name>` with a `_in` requisite (such as `watch_in` or `require_in`). If you are not using explicit `-name: <name>` arguments, are targeting with the state ID instead of the name, or are not using `_in` requisites, then you should be safe to upgrade to 2015.8.4.

This issue is resolved in the *2015.8.5* release.

Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Krahmer <krahmer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

Core Changes

- **PR #28994:** *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` (issue 30118 and issue 30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Changes:

- **PR #30613:** (*basepi*) Fix minion/syndic clearfuncs
- **PR #30609:** (*seanjnkns*) Fix documentation for `pillar_merge_lists` which default is False, not ...
- **PR #30584:** (*julianbrost*) `file.line` state: add missing colon in docstring
- **PR #30589:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30599:** (*multani*) Documentation formatting fixes
- **PR #30554:** (*rallytime*) Make the salt-cloud actions output more verbose and helpful

- PR #30549: (*techhat*) Salt Virt cleanup
- PR #30553: (*techhat*) AWS: Support 17-character IDs
- PR #30532: (*whiteinge*) Add execution module for working in sls files
- PR #30529: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30526: (*twangboy*) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30485: (*jtand*) Updated pip_state to work with pip 8.0 on 2015.8
- PR #30494: (*isbm*) Zypper: info_installed – `errors` flag change to type `boolean`
- PR #30506: (*jackson tj*) Properly remove newlines after reading the file
- PR #30508: (*rallytime*) Fix Linode driver cloning functionality
- PR #30522: (*terminalmage*) Update git.list_worktree tests to reflect new return data
- PR #30483: (*borgstrom*) Pyobjects recursive import support (for 2015.8)
- PR #30491: (*jackson tj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match_dict format to accept_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list`` subcommand to list git worktrees
- PR #30445: (*jtand*) Boto uses False for is_default instead of None
- PR #30406: (*frioux*) Add an example of how to use file.managed/check_cmd
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated glusterfs.py for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded val
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with six.u() in cloud/__init__.py
- PR #30384: (*isbm*) Bugfix: info_available does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix FLO_DIR path in 2015.8
- PR #30389: (*jtand*) Older versions of ipset don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
- PR #30267: (*isbm*) Fix RPM issues with the date/time and add package attributes filtering
- PR #30360: (*jfindlay*) file.remove, file.absent: mention recursive dir removal
- PR #30221: (*mbarrien*) No rolcatupdate for user_exist in Postgres>=9.5 [`#26845`_](#)
- PR #30358: (*terminalmage*) Add libgit2 version to versions-report
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all ignore_missing SLses are caught
- PR #30356: (*nmadhok*) Adding code author
- PR #30340: (*jtand*) Updated seed_test.py for changes made to seed module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit crypto before calling RSA.generate when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs ([`#24237`_](#))
- PR #30292: (*thegoodduke*) ipset: fix test=true & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in firewallld.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix
- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file_tree ext_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...

- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes
- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line``
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509._dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh_auth.
- PR #30155: (*rallytime*) Update boto_secgroup and boto_iam_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move _option(value) calls to __salt__[config.option] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=`` in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows
- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up _uptodate() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm_special to crontab module
- PR #30106: (*techhat*) Ensure last dir

- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list_nodes_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
- PR #30069: (*techhat*) Ensure that pki_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8
- PR #30048: (*jacobhammons*) Remove internal APIs from rest_cherry.py docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation
- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto_iam: fix deletion of IAM users when using delete_keys=true
- PR #29937: (*multani*) Fix states.boto_iam group users
- PR #29934: (*multani*) Fix state.boto_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in _active_mounts_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes

- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration
- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated 'provider'
- PR #29729: (*rallytime*) Further clarifications on 'unless' and 'onlyif' requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify db_user and db_password kwargs for postgres_user.present state function
- PR #29722: (*rallytime*) Link 'stateful' kwargs to definition of what 'stateful' means for cmd state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix test=True for file.directory with recurse ignore_files/ignore_dirs.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs
- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in git.latest
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of tls module __virtual__ logging
- PR #29606: (*abednarik*) Fixed duplicate mtu entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create io_loop before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking

- PR #29597: (*terminalmage*) dockerng: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old discover_extensions if available
- PR #29545: (*terminalmage*) git.latest: init submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of esxi_hosts
- PR #29563: (*anlutro*) Fix a call to deprecated method in python-influxdb
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released
- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto_rds state docs to include funky yaml syntax for ``tags" option.
- PR #29513: (*bdrung*) Drop obsolete syslog.target from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add ****kwargs** to debconf.set.
- PR #29399: (*jfindlay*) modules.status: add human_readable option to uptime
- PR #29433: (*cro*) Files for building .pkg files for MacOS X
- PR #29455: (*jfindlay*) modules.nova.__init__: do not return None
- PR #29454: (*jfindlay*) rh_service module __virtual__ return error messages
- PR #29476: (*tbaker57*) Doc fix - route_table_present needs subnet_names (not subnets) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with blade_idrac function specs
- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*gallet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names

- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle acl_type [[d]efault:][user|group|mask|other]
- PR #29305: (*lorenegordon*) Add `file` as a source_hash proto
- PR #29272: (*jfindlay*) win_status module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) file.managed: Allow local file sources to use source_hash
- PR #29264: (*anlutro*) Prevent ssh_auth.absent from running when test=True
- PR #29277: (*terminalmage*) Update git_pillar runner to support new git_ext_pillar config schema
- PR #29283: (*cachedout*) Single-quotes and use format
- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to s3 for aws role assumption
- PR #29278: (*techhat*) Add verify_log to SPM
- PR #29067: (*jackson tj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow ret function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if state_output_profile is False
- PR #29221: (*ticosax*) [dockerng] Docu network mode
- PR #29269: (*jfindlay*) win_status module: fix function names in docs
- PR #29213: (*rallytime*) Move _wait_for_task func from vmware cloud to vmware utils
- PR #29271: (*techhat*) Pass full path for digest (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems
- PR #29255: (*garethgreenaway*) fixes to consul module
- PR #29208: (*whyte wolf*) Glance more profile errors
- PR #29200: (*jfindlay*) mount state: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using winrm on EC2
- PR #29170: (*cachedout*) Migrate pydsl tests to integration test suite
- PR #29198: (*jfindlay*) rh_ip module: only set the mtu once
- PR #29135: (*jfindlay*) ssh_known_hosts.present state: catch not found exc
- PR #29196: (*s0undt3ch*) We need novaclient imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream pygit2 bug
- PR #29112: (*eliasp*) Prevent backtrace (KeyError) in *ssh_known_hosts.present* state
- PR #29178: (*whyte wolf*) Profile not being passed to keystone.endpoint_get in _auth. so if a p...

19.2.17 Salt 2015.8.5 Release Notes

About this Release

Salt 2015.8.5 is identical to the 2015.8.4 release with the addition of a fix for [issue 30820](#), fixed by [PR #30833](#). For convenience, the content from the 2015.8.4 release notes is included below.

Known Issue in `boto_*` execution modules

This release contains an issue that causes the `boto_*` execution modules to display a `__salt__ not defined` error ([issue 30300](#)). This issue will be fixed in an upcoming release, but can be manually resolved by completing the following:

1. Download the `boto_*` execution modules that you would like to update from the 2015.8 branch of Salt. A complete list of affected modules with the specific changes is available in [PR #30867](#).

A simple way to get the updated modules is to [download](#) a zip file of the 2015.8 branch from GitHub. The updated modules are in the `salt\modules` directory.

2. Copy the `boto_*` modules to the `\srv\salt_modules` directory on your Salt master.
3. Run the following command to sync these modules to all Salt minions:

```
salt '*' saltutil.sync_modules
```

2015.8.4 Release Notes

Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <kraemer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

Core Changes

- [PR #28994](#): *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` ([issue 30118](#) and [issue 30189](#)).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Changes:

- PR #30613: (*basepi*) Fix minion/syndic clearfuncs
- PR #30609: (*seanjnkns*) Fix documentation for pillar_merge_lists which default is False, not ...
- PR #30584: (*julianbrost*) file.line state: add missing colon in docstring
- PR #30589: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30599: (*multani*) Documentation formatting fixes
- PR #30554: (*rallytime*) Make the salt-cloud actions output more verbose and helpful
- PR #30549: (*techhat*) Salt Virt cleanup
- PR #30553: (*techhat*) AWS: Support 17-character IDs
- PR #30532: (*whiteinge*) Add execution module for working in sls files
- PR #30529: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30526: (*twangboy*) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30485: (*jtand*) Updated pip_state to work with pip 8.0 on 2015.8
- PR #30494: (*isbm*) Zypper: info_installed — `errors` flag change to type `boolean`
- PR #30506: (*jackson tj*) Properly remove newlines after reading the file
- PR #30508: (*rallytime*) Fix Linode driver cloning functionality
- PR #30522: (*terminalmage*) Update git.list_worktree tests to reflect new return data
- PR #30483: (*borgstrom*) Pyobjects recursive import support (for 2015.8)
- PR #30491: (*jackson tj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match_dict format to accept_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list`` subcommand to list git worktrees

- PR #30445: (*jtand*) Boto uses False for `is_default` instead of None
- PR #30406: (*frioux*) Add an example of how to use `file.managed/check_cmd`
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated `glusterfs.py` for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded `val`
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with `six.u()` in `cloud/__init__.py`
- PR #30384: (*isbm*) Bugfix: `info_available` does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix `FLO_DIR` path in 2015.8
- PR #30389: (*jtand*) Older versions of `ipset` don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for `proxymodule` imports, add more fns for `esxi proxy`
- PR #30267: (*isbm*) Fix RPM issues with the `date/time` and add package attributes filtering
- PR #30360: (*jfindlay*) `file.remove`, `file.absent`: mention recursive dir removal
- PR #30221: (*mbarrien*) No `rolcatupdate` for `user_exist` in `Postgres` >= 9.5 ``#26845`_``
- PR #30358: (*terminalmage*) Add `libgit2` version to `versions-report`
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all `ignore_missing` SLses are caught
- PR #30356: (*nmadhok*) Adding code author
- PR #30340: (*jtand*) Updated `seed_test.py` for changes made to `seed` module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit `crypto` before calling `RSA.generate` when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs (``#24237`_``)
- PR #30292: (*thegoodduke*) `ipset`: fix `test=true` & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in `firewalld`.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix

- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file_tree ext_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...
- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes
- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line"
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509._dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh_auth.
- PR #30155: (*rallytime*) Update boto_secgroup and boto_iam_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move _option(value) calls to __salt__[config.option] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=' in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows

- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up _update() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm_special to crontab module
- PR #30106: (*techhat*) Ensure last dir
- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list_nodes_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
- PR #30069: (*techhat*) Ensure that pki_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8
- PR #30048: (*jacobhammons*) Remove internal APIs from rest_cherry.py docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation

- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto_iam: fix deletion of IAM users when using delete_keys=true
- PR #29937: (*multani*) Fix states.boto_iam group users
- PR #29934: (*multani*) Fix state.boto_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in _active_mounts_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes
- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration
- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated 'provider'
- PR #29729: (*rallytime*) Further clarifications on 'unless' and 'onlyif' requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify db_user and db_password kwargs for postgres_user.present state function
- PR #29722: (*rallytime*) Link 'stateful' kwargs to definition of what 'stateful' means for cmd state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix test=True for file.directory with recurse ignore_files/ignore_dirs.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs

- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in git.latest
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of tls module `__virtual__` logging
- PR #29606: (*abednarik*) Fixed duplicate mtu entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create `io_loop` before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking
- PR #29597: (*terminalmage*) dockerng: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old discover_extensions if available
- PR #29545: (*terminalmage*) git.latest: init submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of `esxi_hosts`
- PR #29563: (*anlutro*) Fix a call to deprecated method in python-influxdb
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released
- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto_rds state docs to include funky yaml syntax for ```tags``` option.
- PR #29513: (*bdrung*) Drop obsolete `syslog.target` from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add `**kwargs` to `debconf.set`.
- PR #29399: (*jfindlay*) `modules.status`: add `human_readable` option to uptime
- PR #29433: (*cro*) Files for building `.pkg` files for MacOS X
- PR #29455: (*jfindlay*) `modules.nova.__init__`: do not return `None`
- PR #29454: (*jfindlay*) `rh_service` module `__virtual__` return error messages
- PR #29476: (*tbaker57*) Doc fix - `route_table_present` needs `subnet_names` (not `subnets`) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with `blade_idrac` function specs

- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*gallet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names
- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle acl_type [[d]efault:][user|group|mask|other]
- PR #29305: (*lorenghordon*) Add `file` as a source_hash proto
- PR #29272: (*jfindlay*) win_status module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) file.managed: Allow local file sources to use source_hash
- PR #29264: (*anlutro*) Prevent ssh_auth.absent from running when test=True
- PR #29277: (*terminalmage*) Update git_pillar runner to support new git_ext_pillar config schema
- PR #29283: (*cachedout*) Single-quotes and use format
- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to s3 for aws role assumption
- PR #29278: (*techhat*) Add verify_log to SPM
- PR #29067: (*jacksonjtj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow ret function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if state_output_profile is False
- PR #29221: (*ticosax*) [dokcerng] Docu network mode
- PR #29269: (*jfindlay*) win_status module: fix function names in docs
- PR #29213: (*rallytime*) Move _wait_for_task func from vmware cloud to vmware utils
- PR #29271: (*techhat*) Pass full path for digest (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems

- PR #29255: (*garethgreenaway*) fixes to consul module
- PR #29208: (*whytewolf*) Glance more profile errors
- PR #29200: (*jfindlay*) mount state: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using winrm on EC2
- PR #29170: (*cachedout*) Migrate pydsl tests to integration test suite
- PR #29198: (*jfindlay*) rh_ip module: only set the mtu once
- PR #29135: (*jfindlay*) ssh_known_hosts.present state: catch not found exc
- PR #29196: (*s0undt3ch*) We need novaclient imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream pygit2 bug
- PR #29112: (*eliasp*) Prevent backtrace (KeyError) in *ssh_known_hosts.present* state
- PR #29178: (*whytewolf*) Profile not being passed to *keystone.endpoint_get* in *_auth*. so if a p...

19.2.18 Salt 2015.8.7 Release Notes

Note: Salt 2015.8.4, 2015.8.5, and 2015.8.7 were all released within a short period due to regressions found soon after the releases of 2015.8.4 and 2015.8.5. These release notes contain all of the changes since 2015.8.3 to make it easier to see everything that has changed recently.

Changes for v2015.8.4..v2015.8.7

For *pkg.installed* states, on Linux distributions which use yum/dnf, packages which have a non-zero epoch in the version number now require this epoch to be included when specifying an exact version for a package. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

The *pkg.latest_version* and *pkg.list_repo_pkgs* functions can be used to get the correct version string to use, as they will now contain the epoch when it is non-zero.

- Total PR references: 3

Changes:

- PR #31111: (*jtand*) Fixes failing npm test on arch. @ 2016-02-10T21:51:47Z
 - 8d84c63 Merge pull request #31111 from jtand/8_4_npm_fix
 - b0a48e5 Fixes failing npm test on arch.

- 733c6ab Some 3rd-party modules (e.g. gnupg) define custom log levels that emit at INFO level and above. This patch sets the color data lookups to default to TextFormat('reset') rather than producing a stack trace every time a log message is generated from an affected module.
 - 3f71fd0 Revert #30217
 - * PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
 - PR #31092: (*terminalmage*) Apply PR #31031 to 2015.8.4.follow_up @ 2016-02-10T20:54:37Z
 - 5a6a93e Merge pull request #31092 from terminalmage/issue31014-2015.8.4.follow_up * 2767a4e Don't handle epoch specially for dnf
 - * e5dfcc0 More efficient way to add the epoch before version number
 - * ed74627 include possible epoch in version for rpm
 - 6c6b66a Comment multiprocessing line in minion config
 - 1f7dfef Set multiprocessing to true in config.py
 - 433c645 Fix remove placeholder files
 - 7103756 Remove placeholder files
 - 20b381f Set overwrite to off
 - ca50f56 Fix boto_secgroup
 - fd571d2 Fix boto test failures
 - cfb6588 Fix regression when contents_pillar/contents_grains is a list.
 - 881d866 utils.aws: use time lib to convert to epoch seconds
 - 3141292 The call to cp.get_url needs the saltenv, if you're using environments other than base, it will fail.
 - a869401 Fix regression in git_pillar when multiple remotes are configured
 - 2243f25 Properly set the default value for pillar_merge_lists
 - c7472ff Lint
 - d868711 Fix failing boto_vpc module unit tests
 - ed09516 Fix failing state module tests
 - fd0e940 Pylint fix
 - bc780a7 Don't use pack=pack. Just pass in pack=__salt__ always.
 - 1ae022d Pass in 'pack' variable to utils.boto.assign_funcs function from ALL boto modules.
 - 1efaff1 Remove bad symlinks in osx pkg dirs
 - c7db435 Fix regression in scanning for state with 'name' param
-

Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It

does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <kraemer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

Core Changes

- **PR #28994:** *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` ([issue 30118](#) and [issue 30189](#)).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Total Merges: 320

Changes:

- **PR #30613:** (*basepi*) Fix minion/syndic clearfuncs
- **PR #30609:** (*seanjknks*) Fix documentation for `pillar_merge_lists` which default is `False`, not ...
- **PR #30584:** (*julianbrost*) `file.line state`: add missing colon in docstring
- **PR #30589:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30599:** (*multani*) Documentation formatting fixes
- **PR #30554:** (*rallytime*) Make the salt-cloud actions output more verbose and helpful
- **PR #30549:** (*techhat*) Salt Virt cleanup
- **PR #30553:** (*techhat*) AWS: Support 17-character IDs
- **PR #30532:** (*whiteinge*) Add execution module for working in sls files
- **PR #30529:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30526:** (*twangboy*) Added `FlushKey` to make sure it's changes are saved to disk
- **PR #30521:** (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- **PR #30485:** (*jtand*) Updated `pip_state` to work with pip 8.0 on 2015.8
- **PR #30494:** (*isbm*) Zypper: `info_installed` — ``errors'` flag change to type ``boolean'`
- **PR #30506:** (*jacksonjtj*) Properly remove newlines after reading the file
- **PR #30508:** (*rallytime*) Fix Linode driver cloning functionality
- **PR #30522:** (*terminalmage*) Update `git.list_worktree` tests to reflect new return data
- **PR #30483:** (*borgstrom*) Pyobjects recursive import support (for 2015.8)

- PR #30491: (*jacksonj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match_dict format to accept_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list'' subcommand to list git worktrees
- PR #30445: (*jtand*) Boto uses False for is_default instead of None
- PR #30406: (*frioux*) Add an example of how to use file.managed/check_cmd
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated glusterfs.py for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded val
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with six.u() in cloud/__init__.py
- PR #30384: (*isbm*) Bugfix: info_available does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix FLO_DIR path in 2015.8
- PR #30389: (*jtand*) Older versions of ipset don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
- PR #30267: (*isbm*) Fix RPM issues with the date/time and add package attributes filtering
- PR #30360: (*jfindlay*) file.remove, file.absent: mention recursive dir removal
- PR #30221: (*mbarrien*) No rolcatupdate for user_exist in Postgres>=9.5 [`#26845`_](#)
- PR #30358: (*terminalmage*) Add libgit2 version to versions-report
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all ignore_missing SLses are caught
- PR #30356: (*nmadhok*) Adding code author

- PR #30340: (*jtand*) Updated seed_test.py for changes made to seed module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit crypto before calling RSA.generate when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs ([`#24237`](#))
- PR #30292: (*thegoodduke*) ipset: fix test=true & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in firewall.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix
- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file_tree ext_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...
- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes

- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line``
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509._dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh_auth.
- PR #30155: (*rallytime*) Update boto_secgroup and boto_iam_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move _option(value) calls to __salt__[config.option] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=`` in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows
- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up _uptodate() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm_special to crontab module
- PR #30106: (*techhat*) Ensure last dir
- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list_nodes_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
- PR #30069: (*techhat*) Ensure that pki_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8

- PR #30048: (*jacobhammons*) Remove internal APIs from rest_cherry.py docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation
- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto_iam: fix deletion of IAM users when using delete_keys=true
- PR #29937: (*multani*) Fix states.boto_iam group users
- PR #29934: (*multani*) Fix state.boto_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in _active_mounts_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes
- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration

- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated `'provider'`
- PR #29729: (*rallytime*) Further clarifications on `'unless'` and `'onlyif'` requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify `db_user` and `db_password` kwargs for `postgres_user.present` state function
- PR #29722: (*rallytime*) Link `'stateful'` kwargs to definition of what `'stateful'` means for `cmd` state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix `test=True` for `file.directory` with `recurse ignore_files/ignore_dirs`.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs
- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in `git.latest`
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of `tls` module `__virtual__` logging
- PR #29606: (*abednarik*) Fixed duplicate `mtu` entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create `io_loop` before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command `umask` in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking
- PR #29597: (*terminalmage*) `dockerng`: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old `discover_extensions` if available
- PR #29545: (*terminalmage*) `git.latest`: init submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of `esxi_hosts`
- PR #29563: (*anlutro*) Fix a call to deprecated method in `python-influxdb`
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released

- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto_rds state docs to include funky yaml syntax for ``tags" option.
- PR #29513: (*bdrung*) Drop obsolete syslog.target from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add ****kwargs** to debconf.set.
- PR #29399: (*jfindlay*) modules.status: add human_readable option to uptime
- PR #29433: (*cro*) Files for building .pkg files for MacOS X
- PR #29455: (*jfindlay*) modules.nova.__init__: do not return None
- PR #29454: (*jfindlay*) rh_service module __virtual__ return error messages
- PR #29476: (*tbaker57*) Doc fix - route_table_present needs subnet_names (not subnets) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with blade_idrac function specs
- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*galet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names
- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle acl_type [[d]efault:][user|group|mask|other]
- PR #29305: (*lorenegordon*) Add `file' as a source_hash proto
- PR #29272: (*jfindlay*) win_status module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) file.managed: Allow local file sources to use source_hash
- PR #29264: (*anlutro*) Prevent ssh_auth.absent from running when test=True
- PR #29277: (*terminalmage*) Update git_pillar runner to support new git_ext_pillar config schema
- PR #29283: (*cachedout*) Single-quotes and use format

- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to s3 for aws role assumption
- PR #29278: (*techhat*) Add verify_log to SPM
- PR #29067: (*jacksonjtj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow ret function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if state_output_profile is False
- PR #29221: (*ticosax*) [dokcerng] Docu network mode
- PR #29269: (*jfindlay*) win_status module: fix function names in docs
- PR #29213: (*rallytime*) Move _wait_for_task func from vmware cloud to vmware utils
- PR #29271: (*techhat*) Pass full path for digest (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems
- PR #29255: (*garethgreenaway*) fixes to consul module
- PR #29208: (*whyte wolf*) Glance more profile errors
- PR #29200: (*jfindlay*) mount state: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using winrm on EC2
- PR #29170: (*cachedout*) Migrate pydsl tests to integration test suite
- PR #29198: (*jfindlay*) rh_ip module: only set the mtu once
- PR #29135: (*jfindlay*) ssh_known_hosts.present state: catch not found exc
- PR #29196: (*s0undt3ch*) We need novaclient imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream pygit2 bug
- PR #29112: (*eliasp*) Prevent backtrace (KeyError) in *ssh_known_hosts.present* state
- PR #29178: (*whyte wolf*) Profile not being passed to keystone.endpoint_get in _auth. so if a p...

19.2.19 Salt 2015.8.8 Release Notes

Important: 2015.8.8.2 was released shortly after 2015.8.8 to fix several known issues. If you installed 2015.8.8 before 03/30/2016, you likely have installed 2015.8.8 and can optionally upgrade (find out which version you have installed using `salt --version`. The latest version is 2015.8.8.2).

Salt 2015.8.8.2

Salt 2015.8.8.2 includes fixes for the following known issues in 2015.8.8:

- [issue 32044](#): Key master with value [...] has an invalid type of list Error
- [issue 32004](#): Failed to import module win_dacl Error
- [issue 32114](#): Wrong validation type for file_ignore_glob key

- [issue 31969](#): Fix file.managed for windows

Important: [issue 32183](#) prevents Salt Cloud from installing the Salt minion on new systems. To workaround this issue, call `salt-cloud -u` to update the bootstrap script to the latest version.

Salt 2015.8.8

Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM `eAuth service` that users authenticate against in the Salt Master configuration.

Read Before Upgrading Debian 7 (Wheezy) from 2015.8.7 to 2015.8.8

Before you upgrade from 2015.8.7 on Debian 7, you must run the following commands to remove previous packages:

```
sudo apt-get remove python-pycrypto
sudo apt-get remove python-apache-libcloud
```

Note that `python-pycrypto` will likely remove `python-apache-libcloud`, so the second command might not be necessary. These have been replaced by `python-crypto` and `python-libcloud` with `~bpo70+1` moniker.

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.8.4

Salt `systemd` service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

Changes for v2015.8.7..v2015.8.8

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-03-17T21:03:44Z

Total Merges: 312

Changes:

- [PR #31947](#): (*cro*) Move proxymodule assignment earlier in proxy minion init
- [PR #31948](#): (*rallytime*) Revert ``not not" deletion and add comment as to why that is there
- [PR #31952](#): (*rallytime*) Fix lint for 2015.8 branch

- PR #31933: (*rallytime*) Fix linking syntax in testing docs
- PR #31930: (*cro*) Backport changes from 2016.3
- PR #31924: (*jfindlay*) update 2015.8.8 release notes
- PR #31922: (*cachedout*) For 2015.8 head
- PR #31904: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31906: (*sbreidba*) Win_dacl module: fix FULLCONTROL / FILE_ALL_ACCESS definition
- PR #31745: (*isbm*) Fix the always-false behavior on checking state
- PR #31911: (*rallytime*) Merge #31903 with pylint fix
- PR #31883: (*paiou*) Fix scaleway cloud provider and manage x86 servers
- PR #31903: (*terminalmage*) Use remote_ref instead of local_ref to see if checkout is necessary
- PR #31845: (*sakateka*) Now a check_file_meta deletes temporary files when test=True
- PR #31901: (*rallytime*) Back-port #31846 to 2015.8
- PR #31905: (*terminalmage*) Update versionadded directive
- PR #31902: (*rallytime*) Update versionadded tag for new funcs
- PR #31888: (*terminalmage*) Fix salt.utils.decorators.Depends
- PR #31857: (*sjorge*) gen_password and del_password missing from solaris_shadow
- PR #31879: (*cro*) Clarify some comments
- PR #31815: (*dr4Ke*) Fix template on contents 2015.8
- PR #31818: (*anlutro*) Prevent event logs from writing huge amounts of data
- PR #31836: (*terminalmage*) Fix git_pillar race condition
- PR #31824: (*rallytime*) Back-port #31819 to 2015.8
- PR #31856: (*szeestraten*) Adds missing docs for Virtual Network and Subnet options in salt-cloud Azure cloud profile
- PR #31839: (*jfindlay*) add 2015.8.8 release notes
- PR #31828: (*gtmanfred*) Remove ability of authenticating user to specify pam service
- PR #31787: (*anlutro*) Fix user_create and db_create for new versions of influxdb
- PR #31800: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31797: (*Ch3LL*) Change pkg name to less for suse pkg.info_installed test
- PR #31793: (*xopher-mc*) fixing init system detection on sles 11, refs [`#31617`](#)
- PR #31786: (*isbm*) Bugfix: zypper doesn't detect base product on SLE11 series
- PR #31780: (*gtmanfred*) use already created vsphere connection
- PR #31779: (*sbreidba*) win_dacl state & module: return comment field as strings, not lists.
- PR #31723: (*sjorge*) file_ignore_regex is a list, not bool
- PR #31747: (*techhat*) Use get_local_client with MASTER opts, not MINION
- PR #31688: (*whiteinge*) Various SMTP returner fixes
- PR #31752: (*rallytime*) Back-port #31686 to 2015.8

- PR #31733: (*jacobhammons*) docs to clarify cloud configuration
- PR #31775: (*techhat*) Show correct provider/driver name
- PR #31754: (*techhat*) Check all providers, not just the current one
- PR #31735: (*rallytime*) Add reboot, start, and stop actions to digital ocean driver
- PR #31770: (*anlutro*) Fix influxdb user functionality for version 0.9+
- PR #31743: (*Talkless*) Fix parentheses mismatch in documentation
- PR #31162: (*isbm*) Remove MD5 digest from everywhere and default to SHA256
- PR #31670: (*terminalmage*) Write lists of minions targeted by syndic masters to job cache
- PR #31711: (*ticosax*) [dockerng] Port and Volume comparison should consider Dockerfile
- PR #31719: (*techhat*) Don't worry about KeyErrors if the node is already removed
- PR #31713: (*ticosax*) [dockerng] Fix dockerng.network_present when container is given by name
- PR #31705: (*peripatetic-sojourner*) Foreman pillar
- PR #31702: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31700: (*s0undt3ch*) It's a function!
- PR #31679: (*cro*) Fix bad link to the sample REST endpoint in salt-contrib.
- PR #31668: (*rallytime*) Some more testing documentation improvements
- PR #31653: (*DmitryKuzmenko*) Don't attempt to verify token if it wasn't sent to master.
- PR #31629: (*darix*) Fix services on sles
- PR #31641: (*rallytime*) Improve Salt Testing tutorial to be a more comprehensive intro
- PR #31651: (*dr4Ke*) test case: test_list_present_nested_already
- PR #31643: (*opdude*) Make sure we are really updating the mercurial repository
- PR #31598: (*terminalmage*) Remove limitations on validation types for eauth targets
- PR #31627: (*jakehilton*) Handling error from using gevent 1.1.
- PR #31630: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31594: (*rallytime*) Back-port #31589 to 2015.8
- PR #31604: (*joejulian*) Workaround for non-xml output from gluster cli when not tty
- PR #31583: (*vutny*) Remove trailing white spaces
- PR #31592: (*rallytime*) Back-port #31546 to 2015.8
- PR #31593: (*rallytime*) Back-port #31570 to 2015.8
- PR #31567: (*cachedout*) Restore FIPS compliance when using master_finger
- PR #31568: (*twangboy*) Grant permissions using SID instead of name
- PR #31561: (*jtand*) Skipped test
- PR #31550: (*rallytime*) Correct versionadded tag for win_service.config
- PR #31549: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31544: (*DmitryKuzmenko*) Protect getattr from recursion
- PR #31525: (*DmitryKuzmenko*) Issues/30643 merge forward fixes

- PR #31536: (*virtualguy*) Remove debian repo from raspbian installation
- PR #31528: (*vutny*) Correct Salt Cloud documentation about updating Salt Bootstrap script
- PR #31539: (*DmitryKuzmenko*) Added temporary workaround for CentOS 7 os-release id bug.
- PR #31508: (*mcalmer*) Zypper correct exit code checking
- PR #31510: (*vutny*) Add installation guide for Raspbian (Debian on Raspberry Pi)
- PR #31498: (*Ch3LL*) rename methods in pkg states test
- PR #31471: (*cachedout*) Correct issue where duplicate items in grains list during state run will result in duplicate grains
- PR #31455: (*ticosax*) [dockerng] Disable notset check
- PR #31488: (*isbm*) Unit Test for Zypper's ``remove" and ``purge"
- PR #31485: (*jacobhammons*) Fixed transport description in minion / master config
- PR #31411: (*jtand*) Added some beacons execution module integration tests
- PR #31475: (*jacobhammons*) Assorted doc issues
- PR #31477: (*vutny*) Correct installation documentation for Ubuntu
- PR #31479: (*isbm*) Zypper unit tests & fixes
- PR #31445: (*rallytime*) Only use LONGSIZE in rpm.info if available. Otherwise, use SIZE.
- PR #31464: (*Ch3LL*) integartion test: ensure decorator only runs on one method and not class
- PR #31458: (*vutny*) Correct installation documentation for Debian
- PR #31457: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31439: (*rallytime*) Fix lowpkg.info function for Ubuntu 12 - make sure we have a pkg name
- PR #31456: (*RabidCicada*) Clarified the form of requisite targets/requisite-references
- PR #31453: (*DmitryKuzmenko*) Backport cp_geturl fix for large files into 2015.8
- PR #31444: (*jacobhammons*) Documentation updates - ddns state, file.line state/exe function, installation dependencies
- PR #31341: (*twangboy*) Clarification on Windows Package Manager docs
- PR #31380: (*kiorky*) Bring up ext_pillar rendering errors as well
- PR #31418: (*terminalmage*) Fix core grains when Debian OS detected as `Debian GNU/Linux`
- PR #31429: (*mcalmer*) fix argument handling for pkg.download
- PR #31432: (*ticosax*) [dockerng] Hotfix docker 1.10.2
- PR #31420: (*twangboy*) Handle Unversioned Packages
- PR #31417: (*jacobhammons*) ddns state docs updated with notes regarding the name, zone, and keyfile.
- PR #31391: (*redmcg*) Added sanity check: is `pillar` in self.opts
- PR #31376: (*cro*) Some distros don't have a /lib/systemd
- PR #31352: (*ticosax*) [dockerng] Pull missing images when calling dockerng.running
- PR #31378: (*mcalmer*) Zypper refresh handling
- PR #31373: (*terminalmage*) Use --set-upstream instead of --track to set upstream on older git
- PR #31390: (*abednarik*) Fix Logrotate module.

- PR #31354: (*ticosax*) [dockerng] Don't require auth for all registries
- PR #31368: (*whiteinge*) Update list of netapi clients for autotest
- PR #31367: (*techhat*) Add docs on how to actually use SDB
- PR #31357: (*ticosax*) [dockerng] Support docker inconsistencies
- PR #31353: (*ticosax*) [dockerng] Fix when ports are integers
- PR #31346: (*ticosax*) Backport #31130 to 2015.8
- PR #31332: (*terminalmage*) Clarify documentation for gitfs/hgfs/svnfs mountpoint and root options
- PR #31305: (*mcalmer*) call zypper with option --non-interactive everywhere
- PR #31337: (*jacobhammons*) Release notes and versioning for 2015.8.7
- PR #31326: (*ticosax*) [dockerng] Detect settings removal
- PR #31292: (*twangboy*) Fix dunder virtual to check for Remote Administration Tools
- PR #31287: (*joejulian*) Rework tests and fix reverse peering with gluster 3.7
- PR #31196: (*sakateka*) Here are a few fixes utils.network
- PR #31299: (*rallytime*) Allow state-output and state-verbose default settings to be set from CLI
- PR #31317: (*terminalmage*) Fix versionadded directive
- PR #31301: (*terminalmage*) Corrected fix for ``#30999`_`
- PR #31302: (*terminalmage*) Audit CLI opts used in git states
- PR #31312: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #31225: (*pprince*) Fix in file_tree pillar (Fixes ``#31223`_`)
- PR #31233: (*mcalmer*) implement version_cmp for zypper
- PR #31273: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31253: (*gtmanfred*) allow for nova servers to be built with premade volumes
- PR #31271: (*rallytime*) Back-port #30689 to 2015.8
- PR #31255: (*jacobhammons*) Fixes ``#30461`_`
- PR #31189: (*dmacvicar*) Fix crash with scheduler and runners (``#31106`_`)
- PR #31201: (*The-Loeki*) Utilize prepared grains var in master-side ipcidr matching
- PR #31239: (*terminalmage*) Improve logging when master cannot decode a payload
- PR #31190: (*twangboy*) Clear minion cache before caching from master
- PR #31226: (*pprince*) Minor docs fix: file_tree pillar (Fixes #31124)
- PR #31234: (*mcalmer*) improve doc for list_pkgs
- PR #31237: (*mcalmer*) add handling for OEM products
- PR #31182: (*rallytime*) Back-port #31172 to 2015.8
- PR #31191: (*rallytime*) Make sure doc example matches kwarg
- PR #31171: (*Ch3LL*) added logic to check for installed package
- PR #31177: (*Ch3LL*) add integration test for issue ``#30934`_`
- PR #31181: (*cachedout*) Lint 2015.8 branch

- PR #31169: (*rallytime*) Back-port #29718 to 2015.8
- PR #31170: (*rallytime*) Back-port #31157 to 2015.8
- PR #31147: (*cro*) Documentation clarifications.
- PR #31153: (*edencrane*) Fixed invalid host causing `reference to variable before assignment`
- PR #31152: (*garethgreenaway*) fixes to beacon module, state module and friends
- PR #31149: (*jfindlay*) add 2015.8.7 release notes
- PR #31134: (*isbm*) Fix types in the output data and return just a list of products
- PR #31120: (*gtmanfred*) Clean up some bugs in the nova driver
- PR #31132: (*rallytime*) Make sure required profile configurations passed in a map file work
- PR #31131: (*Ch3LL*) integration test for issue [`#31014`_](#)
- PR #31133: (*cachedout*) Fixup 31121
- PR #31125: (*isbm*) Force-kill websocket's child processes faster than default two minutes.
- PR #31119: (*sakateka*) fixes for ipv6-only multi-master failover
- PR #31107: (*techhat*) Don't try to add a non-existent IP address
- PR #31108: (*jtand*) Changed npm integration test to install request.
- PR #31105: (*cachedout*) Lint 30975
- PR #31100: (*jfindlay*) states.x509: docs: peer.sls -> peer.conf
- PR #31103: (*twangboy*) Point to reg.delete_key_recursive
- PR #31093: (*techhat*) Ensure double directories don't get created
- PR #31095: (*jfindlay*) modules.file, states.file: explain symbolic links
- PR #31061: (*rallytime*) Revert #30217 - was causing salt-cloud -a breakage
- PR #31090: (*rallytime*) Back-port #30542 to 2015.8
- PR #31085: (*jackson tj*) Correctly remove path we added after loader is completed
- PR #31037: (*vutny*) Update RHEL installation guide to reflect latest repo changes
- PR #31050: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31053: (*cachedout*) Fix boto test failures
- PR #31029: (*twangboy*) Windows defaults to multiprocessing true
- PR #30998: (*dmacvicar*) add_key/reject_key: do not crash w/Permission denied: `/var/cache/salt/master/.dfn' ([`#27796`_](#))
- PR #31049: (*twangboy*) Fix versionadded in win_service.config
- PR #30987: (*youngnick*) Changed glusterfs.peer() module so state can handle localhost peering attempts.
- PR #31042: (*moltob*) Allow using Windows path in archive.extracted name attribute
- PR #31012: (*terminalmage*) Fix gitfs/git_pillar/winrepo provider to allow lowercase values
- PR #31024: (*jfindlay*) modules.aptpkg.upgrade: clarify dist-upgrade usage
- PR #31028: (*twangboy*) Fix config overwrite by windows installer
- PR #31031: (*terminalmage*) More complete fix for [`#31014`_](#)

- PR #31026: (*terminalmage*) Fix regression when contents_pillar/contents_grains is a list.
- PR #30978: (*garethgreenaway*) fixes to state.py in 2015.8
- PR #30893: (*bdrung*) Make build reproducible
- PR #30945: (*cachedout*) Note that pillar cli args are sent via pub
- PR #31002: (*rmtmckenzie*) Fix lxc cloud provided minion reporting present
- PR #31007: (*jtand*) Fixed rabbitmq_vhost test failure.
- PR #31004: (*rallytime*) Remove overstate docs and a few references.
- PR #30965: (*anlutro*) Fix rabbitmq_vhost.present result when test=True
- PR #30955: (*Ch3LL*) docs: add clarification when source is not defined
- PR #30941: (*rallytime*) Back-port #30879 to 2015.8
- PR #30940: (*twangboy*) Fix Build Process for OSX
- PR #30944: (*jacobhammons*) 2015.8.5 release notes linking and clean up
- PR #30905: (*joejulian*) Add realpath to lvm.pvdisplay and use it in vg_present
- PR #30924: (*youngnick*) Fix small bug with starting volumes after creation.
- PR #30910: (*cro*) fix iDRAC state
- PR #30919: (*garethgreenaway*) Fixes to ssh_auth state module
- PR #30920: (*jacobhammons*) Versioned to 2015.8.5, added known issue ``#30300`_` to release notes
- PR #30894: (*terminalmage*) git module/state: Handle identity files more gracefully
- PR #30750: (*jfindlay*) extract whole war version
- PR #30884: (*rallytime*) Move checks for private_key file existence and permissions to create function
- PR #30888: (*ticosax*) Backport #30797 to 2015.8
- PR #30895: (*bdrung*) Fix various typos
- PR #30889: (*anlutro*) Make msgpack an optional dependency in salt.utils.cache
- PR #30896: (*vutny*) Update nodegroups parameter examples in master config example and docs
- PR #30898: (*abednarik*) Fix pkg install with version.
- PR #30867: (*rallytime*) Pass in ``pack`` variable to `utils.boto.assign_funcs` function from ALL boto modules
- PR #30849: (*jfindlay*) `utils.aws`: use time lib to convert to epoch seconds
- PR #30874: (*terminalmage*) Fix regression in `git_pillar` when multiple remotes are configured
- PR #30850: (*jfindlay*) `modules.dpkg._get_pkg_info`: allow for ubuntu 12.04
- PR #30852: (*replicant0wnz*) Added more descriptive error message
- PR #30847: (*terminalmage*) Backport #30844 to 2015.8 branch
- PR #30860: (*vutny*) Correct installation documentation for RHEL-based distributions
- PR #30841: (*jacobhammons*) Release notes for 2015.8.5
- PR #30835: (*terminalmage*) Integration test for ``#30820`_`
- PR #30837: (*jacobhammons*) Added known issue ``#30820`_` to release notes
- PR #30832: (*rallytime*) Add grains modules to salt modindex

- PR #30822: (*rallytime*) Make sure setting `list_user_permissions` to `['', '', '']` doesn't stacktrace
- PR #30833: (*terminalmage*) Fix regression in scanning for state with `'name'` param
- PR #30823: (*yannis666*) Fix for mine to merge configuration on update.
- PR #30827: (*jacobhammons*) Version to 2015.8.4, added CVE 2016-1866 to release notes
- PR #30813: (*anlutro*) Properly set the default value for `pillar_merge_lists`
- PR #30826: (*cachedout*) Fix 30682
- PR #30818: (*rallytime*) Back-port #30790 to 2015.8
- PR #30815: (*vutny*) Pick right user argument for updating reactor function's low data
- PR #30747: (*jfindlay*) `modules.lxc.running_systemd`: use `command -v` not `which`
- PR #30800: (*twangboy*) Ability to handle special case installations
- PR #30794: (*rallytime*) A spelling fix and some spacing fixes for the `boto_ec2` module docs
- PR #30756: (*basepi*) [2015.8] Fix two error conditions in the highstate outputter
- PR #30788: (*rallytime*) Fix incorrect doc example for `dellchassis blade_idrac` state
- PR #30791: (*Ch3LL*) do not shadow `ret` function argument for `salt.function`
- PR #30726: (*sjmh*) Fix improper use of `yield` in generator
- PR #30752: (*terminalmage*) Backport `systemd` and `yum/dnf` optimizations from `develop` into 2015.8
- PR #30759: (*thusoy*) Allow managing empty files
- PR #30758: (*thusoy*) Support mounting labelled volumes with multiple drives
- PR #30686: (*cachedout*) Master-side pillar caching
- PR #30675: (*jfindlay*) handle non-ascii minion IDs
- PR #30691: (*rallytime*) Make sure we use the `''instance''` kwarg in `cloud.action`.
- PR #30713: (*rallytime*) Fix-up autodoc proxy modules for consistency
- PR #30741: (*jfindlay*) `states.locale.__virtual__`: return `exec mod load err`
- PR #30751: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30720: (*clinta*) `x509.pem_managed` does not return changes dict
- PR #30687: (*clarkperkins*) Setting `'del_root_vol_on_destroy'` changes the root volume type to `'standard'`
- PR #30673: (*terminalmage*) Properly derive the `git_pillar cachedir` from the `id` instead of the URL
- PR #30666: (*cachedout*) Fix grains cache
- PR #30623: (*twangboy*) Added `service.config` function
- PR #30678: (*rallytime*) Back-port #30668 to 2015.8
- PR #30677: (*clarkperkins*) Fix EC2 volume creation logic
- PR #30680: (*cro*) Merge forward from 2015.5, primarily for #30671
- PR #30663: (*isbm*) Zypper: latest version bugfix and epoch support feature
- PR #30652: (*mew1033*) Fix sh beacon
- PR #30657: (*jfindlay*) [2015.8] Backport #30378 and #29650
- PR #30656: (*rallytime*) [2015.8] Merge 2015.5 into 2015.8

- PR #30644: (*tbaker57*) Another go at fixing 30573
- PR #30611: (*isbm*) Bugfix: Zypper *pkg.latest* crash fix
- PR #30631: (*rallytime*) Refactor rabbitmq_cluster states to use test=true functionality correctly
- PR #30628: (*rallytime*) Refactor rabbitmq_policy states to use test=true functionality correctly
- PR #30624: (*cro*) Remove bad symlinks from osx pkg dir
- PR #30622: (*rallytime*) Add glance state to list of state modules
- PR #30618: (*rallytime*) Back-port #30591 to 2015.8
- PR #30625: (*jfindlay*) doc.topics.eauth: clarify client_acl vs eauth

19.2.20 Salt 2015.8.9 Release Notes

Version 2015.8.9 is a bugfix release for *2015.8.0*.

Mint Linux: Important Post-Upgrade Instructions

As a result of some upstream changes, the `os` grain on Mint Linux is now being detected as `LinuxMint` (issue 33295). Run the following command **after you upgrade to 2015.8.9** to reset the `os` grain to `Mint` and the `os_family` grain to `Debian`:

```
salt -G 'os:LinuxMint' grains.setvals '{"os': 'Mint', 'os_family': 'Debian'}"
```

Changes for v2015.8.8..v2015.8.9

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-05-17T17:09:39Z

Total Merges: 145

Changes:

- PR #33293: (*twangboy*) Fix minion start retry on Windows (2015.8)
- 22c4331 linux_acl: Allow '-' as a separation character in ACL permissions. Fixes '#31270' (#33172) (#33305)
- 7a181f2 Handle more ipv6 error as an exception '#33299' (#33300)
- eb47a15 Ignore retcode when checking service's status (#33294)
- PR #33274: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 4f3596a Add comment for test=true w/o changes ret and add changes dict example (#33254)
- 2a30c48 Update Git Policy docs to match Contribution guide (#33252)
- 056c273 Fix '#33238' (#33239)
- 1cd34ab Properly report on invalid gitfs/git_pillar/winrepo repos (#33245)
- PR #33253: (*rallytime*) Update the release process docs
- 8c2c5b1 update 2015.8.9 release notes (#33251)
- 8ee8ee3 Handle ipv6 error as an exception (#33246)
- 855bed3 Check rendered YAML for invalid keys (#33213)

- 6fb25a8 Make note of files that begin with `_' in master.d or minion.d dirs (#33224)
- a6dc0d2 Gate jnpr imports in salt.proxy.junos.py (#33150)
- 64a89c4 Add docs for the http state (#33222)
- 0a32163 Don't stacktrace when using --out=highstate at CLI during staterun. (#33215)
- 04d714d propagate opts to salt.util.http call (#33219)
- c8236c0 update 2015.8.9 release notes (#33237)
- PR #33217: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 730bec1 [2015.8] Merge forward from 2015.5 to 2015.8 (#33207)
- 379b151 Add a fetch when compiling git_pillar for masterless minions (#33204)
- b3805d8 cloud.clouds.ec2: cache each named node (#33164)
- 86db5df Properly handle failed git commands when redirect_stderr=True (#33203)
- 8a0950d Don't force use of global ssh_config when git identity file is specified (#33152)
- ce07133 update 2015.8.9 release notes (#33198)
- PR #33188: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- e9108e0 add 2015.8.9 release notes (#33161)
- 2d9919e [2015.8] Update to latest bootstrap script v2016.05.10 (#33156)
- 033bef2 Hash fileclients by opts (#33142)
- f520fa3 Back-port #31769 to 2015.8 (#33139)
- PR #33144: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33140: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- ad607ef If cache_jobs: True is set, populate the local job cache when running salt-call (#33100)
- 64689a6 Fix broken parsing of usermgmt.conf on OpenBSD (#33135)
- 06a382e Add a check that the cmdline of the found proc matches (#33129)
- 10018e9 salt.utils.gitfs: fix formatting for warning messages (#33064)
- d45b599 Fix 33058 (#33099)
- PR #33106: (*abednarik*) Moved _finger_fail method to parent class.
- 20c7e10 clarify docs that map is designed to be run once. is not stateful (#33102)
- 558561d cloud.query needs to define mapper.opts (#33098)
- PR #33096: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 22a327b salt-cloud: fix ipv6-only virtual machines (#32865)
- e788f7e modules.npm: do not log npm --version at info level (#33084)
- PR #33081: (*jfindlay*) ssh docs: install py-2.6 for RHEL 5
- PR #33088: (*isbm*) Bugfix: Restore boolean values from the repo configuration
- 2c6326f fix tests for file.blockplace to remove newline (#33082)
- PR #32892: (*isbm*) Resolve Zypper locks on asynchronous calls
- 3e0bf23 Add fun_args to scheduled return data (part of `#24237`_) (#33039)

- 264c0d4 Don't append a newline when creating new content with blockreplace (#33049)
- 54b783a Pass all data to batch.run() call when using --failhard (#33048)
- 2dbfa55 Display command output when command fails with batch + failhard options (#33050)
- add9199 Allow security_groups kwarg for boto_elb.present to be string or list (#33053)
- 111701c [2015.8] Merge forward from 2015.5 to 2015.8 (#33054)
- 1066063 File and User test fixes for 2015.8 on Fedora23 (#33056)
- f97b5d5 Back-port #33030 to 2015.8 (#33040)
- e90a501 Update the docs for saltutil.find_job to be more clear/accurate (#33017)
- d3d77ce Add saltenv to the cmd.script state function (#33031)
- 3434f44 Fix syndic regression (#33021)
- 4bb3ca5 Compare uid and gid instead of name and group (#32674)
- 9ca5b02 Allow batch mode to use verbose option, as well as show_jid. (#32996)
- 81c0fa4 Fixed glusterfs.peered output (#32955)
- 8c70d7a Clarify some arg docs (#32994)
- 00fbeb Fix boto_secgroup_test (#32986)
- 3362367 fix user cron on solarish operating systems (#32970)
- 07e38bc salt.log.setup: process user args before format (#32796)
- b2d7c81 doc.ref.states.ordering: clarify requisite change (#32934)
- df41d5d mode should default to `text` (#32928)
- f581a82 Remove FileClient class references from docs - it doesn't exist. (#32925)
- 31b96de Update contents_grains option with relevant docs (#32922)
- PR #32926: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 1cd6a45 specify volume tags in profile configuration (#32908)
- 85ca86d Update docs to warn users that -1 isn't valid for iptables insert state (#32906)
- cb68706 Allow profile options to be specified in provider file when using maps (#32900)
- 1a55fcb Clarify service state opening docs - uses `service` virtualname (#32880)
- PR #32884: (*terminalmage*) Fix incorrect deprecation notice
- PR #32878: (*jacobhammons*) added note about updating the bootstrap script in salt-cloud using th...
- PR #32869: (*rallytime*) Use correct config setting in cloud syndic docs
- PR #32844: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- eb8fb6b Back-port #31139 to 2015.8 (#32868)
- 4bb5545 backport PR #32732 for issue `#23714`_ (#32847)
- 5ea003b Add pyvmomi version warning to Getting Started with VMware docs (#32845)
- 44f08d0 Pass None as memory limit. (#32841)
- feebe69 Back-port #32813 to 2015.8 (#32839)
- 3b81031 various improvements on cloud deploy script docs (#32659)

- bf85987 update bootstrap to 2016.04.18 release (#32668)
- 83dee63 Back-port #29322 to 2015.8 (#32785)
- PR #32787: (*rallytime*) Back-port #32722 to 2015.8
- PR #32786: (*rallytime*) Back-port #32703 to 2015.8
- a6a42740 Merge branch `pr-32775' into 2015.8
- cda00f4 Improve documentation on pygit2 versions (#32779)
- 1d6d234 Properly handle minion failback failure. (#32749)
- 3751a27 Document pillar cache options (#32643)
- 35c8af3 modules.win_dacl: consistent case of dacl constants (#32720)
- 2cd0817 Update external auth documentation to list supported matcher. (#32733)
- bba089d Check dependencies type before applying str operations (#32693)
- 3aa0605 Handle when beacon not configured and we try to enable/disable them (#32692)
- PR #32718: (*garethgreenaway*) Fixes to schedule.list in 2015.8
- PR #32684: (*captaininspiration*) Fix routes for redhat < 6
- 7cdd512 Handle a couple of arguments better (Azure) (#32683)
- aaa03bc Fix for issue 32523 (#32672)
- 21081b1 Don't access deprecated Exception.message attribute. (#32556)
- 5d1e9a4 Lower log level for pillar cache (#32655)
- PR #32588: (*anlutro*) Fix salt-ssh module function call argument type juggling by JSON encoding them
- 5e7edfc yumpkg: Ignore epoch in version comparison for explicit versions without an epoch (#32563)
- fea6056 Fixing critical bug to remove only the specified Host instead of the entire Host cluster (#32640)
- 0477f66 align OS grains from older SLES with current one (#32649)
- 8d46244 Prevent crash if pygit2 package is requesting re-compilation of the eâ (#32652)
- PR #32614: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32616: (*rallytime*) Back-port #32547 to 2015.8
- 3047471 Fix comments value in salt.states.pkgrepo example (#32604)
- ab9da90 Revert PR #32480 and apply #32314 with fixes / documentation (#32558)
- c84c921 Better log message on minion restart if master couldn't be reached. (#32576)
- 3c81798 Don't return None from eval_master (#32555)
- PR #32536: (*rallytime*) Back-port #31898 to 2015.8
- d12a1c2 Fix binary search and replace (#32542)
- PR #32539: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32531: (*ticosax*) [dockerng] Fix support of dockerng.volume_present when no volume is on present.
- 5d73d54 Enhance dockerng.wait() to control success on exit_code and on already stopped containers (#32475)
- 214f01e Bugfix: salt-key crashes if tries to generate keys to the directory w/o write access (#32436)
- 288839f Turn on exc_info when logging failed minion startup (#32515)

- 08a8020 Add ignore_epoch option to pkg.installed/removed/purged states (#32520)
- 492ebfc Isbm zypper list products sles11 crash (#32505)
- ae89882 Clear VCS fsbackend and git_pillar locks on master start (#32480)
- a6482a3 Use win32api to get Total System Memory (#32491)
- PR #32487: (*terminalmage*) Add explanation of nonzero epoch requirement to pkg.installed state documentation
- PR #32482: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- f5bd6bd Backport 31164 and 31364 (#32474)
- PR #32450: (*cachedout*) Pass parser options into batch mode
- b299835 Issue `#28706`_: Fix state user.present behavior. (#32448)
- cef33d5 Argument name in docs should match actual arg name (#32445)
- PR #32432: (*ticosax*) [dockerng] Fix Domainname introspection
- PR #32427: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32423: (*jtand*) Update glusterfs_test to be inline with #32312
- PR #32425: (*cachedout*) Fix salt-cloud parallel provisioning
- 51fb2ac FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check `freebsd/pkg`#1409`_` for more info.
- 709410a Improve git_pillar documentation/logging
- c53efc3 Update master config docs
- PR #32323: (*mcalmer*) fix sorting by latest version when called with an attribute
- PR #32376: (*amontalban*) Fixes saltstack/salt`#28262`_
- 0d9a06b Cleaner deprecation process with decorators
- 6979fda Correctly index glusterfs bricks
- PR #32393: (*jfindlay*) modules.win_timezone: don't list all zones in debug log
- PR #32372: (*rallytime*) Back-port #32358 to 2015.8
- PR #32392: (*multani*) Fix documentation on boto_asg and boto_elb modules and states
- PR #32373: (*cachedout*) Resolve memory leak in authentication
- PR #32126: (*cro*) Add a couple CLI examples for the highstate outputter.
- PR #32353: (*mcalmer*) Prevent metadata download when listing installed products
- PR #32321: (*abednarik*) Better message when minion fail to start
- PR #32345: (*nmadhok*) [2015.8] Check if profile key exists in `vm_` dict
- PR #32343: (*Ferbla*) Fixed win_wua example documentation
- PR #32360: (*rallytime*) Make sure hash_type is lowercase in master/minion config files
- PR #32361: (*cro*) SDB is no longer experimental
- PR #32336: (*rallytime*) Back-port #28639 to 2015.8
- PR #32332: (*rallytime*) Don't unsubscribe from open events on the CLI too early on long-running commands
- PR #32333: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #32289: (*rallytime*) New salt-cloud instances should not use old hash_type default.
- PR #32291: (*twangboy*) Fix bad output for chocolatey.version (fixes [`#14277`](#))
- PR #32295: (*rallytime*) Test the contents of `'deploy_scripts_search_path'` in `salt.config.cloud_config`
- PR #32315: (*ahus1*) fixing file.managed with requests lib
- PR #32316: (*vutny*) Update Salt Bootstrap tutorial
- PR #32325: (*bdrung*) Re-add shebang to ssh-id-wrapper shell script
- PR #32326: (*bdrung*) Fix typos
- PR #32300: (*twangboy*) Add documentation to disable winrepo/winrepo_ng
- PR #32288: (*terminalmage*) use dictupdate.merge instead of dict.update to merge CLI pillar overrides
- PR #32243: (*isbm*) Ensure latest pkg.info_installed ensure latest
- PR #32268: (*ticosax*) [dockerng] Improve detection for older versions of docker-py
- PR #32258: (*jacobhammons*) Replaces incorrect reference to `master_alive_check`
- PR #32254: (*twangboy*) Fix Display Name with spaces in win_servermanager
- PR #32248: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32230: (*terminalmage*) systemd.py: Support both update-rc.d and chkconfig as managers of sysv services
- PR #32249: (*jacobhammons*) Fixes windows download paths to account for patch
- PR #32221: (*dmurphy18*) Fix version check, fix extracting Major and Minor versions from `__ver...`
- PR #32227: (*twangboy*) Remove list2cmdline usage from win_service.py
- PR #32239: (*anlutro*) Add state file name to warning log line
- PR #32215: (*DmitryKuzmenko*) rhel oscodename
- PR #32217: (*jacobhammons*) 2015.8.8.2 release notes
- PR #32212: (*rallytime*) Back-port [#32197](#) to 2015.8
- PR #32211: (*rallytime*) Back-port [#32210](#) to 2015.8
- PR #32209: (*rallytime*) Back-port [#32208](#) to 2015.8
- PR #32204: (*ticosax*) [dockerng] Consider labels carried by the image when comparing user defined labels.
- PR #32186: (*rallytime*) Add some ``best practices'' information to test documentation
- PR #32176: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32163: (*rallytime*) Update nacl.config docs to use key value instead of `'None'`
- PR #32166: (*vutny*) `salt.states.file`: correct examples with multiline YAML string
- PR #32168: (*rallytime*) Lint 2015.8
- PR #32165: (*terminalmage*) Make `__virtual__` for `rhservice.py` more robust
- PR #32160: (*cachedout*) Fix beacon tutorial docs
- PR #32145: (*paclat*) fixes 29817
- PR #32133: (*basepi*) Pass eauth user/groups through salt-api to destination functions
- PR #32127: (*rallytime*) Add runners to `__salt__` docs
- PR #32143: (*DmitryKuzmenko*) Set auth retry count to 0 if multimaster mode is failover.

- PR #32134: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32091: (*clarkperkins*) Fixed the regression in 410da78
- PR #32135: (*rallytime*) [2015.8] Support multiple valid option types when performing type checks
- PR #31760: (*sakateka*) SMinion need wait future from eval_master
- PR #32106: (*jfindlay*) update suse master service patch
- PR #32130: (*jacobhammons*) Added known issues 32004 and 32044 to 2015.8.8 release notes
- PR #32105: (*clarkperkins*) Fixed invalid deploy_scripts_search_path
- PR #32117: (*tomlaredo*) Fixed validation type for file_ignore_glob
- PR #32113: (*sakateka*) Fix log message for AsyncAuth initialization
- PR #32116: (*ticosax*) Obtain default value of *memory_swap* from the container.
- PR #32098: (*rallytime*) Back-port #32083 to 2015.8
- PR #32099: (*jacobhammons*) 2015.8.8 release docs
- PR #32088: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #32074: (*Xiami2012*) Fix code for proto args in modules.iptables
- PR #32053: (*basepi*) [2015.8] Fix rabbitmq_user.present tag handling
- PR #32023: (*sbreidba*) Move constant declaration into member variable to avoid issues when m...
- PR #32026: (*techhat*) Don't require the decode_out file to already exist
- PR #32019: (*rallytime*) Back-port #32012 to 2015.8
- PR #32015: (*ticosax*) [dockerng] Fix ports exposition when protocol is passed.
- PR #31999: (*jacobhammons*) Fixes a doc build exception caused by missing mocks for modules.win_dacl
- PR #31992: (*notpeter*) salt-cloud: add D2 and G2 EC2 instance types
- PR #31981: (*lloydoliver*) include rotational disks in grains under linux
- PR #31970: (*twangboy*) Add apply_template_on_contents for windows
- PR #31960: (*aletourneau*) fixed ec2 get_console_output
- PR #31958: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- 3934c66 Merge branch `2015.5' into `2015.8'
- PR #31935: (*twangboy*) Back port nullsoft build script from 2015.8
- PR #31912: (*jfindlay*) log.mixins: remove extermoporaneous .record

19.2.21 Salt 2015.5.0 Release Notes - Codename Lithium

The 2015.5.0 feature release of Salt is focused on hardening Salt and mostly on improving existing systems. A few major additions are present, primarily the new Beacon system. Most enhancements have been focused around improving existing features and interfaces.

As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

Warning: In order to fix potential shell injection vulnerabilities in salt modules, a change has been made to the various `cmd` module functions. These functions now default to `python_shell=False`, which means that the commands will not be sent to an actual shell.

The largest side effect of this change is that ``shellisms'', such as pipes, will not work by default. The modules shipped with salt have been audited to fix any issues that might have arisen from this change. Additionally, the `cmd` state module has been unaffected, and use of `cmd.run` in jinja is also unaffected. `cmd.run` calls on the CLI will also allow shellisms.

However, custom execution modules which use shellisms in `cmd` calls will break, unless you pass `python_shell=True` to these calls.

As a temporary workaround, you can set `cmd_safe: False` in your minion and master configs. This will revert the default, but is also less secure, as it will allow shell injection vulnerabilities to be written in custom code. We recommend you only set this setting for as long as it takes to resolve these issues in your custom code, then remove the override.

Note: Starting in this version of salt, `pillar_opts` defaults to `False` instead of `True`. This means that master opts will not be present in minion pillar, and as a result, `config.get` calls will not include master opts.

We recommend pillar is used for configuration options which need to make it to the minion.

Beacons

The beacon system allows the minion to hook into system processes and continually translate external events into the salt event bus. The primary example of this is the `inotify` beacon. This beacon uses `inotify` to watch configured files or directories on the minion for changes, creation, deletion etc.

This allows for the changes to be sent up to the master where the reactor can respond to changes.

Sudo Minion Settings

It is now possible to run the minion as a non-root user and for the minion to execute commands via `sudo`. Simply add `sudo_user: root` to the minion config, run the minion as a non-root user and grant that user `sudo` rights to execute `salt-call`.

Lazy Loader

The Lazy Loader is a significant overhaul of Salt's module loader system. The Lazy Loader will lazily load modules on access instead of all on start. In addition to a major performance improvement, this ``sandboxes'' modules so a bad/broken import of a single module will only affect jobs that require accessing the broken module. (:issue: 20274)

Enhanced Active Directory Support

The `eauth` system for LDAP has been extended to support Microsoft Active Directory out of the box. This includes Active Directory and LDAP group support for `eauth`.

Salt LXC Enhancements

The LXC systems have been overhauled to be more consistent and to fix many bugs.

This overhaul makes using LXC with Salt much easier and substantially improves the underlying capabilities of Salt's LXC integration.

Salt SSH

- Additional configuration options and command line flags have been added to configure the scan roster on the fly
- Added support for `state.single` in `salt-ssh`
- Added support for `publish.publish`, `publish.full_data`, and `publish.runner` in `salt-ssh`
- Added support for `mine.get` in `salt-ssh`

New Windows Installer

The new Windows installer changes how Salt is installed on Windows. The old installer used `bbfreeze` to create an isolated python environment to execute in. This made adding modules and python libraries difficult. The new installer sets up a more flexible python environment making it easy to manage the python install and add python modules.

Instead of frozen packages, a full python implementation resides in the `bin` directory (`C:\salt\bin`). By executing `pip` or `easy_install` from within the `Scripts` directory (`C:\salt\bin\Scripts`) you can install any additional python modules you may need for your custom environment.

The `.exe`'s that once resided at the root of the `salt` directory (`C:\salt`) have been replaced by `.bat` files and should function the same way as the `.exe`'s in previous versions.

The new Windows Installer will not replace the minion config file and key if they already exist on the target system. Only the `salt` program files will be replaced. `C:\salt\conf` and `C:\salt\var` will remain unchanged.

Removed Requests Dependency

The hard dependency on the `requests` library has been removed. `Requests` is still required by a number of cloud modules but is no longer required for normal Salt operations.

This removal fixes issues that were introduced with `requests` and `salt-ssh`, as well as issues users experienced from the many different packaging methods used by `requests` package maintainers.

Python 3 Updates

While Salt does not YET run on Python 3 it has been updated to INSTALL on Python 3, taking us one step closer. What remains is getting the test suite to the point where it can run on Python 3 so that we can verify compatibility.

RAET Additions

The RAET support continues to improve. RAET now supports multi-master and many bugs and performance issues have been fixed. RAET is much closer to being a first class citizen.

Modified File Detection

A number of functions have been added to the RPM-based package managers to detect and diff files that are modified from the original package installs. This can be found in the new `pkg.modified` functions.

Reactor Update

Fix an infinite recursion problem for runner/wheel reactor jobs by passing a ```user"` (Reactor) to all jobs that the reactor starts. The reactor skips all events created by that username -- thereby only reacting to events not caused by itself. Because of this, runner and wheel executions from the runner will have user ```Reactor"` in the job cache.

Misc Fixes/Additions

- SDB driver for `etcd`. (:issue: 22043)
- Add `only_upgrade` argument to apt-based `pkg.install` to only install a package version if the package is already installed. (Great for security updates!)
- Joyent now requires a `keyname` to be specified in the provider configuration. This change was necessitated upstream by the 7.0+ API.
- Add `args` argument to `cmd.script_retcode` to match `cmd.script` in the `cmd` module. (:issue: 21122)
- Fixed bug where TCP keepalive was not being sent on the defined interval on the return port (4506) from minion to master. (:issue: 21465)
- `LocalClient` may now optionally raise `SaltClientError` exceptions. If using this class directly, checking for and handling this exception is recommended. (:issue: 21501)
- The `SAuth` object is now a singleton, meaning authentication state is global (per master) on each minion. This reduces sign-ins of minions from 3->1 per startup.
- Nested outputter has been optimized, it is now much faster.
- Extensive fileserver backend updates.

Deprecations

- Removed `parameter` keyword argument from `eselect.exec_action` execution module.
- Removed `runas` parameter from the following `pip`` execution module functions: `install`, `uninstall`, `freeze`, `list_`, `list_upgrades`, `upgrade_available`, `upgrade`. Please migrate to `user`.
- Removed `runas` parameter from the following `pip` state module functions: `installed`, `removed`, `update`. Please migrate to `user`.
- Removed `quiet` option from all functions in `cmdmod` execution module. Please use `output_loglevel=quiet` instead.
- Removed `parameter` argument from `eselect.set_state`. Please migrate to `module_parameter` or `action_parameter`.
- The `salt_events` table schema has changed to include an additional field called `master_id` to distinguish between events flowing into a database from multiple masters. If `event_return` is enabled in the master config, the database schema must first be updated to add the `master_id` field. This alteration can be accomplished as follows:

```
ALTER TABLE salt_events ADD master_id VARCHAR(255) NOT NULL;
```

Known Issues

- In multi-master mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.

19.2.22 Salt 2015.5.1 Release Notes

release 2015-05-20

Version 2015.5.1 is a bugfix release for *2015.5.0*.

Changes:

- `salt.runners.cloud.action()` has changed the *fun* keyword argument to *func*. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

PR #23989: (*rallytime*) Backport #23980 to 2015.5 @ 2015-05-20T19:33:41Z

- PR #23980: (*iggy*) template: jinja2 -> jinja | refs: #23989
- 117ecb1 Merge pull request #23989 from rallytime/bp-23980
- 8f8557c template: jinja2 -> jinja

PR #23988: (*rallytime*) Backport #23977 to 2015.5 @ 2015-05-20T19:13:36Z

- PR #23977: (*ionutbalutoiu*) Fixed glance image_create | refs: #23988
- d4f1ba0 Merge pull request #23988 from rallytime/bp-23977
- 46fc7c6 Fixed glance image_create

PR #23986: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-20T18:41:33Z

- PR #23965: (*hvnstweeting*) handle all exceptions gitpython can raise
- 9566e7d Merge pull request #23986 from basepi/merge-forward-2015.5
- 0b78156 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
- 314e4db Merge pull request #23965 from hvnstweeting/20147-fix-gitfs-gitpython-exception
- 2576301 handle all exception gitpython can raise

PR #23985: (*UtahDave*) Add 2014.7.5-2 and 2015.5.0-2 Windows installer download links @ 2015-05-20T18:32:44Z

- 9d1130e Merge pull request #23985 from UtahDave/2015.5local
- 10338d0 Add links to Windows 2015.5.0-2 install downloads
- b84f975 updated Windows 2014.7.5-2 installer download link

PR #23983: (*rallytime*) Versionadded tags for https_user and https_pass args new in 2015.5.0 @ 2015-05-20T18:05:27Z

- ca7729d Merge pull request #23983 from rallytime/versionadded_git_options
- 14eae22 Versionadded tags for https_user and https_pass args new in 2015.5.0

PR #23970: (*jayeshka*) adding system unit test case @ 2015-05-20T17:12:57Z

- b06df57 Merge pull request #23970 from jayeshka/system-unit-test

- 89eb008 adding system unit test case

PR #23967: (jayeshka) adding states/memcached unit test case @ 2015-05-20T17:12:26Z

- 38d5f75 Merge pull request #23967 from jayeshka/memcached-states-unit-test
- 8ef9240 adding states/memcached unit test case

PR #23966: (jayeshka) adding states/modjk unit test case @ 2015-05-20T17:11:48Z

- 868e807 Merge pull request #23966 from jayeshka/modjk-states-unit-test
- 422a964 adding states/modjk unit test case

PR #23942: (jacobhammons) Updates to sphinx saltstack2 doc theme @ 2015-05-20T15:43:54Z

- 6316490 Merge pull request #23942 from jacobhammons/2015.5
- 31023c8 Updates to sphinx saltstack2 doc theme

PR #23874: (joejulian) Validate keyword arguments to be valid @ 2015-05-20T04:53:40Z

- **ISSUE #23872: (joejulian) create_ca_signed_cert can error if dereferenced dict is used for args | refs: #23874**
- 587957b Merge pull request #23874 from joejulian/2015.5_tls_validate_kwargs
- 30102ac Fix py3 and ordering inconsistency problems.
- 493f7ad Validate keyword arguments to be valid

PR #23960: (rallytime) Backport #22114 to 2015.5 @ 2015-05-20T04:37:09Z

- **PR #22114: (dmyerscough) Fixing KeyError when there are no additional pages | refs: #23960**
- 00c5c22 Merge pull request #23960 from rallytime/bp-22114
- f3e1d63 Catch KeyError
- 306b1ea Fixing KeyError
- 6b2cda2 Fix PEP8 complaint
- 239e50f Fixing KeyError when there are no additional pages

PR #23961: (rallytime) Backport #23944 to 2015.5 @ 2015-05-20T04:35:41Z

- **PR #23944: (ryan-lane) Add missing loginclass argument to _changes call | refs: #23961**
- 4648b46 Merge pull request #23961 from rallytime/bp-23944
- 970d19a Add missing loginclass argument to _changes call

PR #23948: (jfindlay) augeas.change state now returns changes as a dict @ 2015-05-20T04:00:10Z

- 0cb5cd3 Merge pull request #23948 from jfindlay/augeas_changes
- f09b80a augeas.change state now returns changes as a dict

PR #23957: (rallytime) Backport #23951 to 2015.5 @ 2015-05-20T03:04:24Z

- **PR #23951: (ryan-lane) Do not check perms in file.copy if preserve | refs: #23957**
- 2d185f7 Merge pull request #23957 from rallytime/bp-23951
- 996b431 Update file.py
- 85d461f Do not check perms in file.copy if preserve

- **PR #23956: (rallytime) Backport #23906 to 2015.5 @ 2015-05-20T03:04:14Z**

- ISSUE #23839: (*gladiatr72*) wonky loader syndrome | refs: #23906
- ISSUE #23373: (*tnypex*) reactor/orchestrator race condition on salt['pillar.get'] | refs: #23906
- PR #23906: (*gladiatr72*) Added exception handler to trap the RuntimeError raised when | refs: #23956
- ebf1ff Merge pull request #23956 from rallytime/bp-23906
- 9d87fd3 add proper marker for format argument
- 197688e Added exception handler to trap the RuntimeError raised when Depends.enforce_dependency() class method fires unsuccessfully. There appears to be no synchronization within the Depends decorator class wrt the class global_dependency_dict which results in incomplete population of any loader instantiation occurring at the time of one of these exceptions.
- PR #23955: (*rallytime*) Backport #19305 to 2015.5 @ 2015-05-20T03:03:55Z
 - ISSUE #19852: (*TaiSHiNet*) DigitalOcean APIv2 can't delete machines when there is only 1 page | refs: #23955
 - ISSUE #19304: (*TaiSHiNet*) DigitalOcean API v2 cannot delete VMs on 2nd page | refs: #19305
 - PR #19305: (*TaiSHiNet*) Fixes droplet listing past page 1 | refs: #23955
 - da3f919 Merge pull request #23955 from rallytime/bp-19305
 - bbf2429 Fixes droplet listing past page 1
- PR #23940: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-19T22:37:58Z

 - aee00c8 Merge pull request #23810 from rallytime/bp-23757
 - * fb32c32 use abspath, do not eliminating symlinks
 - 6b3352b Merge pull request #23809 from rallytime/virt_get_nics_fix
 - * 0616fb7 Fix virtualport section of virt.get_nics loop
 - 188f03f Merge pull request #23823 from gtmanfred/2014.7
 - * 5ef006d add link local for ipv6
 - f3ca682 Merge pull request #23802 from gtmanfred/2014.7
 - * 2da98b5 if it is ipv6 ip_to_int will fail
- **PR #23863:** (*rahulhan*) Adding states/timezone.py unit test @ 2015-05-18T17:02:19Z
 - 433f873 Merge pull request #23863 from rahulhan/states_timezone_unit_test
 - 72fcabc Adding states/timezone.py unit test
- **PR #23862:** (*rahulhan*) Adding states/tomcat.py unit tests @ 2015-05-18T17:02:10Z
 - 37b3ee5 Merge pull request #23862 from rahulhan/states_tomcat_unit_test
 - 65d7752 Adding states/tomcat.py unit tests
- **PR #23860:** (*rahulhan*) Adding states/test.py unit tests @ 2015-05-18T17:01:49Z
 - dde7207 Merge pull request #23860 from rahulhan/states_test_unit_test
 - 1f4cf86 Adding states/test.py unit tests
- **PR #23859:** (*rahulhan*) Adding states/sysrc.py unit tests @ 2015-05-18T17:01:46Z
 - 3c9b813 Merge pull request #23859 from rahulhan/states_sysrc_unit_test
 - 6a903b0 Adding states/sysrc.py unit tests
- **PR #23812:** (*rallytime*) Backport #23790 to 2015.5 @ 2015-05-18T15:30:34Z
 - **PR #23790:** (*aboe76*) updated suse spec file to version 2015.5.0 | refs: #23812
 - 4cf30a7 Merge pull request #23812 from rallytime/bp-23790

- 3f65631 updated suse spec file to version 2015.5.0
- **PR #23811:** (*rallytime*) Backport #23786 to 2015.5 @ 2015-05-18T15:30:27Z
 - **PR #23786:** (*kaithar*) Log the error generated that causes returns.mysql.returner to except. | refs: #23811
 - c6f939a Merge pull request #23811 from rallytime/bp-23786
 - 346f30b Log the error generated that causes returns.mysql.returner to except.
- **PR #23850:** (*jayeshka*) adding sysbench unit test case @ 2015-05-18T15:28:04Z
 - ce60582 Merge pull request #23850 from jayeshka/sysbench-unit-test
 - 280abde adding sysbench unit test case
- **PR #23843:** (*The-Loeki*) Fix erroneous virtual:physical core grain detection @ 2015-05-18T15:24:22Z
 - 060902f Merge pull request #23843 from The-Loeki/patch-1
 - 9e2cf60 Fix erroneous virtual:physical core grain detection
- **PR #23816:** (*Snergster*) Doc for #23685 Added prereq, caution, and additional mask information @ 2015-05-18T15:18:03Z
 - **ISSUE #23815:** (*Snergster*) [beacons] inotify errors on subdir creation | refs: #23816
 - 3257a9b Merge pull request #23816 from Snergster/23685-doc-fix
 - 0fca49d Added prereq, caution, and additional mask information
- **PR #23832:** (*ahus1*) make saltify provider use standard bootstrap procedure @ 2015-05-18T02:18:29Z
 - **PR #23829:** (*ahus1*) make saltify provider use standard bootstrap procedure | refs: #23832
 - 3df3b85 Merge pull request #23832 from ahus1/ahus1_saltify_bootstrap_2015.5
 - f5b1734 fixing problem in unit test
 - cba47f6 make saltify to use standard bootstrap procedure, therefore providing all options like master_sign_pub_file
- **PR #23791:** (*optix2000*) Psutil compat @ 2015-05-16T04:05:54Z
 - 8ec4fb2 Merge pull request #23791 from optix2000/psutil_compat
 - 5470cf5 Fix pylint errors and sloppy inline comments
 - 64634b6 Update psutil.pid_list to use psutil.pids
 - 5dd6d69 Fix imports that aren't in __all__
 - 8a1da33 Fix test cases by mocking psutil_compat
 - 558798d Fix net_io_counters deprecation issue
 - 8140f92 Override unnecessary pylint errors
 - 7d02ad4 Fix some of the mock names for the new API
 - 9b3023e Fix overloaded getters/setters. Fix line lengths
 - 180eb87 Fix whitespace
 - f8edf72 Use new psutil API in ps module
 - e48982f Fix version checking in psutil_compat
 - 93ee411 Create compatibility psutil. psutil 3.0 drops 1.0 API, but we still support old psutil versions.

- **PR #23782:** (*terminalmage*) Replace ``command -v" with ``which" and get rid of spurious log messages @ 2015-05-16T04:03:10Z
 - 405517b Merge pull request #23782 from terminalmage/issue23772
 - 0f6f239 More ignore_retcode to suppress spurious log msgs
 - b4c48e6 Ignore return code in lxc.attachable
 - 08658c0 Replace ``command -v" with ``which"
- **PR #23783:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-15T21:38:51Z
 - **ISSUE #22959:** (*highlyunavailable*) Windows Salt hangs if file.directory is trying to write to a drive that doesn't exist
 - **ISSUE #22332:** (*rallytime*) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
 - **ISSUE #16424:** (*stanvit*) salt-run cloud.create fails with saltify
 - **PR #23748:** (*basepi*) [2014.7] Log salt-ssh roster render errors more assertively and verbosely
 - **PR #23731:** (*twangboy*) Fixes #22959: Trying to add a directory to an unmapped drive in windows
 - **PR #23730:** (*rallytime*) Backport #23729 to 2014.7
 - **PR #23729:** (*rallytime*) Partially merge #23437 (grains fix) | refs: #23730
 - **PR #23688:** (*twangboy*) Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows
 - **PR #23488:** (*cellscape*) LXC cloud fixes
 - **PR #23437:** (*cedwards*) Grains item patch | refs: #23729
 - cb2eb40 Merge pull request #23783 from basepi/merge-forward-2015.5
 - 9df51ca __opts__.get
 - 51d23ed Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
 - * d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
 - 64250a6 Remove profile from opts after creating LXC container
 - c4047d2 Set destroy=True in opts when destroying cloud instance
 - 9e1311a Store instance names in opts when performing cloud action
 - 934bc57 Correctly pass custom env to lxc-attach
 - 7fb85f7 Preserve test=True option in cloud states
 - 9771b5a Fix detection of absent LXC container in cloud state
 - fb24f0c Report failure when failed to create/clone LXC container
 - 2d9aa2b Avoid shadowing variables in lxc module
 - 792e102 Allow overriding profile options in lxc.cloud_init_interface
 - 42bd64b Return changes on successful lxc.create from salt-cloud
 - 4409eab Return correct result when creating cloud LXC container
 - 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
 - * 808bbe1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
 - bc53e04 Log entire exception for render errors in roster
 - 753de6a Log render errors in roster to error level

- e01a7a9 Always let the real YAML error through
- * 72cf360 Merge pull request #23731 from twangboy/fix_22959
 - 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows
- * 2610195 Merge pull request #23730 from rallytime/bp-23729
 - 1877cae adding support for nested grains to grains.item
- * 3e9df88 Merge pull request #23688 from twangboy/fix_23415
 - 6a91169 Fixed unused-import pylint error
 - 5e25b3f fixed pylint errors
 - 1a96766 Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows
- PR #23781: (*jfindlay*) fix unit test mock errors on arch @ 2015-05-15T19:40:07Z
 - 982f873 Merge pull request #23781 from jfindlay/fix_locale_tests
 - 14c711e fix unit test mock errors on arch
- PR #23740: (*jfindlay*) Binary write @ 2015-05-15T18:10:44Z
 - ISSUE #23566: (*rks2286*) Salt-cp corrupting the file after transfer to minion | refs: #23740
 - 916b1c4 Merge pull request #23740 from jfindlay/binary_write
 - 626930a update incorrect comment wording
 - a978f5c always use binary file write mode on windows
- PR #23736: (*jfindlay*) always load pip execution module @ 2015-05-15T18:10:16Z
 - ISSUE #23682: (*chrish42*) Pip module requires system pip, even when not used (with env_bin) | refs: #23736
 - 348645e Merge pull request #23736 from jfindlay/fix_pip
 - b8867a8 update pip tests
 - 040bbc4 only check pip version in one place
 - 6c453a5 check for executable status of bin_env
 - 3337257 always load the pip module as pip could be anywhere
- PR #23770: (*cellscape*) Fix cloud LXC container destruction @ 2015-05-15T17:38:59Z
 - 10cedfb Merge pull request #23770 from cellscape/fix-cloud-lxc-destruction
 - 4f6021c Fix cloud LXC container destruction
- PR #23759: (*lisa2lisa*) fixed the problem for not beable to revoke ., for more detail https... @ 2015-05-15T17:38:38Z
 - ddea822 Merge pull request #23759 from lisa2lisa/iss23664
 - a29f161 fixed the problem for not beable to revoke ., for more detail <https://github.com/saltstack/salt/issues/23201>, fixed mysql cannot create user with pure digit password, for more info <https://github.com/saltstack/salt/issues/23664>
- PR #23769: (*cellscape*) Fix file_roots CA lookup in salt.utils.http.get_ca_bundle @ 2015-05-15T16:21:49Z
 - 10615ff Merge pull request #23769 from cellscape/utils-http-ca-file-roots
 - 8e90f32 Fix file_roots CA lookup in salt.utils.http.get_ca_bundle

- **PR #23765:** (*jayeshka*) adding states/makeconf unit test case @ 2015-05-15T14:29:43Z
 - fd8a1b7 Merge pull request #23765 from jayeshka/makeconf_states-unit-test
 - 26e31af adding states/makeconf unit test case
- **PR #23760:** (*ticosax*) [doc] document refresh argument @ 2015-05-15T14:23:47Z
 - ee13b08 Merge pull request #23760 from ticosax/2015.5
 - e3ca859 document refresh argument
- **PR #23766:** (*jayeshka*) adding svn unit test case @ 2015-05-15T14:23:18Z
 - a017f72 Merge pull request #23766 from jayeshka/svn-unit-test
 - 19939cf adding svn unit test case
- **PR #23751:** (*rallytime*) Backport #23737 to 2015.5 @ 2015-05-15T03:58:37Z
 - **ISSUE #23734:** (*bradthurber*) 2015.5.0 modules/archive.py ZipFile instance has no attribute `__exit__` - only python 2.6? | refs: #23737
 - **PR #23737:** (*bradthurber*) fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute... | refs: #23751
 - 0ed9d45 Merge pull request #23751 from rallytime/bp-23737
 - 8d1eb32 fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute `__exit__` - only python 2.6? #23734
- **PR #23710:** (*kiorky*) Get more useful output from stateful commands @ 2015-05-14T21:58:10Z
 - **ISSUE #23709:** (*kiorky*) cmdmod: enhancement is really needed for stateful commands | refs: #23710
 - d73984e Merge pull request #23710 from makinacorp/i23709
 - c706909 Get more useful output from stateful commands
- **PR #23724:** (*rallytime*) Backport #23609 to 2015.5 @ 2015-05-14T19:34:22Z
 - **PR #23609:** (*kaidokert*) file_map: chown created directories if not root #23608 | refs: #23724
 - cdf421b Merge pull request #23724 from rallytime/bp-23609
 - fe3a762 file_map: chmod created directories if not root
- **PR #23723:** (*rallytime*) Backport #23568 to 2015.5 @ 2015-05-14T19:34:11Z
 - **PR #23568:** (*techhat*) Allow Salt Cloud to use either SCP or SFTP, as configured | refs: #23723
 - 94f9099 Merge pull request #23723 from rallytime/bp-23568
 - bbec34a Allow Salt Cloud to use either SCP or SFTP, as configured
- **PR #23725:** (*rallytime*) Backport #23691 to 2015.5 @ 2015-05-14T19:32:30Z
 - **PR #23691:** (*dennisjac*) add initial configuration documentation for varstack pillar | refs: #23725
 - 137e5ee Merge pull request #23725 from rallytime/bp-23691
 - 28a846e add initial configuration documentation for varstack pillar
- **PR #23722:** (*rallytime*) Backport #23472 to 2015.5 @ 2015-05-14T19:31:52Z
 - **PR #23472:** (*techhat*) Allow neutron network list to be used as pillar data | refs: #23722
 - 0c00995 Merge pull request #23722 from rallytime/bp-23472
 - c3d0f39 Change versionadded tag for backport

- 023e88f Allow neutron network list to be used as pillar data
- PR #23727: (*jfindlay*) fix npm execution module stacktrace @ 2015-05-14T18:14:12Z
 - ISSUE #23657: (*arthurlogilab*) [salt-cloud lxc] NameError: global name `__salt__` is not defined | refs: #23727 #23898 #23897
 - cbf4ca8 Merge pull request #23727 from jfindlay/npm_salt
 - 05392f2 fix npm execution module stacktrace
- PR #23718: (*rahulhan*) Adding states/user.py unit tests @ 2015-05-14T17:15:38Z
 - ef536d5 Merge pull request #23718 from rahulhan/states_user_unit_tests
 - aad27db Adding states/user.py unit tests

 - 1cdaeed Merge pull request #23363 from jayeshka/riak-unit-test
 - f9da6db adding riak unit test case

19.2.23 Salt 2015.5.10 Release Notes

Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM eAuth service that users authenticate against in the Salt Master configuration.

(No additional fixes are contained in this release).

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.5.9

Salt systemd service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

19.2.24 Salt 2015.5.11 Release Notes

Version 2015.5.11 is a bugfix release for 2015.5.0.

Changes for v2015.5.10..v2015.5.11

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-05-20T21:02:38Z

Total Merges: 101

Changes:

- dc8ce2d Fix traceback in logging for config validation (#33386) (#33405)
- **PR #33383:** (*thatch45*) maintain the fallback because I am totally sick of this crap
- 755acfb Improve doc clarity for disable_modules documentation (#33379)
- 2b5ad12 Better YAML syntax error handling (#33375)
- **PR #33372:** (*jacobhammons*) revved 2015.8 branch to .9 in version selector

- 55be0ab Expanded documentation for boto_elb state and module (#33341)
- 9b42a05 Added some more docs for master and minion config settings (#33292)
- 8acee5e Fix iptables --match-set (``#23643`_`) (#33301)
- 757ef20 fix ``loose" typo (#33290)
- b7d98da Add auth_tries config option to minion.rst docs (#33287)
- 061851b Document minion_id_caching config value (#33282)
- 8fa72f6 Clarify file.replace MULTILINE flag interaction with regex anchors (#33137)
- 4b1f460 update 2015.5.11 release notes (#33236)
- **PR #33211:** (*cachedout*) Don't try to kill a parent proc if we can't
- f868329 Resolve issue with pkg module on Mint Linux (#33205)
- a09e1b6 Add pip installed and removed test (#33178)
- 96e3586 update 2015.5.11 release notes (#33197)
- 09b072a Fix file.managed for Windows (#33181)
- 30868ab [2015.5] Update to latest bootstrap script v2016.05.11 (#33185)
- 264ad34 Pip fix (#33180)
- 43288b2 add 2015.5.11 release notes (#33160)
- e0da8fd [2015.5] Update to latest bootstrap script v2016.05.10 (#33155)
- **PR #33141:** (*jtand*) Skipping salt-call --local test
- 878d34a Doc mock decorators (#33132)
- 30edead Lower display of msgpack failure msg to debug (#33078)
- d4928c5 Use saltstack repo in buildpackage.py on CentOS 5 (#33080)
- 61d126c add test for installing package while using salt-call --local (#33025)
- 6d3e4e8 File and User test fixes for 2015.5 on Fedora23 (#33055)
- d48b2b8 test pillar.items output (#33060)
- 398793b Fix minor document error of test.assertion (#33067)
- f875763 Saltfile with pillar tests (#33045)
- 1d78924 Backport #33021 manually to 2015.5 (#33044)
- f00b5f9 Add run_on_start docs to schedule.rst (#32958)
- edce22a backport PR #32732 to 2015.5 fixes ``#23714`_` (#32848)
- 9b5c14c `salt-cloud -u` downloads stable version from bootstrap.saltstack.com by default (#32837)
- 9725804 update bootstrap to 2016.04.18 release (#32667)
- **PR #32776:** (*rallytime*) [2015.5] Merge forward from 2014.7 to 2015.5
- 67d0c81 Support remote sources in a source list (#32691)
- **PR #32686:** (*cachedout*) Fix stacktrace in batch with dup minion ids
- 3ec9502 Update ``Low Hanging Fruit" to ``Help Wanted" (#32675)
- 77bea56 Additional documentation on calling exec modules from templates (#32657)

- c910b8d Fixing critical bug to remove only the specified Host instead of the entire Host cluster (#32639)
- 4568565 Add _syspaths.py to .gitignore (#32638)
- PR #32561: (*gtmanfred*) redact passwords and hashes from user.present updates
- PR #32538: (*rallytime*) Back-port #32528 to 2015.5
- 29333e5 Add documentation for some master/minion configs (#32454)
- PR #32458: (*terminalmage*) Improve and clarify docs on provider overrides.
- 0809126 Merge #32293 with test fixes (#32418)
- bbd8260 Ignore Raspbian in service.py __virtual__ (#32421)
- 690addf FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check `freebsd/pkg`#1409`_` for more info.
- PR #32399: (*amontalban*) Backport to fix ``#28262`_` for 2015.5 as requested in PR #32376
- PR #32374: (*cachedout*) Update proxmox documentation
- PR #32339: (*Ch3LL*) remove reference to `master_alive_check` in 2015.5
- PR #32284: (*rallytime*) Audit `config.py` default types and values
- PR #32302: (*terminalmage*) Properly support packages with blank ```Release``` param in `pkg.latest_version`
- PR #32162: (*terminalmage*) Properly handle yum/zypper repositories in `pkgrepo.managed`
- PR #32223: (*twangboy*) Create `minion.d` directory on install for Windows
- PR #32218: (*cachedout*) Only display error when `tty` is `True` in `salt-ssh`
- PR #32196: (*jtand*) Fixed pylint error in `app_pam_test.py`
- PR #32154: (*Ch3LL*) Add integration tests for salt-api using pam eauth
- PR #32170: (*gtmanfred*) add name for `lxc` for use with cloud cache
- PR #32164: (*terminalmage*) Make `__virtual__` for `rhservice.py` more robust (2015.5 branch)
- PR #32141: (*paclat*) fixes 32108
- PR #32129: (*terminalmage*) Support multiple valid option types when performing type checks
- PR #32056: (*bstevenson*) Fix list absent
- PR #32096: (*rallytime*) Back-port #32065 to 2015.5
- PR #32104: (*jacobhammons*) One additional known issue for 2015.5.10 release notes
- PR #32100: (*jacobhammons*) 2015.5.10 release docs
- PR #32038: (*terminalmage*) Improve state module docs, replace references to `state.highstate/state.sls` with `state.apply`
- PR #32051: (*terminalmage*) Fix outputter for `state.apply`
- PR #32002: (*abednarik*) Added Manajro Linux to `virtual`.
- PR #31957: (*rallytime*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #31972: (*terminalmage*) Make lack of `python-ldap` module more explicit when LDAP eauth is enabled
- PR #31935: (*twangboy*) Back port nullsoft build script from 2015.8
- PR #31912: (*jfindlay*) `log.mixins`: remove extermoporaneous `.record`
- PR #31825: (*jtand*) Updated `.testing.pylintrc` to match newer versions of pylint

- PR #31900: (*rallytime*) Add ``python module" clarification to ps __virtual__ warning.
- PR #31878: (*rallytime*) Make sure __virtual__ error message is helpful when psutil is missing
- PR #31852: (*rallytime*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #31827: (*gtmanfred*) Remove ability of authenticating user to specify pam service
- PR #31810: (*whiteinge*) Fix outdated Jinja `env' variable reference
- PR #31744: (*brejoc*) Fix for AttributeError with libcloud <0.15
- PR #31740: (*terminalmage*) Assume pillar_opts is False when not specified in masterless mode
- PR #31750: (*rallytime*) Back-port #26170 to 2015.5
- PR #31689: (*rallytime*) Back-port #29467 to 2015.5
- PR #31687: (*cachedout*) Removed useless GPG tests
- PR #31660: (*terminalmage*) Remove epoch from version string if present when installing with yum
- PR #31683: (*rallytime*) Back-port #31578 to 2015.5
- PR #31682: (*cachedout*) Add definition of job cache to glossary
- PR #31658: (*rallytime*) Add mentioned of Salt's Coding Style docs to the Contributing docs
- PR #31655: (*rallytime*) Make note of pylint dependencies in docs
- PR #31440: (*cachedout*) Set correct type for master_tops config value
- PR #31622: (*jfindlay*) doc/topics/tutorials/http: update query decoding docs
- PR #31558: (*cachedout*) Don't stacktrace if ssh binary is not installed with salt-ssh
- PR #31521: (*terminalmage*) salt-ssh: Fix race condition when caching files to build the thin tarball
- PR #31497: (*rallytime*) Remove duplicate ``timeout" definition in Roster docs
- PR #31472: (*rallytime*) Update contributing docs
- PR #31461: (*DmitryKuzmenko*) Set auth retry count to 0 if multimaster mode is failover.
- PR #31442: (*sastorsl*) Add os.path.exists(src) to file.py, def copy
- PR #31441: (*cachedout*) Include localhost minions in presence detection for runner
- PR #31416: (*carlwgeorge*) selinux module documentation fix
- PR #31336: (*terminalmage*) Improve config validation logging
- PR #31374: (*sjorge*) fix for `#31369`_
- PR #31339: (*jacobhammons*) changed latest release to 2015.8.7
- PR #31288: (*notpeter*) Improve salt.states.ssh_known_hosts documentation.
- PR #31183: (*heyfife*) Fixed named external_ip reservation/re-use code in gce driver.
- PR #31032: (*terminalmage*) (2015.5 branch) yumpkg: ensure that dnf-plugins-core >= 0.1.15 is installed
- PR #31264: (*sjorge*) fix if_missing gets appended to dirs list, take III
- PR #31110: (*cachedout*) Fixup 30730
- PR #30974: (*rallytime*) Back-port #30949 to 2015.5
- PR #30942: (*rallytime*) Back-port #30897 to 2015.5
- PR #30922: (*jacobhammons*) Rev latest version to 2015.8.5

- PR #30865: (*abednarik*) Better boto elb error message.
- PR #30831: (*jacobhammons*) Updated readme
- PR #30829: (*jacobhammons*) Updated latest version to 2015.8.4
- PR #30784: (*rallytime*) Back-port #24952 to 2015.5
- PR #30764: (*terminalmage*) Work around yum versionlock's inability to remove holds by package name alone
- PR #30760: (*toanju*) Changed output format of arp_ip_target from list to comma delimited...
- PR #30757: (*yannis666*) Fix to mine update to merge configuration
- PR #30749: (*abednarik*) Fix Netwok hostname Module in Debian systems.
- PR #30699: (*abednarik*) Add Retry to save_load.
- PR #30659: (*sjmh*) Fix lsscsi issues for certain platforms
- PR #30671: (*techhat*) Add file locking to cloud index
- PR #30586: (*abednarik*) Fix comment_line permissions.
- PR #30582: (*terminalmage*) yumpkg.check_db: run separate repoquery commands when multiple names passed
- PR #30548: (*jacobhammons*) Added placeholder release notes for 2015.5.10
- PR #30530: (*terminalmage*) 2015.5 tweaks from #30529
- PR #30484: (*terminalmage*) Backport DNF support to 2015.5 branch
- PR #30512: (*jfindlay*) disable pkgrepo test for ubuntu 15.10+
- PR #30478: (*jtand*) Updated pip_state to work with pip 8.0
- PR #30482: (*borgstrom*) Pyobjects recursive import support (for 2015.5)
- PR #30459: (*jfindlay*) modules.pkg: disable repo int test for ubuntu 15.10
- PR #30443: (*jtand*) Boto uses False for is_default instead of None
- PR #30420: (*attiasr*) Backport #26853
- PR #30364: (*rallytime*) Add TLS version imports and add linode driver documentation notices
- PR #30184: (*rallytime*) Back-port #30166 to 2015.5
- PR #30291: (*thegoodduke*) ipset: fix test=true & add comment for every entry

19.2.25 Salt 2015.5.2 Release Notes

release 2015-06-10

Version 2015.5.2 is a bugfix release for *2015.5.0*.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

PR #24013: (*jbq*) Fix enabling a service on Ubuntu #24012

refs: #24345

- 4afa03d Merge pull request #24345 from rallytime/bp-24013
- 16e0732 Fix enabling a service on Ubuntu #24012

PR #24365: (*jacobhammons*) Fixes for PDF build errors @ 2015-06-03T17:50:02Z

- c3392c2 Merge pull request #24365 from jacobhammons/DocFixes
- 0fc1902 Fixes for PDF build errors

PR #24313: (*nicholascapo*) Fix #22991 Correctly set result when test=True @ 2015-06-03T14:49:18Z

ISSUE #22991: (*nicholascapo*) npm.installed ignores test=True * ae681a4 Merge pull request #24313 from nicholascapo/fix-22991-npm.installed-test-true * ac9644c Fix #22991 npm.installed correctly set result on test=True

PR #24312: (*nicholascapo*) Fix #18966: file.serialize supports test=True @ 2015-06-03T14:49:06Z

ISSUE #18966: (*bechtoldt*) file.serialize ignores test=True * d57a9a2 Merge pull request #24312 from nicholascapo/fix-18966-file.serialize-test-true * e7328e7 Fix #18966 file.serialize correctly set result on test=True

PR #24302: (*jfindlay*) fix pkg hold/unhold integration test @ 2015-06-03T03:27:43Z

- 6b694e3 Merge pull request #24302 from jfindlay/pkg_tests
- c2db0b1 fix pkg hold/unhold integration test

PR #24349: (*rallytime*) Remove references to mount_points in ec2 docs @ 2015-06-03T01:54:09Z

ISSUE #14021: (*mathrawka*) EC2 doc mentions mount_point, but unable to use properly

refs: #24349

- aca8447 Merge pull request #24349 from rallytime/fix-14021
- a235b11 Remove references to mount_points in ec2 docs

PR #24328: (*dr4Ke*) Fix state grains silently fails 2015.5 @ 2015-06-02T15:18:46Z

ISSUE #24319: (*dr4Ke*) grains state shouldn't fail silently * 88a997e Merge pull request #24328 from dr4Ke/fix_state_grains_silently_fails_2015.5 * 8a63d1e fix state grains silently fails #24319

- ca1af20 grains state: add some tests

PR #24310: (*techhat*) Add warning about destroying maps @ 2015-06-02T03:01:28Z

ISSUE #24036: (*arthurlogilab*) [salt-cloud] Protect against passing command line arguments as names for the --destroy command

refs: #24310

ISSUE #9772: (*s0undt3ch*) Delete VM's in a map does not delete them all

refs: #24310

- 7dcd9bb Merge pull request #24310 from techhat/mapwarning
- ca535a6 Add warning about destroying maps

PR #24281: (*steverweber*) Ipmi docfix @ 2015-06-01T17:45:36Z

- 02bfb25 Merge pull request #24281 from steverweber/ipmi_docfix
- dd36f2c yaml formatting
- f6deef3 include api_kg kwarg in ipmi state
- a7d4e97 doc cleanup
- 0ded2fd save more cleanup to doc
- 08872f2 fix name api_key to api_kg
- 165a387 doc fix add api_kg kwarg
- 1ec7888 cleanup docs

PR #24287: (jfindlay) fix pkg test on ubuntu 12.04 for realz @ 2015-06-01T14:16:37Z

- 73cd2cb Merge pull request #24287 from jfindlay/pkg_test
- 98944d8 fix pkg test on ubuntu 12.04 for realz

PR #24279: (rallytime) Backport #24263 to 2015.5 @ 2015-06-01T04:29:34Z

PR #24263: (cdarwin) Correct usage of import_yaml in formula documentation

refs: #24279

- 02017a0 Merge pull request #24279 from rallytime/bp-24263
- beff7c7 Correct usage of import_yaml in formula documentation

PR #24277: (rallytime) Put a space between after_jump commands @ 2015-06-01T04:28:26Z

ISSUE #24226: (c4urself) iptables state needs to keep ordering of flags

refs: #24277

- 2ba696d Merge pull request #24277 from rallytime/fix_iptables_jump
- e2d1606 Move after_jump split out of loop
- d14f130 Remove extra loop
- 42ed532 Put a space between after_jump commands

PR #24262: (basepi) More dictupdate after #24142 @ 2015-05-31T04:09:37Z

PR #24142: (basepi) Optimize dictupdate.update and add #24097 functionality

refs: #24262

PR #24097: (kiorky) Optimize dictupdate

refs: #24142 #24142

- 113eba3 Merge pull request #24262 from basepi/dictupdatefix
- 0c4832c Raise a TypeError if non-dict types
- be21aaa Pylint
- bb8a6c6 More optimization
- c933249 py3 compat
- ff6b2a7 Further optimize dictupdate.update()
- c73f5ba Remove unused valtype

PR #24269: (kiorky) zfs: Fix spurious retcode hijacking in virtual @ 2015-05-30T17:47:49Z

- 785d5a1 Merge pull request #24269 from makinacorpuz/zfs
- 0bf23ce zfs: Fix spurious retcode hijacking in virtual

PR #24257: (*jfindlay*) fix pkg mod integration test on ubuntu 12.04 @ 2015-05-29T23:09:00Z

- 3d885c0 Merge pull request #24257 from jfindlay/pkg_tests
- 9508924 fix pkg mod integration test on ubuntu 12.04

PR #24260: (*basepi*) Fix some typos from #24080 @ 2015-05-29T22:54:58Z

ISSUE #23657: (*arthurlogilab*) [salt-cloud lxc] NameError: global name `__salt__` is not defined

refs: #24080 #23982

PR #24080: (*kiorky*) Lxc consistency2

refs: #24260 #23982 #24066

PR #24066: (*kiorky*) Merge forward 2015.5 -> develop

refs: #23982

PR #24247: (*rallytime*) Backport #24220 to 2015.5 @ 2015-05-29T21:40:01Z

ISSUE #24210: (*damonnk*) salt-cloud vsphere.py should allow key_filename param

refs: #24220

PR #24220: (*djcrabhat*) adding key_filename param to vsphere provider

refs: #24247

- da14f3b Merge pull request #24247 from rallytime/bp-24220
- 0b1041d adding key_filename param to vsphere provider

PR #24254: (*rallytime*) Add deprecation warning to Digital Ocean v1 Driver @ 2015-05-29T21:39:25Z

PR #22731: (*dmyerscough*) Decommission DigitalOcean APIv1 and have users use the new DigitalOcean APIv2

refs: #24254

- 21d6126 Merge pull request #24254 from rallytime/add_deprecation_warning_digitalocean
- cafe37b Add note to docs about deprecation
- ea0f1e0 Add deprecation warning to digital ocean driver to move to digital_ocean_v2

PR #24252: (*aboe76*) Updated suse spec to 2015.5.1 @ 2015-05-29T21:38:45Z

- dac055d Merge pull request #24252 from aboe76/opensuse_package
- 0ad617d Updated suse spec to 2015.5.1

PR #24251: (*garethgreenaway*) Returners broken in 2015.5 @ 2015-05-29T21:37:52Z

- 49e7fe8 Merge pull request #24251 from garethgreenaway/2015_5_returner_brokenness
- 5df6b52 The code calling cfg as a function vs treating it as a dictionary and using get is currently backwards causing returners to fail when used from the CLI and in scheduled jobs.

PR #24255: (*rallytime*) Clarify digital ocean documentation and mention v1 driver deprecation @ 2015-05-29T21:37:07Z

ISSUE #21498: (*rallytime*) Clarify Digital Ocean Documentation

refs: #24255

- bfb9461 Merge pull request #24255 from rallytime/clarify_digital_ocean_driver_docs
- 8d51f75 Clarify digital ocean documentation and mention v1 driver deprecation

PR #24232: (*rallytime*) Backport #23308 to 2015.5 @ 2015-05-29T21:36:46Z

PR #23308: (*thusoy*) Don't merge: Add missing jump arguments to iptables module

refs: #24232

- 41f5756 Merge pull request #24232 from rallytime/bp-23308
- 2733f66 Import string
- 9097cca Add missing jump arguments to iptables module

PR #24245: (*Sacro*) Unset PYTHONHOME when starting the service @ 2015-05-29T20:00:31Z

- a95982c Merge pull request #24245 from Sacro/patch-2
- 6632d06 Unset PYTHONHOME when starting the service

PR #24121: (*hvnsweeting*) deprecate setting user permission in rabbitmq_vhost.present @ 2015-05-29T15:55:40Z

- 1504c76 Merge pull request #24121 from hvnsweeting/rabbitmq-host-deprecate-set-permission
- 2223158 deprecate setting user permission in rabbitmq_host.present

PR #24179: (*merll*) Changing user and group only possible for existing ids. @ 2015-05-29T15:52:43Z

PR #24169: (*merll*) Changing user and group only possible for existing ids.

refs: #24179

- ba02f65 Merge pull request #24179 from Precis/fix-file-uid-gid-2015.0
- ee4c9d5 Use ids if user or group is not present.

PR #24229: (*msteed*) Fix auth failure on syndic with external_auth @ 2015-05-29T15:04:06Z

ISSUE #24147: (*paclat*) Syndication issues when using authentication on master of masters.

refs: #24229

- 9bfb066 Merge pull request #24229 from msteed/issue-24147
- 482d1cf Fix auth failure on syndic with external_auth

PR #24234: (*jayeshka*) adding states/quota unit test case. @ 2015-05-29T14:14:27Z

- 19fa43c Merge pull request #24234 from jayeshka/quota-states-unit-test
- c233565 adding states/quota unit test case.

PR #24217: (*jfindlay*) disable intermittently failing tests @ 2015-05-29T03:08:39Z

ISSUE #40: (*thatch45*) Clean up timeouts

refs: #22857

PR #23623: (*jfindlay*) Fix /jobs endpoint's return

refs: #24217

PR #22857: (*jackson tj*) Fix /jobs endpoint's return

refs: #23623

- e15142c Merge pull request #24217 from jfindlay/disable_bad_tests
- 6b62804 disable intermittently failing tests

PR #24199: (*ryan-lane*) Various fixes for boto_route53 and boto_elb @ 2015-05-29T03:02:41Z

- ce8e43b Merge pull request #24199 from lyft/route53-fix-elb
- d8dc9a7 Better unit tests for boto_elb state
- 62f214b Remove cnames_present test
- 7b9ae82 Lint fix
- b74b0d1 Various fixes for boto_route53 and boto_elb

PR #24142: (*basepi*) Optimize dictupdate.update and add #24097 functionality

refs: #24262

@ 2015-05-29T03:00:56Z

PR #24097: (*kiorky*) Optimize dictupdate

refs: #24142 #24142

PR #21968: (*ryanwohara*) Verifying the key has a value before using it. * a43465d Merge pull request #24142 from basepi/dictupdate24097 * 5c6e210 Deepcopy on merge_recurse

- a13c84a Fix None check from #21968
- 9ef2c64 Add docstring
- 8579429 Add in recursive_update from #24097
- 8599143 if key not in dest, don't recurse
- d8a84b3 Rename klass to valtype

PR #24208: (*jayeshka*) adding states/ports unit test case. @ 2015-05-28T23:06:33Z

- 526698b Merge pull request #24208 from jayeshka/ports-states-unit-test
- 657b709 adding states/ports unit test case.

PR #24219: (*jfindlay*) find zfs without modinfo @ 2015-05-28T21:07:26Z

ISSUE #20635: (*dennisjac*) 2015.2.0rc1: zfs errors in log after update

refs: #24219

- d00945f Merge pull request #24219 from jfindlay/zfs_check
- 15d4019 use the salt loader in the zfs mod
- 5599b67 try to search for zfs if modinfo is unavailable

PR #24190: (*msteed*) Fix issue 23815 @ 2015-05-28T20:10:34Z

ISSUE #23815: (*Snergster*) [beacons] inotify errors on subdir creation * 3dc4b85 Merge pull request #24190 from msteed/issue-23815 * 086a1a9 lint

- 65de62f fix #23815
- d04e916 spelling
- db9f682 add inotify beacon unit tests

PR #24211: (*rallytime*) Backport #24205 to 2015.5 @ 2015-05-28T18:28:15Z

PR #24205: (*hazelesque*) Docstring fix in salt.modules.yumpkg.hold

refs: #24211

- 436634b Merge pull request #24211 from rallytime/bp-24205
- 23284b5 Docstring fix in salt.modules.yumpkg.hold

PR #24212: (*terminalmage*) Clarify error in rendering template for top file @ 2015-05-28T18:26:20Z

- cc58624 Merge pull request #24212 from terminalmage/clarify-error-msg
- ca807fb Clarify error in rendering template for top file

PR #24213: (*The-Loeki*) ShouldFix _- troubles in debian_ip @ 2015-05-28T18:24:39Z

ISSUE #23904: (*mbrgm*) Network config bonding section cannot be parsed when attribute names use dashes

refs: #23917

ISSUE #23900: (*hashi825*) salt ubuntu network building issue 2015.5.0

refs: #23922

PR #23922: (*garethgreenaway*) Fixes to debian_ip.py

refs: #24213

PR #23917: (*corywright*) Split debian bonding options on dash instead of underscore

refs: #24213

- 9825160 Merge pull request #24213 from The-Loeki/patch-3
- a68d515 ShouldFix _- troubles in debian_ip

PR #24214: (*basepi*) 2015.5.1release @ 2015-05-28T16:23:57Z

- 071751d Merge pull request #24214 from basepi/2015.5.1release
- e5ba31b 2015.5.1 release date
- 768494c Update latest release in docs

PR #24202: (*rallytime*) Backport #24186 to 2015.5 @ 2015-05-28T05:16:48Z

PR #24186: (*thcipriani*) Update salt vagrant provisioner info

refs: #24202

- c2f1fdb Merge pull request #24202 from rallytime/bp-24186
- db793dd Update salt vagrant provisioner info

PR #24192: (*rallytime*) Backport #20474 to 2015.5 @ 2015-05-28T05:16:18Z

PR #20474: (*djcrabhat*) add sudo, sudo_password params to vsphere deploy to allow for non-root deploys

refs: #24192

- 8a085a2 Merge pull request #24192 from rallytime/bp-20474
- fd3c783 add sudo, sudo_password params to deploy to allow for non-root deploys

PR #24184: (*rallytime*) Backport #24129 to 2015.5 @ 2015-05-28T05:15:08Z

PR #24129: (*pengyao*) Wheel client doc

refs: #24184

- 7cc535b Merge pull request #24184 from rallytime/bp-24129
- 722a662 fixed a typo
- 565eb46 Add cmd doc for WheelClient

PR #24183: (*rallytime*) Backport #19320 to 2015.5 @ 2015-05-28T05:14:36Z

PR #19320: (*clan*) add `state_output_profile` option for profile output

refs: #24183

- eb0af70 Merge pull request #24183 from rallytime/bp-19320
- 55db1bf sate_output_profile default to True
- 9919227 fix type: statei -> state
- 0549ca6 add `state_output_profile` option for profile output

PR #24201: (*whiteinge*) Add list of client libraries for the rest_cherry module to the top-level documentation @ 2015-05-28T02:12:09Z

- 1b5bf23 Merge pull request #24201 from whiteinge/rest_cherry-client-libs
- 5f71802 Add list of client libraries for the rest_cherry module
- 28fc77f Fix rest_cherry config example indentation

PR #24195: (*rallytime*) Merge #24185 with a couple of fixes @ 2015-05-27T22:18:37Z**PR #24185: (*jacobhammons*) Fixes for doc build errors**

refs: #24195

- 3307ec2 Merge pull request #24195 from rallytime/merge-24185
- d8daa9d Merge #24185 with a couple of fixes
- 634d56b Fixed pylon error
- 0689815 Fixes for doc build errors

PR #24166: (*jayeshka*) adding states/pkgng unit test case. @ 2015-05-27T20:27:49Z

- 7e400bc Merge pull request #24166 from jayeshka/pkgng-states-unit-test
- 2234bb0 adding states/pkgng unit test case.

PR #24189: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-27T20:26:31Z

PR #24178: (*rallytime*) Backport #24118 to 2014.7, too. PR #24159: (*rallytime*) Fill out modules/keystone.py CLI Examples PR #24158: (*rallytime*) Fix test_valid_docs test for tls module PR #24118: (*trevor-h*) removed deprecated pymongo usage

refs: #24139 #24178

- 9fcda79 Merge pull request #24189 from basepi/merge-forward-2015.5
- 8839e9c Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
- 9d7331c Merge pull request #24178 from rallytime/bp-24118
 - e2217a0 removed deprecated pymongo usage as no longer functional with pymongo > 3.x
- 4e8c503 Merge pull request #24159 from rallytime/keystone_doc_examples
 - dadac8d Fill out modules/keystone.py CLI Examples
- fc10ee8 Merge pull request #24158 from rallytime/fix_doc_error
 - 49a517e Fix test_valid_docs test for tls module

PR #24181: (*jtand*) Fixed error where file was evaluated as a symlink in test_absent @ 2015-05-27T18:26:28Z

- 2303dec Merge pull request #24181 from jtand/file_test
- 5f0e601 Fixed error where file was evaluated as a symlink in test_absent

PR #24180: (*terminalmage*) Skip libvirt tests if not running as root @ 2015-05-27T18:18:47Z

- a162768 Merge pull request #24180 from terminalmage/fix-libvirt-test
- 72e7416 Skip libvirt tests if not running as root

PR #24165: (*jayeshka*) adding states/portage_config unit test case. @ 2015-05-27T17:15:08Z

- 1fbc5b2 Merge pull request #24165 from jayeshka/portage_config-states-unit-test
- 8cf1505 adding states/portage_config unit test case.

PR #24164: (*jayeshka*) adding states/pecl unit test case. @ 2015-05-27T17:14:26Z

- 4747856 Merge pull request #24164 from jayeshka/pecl-states-unit-test
- 563a5b3 adding states/pecl unit test case.

PR #24160: (*The-Loeki*) small enhancement to data module; pop() @ 2015-05-27T17:03:10Z

- cdaaa19 Merge pull request #24160 from The-Loeki/patch-1
- 2175ff3 doc & merge fix
- eba382c small enhancement to data module; pop()

PR #24153: (*techhat*) Batch mode sometimes improperly builds lists of minions to process @ 2015-05-27T16:21:53Z

- 4a8dbc7 Merge pull request #24153 from techhat/batchlist
- 467ba64 Make sure that minion IDs are strings

PR #24167: (*jayeshka*) adding states/pagerduty unit test case. @ 2015-05-27T16:14:01Z

- ed8ccf5 Merge pull request #24167 from jayeshka/pagerduty-states-unit-test
- 1af8c83 adding states/pagerduty unit test case.

PR #24156: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-27T15:05:01Z

ISSUE #23464: (*tibold*) cmd_iter_no_block() blocks

refs: #24093

 - 39a8f30 Merge pull request #24093 from mstead/issue-23464
 - * fd35903 Fix failing test
 - * 41b344c Make LocalClient.cmd_iter_no_block() not block
 - 5bffd30 Merge pull request #24008 from davidjb/2014.7
 - * 8b8d029 Correct reST formatting for documentation

- 1aa0420 Merge pull request #23933 from jacobhammons/2014.7
- a3613e6 removed numbering from doc TOC
- 78b737c removed 2015.* release from release notes, updated index page to remove PDF/epub links
- e867f7d Changed build settings to use saltstack2 theme and update release versions.
- 81ed9c9 sphinx saltstack2 doc theme

PR #24145: (jfindlay) attempt to decode win update package @ 2015-05-26T23:20:20Z

ISSUE #24102: (bormotov) win_update encondig problems

refs: #24145

- 05745fa Merge pull request #24145 from jfindlay/win_update_encoding
- cc5e17e attempt to decode win update package

PR #24123: (kiorky) fix service enable/disable change @ 2015-05-26T21:24:19Z

ISSUE #24122: (kiorky) service.dead is no more stateful: services does not handle correctly enable/disable change state

refs: #24123

- 7024789 Merge pull request #24123 from makinacorpuss
- 2e2e1d2 fix service enable/disable change

PR #24146: (rallytime) Fixes the boto_vpc_test failure on CentOS 5 tests @ 2015-05-26T20:15:19Z

- 51c3cec Merge pull request #24146 from rallytime/fix_centos_boto_failure
- ac0f97d Fixes the boto_vpc_test failure on CentOS 5 tests

PR #24144: (twangboy) Compare Keys ignores all newlines and carriage returns @ 2015-05-26T19:25:48Z

ISSUE #24052: (twangboy) v2015.5.1 Changes the way it interprets the minion_master.pub file

refs: #24089 #24144

ISSUE #23566: (rks2286) Salt-cp corrupting the file after transfer to minion

refs: #24144 #23740

PR #23740: (jfindlay) Binary write

refs: #24144

- 1c91a21 Merge pull request #24144 from twangboy/fix_24052
- c197b41 Compare Keys removing all newlines and carriage returns

PR #24139: (rallytime) Backport #24118 to 2015.5 @ 2015-05-26T18:24:27Z

PR #24118: (trevor-h) removed deprecated pymongo usage

refs: #24139 #24178

- 0841667 Merge pull request #24139 from rallytime/bp-24118
- 4bb519b removed deprecated pymongo usage as no longer functional with pymongo > 3.x

PR #24138: (rallytime) Backport #24116 to 2015.5 @ 2015-05-26T18:23:51Z

PR #24116: (awdrius) Fixed typo in chown username (ending dot) that fails the command.

refs: #24138

- 742eca2 Merge pull request #24138 from rallytime/bp-24116
- 7f08641 Fixed typo in chown username (ending dot) that fails the command.

PR #24137: (*rallytime*) Backport #24105 to 2015.5 @ 2015-05-26T18:23:40Z

PR #24105: (*cedwards*) Updated some beacon-specific documentation formatting

refs: #24137

- e01536d Merge pull request #24137 from rallytime/bp-24105
- f0778a0 Updated some beacon-specific documentation formatting

PR #24136: (*rallytime*) Backport #24104 to 2015.5 @ 2015-05-26T15:58:47Z

ISSUE #23364: (*pruiz*) Unable to destroy host using proxmox cloud: There was an error destroying machines: 501 Server Error: Method `DELETE /nodes/pmx1/openvz/openvz/100' not implemented PR #24104: (*pruiz*) Only try to stop a VM if it's not already stopped. (fixes #23364)

refs: #24136

- 89cdf97 Merge pull request #24136 from rallytime/bp-24104
- c538884 Only try to stop a VM if it's not already stopped. (fixes #23364)

PR #24135: (*rallytime*) Backport #24083 to 2015.5 @ 2015-05-26T15:58:27Z

PR #24083: (*swdream*) fix code block syntax

refs: #24135

- 67c4373 Merge pull request #24135 from rallytime/bp-24083
- e1d06f9 fix code block syntax

PR #24131: (*jayeshka*) adding states/mysql_user unit test case @ 2015-05-26T15:58:10Z

- a83371e Merge pull request #24131 from jayeshka/mysql_user-states-unit-test
- ed1ef69 adding states/mysql_user unit test case

PR #24130: (*jayeshka*) adding states/ntp unit test case @ 2015-05-26T15:57:29Z

- 1dc1d2a Merge pull request #24130 from jayeshka/ntp-states-unit-test
- ede4a9f adding states/ntp unit test case

PR #24128: (*jayeshka*) adding states/openstack_config unit test case @ 2015-05-26T15:56:08Z

- 3943417 Merge pull request #24128 from jayeshka/openstack_config-states-unit-test
- ca09e0f adding states/openstack_config unit test case

PR #24127: (*jayeshka*) adding states/npm unit test case @ 2015-05-26T15:55:18Z

- 23f25c4 Merge pull request #24127 from jayeshka/npm-states-unit-test
- c3ecabb adding states/npm unit test case

PR #24077: (*anlutro*) Change how state_verbose output is filtered @ 2015-05-26T15:41:11Z

ISSUE #24009: (*hvnswesting*) state_verbose False summary is wrong

refs: #24077

- 07488a4 Merge pull request #24077 from alprs/fix-outputter_highstate_nonverbose_count
- 7790408 Change how state_verbose output is filtered

PR #24119: (*jfindlay*) Update contrib docs @ 2015-05-26T15:37:01Z

- 224820f Merge pull request #24119 from jfindlay/update_contrib_docs
- fa2d411 update example release branch in contrib docs
- a0b76b5 clarify git rebase instructions
- 3517e00 fix contribution docs link typos
- 651629c backport dev contrib doc updates to 2015.5

PR #23928: (joejulian) Add the ability to replace existing certificates @ 2015-05-25T19:47:26Z

- 5488c4a Merge pull request #23928 from joejulian/2015.5_tls_module_replace_existing
- 4a4cbdd Add the ability to replace existing certificates

PR #24078: (jfindlay) if a charmap is not supplied, set it to the codeset @ 2015-05-25T19:39:19Z

ISSUE #23221: (Reiner030) Debian Jessie: locale.present not working again

refs: #24078

- dd90ef0 Merge pull request #24078 from jfindlay/locale_charmap
- 5eb97f0 if a charmap is not supplied, set it to the codeset

PR #24088: (jfindlay) pkg module integration tests @ 2015-05-25T19:39:02Z

- 9cec5d3 Merge pull request #24088 from jfindlay/pkg_tests
- f1bd5ec adding pkg module integration tests
- 739b2ef rework yumpkg refresh_db so args are not mandatory

PR #24089: (jfindlay) allow override of binary file mode on windows @ 2015-05-25T19:38:44Z

ISSUE #24052: (twangboy) v2015.5.1 Changes the way it interprets the minion_master.pub file

refs: #24089 #24144

- 517552c Merge pull request #24089 from jfindlay/binary_write
- b2259a6 allow override of binary file mode on windows

PR #24092: (jfindlay) collect scattered contents edits, ensure it's a str @ 2015-05-25T19:38:10Z

ISSUE #23973: (mschiff) state file.managed: setting contents_pillar to a pillar which is a list throws exception instead giving

refs: #24092

- 121ab9f Merge pull request #24092 from jfindlay/file_state
- cfa0f13 collect scattered contents edits, ensure it's a str

PR #24112: (The-Loeki) thin_gen breaks when thinver doesn't exist @ 2015-05-25T19:37:47Z

- 84e65de Merge pull request #24112 from The-Loeki/patch-1
- 34646ea thin_gen breaks when thinver doesn't exist

PR #24108: (jayeshka) adding states/mysql_query unit test case @ 2015-05-25T12:30:48Z

- ec509ed Merge pull request #24108 from jayeshka/mysql_query-states-unit-test
- ec50450 adding states/mysql_query unit test case

PR #24110: (jayeshka) adding varnish unit test case @ 2015-05-25T12:30:21Z

- f2e5d6c Merge pull request #24110 from jayeshka/varnish-unit-test

- e119889 adding varnish unit test case

PR #24109: (jayeshka) adding states/mysql_grants unit test case @ 2015-05-25T12:29:53Z

- 4fca2b4 Merge pull request #24109 from jayeshka/mysql_grants-states-unit-test
- 11a93cb adding states/mysql_grants unit test case

PR #24028: (nleib) send a disable message to disable puppet @ 2015-05-25T04:02:11Z

- 6b43c9a Merge pull request #24028 from nleib/2015.5
- 15f24b4 update format of string in disabled msg
- 7690e5b remove trailing whitespaces
- 56a9720 Update puppet.py
- 9686391 Update puppet.py
- 33f3d68 send a disable message to disable puppet

PR #24100: (jfindlay) adding states/file unit test case @ 2015-05-24T05:17:54Z

PR #23963: (jayeshka) adding states/file unit test case

refs: #24100

- 52c9aca Merge pull request #24100 from jfindlay/merge_23963
- 7d59deb adding states/file unit test case

PR #24098: (galet) Systemd not recognized properly on Oracle Linux 7 @ 2015-05-24T04:07:31Z

ISSUE #21446: (dpheasant) check for systemd on Oracle Linux

refs: #24098

- 0eb9f15 Merge pull request #24098 from galet/2015.5
- 4d6ab21 Systemd not recognized properly on Oracle Linux 7

PR #24090: (jfindlay) adding states/mount unit test case @ 2015-05-22T23:02:57Z

PR #24062: (jayeshka) adding states/mount unit test case

refs: #24090

- 8e04db7 Merge pull request #24090 from jfindlay/merge_24062
- a81a922 adding states/mount unit test case

PR #24086: (rallytime) Backport #22806 to 2015.5 @ 2015-05-22T21:18:20Z

ISSUE #22574: (unicolet) error when which is not available

refs: #22806

PR #22806: (jfindlay) use cmd.run_all instead of cmd.run_stdout

refs: #24086

- c0079f5 Merge pull request #24086 from rallytime/bp-22806
- f728f55 use cmd.run_all instead of cmd.run_stdout

PR #24024: (jayeshka) adding states/mongodb_user unit test case @ 2015-05-22T20:53:19Z

- 09de253 Merge pull request #24024 from jayeshka/mongodb_user-states-unit-test
- f31dc92 resolved errors

- d038b1f adding states/mongodb_user unit test case

PR #24065: (kiorky) continue to fix #23883

refs: #24080 #24066

@ 2015-05-22T18:59:21Z

ISSUE #23883: (kaithar) max_event_size seems broken * bfd812c Merge pull request #24065 from makinacorus/real23883 * 028282e continue to fix #23883

PR #24029: (kiorky) Fix providers handling @ 2015-05-22T16:56:06Z

ISSUE #24017: (arthurlogilab) [salt-cloud openstack] TypeError: unhashable type: `dict' on map creation

refs: #24029

- 429adfe Merge pull request #24029 from makinacorus/fixproviders
- 412b39b Fix providers handling

PR #23936: (jfindlay) remove unreachable returns in file state @ 2015-05-22T16:26:49Z

- a42cccc Merge pull request #23936 from jfindlay/file_state
- ac29c0c also validate file.recurse source parameter
- 57f7388 remove unreachable returns in file state

PR #24063: (jayeshka) removed tuple index error @ 2015-05-22T14:58:20Z

- 8b69b41 Merge pull request #24063 from jayeshka/mount-states-module
- b9745d5 removed tuple index error

PR #24057: (rallytime) Backport #22572 to 2015.5 @ 2015-05-22T05:36:25Z

PR #22572: (The-Loeki) Small docfix for GitPillar

refs: #24057

- 02ac4aa Merge pull request #24057 from rallytime/bp-22572
- 49aad84 Small docfix for GitPillar

PR #24040: (rallytime) Backport #24027 to 2015.5 @ 2015-05-21T23:43:54Z

ISSUE #23088: (wfhg) Segfault when adding a Zypper repo on SLES 11.3

refs: #24027

PR #24027: (wfhg) Add baseurl to salt.modules.zypper.mod_repo

refs: #24040

- 82de059 Merge pull request #24040 from rallytime/bp-24027
- 37d25d8 Added baseurl as alias for url and mirrorlist in salt.modules.zypper.mod_repo.

PR #24039: (rallytime) Backport #24015 to 2015.5 @ 2015-05-21T23:43:25Z

PR #24015: (YanChii) minor improvement of solarisips docs & fix typos

refs: #24039

- d909781 Merge pull request #24039 from rallytime/bp-24015
- 6bfaa94 minor improvement of solarisips docs & fix typos

PR #24038: (rallytime) Backport #19599 to 2015.5 @ 2015-05-21T23:43:10Z

ISSUE #19598: (*fayatted*) ssh_auth.present test=true incorectly reports changes will be made

refs: #19599

PR #19599: (*fayatted*) Fix ssh_auth test mode, compare lines not just key

refs: #24038

- 4a0f254 Merge pull request #24038 from rallytime/bp-19599
- ea00d3e Fix ssh_auth test mode, compare lines not just key

PR #24046: (*rallytime*) Remove key management test from digital ocean cloud tests @ 2015-05-21T22:32:04Z

- 42b87f1 Merge pull request #24046 from rallytime/remove_key_test
- 1d031ca Remove key management test from digital ocean cloud tests

PR #24044: (*cro*) Remove spurious log message, fix typo in doc @ 2015-05-21T22:31:49Z

- eff54b1 Merge pull request #24044 from cro/pgjsonb
- de06633 Remove spurious log message, fix typo in doc

PR #24001: (*msteed*) issue #23883 @ 2015-05-21T20:32:30Z

ISSUE #23883: (*kaithar*) max_event_size seems broken * ac32000 Merge pull request #24001 from msteed/issue-23883 * bea97a8 issue #23883

PR #23995: (*kiorky*) Lxc path pre @ 2015-05-21T17:26:03Z

- f7fae26 Merge pull request #23995 from makinacorp/lxc_path_pre
- 319282a lint
- 1dc67e5 lxc: versionadded
- fcad7cb lxc: states improvements
- 644bd72 lxc: more consistence for profiles
- 139372c lxc: remove merge cruft
- 725b046 lxc: Repair merge

PR #24032: (*kartiksubbarao*) Update augeas_cfg.py @ 2015-05-21T17:03:42Z

ISSUE #16383: (*interjection*) salt.states.augeas.change example from docs fails with exception

refs: #24032

- 26d6851 Merge pull request #24032 from kartiksubbarao/augeas_insert_16383
- 3686dcd Update augeas_cfg.py

PR #24025: (*jayeshka*) adding timezone unit test case @ 2015-05-21T16:50:53Z

- 55c9245 Merge pull request #24025 from jayeshka/timezone-unit-test
- 1ec33e2 removed assertion error
- 16ecb28 adding timezone unit test case

PR #24023: (*jayeshka*) adding states/mongodb_database unit test case @ 2015-05-21T16:49:17Z

- e243617 Merge pull request #24023 from jayeshka/mongodb_database-states-unit-test
- 5a9ac7e adding states/mongodb_database unit test case

PR #24022: (*jayeshka*) adding states/modjk_worker unit test case @ 2015-05-21T16:48:29Z

- b377bd9 Merge pull request #24022 from jayeshka/modjk_worker-states-unit-test
- 05c0a98 adding states/modjk_worker unit test case

PR #24005: (mstead) issue #23776 @ 2015-05-21T01:55:34Z

ISSUE #23776: (*enblde*) Presence change events constantly reporting all minions as new in 2015.5 * 701c51b
Merge pull request #24005 from mstead/issue-23776 * 62e67d8 issue #23776

PR #23996: (neogenix) iptables state generates a 0 position which is invalid in iptables cli #23950 @ 2015-05-20T22:44:27Z

ISSUE #23950: (*neogenix*) iptables state generates a 0 position which is invalid in iptables cli

refs: #23996

- 17b7c0b Merge pull request #23996 from neogenix/2015.5-23950
- ad417a5 fix for #23950

PR #23994: (rallytime) Skip the gpodder pkgrepo test for Ubuntu 15 - they don't have vivid ppa up yet @ 2015-05-20T21:18:21Z

- 4cb8773 Merge pull request #23994 from rallytime/skip_test_ubuntu_15
- 9e0ec07 Skip the gpodder pkgrepo test - they don't have vivid ppa up yet

19.2.26 Salt 2015.5.3 Release Notes

Statistics:

- Total Merges: 177
- Total Issue references: 81
- Total PR references: 231

Changes:

- **PR #25096: (jfindlay) Postgres group test @ 2015-07-01T18:48:26Z**
 - PR #24330: (*jayeshka*) adding states/postgres_group unit test case. | refs: #25096
 - 21709aa Merge pull request #25096 from jfindlay/postgres_group_test
 - 3c379dc decllobber postgres state unit test mocking
 - a162ffa adding states/postgres_group unit test case.
- **PR #25085: (jfindlay) accept all sources in the file state @ 2015-07-01T18:23:45Z**
 - ISSUE #25041: (*wt*) REGRESSION: pillar.get of integer fails to render in sls | refs: #25085
 - 0a84640 Merge pull request #25085 from jfindlay/fix_file
 - 937a252 remove unnecessary file state tests
 - 6f238e9 integration test file.managed sources
 - a5978d3 iterate an iterable source othwerise list+str it
- **PR #25095: (jfindlay) Win groupadd unit tests @ 2015-07-01T18:18:53Z**
 - PR #24207: (*jayeshka*) adding win_groupadd unit test case. | refs: #25095

- a983942 Merge pull request #25095 from jfindlay/win_groupadd_test
- 564dff depend on win libs rather than mocking them
- 9b9aeb8 resolved all errors.
- aaf8935 adding win_groupadd unit test case.
- PR #25089: (*jfindlay*) fix minion sudo @ 2015-07-01T15:53:16Z
 - ISSUE #21520: (*jfindlay*) sudo.salt_call is broken | refs: #25089
 - PR #20226: (*thatch45*) Allow sudo priv escalation | refs: #25089
 - 7c8d2a8 Merge pull request #25089 from jfindlay/fix_sudo
 - d8f91d4 add some apprehension to the sudo exec module
 - a9269c0 adding sudo exec module docs
 - e4a40b7 comment whitespace in minion config
 - 44cb167 adding sudo_user minion config docs
 - d461060 adding sudo_user minion config to default
- PR #25099: (*driskell*) Fix broken batch results @ 2015-07-01T15:51:29Z
 - ISSUE #24875: (*ahammond*) ValueError: list.remove(x): x not in list in File ``/usr/lib/python2.6/site-packages/salt/cli/batch.py``, line 179, in run active.remove(minion) | refs: #25099
 - 4d6078e Merge pull request #25099 from driskell/patch-1
 - 59b23e5 Fix broken batch results
- PR #25083: (*steverweber*) ipmi: get_sensor_data would always fail @ 2015-06-30T20:57:21Z
 - 4635079 Merge pull request #25083 from steverweber/fix_ipmi_stat
 - 836f48c include _ in IpmiCommand
 - 817e434 get_sensor_data would always fail
- PR #25067: (*The-Loeki*) Fix for maxdepth=0 in find @ 2015-06-30T20:54:06Z
 - 15f2a40 Merge pull request #25067 from The-Loeki/patch-1
 - 61edad3 Fix for maxdepth=0 in find
- PR #25078: (*terminalmage*) Use smaller number for upper limit of mac_user's _first_avail_uid helper function @ 2015-06-30T20:53:24Z
 - 58d933c Merge pull request #25078 from terminalmage/fix-mac-uid
 - df2ab7e Use smaller number for upper limit of mac_user's _first_avail_uid helper function
- PR #25045: (*garethgreenaway*) Fixes to debian_ip.py in 2015.5 @ 2015-06-30T17:36:43Z
 - ISSUE #24521: (*multani*) State network.managed fails on Debian (Jessie) | refs: #25045
 - ebd6cdc Merge pull request #25045 from garethgreenaway/24521_debian_networking
 - 6f2a6c9 having proto default to static since it's needed to build the template.
- PR #25065: (*lorengordon*) Add download links for 2015.5.1-3 and 2015.5.2 Windows installers @ 2015-06-30T15:29:31Z
 - ISSUE #25057: (*TheBigBear*) why is there still no newer salt-minion for windows than ver. 2015.5.0-2? no 2015.5.1 or 2015.5.2?

- ae31b27 Merge pull request #25065 from lorengordon/update-windows-installer-links
- 40a0c13 Add download links for 2015.5.1-3 and 2015.5.2, Fixes #25057
- PR #25052: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-30T01:05:00Z
 - ISSUE #15209: (*hubez*) file.manage: source_hash not working with s3:// (2014.7.0rc1) | refs: #25011
 - PR #25011: (*notpeter*) Add s3 to protocols for remote source_hash (2014.7 backport)
 - ddaeb0f Merge pull request #25052 from basepi/merge-forward-2015.5
 - 2c5e664 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
 - a7154e7 Merge pull request #25011 from notpeter/s3_2014.7_backport
 - * 8b8af64 Add s3 to protocols for remote source_hash

 - b1211c5 Re-enable tests for complex prereq and prereq_in
 - 378f6bf Only merge when the merge is of requisites
- PR #24766: (*msteed*) Remove doc references to obsolete minion opt @ 2015-06-17T21:36:55Z
 - 5fe4de8 Merge pull request #24766 from msteed/undoc-dns_check
 - f92a769 Remove doc references to obsolete minion opt
- PR #24329: (*jayeshka*) adding states/postgres_database unit test case. | refs: #24798 @ 2015-06-17T19:11:02Z
 - a407ab7 Merge pull request #24329 from jayeshka/postgres_database-states-unit-test
 - ee06f1a adding states/postgres_database unit test case.
- PR #24632: (*jacobhammons*) Doc bug fixes @ 2015-06-17T18:40:02Z
 - ISSUE #24560: (*hydrosine*) Documentation missing on parameter | refs: #24632
 - ISSUE #24547: (*dragonpaw*) Artifactory docs say module is `jboss7`. | refs: #24632
 - ISSUE #24375: (*companykitchen-dev*) Custom grain won't sync under any circumstances | refs: #24632
 - ISSUE #24275: (*kartiksubbarao*) augeas issue with apache and recognizing changes that have been already made | refs: #24632
 - ISSUE #24163: (*tbaker57*) enable_gpu_grains default value confusion | refs: #24632
 - 3ff6eff Merge pull request #24632 from jacobhammons/bug-fixes
 - 7c52012 Fixed typos
 - c7cdd41 Doc bug fixes Refs #24547 Refs #24275 Refs #24375 Refs #24560 Refs #24163
- PR #24607: (*garethgreenaway*) fixes to minion.py @ 2015-06-17T18:16:42Z
 - ISSUE #24198: (*ahammond*) salt-call event.send doesn't send events from minion | refs: #24607

- 9995f64 Merge pull request #24607 from garethgreenaway/2015_5_sending_events_multi_master
- 8abd3f0 A fix if you have multiple masters configured and try to fire events to the minion. Currently they fail silently. Might be the cause of #24198.
- PR #24755: (*rallytime*) Remove SALT_CLOUD_REQS from setup.py @ 2015-06-17T17:42:25Z
 - bf2dd94 Merge pull request #24755 from rallytime/fix_setup_15
 - 48769a5 Remove SALT_CLOUD_REQS from setup.py
- PR #24740: (*rallytime*) Backport #24720 to 2015.5 @ 2015-06-17T16:43:37Z
 - PR #24720: (*TheScriptSage*) Issue 24621 - AD/LDAP Group Auth Issue | refs: #24740
 - 3d53d79 Merge pull request #24740 from rallytime/bp-24720
 - a9bcdb5 Updating master.py to properly check against groups when user is only authenticated against group. Tested against unit.auth_test.
- PR #24723: (*rallytime*) Back-port #20124 to 2015.5 @ 2015-06-17T16:43:20Z
 - PR #20124: (*cgtx*) add init system to default grains | refs: #24723
 - ac2851b Merge pull request #24723 from rallytime/bp-20124
 - 4d0061b fix infinite loop introduced by #20124 when the init system is not in the supported_inits list
 - 0c7fa0f Optimizations for #20124
 - f353454 add init system to default grains (resolve #20124)
- PR #24754: (*anlutro*) salt-cloud documentation - Add information about linode location @ 2015-06-17T16:04:48Z
 - 78cd09b Merge pull request #24754 from alprs/docs-add_linode_location_option
 - d88e071 add information about linode location
- PR #24748: (*jayeshka*) adding states/serverdensity_device unit test case. @ 2015-06-17T15:39:07Z
 - d5554f7 Merge pull request #24748 from jayeshka/serverdensity_device-states-unit-test
 - 1a4c241 adding states/serverdensity_device unit test case.
- PR #24739: (*rallytime*) Back-port #24735 to 2015.5 @ 2015-06-17T15:16:47Z
 - PR #24735: (*notpeter*) Add 2015.5 codename to version numbers docs | refs: #24739
 - 0b7e7ef Merge pull request #24739 from rallytime/bp-24735
 - 64c565d Add .0 to version number
 - 5ed801b Add codenames for 2015.5 and future versions. Trailing newline.
- PR #24732: (*msteed*) Fix stacktrace when --summary is used @ 2015-06-17T03:27:57Z
 - ISSUE #24111: (*yermulnik*) cli option '--summary' got broken after upgrade to 2015.5.1 | refs: #24732
 - c8713f2 Merge pull request #24732 from msteed/issue-24111
 - 54b33dd Fix stacktrace when --summary is used
- PR #24721: (*rallytime*) Back-port #24668 to 2015.5 @ 2015-06-17T03:23:47Z
 - PR #24668: (*grischa*) enable virtual package names in pyobjects renderer | refs: #24721 #24757
 - 70d3781 Merge pull request #24721 from rallytime/bp-24668
 - 68fb5af fixing other test

- ba4f262 fixing text for virtual support in pyobjects
- b349d91 enable virtual package names in pyobjects renderer
- PR #24718: (*rallytime*) Added some missing config documentation to the vsphere driver @ 2015-06-17T03:19:35Z
 - ISSUE #21923: (*Fluro*) Salt cloud not running provisioning script as root | refs: #24718
 - ISSUE #17241: (*hasues*) Salt-Cloud for vSphere needs additional documentation | refs: #24718
 - 1b9d689 Merge pull request #24718 from rallytime/update_vsphere_docs
 - bfdebb6 Added some missing config documentation to the vsphere driver
- PR #24714: (*rallytime*) Remove cloud-requirements.txt @ 2015-06-17T03:17:04Z
 - 64857c7 Merge pull request #24714 from rallytime/remove_cloud_reqs_15
 - 67b796d Remove cloud-requirements.txt
- PR #24733: (*mstead*) Include Tornado in versions report @ 2015-06-17T03:13:53Z
 - ISSUE #24439: (*bechtoldt*) Add tornado version to versions report | refs: #24733
 - f96b1d6 Merge pull request #24733 from mstead/issue-24439
 - 76cfef0 Include Tornado in versions report
- PR #24737: (*jacksontj*) Move AES command logging to trace @ 2015-06-17T01:48:11Z
 - a861fe0 Merge pull request #24737 from jacksontj/2015.5
 - a4ed41a Move AES command logging to trace
- PR #24724: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-16T22:46:27Z
 - ISSUE #24196: (*johnccfm*) Exception when using user.present with Windows | refs: #24646
 - PR #24646: (*twangboy*) Fixed user.present on existing user
 - 0d2dc46 Merge pull request #24724 from basepi/merge-forward-2015.5
 - 4641028 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
 - a18dada Merge pull request #24646 from twangboy/fix_24196
 - * a208e1d Fixed user.present on existing user
- PR #24701: (*jayeshka*) adding states/selinux unit test case. @ 2015-06-16T15:27:29Z
 - 3d33fe7 Merge pull request #24701 from jayeshka/selinux-states-unit-test
 - 0c136fd adding states/selinux unit test case.
- PR #24687: (*cachedout*) Note about minimum worker_threads @ 2015-06-15T20:46:23Z
 - 2e287a9 Merge pull request #24687 from cachedout/min_worker_threads
 - b7bb7ea Note about minimum worker_threads
- PR #24688: (*cachedout*) Update AUTHORS @ 2015-06-15T20:46:03Z
 - 432478c Merge pull request #24688 from cachedout/update_authors
 - 3f6880e Better email
 - 6c7b773 Update AUTHORS
- PR #24649: (*cachedout*) Improved error reporting for failed states @ 2015-06-15T16:04:20Z

- ISSUE #22385: (*cachedout*) States which require unavailable modules should display the reason | refs: #24649
- 9a2b50d Merge pull request #24649 from cachedout/issue_22385
- b9fe792 States will now return the reason behind failure if a module could not be loaded
- PR #24673: (*jayeshka*) adding states/schedule unit test case. @ 2015-06-15T15:24:52Z
 - 66e9e16 Merge pull request #24673 from jayeshka/schedule-states-unit-test
 - 54aaaa5 adding states/schedule unit test case.
- PR #24663: (*kartiksubbarao*) Update augeas_cfg.py @ 2015-06-15T15:18:48Z
 - ISSUE #24661: (*kartiksubbarao*) augeas.change doesn't support setting empty values | refs: #24663
 - 5eb19c4 Merge pull request #24663 from kartiksubbarao/patch-2
 - e18db50 Update augeas_cfg.py
- PR #24667: (*dkiser*) fix for #24583 clouds/openstack.py keyring first time succeeds @ 2015-06-14T21:58:58Z
 - ISSUE #24583: (*dkiser*) salt-cloud keyring password referenced before assignment | refs: #24667
 - 4450432 Merge pull request #24667 from dkiser/fix-cloud-keyring
 - c92c05f fix for #24583 clouds/openstack.py keyring first time succeeds
- PR #24659: (*kartiksubbarao*) Update aliases.py @ 2015-06-13T17:31:42Z
 - ISSUE #24537: (*kartiksubbarao*) alias.present doesn't update alias values that are substrings of the existing value | refs: #24659
 - 4c64ee9 Merge pull request #24659 from kartiksubbarao/patch-1
 - d683474 Update aliases.py
- PR #24644: (*cro*) Merge forward 2014.7->2015.5 @ 2015-06-12T21:31:41Z
 - PR #24643: (*cro*) Add reference to salt-announce mailing list
 - PR #24620: (*twangboy*) Fixed comment and uncomment functions in file.py
 - 89eb616 Merge pull request #24644 from cro/2014.7-2015.5-20150612
 - 4136dc3 Merge forward from 2014.7 to 2015.5
 - b99484f Merge pull request #24643 from cro/saltannounce
 - * ecb0623 Add salt-announce mailing list.
 - 635121e Merge pull request #24620 from twangboy/fix_24215
 - * d7a9999 Fixed comment and uncomment functions in file.py
- PR #24642: (*basepi*) Revert ``fix target rule, remove unneeded quotation mark" @ 2015-06-12T20:14:26Z
 - PR #24595: (*tankywoo*) fix target rule, remove unneeded quotation mark | refs: #24642

 - 0cb11a2 lxc: typo
 - d71efa6 Try to close input pipes before calling lxc-start

19.2.27 Salt 2015.5.4 Release Notes

Version 2015.5.4 is a bugfix release for *2015.5.0*.

Changes:

- The `cron.present` state now correctly defaults to state ID as identifier.
- When querying for VMs in `digital_ocean_v2.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` Salt-Cloud driver was back-ported from the `develop` branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

Changes for v2015.5.3..v2015.5.4

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

19.2.28 Salt 2015.5.5 Release Notes

Version 2015.5.5 is a bugfix release for *2015.5.0*.

Changes:

- The `cron.present` state now correctly defaults to state ID as identifier.
- When querying for VMs in `digital_ocean_v2.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` Salt-Cloud driver was back-ported from the `develop` branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

Changes for v2015.5.3..v2015.5.5

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Changes:

- PR #26292: (*jquast*) Rabbitmq 3.2.4 on Ubuntu has "...done.", not "...done" @ 2015-08-13T19:53:29Z
- PR #26296: (*jquast*) bugfix missing `runas=None` for rabbitmqctl cmds (backport to 2015.5) @ 2015-08-13T19:52:40Z
- PR #26293: (*jfindlay*) Fix #26268 @ 2015-08-13T19:48:06Z
 - ISSUE #25618: (*twangboy*) Fix reg.py to work with the registry properly | refs: #26268
 - PR #26268: (*twangboy*) Multiple improvements to reg executionmod and state mod | refs: #26293
- PR #26290: (*rallytime*) Only call convert_to_arn when action name is provided @ 2015-08-13T18:48:58Z
 - ISSUE #25192: (*deuscapturus*) 2015.5.2 boto_cloudwatch_alarm.present not working. | refs: #26290
- PR #26288: (*bbinet*) allow deleting grains which value is False @ 2015-08-13T18:24:36Z
- PR #26263: (*rallytime*) Don't make changes when test=True for openstack present/absent funcs @ 2015-08-13T16:30:31Z
 - ISSUE #24882: (*nmadhok*) salt.states.openstack_config.present and salt.states.openstack_config.absent make changes when test=True | refs: #26263
- PR #26265: (*rallytime*) Don't stacktrace on query return in ec2.create_snapshot @ 2015-08-13T16:28:48Z
 - ISSUE #24484: (*codehotter*) clouds/ec2.py: create_snapshot throws exception | refs: #26265
- PR #26285: (*stanislavb*) Remove explicit version from instance identity URL @ 2015-08-13T16:25:32Z
- PR #26275: (*cachedout*) Re-init modules on multi-master reconnect @ 2015-08-13T15:52:50Z
- PR #26273: (*garethgreenaway*) Fixes to schedule module in 2015.5 @ 2015-08-13T15:34:43Z
- PR #26271: (*rallytime*) Fix del_root_vol_on_destroy and del_all_vols_on_destroy functionality on ec2 @ 2015-08-12T23:22:47Z
 - ISSUE #24483: (*codehotter*) clouds/ec2.py: del_root_vol_on_destroy and del_all_vols_on_destroy not working | refs: #26271
- PR #26219: (*anlutro*) cron: make identifier default to state ID @ 2015-08-12T18:42:33Z
 - ISSUE #25958: (*anlutro*) Cron identifier does not default to state ID as documented | refs: #26219
- PR #26257: (*rallytime*) Back-port #26237 to 2015.5 @ 2015-08-12T18:40:35Z
 - ISSUE #26207: (*fullermd*) group members setting fails with obscure error message on FreeBSD | refs: #26237
 - PR #26237: (*silenius*) fix issue #26207 | refs: #26257
- PR #26258: (*nmadhok*) Fix permission on tests/runtests.py on 2015.5 branch @ 2015-08-12T18:40:04Z
- PR #26261: (*nmadhok*) Correct spelling of integration in docs @ 2015-08-12T18:14:48Z
 - PR #2015: (*thekuffs*) Esky / bbfreeze support
- PR #26247: (*nmadhok*) Initial commit of unit tests for vmware cloud driver @ 2015-08-12T16:58:24Z
- PR #26246: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.5 branch @ 2015-08-12T15:11:26Z
- PR #26239: (*opdude*) Fixed documentation to match function name @ 2015-08-12T14:48:52Z
- PR #26232: (*garethgreenaway*) Fix to trust_key in gpg module for 2015.5. @ 2015-08-12T04:48:27Z
- PR #26084: (*twangboy*) Added python_shell=True, quoted user input @ 2015-08-10T21:29:35Z

- ISSUE #25802: (*jefftucker*) Running module ``npm.list" fails on Windows for masterless minion | refs: #26084
- PR #26183: (*cro*) Fix LDAP configuration issue. @ 2015-08-10T19:09:41Z
- PR #26186: (*jacobhammons*) regenerated man pages @ 2015-08-10T19:07:44Z
- PR #26182: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-10T19:00:10Z
 - ISSUE #25961: (*getabe*) [2015.5.3-2] salt-winrepo.git/salt-minion.sls fails certificate ``*.wpengine.com' or `wpengine.com' | refs: #26047
 - ISSUE #25751: (*basepi*) Document *master_finger* more prominently | refs: #26088
 - PR #26116: (*corux*) file.replace fails if repl string is an invalid regex and append/prepend is used
 - PR #26088: (*jacobhammons*) Master finger
 - PR #26047: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com>
- PR #26000: (*driskell*) Implement full event caching for subscribed tags @ 2015-08-10T18:57:17Z
 - ISSUE #25998: (*driskell*) Event subsystem discarding required events during --batch breaking it for slow running commands | refs: #26000
- PR #26175: (*rallytime*) Back-port #26153 to 2015.5 @ 2015-08-10T18:22:32Z
 - PR #26153: (*loa*) Fix dockerio state documentation typo | refs: #26175
- PR #26177: (*rallytime*) Back-port #26147 to 2015.5 @ 2015-08-10T18:22:01Z
 - ISSUE #26024: (*jpgic*) lxc_conf_unset in cloud.profile is ignored
 - PR #26147: (*martinhoefling*) Fixes #26024 | refs: #26177
- PR #26179: (*rallytime*) Back-port #25404 to 2015.5 @ 2015-08-10T18:21:50Z
 - ISSUE #21082: (*clinta*) master_type failover does not failover on DNS errors | refs: #25404
 - PR #25404: (*DmitryKuzmenko*) Fixed minion failover to next master on DNS errors. | refs: #26179
- PR #26180: (*jfindlay*) fix processing of state.template @ 2015-08-10T18:21:38Z
 - ISSUE #26112: (*wt*) state.template fails with unclear error with template with only an include | refs: #26180
- PR #26172: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it. @ 2015-08-10T16:42:50Z
 - ISSUE #26162: (*nmadhok*) VMware cloud driver create function failing with traceback on latest develop | refs: #26163 #26172
 - PR #26163: (*nmadhok*) Make sure variable is a dictionary before popping something from it.
- PR #26168: (*cachedout*) Fix slack docs @ 2015-08-10T14:57:18Z
 - ISSUE #26098: (*rdinoff*) SALT.STATES.SLACK Doc update | refs: #26168
- PR #26127: (*garethgreenaway*) Fixes to salt.utils.http related to cp.get_file_str bug. @ 2015-08-10T14:38:25Z
 - ISSUE #24106: (*nvx*) fileclient.py#get_url ignores HTTP Auth again (2015.5 regression) | refs: #26127
- PR #26140: (*nmadhok*) VMware cloud driver fixes @ 2015-08-10T13:15:58Z
 - ISSUE #26141: (*nmadhok*) salt-cloud VMware driver fails with error in parsing configuration file | refs: #26140
 - ISSUE #25809: (*o-sleep*) vmware cloud module error message | refs: #26140

- ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac_address unless vmware tools is running | refs: #26137 #26140
- PR #26137: (*steverweber*) use device mac address if vmttools not active @ 2015-08-09T03:05:36Z
 - ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac_address unless vmware tools is running | refs: #26137 #26140
- PR #26119: (*jodv*) Backport eauth bugfix to 2015.5 @ 2015-08-09T02:19:52Z
- PR #26135: (*cro*) Fix proxy minions in 2015.5 and significantly update documentation. @ 2015-08-09T02:19:21Z
- PR #26132: (*TheBigBear*) minor edit @ 2015-08-08T21:05:34Z
- PR #26133: (*amontalban*) Fixed #25915 in salt/modules/pkgng.py and salt/states/pkg.py @ 2015-08-08T21:05:05Z
 - ISSUE #25915: (*ari*) FreeBSD pkg install fails
- PR #26111: (*anlutro*) Better error messages when virtualenv creation fails @ 2015-08-07T21:42:09Z
- PR #26110: (*jfindlay*) check for sources before adding them to cmd str @ 2015-08-07T21:33:23Z
 - ISSUE #26093: (*freedba*) archive.tar bug | refs: #26110
- PR #26106: (*vr-jack*) Update __init__.py @ 2015-08-07T21:15:55Z
- PR #26101: (*rallytime*) Back-port #25984 to 2015.5 @ 2015-08-07T18:56:26Z
 - ISSUE #25983: (*jmdcal*) Trying to get md5 of local zip | refs: #25984
 - PR #25984: (*jmdcal*) Support local files without md5sum | refs: #26101
- PR #26080: (*techhat*) Fix string checking in s3fs @ 2015-08-06T23:36:09Z
- PR #26079: (*cachedout*) Update docs to remove state.over @ 2015-08-06T23:35:26Z
 - ISSUE #26039: (*basepi*) Update scheduler docs to use orchestrate instead of overstate | refs: #26079
- PR #26058: (*opdude*) Fix choco version on chocolatey versions below 0.9.9 @ 2015-08-06T18:50:10Z
- PR #26068: (*jfindlay*) fix autoruns.list looking in wrong directory @ 2015-08-06T18:49:48Z
- PR #26065: (*s0undt3ch*) [2015.5] Update to latest bootstrap stable release v2015.06.08 @ 2015-08-06T17:09:35Z
 - ISSUE #634: (*loupgaroublond*) /srv/salt/_grains/ not documented | refs: #26065
 - ISSUE #631: (*fatbox*) Can't extend the same item multiple times | refs: #26065
 - ISSUE #625: (*whiteinge*) cmd.run state user flag is not working | refs: #25506 #632
 - PR #640: (*terminalmage*) fix syntax errors introduced in 0f776c13 | refs: #26065
 - PR #638: (*blast-hardcheese*) Tightened up configuration documentation | refs: #26065
 - PR #633: (*epoelke*) Bug fix to salt-key | refs: #26065
 - PR #632: (*whiteinge*) Change the cmd.run state to use the new runas arg | refs: #26065
- PR #26061: (*gmcwhistler*) Patch for issue #25994 @ 2015-08-06T17:07:34Z
 - ISSUE #25994: (*gmcwhistler*) module.ilo tempfile creation in __execute_cmd results in TypeError: cannot concatenate `str` and `int` objects
- PR #26064: (*s0undt3ch*) Don't stacktrace when trying to get the default locale. @ 2015-08-06T16:11:05Z
 - ISSUE #26063: (*saltstack-bot*) not working with salt-cloud shows unknown locale error | refs: #26064
- PR #26048: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com> @ 2015-08-05T22:59:50Z

- PR #26044: (*rallytime*) Make sure the key we're comparing is also lowercase @ 2015-08-05T19:23:54Z

19.2.29 Salt 2015.5.6 Release Notes

Version 2015.5.6 is a bugfix release for *2015.5.0*.

Security Fixes

CVE-2015-6941 - win_useradd module and salt-cloud display passwords in debug log

Updated the win_useradd module return data to no longer include the password of the newly created user. The password is now replaced with the string XXX-REDACTED-XXX. Updated the Salt Cloud debug output to no longer display win_password and sudo_password authentication credentials.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Changes for v2015.5.5..v2015.5.6

Total Merges: 144

Changes:

- PR #27557: (*jfindlay*) add doc motivating mine vs grains
- PR #27515: (*jfindlay*) save iptables rules on SuSE
- PR #27509: (*jfindlay*) tell the user why the gluster module does not work
- PR #27379: (*jfindlay*) document and check dict type for pip env_vars
- PR #27516: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27472: (*cachedout*) Change recommended schema for data field in mysql event table
- PR #27468: (*cachedout*) Fix 27351
- PR #27479: (*aboe76*) fix locale on opensuse and suse `#27438`_
- PR #27483: (*rallytime*) Outputters should sync to output, not outputters, on the minion.
- PR #27484: (*rallytime*) Back-port #27434 and #27470 to 2015.5
- PR #27469: (*twangboy*) Added quotes to version numbers example
- PR #27467: (*cachedout*) file.managed: check contents_{pillar|grain} result
- PR #27419: (*rallytime*) Amend error log to include multiple tips for troubleshooting.
- PR #27426: (*rallytime*) Don't stacktrace if there are conflicting id errors in highstate
- PR #27408: (*rallytime*) Fix avail_locations function for the softlayer_hw driver in 2015.5
- PR #27410: (*jacobhammons*) Fix css layout Refs `#27389`_
- PR #27336: (*rallytime*) [2015.5] Fixup salt-cloud logging
- PR #27358: (*lorenegordon*) Escape search replacement text, fixes `#27356`_
- PR #27345: (*rallytime*) Allow use of rst header links by separating options out from yaml example
- PR #26903: (*bersace*) Review defaults.get
- PR #27317: (*efficks*) State unzip should use unzip command instead of unzip_cmd.
- PR #27309: (*rallytime*) Change a value list to a comma-separated string in boto_route53.present
- PR #27311: (*jfindlay*) discuss replacement occurrences in file doc
- PR #27310: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27308: (*terminalmage*) Fix refresh_db regression in yumpkg.py
- PR #27286: (*terminalmage*) Add a configurable timer for minion return retries
- PR #27278: (*rallytime*) Back-port #27256 to 2015.5
- PR #27277: (*rallytime*) Back-port #27230 to 2015.5
- PR #27253: (*jfindlay*) 2015.5 -> 2015.5.0
- PR #27244: (*garethgreenaway*) Exception in cloud.ec2.create_snapshot
- PR #27231: (*jfindlay*) only write cron file if it is changed

- PR #27233: (*basepi*) [2015.5] Add stub release notes for 2015.5.6
- PR #27208: (*basepi*) [2015.5] Add test.nop state
- PR #27201: (*jfindlay*) rename hash_hostname to hash_known_hosts
- PR #27214: (*jacksonjtj*) Correctly support https, port 443 is not a requirement
- PR #27172: (*rallytime*) Back-port #27150 to 2015.5
- PR #27194: (*rallytime*) Back-port #27180 to 2015.5
- PR #27176: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27170: (*rallytime*) Update Getting Started with GCE docs to use cloud.profiles or cloud.profiles.d examples
- PR #27167: (*rallytime*) Back-port #27148 to 2015.5
- PR #27168: (*techhat*) Add further gating of impacket library
- PR #27166: (*rallytime*) Allow a full-query for EC2, even if there are no profiles defined
- PR #27162: (*rallytime*) Be explicit in using ``SoftLayer`` for service queries in SoftLayer drivers
- PR #27149: (*twangboy*) Fixed problem with add/remove path
- PR #27147: (*rallytime*) Enforce bounds in the GCE Regex
- PR #27128: (*eguwen*) don't show diff for test run if show_diff=False
- PR #27116: (*jacobhammons*) Update latest to 2015.8, 2015.5 is now previous
- PR #27033: (*jfindlay*) Merge #27019
- PR #26942: (*Arabus*) Fix docker.run
- PR #26977: (*abh*) Add support for PEERNTP network interface configuration
- PR #27023: (*jfindlay*) add test support for htpasswd state mod
- PR #27074: (*twangboy*) Replaced password with redacted when displayed
- PR #27073: (*rallytime*) Remove ``use develop branch`` warning from LXC tutorial
- PR #27054: (*rallytime*) Back-port #27029 to 2015.5
- PR #27053: (*rallytime*) Back-port #26992 to 2015.5
- PR #27052: (*rallytime*) Back-port #26930 to 2015.5
- PR #27049: (*johanek*) Run repoquery less
- PR #27070: (*stanislavb*) Deprecate salt.utils.iam in Carbon
- PR #27030: (*jfindlay*) Backport #26938
- PR #27025: (*cachedout*) Better try and error handling for prep_jid
- PR #27035: (*terminalmage*) useradd.py: Use contextmanager to prevent leaked filehandles
- PR #27034: (*rallytime*) Update softlayer docs for where to find apikey
- PR #27024: (*rallytime*) Back-port #27004 to 2015.5
- PR #27027: (*rallytime*) Back-port #27013 to 2015.5
- PR #27026: (*rallytime*) Back-port #27011 to 2015.5
- PR #26972: (*twangboy*) Catch the 404 error from fileclient
- PR #26951: (*terminalmage*) Fix timezone module for CentOS

- PR #26875: (*marccardinal*) LXC gateway provisioned only when IP is provided
- PR #26997: (*twangboy*) Fixed symlinks for windows (don't use user root)
- PR #27001: (*twangboy*) Added CLI Example for `reg.delete_key_recursive`
- PR #26996: (*jacobhammons*) Beacon doc updates
- PR #26868: (*joejulian*) Use the actual device name when checking `vgdisplay`
- PR #26955: (*dsumsky*) S3 `ext_pillar` module has broken caching mechanism (backport to 2015.5)
- PR #26987: (*rallytime*) Back-port #26966 to 2015.5
- PR #26915: (*rallytime*) Update Joyent Cloud Tests
- PR #26971: (*rallytime*) Fix a couple of typos in reactor docs
- PR #26976: (*thatch45*) Revert `file.symlink` gets windows account instead of root"
- PR #26975: (*whiteinge*) Remove mocks from `rest_cherryPy` integration tests; fix groups check bug
- PR #26899: (*twangboy*) `file.symlink` gets windows account instead of root
- PR #26960: (*rallytime*) Fix bash code block formatting in CherryPy netapi docs
- PR #26940: (*rallytime*) Fix minor doc typo in client api
- PR #26871: (*rallytime*) Back-port #26852 to 2015.5
- PR #26851: (*jacobhammons*) `states/pkgrepo` examples, suse installation updates
- PR #26817: (*jfindlay*) modify `groupadd` for rhel 5
- PR #26824: (*pravka*) [salt-cloud] Fix creating droplet from snapshot in `digital_ocean` provider
- PR #26823: (*joejulian*) use `dbus` instead of `localectl`
- PR #26820: (*jfindlay*) add default param in `_parse_localectl` in `locale` mod
- PR #26821: (*twangboy*) Fixed `user.rename` function in windows
- PR #26803: (*twangboy*) Added check for PyMySQL if MySQLdb import fails
- PR #26815: (*jfindlay*) stringify `linode id` before performing `str` actions
- PR #26800: (*jacobhammons*) Doc bug fixes
- PR #26793: (*rallytime*) Don't stacktrace if `name` is specified as a minion id in a map file
- PR #26790: (*rallytime*) Update Saltify docs to be more accurate and helpful
- PR #26787: (*jfindlay*) merge #26775
- PR #26759: (*terminalmage*) Backport PR #26726 to 2015.5 branch
- PR #26768: (*garthgreenaway*) Fixes to `ipset` in 2015.5 for `#26628` _
- PR #26753: (*jfindlay*) import `elementree` from `_compat` in `ilo` exec mod
- PR #26736: (*twangboy*) Changed import from `smbconnection` to `smb3`
- PR #26714: (*jfindlay*) add exception placeholder for older `msgpacks`
- PR #26710: (*rallytime*) Update GCE driver to return `True`, `False` or a new name in `__virtual__()`
- PR #26709: (*rallytime*) Ensure VM name is valid before trying to create Linode VM
- PR #26617: (*terminalmage*) Fix Windows failures in `pip` module due to raw string formatting
- PR #26700: (*kev009*) Ignore the first element of `kern.disks` split, which is the `sysctl` name

- PR #26695: (*terminalmage*) Better HTTPS basic auth redaction for 2015.5 branch
- PR #26694: (*terminalmage*) Backport #26693 to 2015.5
- PR #26681: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #26676: (*rallytime*) Back-port #26648 to 2015.5
- PR #26677: (*rallytime*) Back-port #26653 to 2015.5
- PR #26675: (*rallytime*) Back-port #26631 to 2015.5
- PR #26655: (*cheng0919*) Update win_dns_client.py
- PR #26662: (*jacobhammons*) update version to 2015.5
- PR #26651: (*jfindlay*) add 2015.5.4 notes to 2015.5.5 notes
- PR #26525: (*jfindlay*) document check_file_meta args, remove unused arg
- PR #26561: (*stanislavb*) Leave salt.utils.s3 location fallback to salt.utils.aws
- PR #26573: (*rallytime*) Don't stacktrace if using private_ips and delete_sshkeys together
- PR #26563: (*rallytime*) Fix error detection when salt-cloud config is missing a master's address
- PR #26641: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #26620: (*rallytime*) Also add -Z to script args for cloud tests
- PR #26618: (*rallytime*) Add script_args: '-P' to Ubuntu 14 profiles for nightly cloud tests
- PR #26612: (*rallytime*) Use an available image to test against
- PR #26576: (*rallytime*) Ensure GCE and EC2 configuration checks are correct
- PR #26580: (*rallytime*) Avoid race condition when assigning floating IPs to new VMs
- PR #26581: (*terminalmage*) Skip tests that don't work with older mock
- PR #26591: (*rallytime*) Back-port #26554 to 2015.5
- PR #26565: (*cachedout*) Fix many errors with __virtual__ in tests
- PR #26553: (*rallytime*) Back-port #26548 to 2015.5
- PR #26552: (*rallytime*) Back-port #26542 to 2015.5
- PR #26551: (*rallytime*) Back-port #26539 to 2015.5
- PR #26549: (*rallytime*) Back-port #26524 to 2015.5
- PR #26527: (*jfindlay*) check exists and values in boto_elb listeners
- PR #26446: (*stanislavb*) Fetch AWS region from EC2 instance metadata
- PR #26546: (*nmadhok*) Do not raise KeyError when calling avail_images if VM/template is in disconnected state
- PR #26537: (*jfindlay*) Merge #26481
- PR #26528: (*zmalone*) Fixing encrypt to instructions in the 2015.5 branch

19.2.30 Salt 2015.5.7 Release Notes

Note: A significant orchestrate issue #29110 was discovered during the release process of 2015.5.7, so it has not been officially released. Please use 2015.5.8 instead.

Changes:

- PR #28731: (*garethgreenaway*) Fixes to salt scheduler in 2015.5, ensuring that return_job is only used on minion scheduler
- PR #28857: (*rallytime*) Back-port #28851 to 2015.5
- PR #28856: (*rallytime*) Back-port #28853 to 2015.5
- PR #28832: (*basepi*) [2015.5] Backport #28826
- PR #28833: (*basepi*) [2015.5] Increase the default gather_job_timeout
- PR #28829: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28756: (*MrCitron*) Fix `#25775`_
- PR #28786: (*chrigl*) closes `#28783`_
- PR #28776: (*rallytime*) Back-port #28740 to 2015.5
- PR #28760: (*dmyerscough*) Fixing CherryPy key bug
- PR #28746: (*rallytime*) Back-port #28718 to 2015.5
- PR #28705: (*cachedout*) Account for new headers class in tornado 4.3
- PR #28699: (*rallytime*) Back-port #28670 to 2015.5
- PR #28703: (*rallytime*) Back-port #28690 to 2015.5
- PR #28694: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.09
- PR #28669: (*rallytime*) Use the -q argument to strip extraneous messages from rabbitmq
- PR #28645: (*jacksonj*) Rework minion return_retry_timer
- PR #28668: (*twangboy*) Fixed join_domain and unjoin_domain for Windows
- PR #28666: (*jfindlay*) define r_data before using it in file module
- PR #28662: (*cachedout*) Add note about disabling master_alive_interval
- PR #28627: (*twangboy*) Backport win_useradd
- PR #28617: (*cachedout*) Set restrictive umask on module sync
- PR #28622: (*gravyboat*) Update puppet module wording
- PR #28563: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.04
- PR #28541: (*twangboy*) Fixed problem with system.set_computer_name
- PR #28537: (*jfindlay*) decode filename to utf-8 in file.recurse state

- PR #28529: (*rallytime*) Update contributing and documentation pages to recommend submitting against branches
- PR #28548: (*nmadhok*) [Backport] [2015.5] Tasks can be in queued state instead of running
- PR #28531: (*rallytime*) Add versionadded directives to virtualenv_mod state/module
- PR #28508: (*twangboy*) Fixed windows tests
- PR #28525: (*rallytime*) Fix spacing in doc examples for boto_route53 state and module
- PR #28517: (*rallytime*) Add state_auto_order defaults to True note to ordering docs
- PR #28512: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28448: (*gwaters*) added a note to the tutorial for redhat derivatives
- PR #28406: (*rallytime*) Back-port #28381 to 2015.5
- PR #28413: (*rallytime*) Back-port #28400 to 2015.5
- PR #28366: (*erchn*) mark repo not enabled when pkgrepo state passes in disable: True
- PR #28373: (*beverlcl*) Fixing bug ``#28372`_` for use_carrier option on bonding network interfaces.
- PR #28359: (*rallytime*) Back-port #28358 to 2015.5
- PR #28346: (*twangboy*) Fix installer
- PR #28315: (*gwaters*) Adding a working example of setting pillar data on the cli
- PR #28211: (*terminalmage*) Fix for ext_pillar being compiled twice in legacy git_pillar code (2015.5 branch)
- PR #28263: (*cachedout*) New channel for event.send
- PR #28293: (*cachedout*) Minor grammar changes
- PR #28271: (*gwaters*) Update tutorial documentation
- PR #28280: (*0xf10e*) Correct Jinja function load_* to import_*
- PR #28255: (*cachedout*) Add __cli opt
- PR #28213: (*rallytime*) If record returned None, don't continue with the state. Something went wrong
- PR #28238: (*basepi*) [2015.5] Fix schedule.present always diffing
- PR #28174: (*lorenegordon*) Add support for multiline regex in file.replace
- PR #28175: (*twangboy*) Fixes ``#19673`_`
- PR #28140: (*rallytime*) Add OpenBSD installation documentation to 2015.5 branch
- PR #28138: (*rallytime*) Back-port #28130 EC2 Sizes Only portion to 2015.5
- PR #28097: (*jacksonjtj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28117: (*rallytime*) Clean up stacktrace when master can't be reached in lxc cloud driver
- PR #28110: (*terminalmage*) Add explanation of file_client: local setting masterless mode
- PR #28109: (*rallytime*) Add created reactor event to lxc cloud driver
- PR #27996: (*rallytime*) Don't fail if pip package is already present and pip1 is installed
- PR #28056: (*rallytime*) Back-port #28033 to 2015.5
- PR #28059: (*rallytime*) Back-port #28040 to 2015.5
- PR #28047: (*cachedout*) Restore FTP functionality to file client

- PR #28032: (*twangboy*) Fixed win_path.py
- PR #28037: (*rallytime*) Back-port #28003 to 2015.5
- PR #28031: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28008: (*jfindlay*) platform independent line endings in hosts mod
- PR #28012: (*rallytime*) Clean up stack trace when something goes wrong with minion output
- PR #27995: (*jacobhammons*) added link to grains security FAQ to targeting and pillar topics.
- PR #27986: (*jacobhammons*) Changed current release to 5.6 and added CVE to release notes
- PR #27913: (*pass-by-value*) Set default
- PR #27876: (*terminalmage*) 2015.5 branch: Fix traceback when 2015.8 git ext_pillar config schema used
- PR #27726: (*jfindlay*) deprecate hash_hostname in favor of hash_known_hosts
- PR #27776: (*jfindlay*) return message when local jobs_cache not found
- PR #27766: (*jfindlay*) better check for debian userdel error
- PR #27758: (*iggy*) Remove redundant text from syslog returner
- PR #27841: (*terminalmage*) Detect Manjaro Linux as Arch derivative
- PR #27852: (*rallytime*) Back-port #27806 to 2015.5
- PR #27838: (*basepi*) [2015.5] Fix highstate outputter for jobs.lookup_jid
- PR #27791: (*egoven*) 2015.5 postgres_user groups backport
- PR #27759: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27732: (*jacobhammons*) update docs for __virtual__ and __virtualname__
- PR #27747: (*Sacro*) Chocolatey doesn't have a help command.
- PR #27733: (*jacobhammons*) hardening topic - updates to docs.saltstack.com theme
- PR #27706: (*jacobhammons*) Assorted doc bugs
- PR #27695: (*rallytime*) Back-port #27671 to 2015.5
- PR #27524: (*jfindlay*) parse pkgng output in quiet mode for >= 1.6.1
- PR #27686: (*rallytime*) Back-port #27476 to 2015.5
- PR #27684: (*rallytime*) Back-port #27656 to 2015.5
- PR #27683: (*rallytime*) Back-port #27659 to 2015.5
- PR #27682: (*rallytime*) Back-port #27566 to 2015.5
- PR #27681: (*rallytime*) Back-port #25928 to 2015.5
- PR #27680: (*rallytime*) Back-port #27535 to 2015.5
- PR #27442: (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in build_schedule_item()
- PR #27641: (*rallytime*) Gate the psutil import and add depends doc for diskusage beacon
- PR #27644: (*rallytime*) Back-port #27640 to 2015.5
- PR #27612: (*rallytime*) Fix GCE external_ip stacktraces in 2015.5
- PR #27568: (*jacobhammons*) regenerated man pages

19.2.31 Salt 2015.5.8 Release Notes

Security Fix

CVE-2015-8034: Saving `state.sls` cache data to disk with insecure permissions

This affects users of the `state.sls` function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to @zmalone for bringing this issue to our attention.

Changes

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2015-11-23T23:16:23Z

Total Merges: 118

Changes:

- PR #29128: (*cachedout*) Set a safer default value for `ret` in `saltmod`
- PR #29122: (*cachedout*) Fix broken state orchestration
- PR #29096: (*rallytime*) Back-port #29093 to 2015.5
- PR #29084: (*rallytime*) Back-port #29055 to 2015.5
- PR #29083: (*rallytime*) Back-port #29053 to 2015.5
- PR #28932: (*twangboy*) Fixed `user.present` / `user.absent` in windows
- PR #29011: (*rallytime*) Back-port #28630 to 2015.5
- PR #28982: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28949: (*whiteinge*) Add `sync_sdb` execution function
- PR #28930: (*twangboy*) Added missing import `mmap` required by `file.py`
- PR #28908: (*rallytime*) A couple of spelling fixes for doc conventions page.
- PR #28902: (*whiteinge*) Fix missing JSON support for `/keys` endpoint
- PR #28897: (*rallytime*) Back-port #28873 to 2015.5
- PR #28871: (*basepi*) [2015.5] Fix command generation for `mdadm.assemble`
- PR #28864: (*jfindlay*) add 2015.5.7 release notes
- PR #28731: (*garthgreenaway*) Fixes to salt scheduler in 2015.5, ensuring that `return_job` is only used on minion scheduler
- PR #28857: (*rallytime*) Back-port #28851 to 2015.5
- PR #28856: (*rallytime*) Back-port #28853 to 2015.5
- PR #28832: (*basepi*) [2015.5] Backport #28826
- PR #28833: (*basepi*) [2015.5] Increase the default `gather_job_timeout`
- PR #28829: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28756: (*MrCitron*) Fix ``#25775`_``
- PR #28786: (*chrigl*) closes ``#28783`_``

- PR #28776: (*rallytime*) Back-port #28740 to 2015.5
- PR #28760: (*dmyerscough*) Fixing CherryPy key bug
- PR #28746: (*rallytime*) Back-port #28718 to 2015.5
- PR #28705: (*cachedout*) Account for new headers class in tornado 4.3
- PR #28699: (*rallytime*) Back-port #28670 to 2015.5
- PR #28703: (*rallytime*) Back-port #28690 to 2015.5
- PR #28694: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.09
- PR #28669: (*rallytime*) Use the -q argument to strip extraneous messages from rabbitmq
- PR #28645: (*jacksonjtj*) Rework minion return_retry_timer
- PR #28668: (*twangboy*) Fixed join_domain and unjoin_domain for Windows
- PR #28666: (*jfindlay*) define r_data before using it in file module
- PR #28662: (*cachedout*) Add note about disabling master_alive_interval
- PR #28627: (*twangboy*) Backport win_useradd
- PR #28617: (*cachedout*) Set restrictive umask on module sync
- PR #28622: (*gravyboat*) Update puppet module wording
- PR #28563: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.04
- PR #28541: (*twangboy*) Fixed problem with system.set_computer_name
- PR #28537: (*jfindlay*) decode filename to utf-8 in file.recurse state
- PR #28529: (*rallytime*) Update contributing and documentation pages to recommend submitting against branches
- PR #28548: (*nmadhok*) [Backport] [2015.5] Tasks can be in queued state instead of running
- PR #28531: (*rallytime*) Add versionadded directives to virtualenv_mod state/module
- PR #28508: (*twangboy*) Fixed windows tests
- PR #28525: (*rallytime*) Fix spacing in doc examples for boto_route53 state and module
- PR #28517: (*rallytime*) Add state_auto_order defaults to True note to ordering docs
- PR #28512: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28448: (*gwaters*) added a note to the tutorial for redhat derivatives
- PR #28406: (*rallytime*) Back-port #28381 to 2015.5
- PR #28413: (*rallytime*) Back-port #28400 to 2015.5
- PR #28366: (*erchn*) mark repo not enabled when pkgrepo state passes in disable: True
- PR #28373: (*beverlcl*) Fixing bug `#28372`_ for use_carrier option on bonding network interfaces.
- PR #28359: (*rallytime*) Back-port #28358 to 2015.5
- PR #28346: (*twangboy*) Fix installer
- PR #28315: (*gwaters*) Adding a working example of setting pillar data on the cli
- PR #28211: (*terminalmage*) Fix for ext_pillar being compiled twice in legacy git_pillar code (2015.5 branch)
- PR #28263: (*cachedout*) New channel for event.send

- PR #28293: (*cachedout*) Minor grammar changes
- PR #28271: (*gwaters*) Update tutorial documentation
- PR #28280: (*0xf10e*) Correct Jinja function `load_*` to `import_*`
- PR #28255: (*cachedout*) Add `__cli` opt
- PR #28213: (*rallytime*) If record returned None, don't continue with the state. Something went wrong
- PR #28238: (*basepi*) [2015.5] Fix `schedule.present` always diffing
- PR #28174: (*loregordon*) Add support for multiline regex in `file.replace`
- PR #28175: (*twangboy*) Fixes ``#19673`_`
- PR #28140: (*rallytime*) Add OpenBSD installation documentation to 2015.5 branch
- PR #28138: (*rallytime*) Back-port #28130 EC2 Sizes Only portion to 2015.5
- PR #28097: (*jacksonjtj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28117: (*rallytime*) Clean up stacktrace when master can't be reached in `lxc` cloud driver
- PR #28110: (*terminalmage*) Add explanation of `file_client`: local setting masterless mode
- PR #28109: (*rallytime*) Add created reactor event to `lxc` cloud driver
- PR #27996: (*rallytime*) Don't fail if `pip` package is already present and `pip1` is installed
- PR #28056: (*rallytime*) Back-port #28033 to 2015.5
- PR #28059: (*rallytime*) Back-port #28040 to 2015.5
- PR #28047: (*cachedout*) Restore FTP functionality to file client
- PR #28032: (*twangboy*) Fixed `win_path.py`
- PR #28037: (*rallytime*) Back-port #28003 to 2015.5
- PR #28031: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28008: (*jfindlay*) platform independent line endings in `hosts` mod
- PR #28012: (*rallytime*) Clean up stack trace when something goes wrong with minion output
- PR #27995: (*jacobhammons*) added link to grains security FAQ to targeting and pillar topics.
- PR #27986: (*jacobhammons*) Changed current release to 5.6 and added CVE to release notes
- PR #27913: (*pass-by-value*) Set default
- PR #27876: (*terminalmage*) 2015.5 branch: Fix traceback when 2015.8 git ext_pillar config schema used
- PR #27726: (*jfindlay*) deprecate `hash_hostname` in favor of `hash_known_hosts`
- PR #27776: (*jfindlay*) return message when local `jobs_cache` not found
- PR #27766: (*jfindlay*) better check for debian `userdel` error
- PR #27758: (*iggy*) Remove redundant text from `syslog` returner
- PR #27841: (*terminalmage*) Detect Manjaro Linux as Arch derivative
- PR #27852: (*rallytime*) Back-port #27806 to 2015.5
- PR #27838: (*basepi*) [2015.5] Fix highstate outputter for `jobs.lookup_jid`
- PR #27791: (*eguen*) 2015.5 `postgres_user` groups backport
- PR #27759: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5

- PR #27732: (*jacobhammons*) update docs for `__virtual__` and `__virtualname__`
- PR #27747: (*Sacro*) Chocolatey doesn't have a help command.
- PR #27733: (*jacobhammons*) hardening topic - updates to docs.saltstack.com theme
- PR #27706: (*jacobhammons*) Assorted doc bugs
- PR #27695: (*rallytime*) Back-port #27671 to 2015.5
- PR #27524: (*jfindlay*) parse pkgng output in quiet mode for `>= 1.6.1`
- PR #27686: (*rallytime*) Back-port #27476 to 2015.5
- PR #27684: (*rallytime*) Back-port #27656 to 2015.5
- PR #27683: (*rallytime*) Back-port #27659 to 2015.5
- PR #27682: (*rallytime*) Back-port #27566 to 2015.5
- PR #27681: (*rallytime*) Back-port #25928 to 2015.5
- PR #27680: (*rallytime*) Back-port #27535 to 2015.5
- PR #27442: (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()`
- PR #27641: (*rallytime*) Gate the psutil import and add depends doc for diskusage beacon
- PR #27644: (*rallytime*) Back-port #27640 to 2015.5
- PR #27612: (*rallytime*) Fix GCE `external_ip` stacktraces in 2015.5
- PR #27568: (*jacobhammons*) regenerated man pages

19.2.32 Salt 2015.5.9 Release Notes

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-01-08T23:02:31Z

Total Merges: 44

Changes:

- PR #30237: (*jacobhammons*) Updated man pages and doc version for 2015.5.9
- PR #30207: (*rallytime*) Use correct spacing in rabbitmq state examples
- PR #30191: (*jacobhammons*) Updated doc site banners
- PR #30125: (*abednarik*) Update user home event when `createhome` is set to False
- PR #30127: (*jsutton*) Updating documentation and example minion config for `random_master/master_shuffle`.
- PR #30110: (*markckimball*) Fixed flag sent to `salt.utils.http` in order for `verify_ssl` to work correctly
- PR #30093: (*zmalone*) Noting that `file_roots` and `state tree` should both be avoided
- PR #30097: (*cachedout*) Note concern about cleartext password in docs for `shadow.gen_password`
- PR #30089: (*mpreziuso*) Fixes terminology and adds more accurate details about the algorithms
- PR #30086: (*cachedout*) Document that `gitfs` needs recent libs
- PR #30070: (*cachedout*) Add documentation on debugging `salt-ssh`
- PR #30059: (*mpreziuso*) Fixes wrong function scope

- PR #30025: (*jtand*) Skipping some Boto tests until resolved moto issue
- PR #29949: (*aletourneau*) Enhanced netcaler docstring
- PR #29941: (*cachedout*) Fix spelling error in boto_vpc
- PR #29908: (*cachedout*) Allow kwargs to be passed to pacman provide for update func
- PR #29909: (*abednarik*) FreeBSD pkgng fix for non-interactive install.
- PR #29730: (*rallytime*) Update docker-py version requirement to 0.6.0 for dockerio.py files
- PR #29715: (*rallytime*) Install correct package version, if provided, for npm state.
- PR #29721: (*terminalmage*) Fix display of multiline strings when iterating over a list
- PR #29646: (*rallytime*) Don't stacktrace on kwargs.get if kwargs=None
- PR #29673: (*rallytime*) Default value should be False and not `False`
- PR #29527: (*jfindlay*) 2015.5.7 notes: add note about not being released
- PR #29539: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #29504: (*rallytime*) Document userdata_file option for EC2 driver
- PR #29507: (*rallytime*) Switch volumes and del_*_on_destroy example ordering
- PR #29469: (*abednarik*) Added Documentation note in salt cloud.
- PR #29461: (*dmyerscough*) Fix resource limits, systemd sets the default too small
- PR #29439: (*rallytime*) Back-port #28656 to 2015.5
- PR #29418: (*jacobhammons*) Added CVE 2015-8034 to 2015.5.8 release notes
- PR #29389: (*jacobhammons*) updated version numbers in documentation
- PR #28501: (*twangboy*) Requested fixes for 26898
- PR #29348: (*jtand*) Fixes an file.search on python2.6
- PR #29336: (*rallytime*) Back-port #29276 to 2015.5
- PR #29333: (*rallytime*) Back-port #29280 to 2015.5
- PR #29316: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #29216: (*clan*) size is 0 doesn't mean no data, e.g. /proc/version
- PR #29261: (*attiasr*) fix incorrect reinstallation of windows pkg
- PR #29214: (*cro*) Doc for salt.utils.http should say verify_ssl not ssl_verify.
- PR #29204: (*lorenegordon*) Use os.path.join to return full path to ca bundle

19.2.33 Salt 2014.7.0 Release Notes - Codename Helium

This release is the largest Salt release ever, with more features and commits than any previous release of Salt. Everything from the new RAET transport to major updates in Salt Cloud and the merging of Salt API into the main project.

Important: The Fedora/RHEL/CentOS `salt-master` package has been modified for this release. The following components of Salt have been broken out and placed into their own packages:

- salt-syndic

- salt-cloud
- salt-ssh

When the **salt-master** package is upgraded, these components will be removed, and they will need to be manually installed.

Important: Compound/pillar matching have been temporarily disabled for the `mine` and `publish` modules for this release due to the possibility of inferring pillar data using pillar glob matching. A proper fix is now in the 2014.7 branch and scheduled for the 2014.7.1 release, and compound matching and non-globbing pillar matching will be re-enabled at that point.

Compound and pillar matching for normal salt commands are unaffected.

New Transport!

RAET Transport Option

This has been a HUGE amount of work, but the beta release of Salt with RAET is ready to go. RAET is a reliable queuing transport system that has been developed in partnership with a number of large enterprises to give Salt an alternative to ZeroMQ and a way to get Salt to scale well beyond tens of thousands of servers. Unlike ZeroMQ, RAET is completely asynchronous in every aspect of its operation and has been developed using the flow programming paradigm. This allows for many new capabilities to be added to Salt in the upcoming releases.

Please keep in mind that this is a beta release of RAET and we hope for bugs to be worked out, performance to be better realized and more in the 2015.5.0 release.

Simply stated, users running Salt with RAET should expect some hiccups as we hammer out the update. This is a BETA release of Salt RAET.

For information about how to use Salt with RAET please see the *tutorial*.

Salt SSH Enhancements

Salt SSH has just entered a new league, with substantial updates and improvements to make salt-ssh more reliable and easier than ever! From new features like the ansible roster and fileservers backends to the new pypi salt-ssh installer to lowered deps and a swath of bugfixes, salt-ssh is basically reborn!

Install salt-ssh Using pip

Salt-ssh is now pip-installable!

<https://pypi.python.org/pypi/salt-ssh/>

Pip will bring in all of the required deps, and while some deps are compiled, they all include pure python implementations, meaning that any compile errors which may be seen can be safely ignored.

```
pip install salt-ssh
```

Fileserver Backends

Salt-ssh can now use the salt fileserver backend system. This allows for the gitfs, hgfs, s3, and many more ways to centrally store states to be easily used with salt-ssh. This also allows for a distributed team to easily use a centralized source.

Saltfile Support

The new saltfile system makes it easy to have a user specific custom extended configuration.

Ext Pillar

Salt-ssh can now use the external pillar system. Making it easier then ever to use salt-ssh with teams.

No More sshpass

Thanks to the enhancements in the salt vt system, salt-ssh no longer requires sshpass to send passwords to ssh. This also makes the manipulation of ssh calls substantially more flexible, allowing for intercepting ssh calls in a much more fluid way.

Pure Python Shim

The salt-ssh call originally used a shell script to discover what version of python to execute with and determine the state of the ssh code deployment. This shell script has been replaced with a pure python version making it easy to increase the capability of the code deployment without causing platform inconsistency issues with different shell interpreters.

Custom Module Delivery

Custom modules are now seamlessly delivered. This makes the deployment of custom grains, states, execution modules and returners a seamless process.

CP Module Support

Salt-ssh now makes simple file transfers easier then ever! The *cp* module allows for files to be conveniently sent from the salt fileserver system down to systems.

More Thin Directory Options

Salt ssh functions by copying a subset of the salt code, or *salt thin* down to the target system. In the past this was always transferred to `/tmp/.salt` and cached there for subsequent commands.

Now, salt thin can be sent to a random directory and removed when the call is complete with the *-W* option. The new *-W* option still uses a static location but will clean up that location when finished.

The default *salt thin* location is now user defined, allowing multiple users to cleanly access the same systems.

State System Enhancements

New Imperative State Keyword ``Listen''

The new `listen` and `listen_in` keywords allow for completely imperative states by calling the `mod_watch()` routine after all states have run instead of re-ordering the states.

Mod Aggregate Runtime Manipulator

The new `mod_aggregate` system allows for the state system to rewrite the state data during execution. This allows for state definitions to be aggregated dynamically at runtime.

The best example is found in the `pkg` state. If `mod_aggregate` is turned on, then when the first `pkg` state is reached, the state system will scan all of the other running states for `pkg` states and take all other packages set for `install` and `install` them all at once in the first `pkg` state.

These runtime modifications make it easy to run groups of states together. In future versions, we hope to fill out the `mod_aggregate` system to build in more and more optimizations.

For more documentation on `mod_aggregate`, see [the documentation](#).

New Requisites: `onchanges` and `onfail`

The new `onchanges` and `onchanges_in` requisites make a state apply only if there are changes in the required state. This is useful to execute post hooks after changes occur on a system.

The other new requisites, `onfail`, and `onfail_in`, allow for a state to run in reaction to the failure of another state.

For more information about these new requisites, see the [requisites documentation](#).

Global `onlyif` and `unless`

The `onlyif` and `unless` options can now be used for any state declaration.

Use `names` to expand and override values

The [names declaration](#) in Salt's state system can now override or add values to the expanded data structure. For example:

```
my_users:
  user.present:
    - names:
      - larry
      - curly
      - moe:
        - shell: /bin/zsh
        - groups:
          - wheel
    - shell: /bin/bash
```

Major Features

Scheduler Additions

The Salt scheduler system has received MAJOR enhancements, allowing for cron-like scheduling and much more granular timing routines. See [here](#) for more info.

Red Hat 7 Family Support

All the needed additions have been made to run Salt on RHEL 7 and derived OSes like CentOS and Scientific.

Fileserver Backends in salt-call

Fileserver backends like gitfs can now be used without a salt master! Just add the fileserver backend configuration to the minion config and execute salt-call. This has been a much-requested feature and we are happy to finally bring it to our users.

Amazon Execution Modules

An entire family of execution modules further enhancing Salt's Amazon Cloud support. They include the following:

- *Autoscale Groups* (includes *state support*) -- related: *Launch Control* states
- *Cloud Watch* (includes *state support*)
- *Elastic Cache* (includes *state support*)
- *Elastic Load Balancer* (includes *state support*)
- *IAM Identity and Access Management* (includes *state support*)
- *Route53 DNS* (includes *state support*)
- *Security Groups* (includes *state support*)
- *Simple Queue Service* (includes *state support*)

LXC Runner Enhancements

BETA The Salt LXC management system has received a number of enhancements which make running an LXC cloud entirely from Salt an easy proposition.

Next Gen Docker Management

The Docker support in Salt has been increased at least ten fold. The Docker API is now completely exposed and Salt ships with Docker data tracking systems which make automating Docker deployments very easy.

Peer System Performance Improvements

The peer system communication routines have been refined to make the peer system substantially faster.

SDB

Encryption at rest for configs

GPG Renderer

Encrypted pillar at rest

OpenStack Expansion

Lots of new OpenStack stuff

Queues System

Ran change external queue systems into Salt events

Multi Master Failover Additions

Connecting to multiple masters is more dynamic than ever

Chef Execution Module

Managing Chef with Salt just got even easier!

salt-api Project Merge

The `salt-api` project has been merged into Salt core and is now available as part of the regular `salt-master` package install. No API changes were made, the **salt-api** script and init scripts remain intact.

`salt-api` has always provided Yet Another Pluggable Interface to Salt (TM) in the form of `netapi` modules. These are modules that bind to a port and start a service. Like many of Salt's other module types, `netapi` modules often have library and configuration dependencies. See the documentation for each module for instructions.

See also:

The full list of netapi modules.

Synchronous and Asynchronous Execution of Runner and Wheel Modules

`salt.runner.RunnerClient` and `salt.wheel.WheelClient` have both gained complimentary `cmd_sync` and `cmd_async` methods allowing for synchronous and asynchronous execution of any Runner or Wheel module function, all protected using Salt's *external authentication* system. `salt-api` benefits from this addition as well.

rest_cherryipy Additions

The `rest_cherryipy` `netapi` module provides the main REST API for Salt.

Web Hooks

This release of course includes the Web Hook additions from the most recent `salt-api` release, which allows external services to signal actions within a Salt infrastructure. External services such as Amazon SNS, Travis-CI, or GitHub, as well as internal services that cannot or should not run a Salt minion daemon can be used as first-class components in Salt's rich orchestration capabilities.

The raw HTTP request body is now available in the event data. This is sometimes required information for checking an HMAC signature in order to verify a HTTP request. As an example, Amazon or GitHub requests are signed this way.

Generating and Accepting Minion Keys

The `/key` convenience URL generates a public and private key for a minion, automatically pre-accepts the public key on the Salt Master, and returns both keys as a tarball for download.

This allows for easily bootstrapping the key on a new minion with a single HTTP call, such as with a Kickstart script, all using regular shell tools.

```
curl -sS http://salt-api.example.com:8000/keys \  
  -d mid=jerry \  
  -d username=kickstart \  
  -d password=kickstart \  
  -d eauth=pam \  
  -o jerry-salt-keys.tar
```

Fileserver Backend Enhancements

All of the fileserver backends have been overhauled to be faster, lighter, and more reliable. The VCS backends (*gitfs*, *hgfs*, and *svnfs*) have also received a lot of new features.

Additionally, most config parameters for the VCS backends can now be configured on a per-remote basis, allowing for global config parameters to be overridden for a specific *gitfs*/*hgfs*/*svnfs* remote.

New *gitfs* Features

Pygit2 and Dulwich

In addition to supporting GitPython, support for *pygit2* (0.20.3 and newer) and *dulwich* have been added. Provided a compatible version of *pygit2* is installed, it will now be the default provider. The config parameter *gitfs_provider* has been added to allow one to choose a specific provider for *gitfs*.

Mountpoints

Prior to this release, to serve a file from *gitfs* at a salt fileserver URL of `salt://foo/bar/baz.txt`, it was necessary to ensure that the parent directories existed in the repository. A new config parameter *gitfs_mountpoint* allows *gitfs* remotes to be exposed starting at a user-defined `salt://` URL.

Environment Whitelisting/Blacklisting

By default, gitfs will expose all branches and tags as Salt fileserver environments. Two new config parameters, *gitfs_env_whitelist*, and *gitfs_env_blacklist*, allow more control over which branches and tags are exposed. More detailed information on how these two options work can be found in the *Gitfs Walkthrough*.

Expanded Authentication Support

As of *pygit2* 0.20.3, both http(s) and SSH key authentication are supported, and Salt now also supports both authentication methods when using *pygit2*. Keep in mind that *pygit2* 0.20.3 is not yet available on many platforms, so those who had been using authenticated git repositories with a passphraseless key should stick to GitPython if a new enough *pygit2* is not yet available for the platform on which the master is running.

A full explanation of how to use authentication can be found in the *Gitfs Walkthrough*.

New hgfs Features

Mountpoints

This feature works exactly like its *gitfs counterpart*. The new config parameter is called *hgfs_mountpoint*.

Environment Whitelisting/Blacklisting

This feature works exactly like its *gitfs counterpart*. The new config parameters are called *hgfs_env_whitelist* and *hgfs_env_blacklist*.

New svnfs Features

Mountpoints

This feature works exactly like its *gitfs counterpart*. The new config parameter is called *svnfs_mountpoint*.

Environment Whitelisting/Blacklisting

This feature works exactly like its *gitfs counterpart*. The new config parameters are called *svnfs_env_whitelist* and *svnfs_env_blacklist*.

Configurable Trunk/Branches/Tags Paths

Prior to this release, the paths where trunk, branches, and tags were located could only be in directories named ```trunk```, ```branches```, and ```tags``` directly under the root of the repository. Three new config parameters (*svnfs_trunk*, *svnfs_branches*, and *svnfs_tags*) allow SVN repositories which are laid out differently to be used with svnfs.

New `minionfs` Features

Mountpoint

This feature works exactly like its *gitfs counterpart*. The new config parameter is called `minionfs_mountpoint`. The one major difference is that, as `minionfs` doesn't use multiple remotes (it just serves up files pushed to the master using `cp.push`) there is no such thing as a per-remote configuration for `minionfs_mountpoint`.

Changing the Saltenv from Which Files are Served

A new config parameter (`minionfs_env`) allows `minionfs` files to be served from a Salt fileserver environment other than `base`.

Minion Whitelisting/Blacklisting

By default, `minionfs` will expose the pushed files from all minions. Two new config parameters, `minionfs_whitelist`, and `minionfs_blacklist`, allow `minionfs` to be restricted to serve files from only the desired minions.

Pyobjects Renderer

Salt now ships with with the *Pyobjects Renderer* that allows for construction of States using pure Python with an idiomatic object interface.

New Modules

In addition to the Amazon modules mentioned above, there are also several other new execution modules:

- *Oracle*
- *Random*
- *Redis*
- *Amazon Simple Queue Service*
- *Block Device Management*
- *CoreOS etcd*
- *Genesis*
- *InfluxDB*
- *Server Density*
- *Twilio Notifications*
- *Varnish*
- *ZNC IRC Bouncer*
- *SMTP*

New Runners

- *Map/Reduce Style*
- *Queue*

New External Pillars

- *CoreOS etcd*

New Salt-Cloud Providers

- Aliyun ECS Cloud
- LXC Containers
- Proxmox (OpenVZ containers & KVM)

Salt Call Change

When used with a returner, salt-call now contacts a master if `--local` is not specified.

Deprecations

salt.modules.virtualenv_mod

- Removed deprecated memoize function from salt/utils/__init__.py (deprecated)
- Removed deprecated no_site_packages argument from create function (deprecated)
- Removed deprecated check_dns argument from minion_config and apply_minion_config functions (deprecated)
- Removed deprecated OutputOptionsWithTextMixin class from salt/utils/parsers.py (deprecated)
- Removed the following deprecated functions from salt/modules/ps.py: - physical_memory_usage (deprecated) - virtual_memory_usage (deprecated) - cached_physical_memory (deprecated) - physical_memory_buffers (deprecated)
- Removed deprecated cloud arguments from cloud_config function in salt/config.py: - vm_config (deprecated) - vm_config_path (deprecated)
- Removed deprecated libcloud_version function from salt/cloud/libcloudfuncs.py (deprecated)
- Removed deprecated CloudConfigMixin class from salt/utils/parsers.py (deprecated)

19.2.34 Salt 2014.7.1 Release Notes

release 2015-01-12

Version 2014.7.1 is a bugfix release for *2014.7.0*. The changes include:

- Fixed gitfs serving symlinks in *file.recurse* states (issue 17700)

- Fixed holding of multiple packages (YUM) when combined with version pinning ([issue 18468](#))
- Fixed use of Jinja templates in masterless mode with non-roots files server backend ([issue 17963](#))
- Re-enabled pillar and compound matching for mine and publish calls. Note that pillar globbing is still disabled for those modes, for security reasons. ([issue 17194](#))
- Fix for `tty: True` in salt-ssh ([issue 16847](#))
- Fix for supervisor states when supervisor not installed to system python ([issue 18044](#))
- Fix for logging when `log_level='quiet'` for `cmd.run` ([issue 19479](#))

19.2.35 Salt 2014.7.2 Release Notes

release 2015-02-09

Version 2014.7.2 is a bugfix release for [2014.7.0](#). The changes include:

- Fix erroneous warnings for systemd service enabled check ([issue 19606](#))
- Fix FreeBSD kernel module loading, listing, and persistence `kmod` ([issue 197151](#), [issue 19682](#))
- Allow case-sensitive npm package names in the `npm state`. This may break behavior for people expecting the state to lowercase their npm package names for them. The `npm module` was never affected by mandatory lowercasing. ([issue 20329](#))
- Deprecate the `activate` parameter for `pip.install` for both the `module` and the `state`. If `bin_env` is given and points to a virtualenv, there is no need to activate that virtualenv in a shell for pip to install to the virtualenv.
- Fix a file-locking bug in `gitfs` ([issue 18839](#))
- Deprecated `archive_user` in favor of standardized `user` parameter in `state` and added `group` parameter.

19.2.36 Salt 2014.7.3 Release Notes

release TBA

Version 2014.7.3 is a bugfix release for [2014.7.0](#).

Changes:

- Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
- Fix bug wherein `network.iface` could produce stack traces.
- `net.arp` will no longer be made available unless `arp` is installed on the system.
- Major performance improvements to Saltnado
- Allow KVM module to operate under KVM itself or VMware Fusion
- Various fixes to the Windows installation scripts
- Fix issue where the syndic would not correctly propagate loads to the master job cache.
- Improve error handling on invalid `/etc/network/interfaces` file in salt networking modules
- Fix bug where a response status was not checked for in `fileclient.get_url`
- Enable `eauth` when running salt in batch mode

- Increase timeout in Boto Route53 module
- Fix bugs with Salt's `tar` module option parsing
- Fix parsing of NTP servers on Windows
- Fix issue with blockdev tuning not reporting changes correctly
- Update to the latest Salt bootstrap script
- Update Linode salt-cloud driver to use either linode-python or apache-libcloud
- Fix for s3.query function to return correct headers
- Fix for s3.head returning None for files that exist
- Fix the disable function in win_service module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
- Add status.master capability for Windows.
- Various fixes to ssh_known_hosts
- Various fixes to states.network bonding for Debian
- The debian_ip.get_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output
- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if *backup* is False, and if a pre-existing file exists with extension *.bak*, then that backup file will be overwritten. This backup behavior is a result of how *fileinput* works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting *file.replace* so it doesn't use *fileinput*
- VCS filereserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled

- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback filesystems on every state run
- Remove requisites from listens after they are called in the state system
- Make system implementation of service.running aware of legacy service calls
- Fix issue where publish.publish would not handle duplicate responses gracefully.
- Accept Kali Linux for aptpkg salt execution module
- Fix bug where cmd.which could not handle a dirname as an argument
- Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.

19.2.37 Salt 2014.7.4 Release Notes

`release` 2015-03-30

Version 2014.7.4 is a bugfix release for [2014.7.0](#).

This is a security release. The security issues fixed have only been present since 2014.7.0, and only users of the two listed modules are vulnerable. The following CVEs have been resolved:

- CVE-2015-1838 SaltStack: insecure /tmp file handling in salt/modules/serverdensity_device.py
- CVE-2015-1839 SaltStack: insecure /tmp file handling in salt/modules/chef.py

Changes:

- Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
- Fix bug wherein network.iface could produce stack traces.
- net.arp will no longer be made available unless arp is installed on the system.
- Major performance improvements to Saltnado
- Allow KVM module to operate under KVM itself or VMware Fusion
- Various fixes to the Windows installation scripts
- Fix issue where the syndic would not correctly propagate loads to the master job cache.
- Improve error handling on invalid `/etc/network/interfaces` file in salt networking modules
- Fix bug where a response status was not checked for in `fileclient.get_url`
- Enable eauth when running salt in batch mode
- Increase timeout in Boto Route53 module
- Fix bugs with Salt's ``tar`` module option parsing
- Fix parsing of NTP servers on Windows
- Fix issue with blockdev tuning not reporting changes correctly
- Update to the latest Salt bootstrap script

- Update Linode salt-cloud driver to use either linode-python or apache-libcloud
- Fix for s3.query function to return correct headers
- Fix for s3.head returning None for files that exist
- Fix the disable function in win_service module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
- Add status.master capability for Windows.
- Various fixes to ssh_known_hosts
- Various fixes to states.network bonding for Debian
- The debian_ip.get_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output
- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if *backup* is False, and if a pre-existing file exists with extension *.bak*, then that backup file will be overwritten. This backup behavior is a result of how *fileinput* works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting *file.replace* so it doesn't use *fileinput*
- VCS filreserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled
- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback filesystems on every state run
- Remove reqsites from listens after they are called in the state system
- Make system implementation of service.running aware of legacy service calls
- Fix issue where publish.publish would not handle duplicate responses gracefully.

- Accept Kali Linux for aptpkg salt execution module
- Fix bug where cmd.which could not handle a dirname as an argument
- Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.
- There are known issues with batch mode operating on the incorrect number of minions. This bug can be patched with the change in [Pull Request #22464](#).
- The *fun*, *state*, and *unless* keywords are missing from the state internals, which can cause problems running some states. This bug can be patched with the change in [Pull Request #22365](#).

19.2.38 Salt 2014.7.5 Release Notes

release 2015-04-16

Version 2014.7.5 is a bugfix release for [2014.7.0](#).

Changes:

- Fixed a key error bug in salt-cloud
- Updated man pages to better match documentation
- Fixed bug concerning high CPU usage with salt-ssh
- Fixed bugs with remounting cvfs and fuse filesystems
- Fixed bug with allowing requisite tracking of entire sls files
- Fixed bug with aptpkg.mod_repo returning OK even if apt-add-repository fails
- Increased frequency of ssh terminal output checking
- Fixed malformed locale string in localmod module
- Fixed checking of available version of package when accept_keywords were changed
- Fixed bug to make git.latest work with empty repositories
- Added `**kwargs` to service.mod_watch which removes warnings about *enable* and `__reqs__` not being supported by the function
- Improved state comments to not grow so quickly on failed requisites
- Added force argument to service to trigger force_reload
- Fixed bug to andle pkgrepo keyids that have been converted to int
- Fixed module.portage_config bug with appending accept_keywords
- Fixed bug to correctly report disk usage on windows minion
- Added the ability to specify key prefix for S3 ext_pillar
- Fixed issues with batch mode operating on the incorrect number of minions
- Fixed a bug with the proxmox cloud provider stacktracing on disk definition
- Fixed a bug with the changes dictionary in the file state
- Fixed the TCP keep alive settings to work better with SREQ caching

- Fixed many bugs within the iptables state and module
- Fixed bug with states by adding *fun*, *state*, and *unless* to the state runtime internal keywords listing
- Added ability to eAuth against Active Directory
- Fixed some salt-ssh issues when running on Fedora 21
- Fixed grains.get_or_set_hash to work with multiple entries under same key
- Added better explanations and more examples of how the Reactor calls functions to docs
- Fixed bug to not pass *ex_config_drive* to libcloud unless it's explicitly enabled
- Fixed bug with pip.install on windows
- Fixed bug where puppet.run always returns a 0 retcode
- Fixed race condition bug with minion scheduling via pillar
- Made efficiency improvements and bug fixes to the windows installer
- Updated environment variables to fix bug with pygit2 when running salt as non-root user
- Fixed cas behavior on data module -- data.cas was not saving changes
- Fixed GPG rendering error
- Fixed strace error in virt.query
- Fixed stacktrace when running chef-solo command
- Fixed possible bug wherein uncaught exceptions seem to make zmq3 tip over when threading is involved
- Fixed argument passing to the reactor
- Fixed glibc caching to prevent bug where salt-minion getaddrinfo in dns_check() never got updated name-servers

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout'` and ``auth_tries'` down to shorter periods.

19.2.39 Salt 2014.7.6 Release Notes

release 2015-05-18

Version 2014.7.6 is a bugfix release for [2014.7.0](#).

This release is a security release. A minor issue was found, as cited below:

- CVE-2015-4017 -- Certificates are not verified when connecting to server in the Aliyun and Proxmox modules

Only users of the Aliyun or Proxmox cloud modules are at risk. The vulnerability does not exist in the latest 2015.5.0 release of Salt.

Changes:

- salt.runners.cloud.action() has changed the *fun* keyword argument to *func*. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

- **PR #23810:** (*rallytime*) Backport #23757 to 2014.7 @ 2015-05-18T15:30:21Z
 - **PR #23757:** (*clan*) use abspath, do not eliminating symlinks | refs: #23810

- aee00c8 Merge pull request #23810 from rallytime/bp-23757
- fb32c32 use abspath, do not eliminating symlinks
- PR #23809: (*rallytime*) Fix virtualport section of virt.get_nics loop @ 2015-05-18T15:30:09Z
 - ISSUE #20198: (*jeftang*) virt.get_graphics, virt.get_nics are broken, in turn breaking other things | refs: #23809
 - PR #21487: (*rallytime*) Backport #21469 to 2014.7 | refs: #23809
 - PR #21469: (*vdesjardins*) fixes #20198: virt.get_graphics and virt.get_nics calls in module virt | refs: #21487
 - 6b3352b Merge pull request #23809 from rallytime/virt_get_nics_fix
 - 0616fb7 Fix virtualport section of virt.get_nics loop
- PR #23823: (*gtmanfred*) add link local for ipv6 @ 2015-05-17T12:48:25Z
 - 188f03f Merge pull request #23823 from gtmanfred/2014.7
 - 5ef006d add link local for ipv6
- PR #23802: (*gtmanfred*) if it is ipv6 ip_to_int will fail @ 2015-05-16T04:06:59Z
 - PR #23573: (*techhat*) Scan all available networks for public and private IPs | refs: #23802
 - f3ca682 Merge pull request #23802 from gtmanfred/2014.7
 - 2da98b5 if it is ipv6 ip_to_int will fail
- PR #23488: (*cellscape*) LXC cloud fixes @ 2015-05-15T18:09:35Z
 - ISSUE #16424: (*stanvit*) salt-run cloud.create fails with saltify
 - d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
 - 64250a6 Remove profile from opts after creating LXC container
 - c4047d2 Set destroy=True in opts when destroying cloud instance
 - 9e1311a Store instance names in opts when performing cloud action
 - 934bc57 Correctly pass custom env to lxc-attach
 - 7fb85f7 Preserve test=True option in cloud states
 - 9771b5a Fix detection of absent LXC container in cloud state
 - fb24f0c Report failure when failed to create/clone LXC container
 - 2d9aa2b Avoid shadowing variables in lxc module
 - 792e102 Allow overriding profile options in lxc.cloud_init_interface
 - 42bd64b Return changes on successful lxc.create from salt-cloud
 - 4409eab Return correct result when creating cloud LXC container
 - 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
- PR #23748: (*basepi*) [2014.7] Log salt-ssh roster render errors more assertively and verbosely @ 2015-05-14T22:38:10Z
 - ISSUE #22332: (*rallytime*) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
 - 808bbe1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
 - bc53e04 Log entire exception for render errors in roster

- 753de6a Log render errors in roster to error level
 - e01a7a9 Always let the real YAML error through
- **PR #23731:** (*twangboy*) Fixes #22959: Trying to add a directory to an unmapped drive in windows @ 2015-05-14T21:59:14Z
 - **ISSUE #22959:** (*highlyunavailable*) Windows Salt hangs if file.directory is trying to write to a drive that doesn't exist
 - 72cf360 Merge pull request #23731 from twangboy/fix_22959
 - 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows
- **PR #23730:** (*rallytime*) Backport #23729 to 2014.7 @ 2015-05-14T21:58:34Z
 - **PR #23729:** (*rallytime*) Partially merge #23437 (grains fix) | refs: #23730
 - **PR #23437:** (*cedwards*) Grains item patch | refs: #23729
 - 2610195 Merge pull request #23730 from rallytime/bp-23729
 - 1877cae adding support for nested grains to grains.item
- **PR #23688:** (*twangboy*) Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows @ 2015-05-14T16:15:56Z
 - 3e9df88 Merge pull request #23688 from twangboy/fix_23415
 - 6a91169 Fixed unused-import pylint error
 - 5e25b3f fixed pylint errors
 - 1a96766 Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows
- **PR #23680:** (*cachedout*) Rename kwarq in cloud runner @ 2015-05-13T19:44:02Z
 - **ISSUE #23403:** (*iamfil*) salt.runners.cloud.action fun parameter is replaced | refs: #23680
 - 1b86460 Merge pull request #23680 from cachedout/issue_23403
 - d5986c2 Rename kwarq in cloud runner
- **PR #23674:** (*cachedout*) Handle lists correctly in grains.list_prsresent @ 2015-05-13T18:34:58Z
 - **ISSUE #23548:** (*kkaig*) grains.list_present produces incorrect (?) output | refs: #23674
 - cd64af0 Merge pull request #23674 from cachedout/issue_23548
 - da8a2f5 Handle lists correctly in grains.list_prsresent
- **PR #23672:** (*twangboy*) Fix user present @ 2015-05-13T18:30:09Z
 - d322a19 Merge pull request #23672 from twangboy/fix_user_present
 - 731e7af Merge branch `2014.7' of <https://github.com/saltstack/salt> into fix_user_present
 - d6f70a4 Fixed user.present to create password in windows
- **PR #23670:** (*rallytime*) Backport #23607 to 2014.7 @ 2015-05-13T18:27:17Z
 - **ISSUE #23604:** (*Azidburn*) service.dead on systemd Minion create an Error Message | refs: #23607
 - **PR #23607:** (*Azidburn*) Fix for #23604. No error reporting. Exitcode !=0 are ok | refs: #23670
 - 43f7025 Merge pull request #23670 from rallytime/bp-23607
 - ed30dc4 Fix for #23604. No error reporting. Exitcode !=0 are ok
- **PR #23661:** (*rallytime*) Merge #23640 with whitespace fix @ 2015-05-13T15:47:30Z

- ISSUE #22141: (*Deshke*) grains.get_or_set_hash render error if hash begins with ``%" | refs: #23640
- PR #23640: (*cachedout*) Add warning to get_or_set_hash about reserved chars | refs: #23661
- 0f006ac Merge pull request #23661 from rallytime/merge-23640
- 4427f42 Whitespace fix
- dd91154 Add warning to get_or_set_hash about reserved chars
- PR #23639: (*cachedout*) Handle exceptions raised by __virtual__ @ 2015-05-13T15:11:12Z
 - ISSUE #23452: (*michaelforge*) minion crashed with empty grain | refs: #23639
 - 84e2ef8 Merge pull request #23639 from cachedout/issue_23452
 - d418b49 Syntax error!
 - 45b4015 Handle exceptions raised by __virtual__
- PR #23637: (*cachedout*) Convert str master to list @ 2015-05-13T15:08:19Z
 - ISSUE #23611: (*hubez*) master_type set to `failover` but `master` is not of type list but of type <type `str`> | refs: #23637
 - bd9b94b Merge pull request #23637 from cachedout/issue_23611
 - 56cb1f5 Fix typo
 - f6fcf19 Convert str master to list
- PR #23595: (*rallytime*) Backport #23549 to 2014.7 @ 2015-05-12T21:19:40Z
 - PR #23549: (*vr-jack*) Update __init__.py | refs: #23595
 - f20c0e4 Merge pull request #23595 from rallytime/bp-23549
 - 6efcac0 Update __init__.py
- PR #23594: (*rallytime*) Backport #23496 to 2014.7 @ 2015-05-12T21:19:34Z
 - ISSUE #23110: (*martinhoefling*) Copying files from gitfs in file.recurse state fails
 - PR #23496: (*martinhoefling*) Fix for issue #23110 | refs: #23594
 - 1acaf86 Merge pull request #23594 from rallytime/bp-23496
 - d5ae1d2 Fix for issue #23110 This resolves issues when the freshly created directory is removed by file-server.update.
- PR #23593: (*rallytime*) Backport #23442 to 2014.7 @ 2015-05-12T21:19:26Z
 - PR #23442: (*clan*) add directory itself to keep list | refs: #23593
 - 2c221c7 Merge pull request #23593 from rallytime/bp-23442
 - 39869a1 check w/ low['name'] only
 - 304cc49 another fix for file defined w/ id, but require name
 - 8814d41 add directory itself to keep list
- PR #23606: (*twangboy*) Fixed checkbox for starting service and actually starting it @ 2015-05-12T21:18:50Z
 - fadd1ef Merge pull request #23606 from twangboy/fix_installer
 - 038331e Fixed checkbox for starting service and actually starting it
- PR #23592: (*rallytime*) Backport #23389 to 2014.7 @ 2015-05-12T16:44:42Z
 - ISSUE #22908: (*karanjad*) Add failhard option to salt orchestration | refs: #23389

- PR #23389: (*cachedout*) Correct fail_hard typo | refs: #23592
- 10b3f0f Merge pull request #23592 from rallytime/bp-23389
- 734cc43 Correct fail_hard typo
- PR #23573: (*techhat*) Scan all available networks for public and private IPs | refs: #23802 @ 2015-05-12T15:22:22Z
 - cd34b9b Merge pull request #23573 from techhat/novaquery
 - f92db5e Linting
 - 26e00d3 Scan all available networks for public and private IPs
- PR #23558: (*jfindlay*) reorder emerge command line @ 2015-05-12T15:17:46Z
 - ISSUE #23479: (*danielmorlock*) Typo in pkg.removed for Gentoo? | refs: #23558
 - 2a72cd7 Merge pull request #23558 from jfindlay/fix_ebuild
 - 45404fb reorder emerge command line
- PR #23530: (*dr4Ke*) salt-ssh state: fix including all salt:// references @ 2015-05-12T15:13:43Z
 - ISSUE #23355: (*dr4Ke*) salt-ssh: `sources: salt://` files from `pkg` state are not included in salt_state.tgz | refs: #23530
 - a664a3c Merge pull request #23530 from dr4Ke/fix_salt-ssh_to_include_pkg_sources
 - 5df6a80 fix pylint warning
 - d0549e5 salt-ssh state: fix including all salt:// references
- PR #23433: (*twangboy*) Obtain all software from the registry @ 2015-05-11T22:47:52Z
 - ISSUE #23004: (*b18*) 2014.7.5 - Windows - pkg.list_pkgs - ``nxlog`` never shows up in output. | refs: #23433
 - 55c3869 Merge pull request #23433 from twangboy/list_pkgs_fix
 - 8ab5b1b Fix pylint error
 - 2d11d65 Obtain all software from the registry
- PR #23554: (*jleroy*) Debian: Hostname always updated @ 2015-05-11T21:57:00Z
 - 755bed0 Merge pull request #23554 from jleroy/debian-hostname-fix
 - 5ff749e Debian: Hostname always updated
- PR #23551: (*dr4Ke*) grains.append unit tests, related to #23474 @ 2015-05-11T21:54:25Z
 - 6ec87ce Merge pull request #23551 from dr4Ke/grains.append_unit_tests
 - ebf9df fix pylint errors
 - c495404 unit tests for grains.append module function
 - 0c9a323 use MagicMock
 - c838a22 unit tests for grains.append module function
- PR #23474: (*dr4Ke*) Fix grains.append in nested dictionary grains #23411 @ 2015-05-11T18:00:21Z
 - ISSUE #23411: (*dr4Ke*) grains.append should work at any level of a grain | refs: #23440
 - PR #23440: (*dr4Ke*) fix grains.append in nested dictionary grains #23411 | refs: #23474
 - e96c5c5 Merge pull request #23474 from dr4Ke/fix_grains.append_nested

- a01a5bb grains.get, parameter delimititer, versionadded: 2014.7.6
- b39f504 remove debugging output
- b6e15e2 fix grains.append in nested dictionary grains #23411
- PR #23537: (*t0rrant*) Update changelog @ 2015-05-11T17:02:16Z
 - ab7e1ae Merge pull request #23537 from t0rrant/patch-1
 - 8e03cc9 Update changelog
- PR #23538: (*cro*) Update date in LICENSE file @ 2015-05-11T15:19:25Z
 - b79fed3 Merge pull request #23538 from cro/licupdate
 - 345efe2 Update date in LICENSE file
- PR #23505: (*aneeshusa*) Remove unused ssh config validator. Fixes #23159. @ 2015-05-09T13:24:15Z
 - ISSUE #23159: (*aneeshusa*) Unused validator
 - a123a36 Merge pull request #23505 from aneeshusa/remove-unused-ssh-config-validator
 - 90af167 Remove unused ssh config validator. Fixes #23159.
- PR #23467: (*slinu3d*) Added AWS v4 signature support @ 2015-05-08T14:36:19Z
 - ISSUE #20518: (*ekle*) module s3.get does not support eu-central-1 | refs: #23467
 - ca2c21a Merge pull request #23467 from slinu3d/2014.7
 - 0b4081d Fixed pylint error at line 363
 - 5be5eb5 Fixed pylink errors
 - e64f374 Fixed lint errors
 - b9d1ac4 Added AWS v4 signature support
- PR #23444: (*techhat*) Add create_attach_volume to nova driver @ 2015-05-07T19:51:32Z
 - e6f9eec Merge pull request #23444 from techhat/novacreateattach
 - ebdb7ea Add create_attach_volume to nova driver
- PR #23460: (*s0undt3ch*) [2014.7] Update to latest stable bootstrap script v2015.05.07 @ 2015-05-07T19:10:54Z
 - ISSUE #563: (*chutz*) pidfile support for minion and master daemons | refs: #23460
 - e331463 Merge pull request #23460 from s0undt3ch/hotfix/bootstrap-script-2014.7
 - edcd0c4 Update to latest stable bootstrap script v2015.05.07
- PR #23439: (*techhat*) Add wait_for_passwd_maxtries variable @ 2015-05-07T07:28:56Z
 - 7a8ce1a Merge pull request #23439 from techhat/maxtries
 - 0ad3ff2 Add wait_for_passwd_maxtries variable
- PR #23422: (*cro*) \$HOME should not be used, some shells don't set it. @ 2015-05-06T21:02:36Z
 - 644eb75 Merge pull request #23422 from cro/gce_sh_home
 - 4ef9e6b Don't use \$HOME to find user's directory, some shells don't set it
- PR #23425: (*basepi*) [2014.7] Fix typo in FunctionWrapper @ 2015-05-06T20:38:03Z
 - ef17ab4 Merge pull request #23425 from basepi/functionwrapper_typo
 - c390737 Fix typo in FunctionWrapper

- **PR #23385:** (*rallytime*) Backport #23346 to 2014.7 @ 2015-05-06T20:12:29Z
 - **PR #23346:** (*ericfode*) Allow file_map in salt-cloud to handle folders. | refs: #23385
 - 1b13ec0 Merge pull request #23385 from rallytime/bp-23346
 - 9efc13c more linting fixes
 - cf131c9 cleaned up some pylint errors
 - f981699 added logic to sftp_file and file_map to allow folder uploads using file_map
- **PR #23414:** (*jfindlay*) 2015.2 -> 2015.5 @ 2015-05-06T20:04:02Z
 - f8c7a62 Merge pull request #23414 from jfindlay/update_branch
 - 8074d16 2015.2 -> 2015.5
- **PR #23404:** (*hvnsweeting*) saltapi cherry-py: initialize var when POST body is empty @ 2015-05-06T17:35:56Z
 - 54b3bd4 Merge pull request #23404 from hvnsweeting/cherry-py-post-empty-body-fix
 - f85f8f9 initialize var when POST body is empty
- **PR #23409:** (*terminalmage*) Update Lithium docstrings in 2014.7 branch @ 2015-05-06T16:20:46Z
 - 160f703 Merge pull request #23409 from terminalmage/update-lithium-docstrings-2014.7
 - bc97d01 Fix sphinx typo
 - 20006b0 Update Lithium docstrings in 2014.7 branch
- **PR #23397:** (*jfindlay*) add more flexible whitespace to locale_gen search @ 2015-05-06T03:44:11Z
 - **ISSUE #17245:** (*tomashavlas*) localemod does not generate locale for Arch | refs: #23307 #23397
 - aa5fb0a Merge pull request #23397 from jfindlay/fix_locale_gen
 - 0941fef add more flexible whitespace to locale_gen search
- **PR #23368:** (*kaithar*) Backport #23367 to 2014.7 @ 2015-05-05T21:42:26Z
 - **PR #23367:** (*kaithar*) Put the sed insert statement back in to the output. | refs: #23368
 - **PR #18368:** (*basepi*) Merge forward from 2014.7 to develop | refs: #23367 #23368
 - 0c76dd4 Merge pull request #23368 from kaithar/bp-23367
 - 577f419 Pylint fix
 - 8d9acd1 Put the sed insert statement back in to the output.
- **PR #23350:** (*lorenegordon*) Append/prepend: search for full line @ 2015-05-05T21:42:11Z
 - **ISSUE #23294:** (*variia*) file.replace fails to append if repl string partially available | refs: #23350
 - 3493cc1 Merge pull request #23350 from lorenegordon/file.replace_assume_line
 - b60e224 Append/prepend: search for full line
- **PR #23341:** (*cachedout*) Fix syndic pid and logfile path @ 2015-05-05T21:29:10Z
 - **ISSUE #23026:** (*adelcast*) Incorrect salt-syndic logfile and pidfile locations | refs: #23341
 - 7be5c48 Merge pull request #23341 from cachedout/issue_23026
 - e98e65e Fix tests
 - 6011b43 Fix syndic pid and logfile path

- **PR #23272:** (*basepi*) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347 @ **
 - **ISSUE #19114:** (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
 - **PR #23188:** (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
 - ea61abf Merge pull request #23272 from basepi/salt-ssh.minion.config.19114
 - c223309 Add versionadded
 - be7407f Lint
 - c2c3375 Missing comma
 - 8e3e8e0 Pass the minion_opts through the FunctionWrapper
 - cb69cd0 Match the master config template in the master config reference
 - 87fc316 Add Salt-SSH section to master config template
 - 91dd9dc Add ssh_minion_opts to master config ref
 - c273ea1 Add minion config to salt-ssh doc
 - a0b6b76 Add minion_opts to roster docs
 - 5212c35 Accept minion_opts from the target information
 - e2099b6 Process ssh_minion_opts from master config
 - 3b64214 Revert ``Work around bug in salt-ssh in config.get for gpg renderer``
 - 494953a Remove the strip (embracing multi-line YAML dump)
 - fe87f0f Dump multi-line yaml into the SHIM
 - b751a72 Inject local minion config into shim if available
- **PR #23347:** (*basepi*) [2014.7] Salt-SSH Backport FunctionWrapper.__contains__ @ 2015-05-05T14:13:21Z
 - **ISSUE #19114:** (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
 - **PR #23272:** (*basepi*) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347
 - **PR #23188:** (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
 - 4f760dd Merge pull request #23347 from basepi/salt-ssh.functionwrapper.contains.19114
 - 30595e3 Backport FunctionWrapper.__contains__
- **PR #23344:** (*cachedout*) Explicitly set file_client on master @ 2015-05-04T23:21:48Z
 - **ISSUE #22742:** (*hvnswearing*) salt-master says: ``This master address: `salt` was previously resolvable but now fails to resolve!`` | refs: #23344
 - 02658b1 Merge pull request #23344 from cachedout/issue_22742
 - 5adc96c Explicitly set file_client on master
- **PR #23318:** (*cellscape*) Honor seed argument in LXC container initializaton @ 2015-05-04T20:58:12Z
 - **PR #23311:** (*cellscape*) Fix new container initialization in LXC runner | refs: #23318
 - ba7605d Merge pull request #23318 from cellscape/honor-seed-argument
 - 228b1be Honor seed argument in LXC container initializaton
- **PR #23307:** (*jfindlay*) check for /etc/locale.gen @ 2015-05-04T20:56:32Z

- ISSUE #17245: (*tomashavlas*) localemod does not generate locale for Arch | refs: #23307 #23397
- 4ac4509 Merge pull request #23307 from jfindlay/fix_locale_gen
- 101199a check for /etc/locale.gen
- PR #23324: (*s0undt3ch*) [2014.7] Update to the latest stable release of the bootstrap script v2015.05.04 @ 2015-05-04T16:28:30Z
 - ISSUE #580: (*thatch45*) recursive watch not being caught | refs: #23324
 - ISSUE #552: (*jhutchins*) Support require and watch under the same state dec | refs: #23324
 - PR #589: (*epoelke*) add --quiet and --outfile options to saltkey | refs: #23324
 - PR #567: (*bastichelaar*) Added upstart module | refs: #23324
 - PR #560: (*UtahDave*) The runas feature that was added in 93423aa2e5e4b7de6452090b0039560d2b13... | refs: #23324
 - PR #504: (*SEJeff*) File state goodies | refs: #23324
 - f790f42 Merge pull request #23324 from s0undt3ch/hotfix/bootstrap-script-2014.7
 - 6643e47 Update to the latest stable release of the bootstrap script v2015.05.04
- PR #23329: (*cro*) Require requests to verify cert when talking to aliyun and proxmox cloud providers @ 2015-05-04T16:18:17Z
 - 5487367 Merge pull request #23329 from cro/cloud_verify_cert
 - 860d4b7 Turn on ssl verify for requests.
- PR #23311: (*cellscape*) Fix new container initialization in LXC runner | refs: #23318 @ 2015-05-04T09:55:29Z
 - ea20176 Merge pull request #23311 from cellscape/fix-salt-cloud-lxc-init
 - 76fbb34 Fix new container initialization in LXC runner
- PR #23298: (*chris-prince*) Fixed issue #18880 in 2014.7 branch @ 2015-05-03T15:49:41Z
 - ISSUE #18880: (*johtso*) npm installed breaks when a module is missing
 - c399b8f Merge pull request #23298 from chris-prince/2014.7
 - 0fa25db Fixed issue #18880 in 2014.7 branch
- PR #23292: (*rallytime*) Merge #23151 with pylint fixes @ 2015-05-02T03:54:12Z
 - ISSUE #23148: (*cr1st1p*) virt - error handling bogus if machine image location is wrong
 - PR #23151: (*cr1st1p*) Fixes #23148 | refs: #23292
 - 16ecefcd Merge pull request #23292 from rallytime/merge-23151
 - 8ff852a Merge #23151 with pylint fixes
 - 8ffa12e Fixes #23148
- PR #23274: (*basepi*) [2014.7] Reduce salt-ssh debug log verbosity @ 2015-05-01T20:19:23Z
 - ce24315 Merge pull request #23274 from basepi/salt-ssh.debug.verbosity
 - ecee6c6 Log stdout and stderr to trace
 - 08f54d7 Log stdout and stderr to trace as well
 - 9b9c30f Reduce salt-ssh debug log verbosity
- PR #23261: (*rallytime*) Fix tornado websocket event handler registration @ 2015-05-01T18:20:31Z

- ISSUE #22605: (*mavenAtHouzz*) Tornado websockets event Handlers registration are incorrect | refs: #23261
- 7b55e43 Merge pull request #23261 from rallytime/fix-22605
- 4950fbf Fix tornado websocket event handler registration
- PR #23258: (*teizz*) TCP keepalives on the ret side, Revisited. @ 2015-05-01T16:13:49Z
 - 83ef7cb Merge pull request #23258 from teizz/i»¿ret_keepalive_2014_7_5
 - 0b9fb6f The fixes by i»¿cachedout which were backported into 2015_2 were missing a single parameter thus not setting up the TCP keepalive for the ZeroMQ Channel by default.
- PR #23241: (*techhat*) Move iptables log options after the jump @ 2015-05-01T01:31:59Z
 - ISSUE #23224: (*twellspring*) iptables.append --log parameters must be after --jump LOG | refs: #23241
 - 8de3c83 Merge pull request #23241 from techhat/issue23224
 - 87f7948 Move iptables log options after the jump
- PR #23228: (*rallytime*) Backport #23171 to 2014.7 @ 2015-04-30T21:09:45Z
 - PR #23171: (*skizunov*) Bugfix: `clean_proc_dir` is broken | refs: #23228
 - f20210e Merge pull request #23228 from rallytime/bp-23171
 - e670e99 Bugfix: `clean_proc_dir` is broken
- PR #23227: (*rallytime*) Backport #22808 to 2014.7 @ 2015-04-30T21:09:14Z
 - ISSUE #22703: (*Xiol*) salt-ssh does not work with list matcher | refs: #22808
 - PR #22808: (*basepi*) [2015.2] Add list targeting to salt-ssh flat roster | refs: #23227
 - 721cc28 Merge pull request #23227 from rallytime/bp-22808
 - d208a00 Dict, not list
 - a3f529e It's already been converted to a list
 - dd57f2d Add list targeting to salt-ssh flat roster
- PR #22823: (*hvnsweeting*) 22822 file directory clean @ 2015-04-30T15:25:51Z
 - 82c22af Merge pull request #22823 from hvnsweeting/22822-file-directory-clean
 - c749c27 fix lint - remove unnecessary parenthesis
 - cb3dfee refactor
 - 8924b5a refactor: use relpath instead of do it manually
 - d3060a5 refactor
 - 5759a0e bugfix: fix file.directory clean=True when it require parent dir
- PR #22977: (*bersace*) Fix fileserver backends __opts__ overwritten by _pillar @ 2015-04-30T15:24:56Z
 - ISSUE #22941: (*bersace*) _pillar func breaks fileserver globals | refs: #22977 #22942
 - PR #22942: (*bersace*) Fix fileserver backends global overwritten by _pillar | refs: #22977
 - f6c0728 Merge pull request #22977 from bersace/fix-fileserver-backends-pillar-side-effect
 - 5f451f6 Fix fileserver backends __opts__ overwritten by _pillar
- PR #23180: (*jfindlay*) fix typos from 36841bdd in masterapi.py @ 2015-04-30T15:22:41Z

- ISSUE #23166: (*claudiupopescu*) ``Error in function _minion_event" resulting in modules not loaded | refs: #23180
- 34206f7 Merge pull request #23180 from jfindlay/remote_event
- 72066e1 fix typos from 36841bdd in masterapi.py
- PR #23176: (*jfindlay*) copy standard cmd.run* kwargs into cmd.run_chroot @ 2015-04-30T15:22:12Z
 - ISSUE #23153: (*cr1st1p*) cmdmod : run_chroot - broken in 2014.7.5 - missing kwargs | refs: #23176
 - b6b8216 Merge pull request #23176 from jfindlay/run_chroot
 - 7dc3417 copy standard cmd.run* kwargs into cmd.run_chroot
- PR #23193: (*joejulian*) supervisord.mod_watch should accept sfun @ 2015-04-30T04:34:21Z
 - ISSUE #23192: (*joejulian*) supervisord mod_watch does not accept sfun | refs: #23193
 - effacbe Merge pull request #23193 from joejulian/2014.7_supervisord_accept_sfun
 - efb59f9 supervisord.mod_watch should accept sfun
- PR #23188: (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272 @ 2015-04-30T04:34:10Z
 - ISSUE #19114: (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
 - 72fe88e Merge pull request #23188 from basepi/salt-ssh.function.wrapper.gpg.19114
 - d73979e Work around bug in salt-ssh in config.get for gpg renderer
- PR #23154: (*cachedout*) Re-establish channel on interruption in fileclient @ 2015-04-29T16:18:59Z
 - ISSUE #21480: (*msciciel*) TypeError: string indices must be integers, not str | refs: #23154
 - 168508e Merge pull request #23154 from cachedout/refresh_channel
 - 9f8dd80 Re-establish channel on interruption in fileclient
- PR #23146: (*rallytime*) Backport #20779 to 2014.7 @ 2015-04-28T20:45:06Z
 - ISSUE #20647: (*ryan-lane*) file.serialize fails to serialize due to ordered dicts | refs: #20779
 - PR #20779: (*cachedout*) Use declared yaml options | refs: #23146
 - 3b53e04 Merge pull request #23146 from rallytime/bp-20779
 - ffd1849 compare OrderedDicts in serializer unit test
 - a221706 Just change serialize
 - a111798 Use declared yaml options
- PR #23145: (*rallytime*) Backport #23089 to 2014.7 @ 2015-04-28T20:44:56Z
 - PR #23089: (*cachedout*) Stringify version number before lstrip | refs: #23145
 - 8bb4664 Merge pull request #23145 from rallytime/bp-23089
 - 93c41af Stringify version number before lstrip
- PR #23144: (*rallytime*) Backport #23124 to 2014.7 @ 2015-04-28T20:44:46Z
 - ISSUE #16188: (*drawks*) salt.modules.parted has various functions with bogus input validation. | refs: #23124
 - PR #23124: (*ether42*) fix parsing the output of parted in parted.list_() | refs: #23144
 - c85d36f Merge pull request #23144 from rallytime/bp-23124-2014-7

- 6b64da7 fix parsing the output of parted
- **PR #23120:** (*terminalmage*) Don't run `os.path.relpath()` if repo doesn't have a ```root"` param set @ 2015-04-28T15:46:54Z
 - a27b158 Merge pull request #23120 from terminalmage/fix-gitfs-relpath
 - 1860fff Don't run `os.path.relpath()` if repo doesn't have a ```root"` param set
- **PR #23132:** (*clinta*) Backport b27c176 @ 2015-04-28T15:00:30Z
 - fcba607 Merge pull request #23132 from clinta/patch-2
 - a824d72 Backport b27c176
- **PR #23114:** (*rallytime*) Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages @ 2015-04-28T03:59:24Z
 - **ISSUE #18476:** (*Auha*) Upgrading salt on my master caused dependency issues | refs: #23114 #18610
 - **PR #18610:** (*rallytime*) Make ZMQ 4 installation docs for ubuntu more clear | refs: #23114
 - b0f4b28 Merge pull request #23114 from rallytime/remove_ubuntu_zmq4_docs
 - f6cc7c8 Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages
- **PR #23108:** (*rallytime*) Backport #23097 to 2014.7 @ 2015-04-28T03:58:05Z
 - **ISSUE #23085:** (*xenophonf*) Use ```s3fs"` (not ```s3"`) in `filesserver_roots` | refs: #23097
 - **PR #23097:** (*rallytime*) Change `s3` to `s3fs` in `filesserver_roots` docs example | refs: #23108
 - 399857f Merge pull request #23108 from rallytime/bp-23097
 - fa88984 Change `s3` to `s3fs` in `filesserver_roots` docs example
- **PR #23112:** (*basepi*) [2014.7] Backport #22199 to fix mysql returner save_load errors @ 2015-04-28T03:55:44Z
 - **ISSUE #22171:** (*basepi*) We should only call `returner.save_load` once per `jid` | refs: #22199
 - **PR #22199:** (*basepi*) [2015.2] Put a bandaid on the `save_load` duplicate issue (mysql returner) | refs: #23112
 - 5541537 Merge pull request #23112 from basepi/mysql_returner_save_load
 - 0127012 Put a bandaid on the `save_load` duplicate issue
- **PR #23113:** (*rallytime*) Revert ```Backport #22895 to 2014.7"` @ 2015-04-28T03:27:29Z
 - **PR #22925:** (*rallytime*) Backport #22895 to 2014.7 | refs: #23113
 - **PR #22895:** (*aletourneau*) `pam_tally` counter was not reset to 0 after a succesfull login | refs: #22925
 - dfe2066 Merge pull request #23113 from saltstack/revert-22925-bp-22895
 - b957ea8 Revert ```Backport #22895 to 2014.7"`
- **PR #23094:** (*terminalmage*) pygit2: disable cleaning of stale refs for authenticated remotes @ 2015-04-27T20:51:28Z
 - **ISSUE #23013:** (*markusr815*) gitfs regression with authenticated repos | refs: #23094
 - 21515f3 Merge pull request #23094 from terminalmage/issue23013
 - aaf7b04 pygit2: disable cleaning of stale refs for authenticated remotes
- **PR #23048:** (*jfindlay*) py-2.6 compat for `utils/boto.py` `ElementTree` exception @ 2015-04-25T16:56:45Z
 - d45aa21 Merge pull request #23048 from jfindlay/ET_error
 - 64c42cc py-2.6 compat for `utils/boto.py` `ElementTree` exception
- **PR #23025:** (*jfindlay*) catch exceptions on bad system locales/encodings @ 2015-04-25T16:56:30Z

- ISSUE #22981: (*syphernl*) Locale state throwing traceback when generating not (yet) existing locale | refs: #23025
- d25a5c1 Merge pull request #23025 from jfindlay/fix_sys_locale
- 9c4d62b catch exceptions on bad system locales/encodings
- PR #22932: (*hvnsweeting*) bugfix: also manipulate dir_mode when source not defined @ 2015-04-25T16:54:58Z
 - 5e44b59 Merge pull request #22932 from hvnsweeting/file-append-bugfix
 - 3f368de do not use assert in execution module
 - 9d4fd4a bugfix: also manipulate dir_mode when source not defined
- PR #23055: (*jfindlay*) prevent ps module errors on accessing dead procs @ 2015-04-24T22:39:49Z
 - ISSUE #23021: (*ether42*) ps.pgrep raises NoSuchProcess | refs: #23055
 - c2416a4 Merge pull request #23055 from jfindlay/fix_ps
 - c2dc7ad prevent ps module errors on accessing dead procs
- PR #23031: (*jfindlay*) convert exception e.message to just e @ 2015-04-24T18:38:13Z
 - bfd9158 Merge pull request #23031 from jfindlay/exception
 - 856bad1 convert exception e.message to just e
- PR #23015: (*hvnsweeting*) if status of service is stop, there is not an error with it @ 2015-04-24T14:35:10Z
 - 7747f33 Merge pull request #23015 from hvnsweeting/set-non-error-lvl-for-service-status-log
 - 92ea163 if status of service is stop, there is not an error with it
- PR #23000: (*jfindlay*) set systemd service killMode to process for minion @ 2015-04-24T03:42:39Z
 - ISSUE #22993: (*jetpak*) salt-minion restart causes all spawned daemons to die on centos7 (systemd) | refs: #23000
 - 2e09789 Merge pull request #23000 from jfindlay/systemd_kill
 - 3d575e2 set systemd service killMode to process for minion
- PR #22999: (*jtand*) Added retry_dns to minion doc. @ 2015-04-24T03:30:24Z
 - ISSUE #22707: (*arthurlogilab*) retry_dns of master configuration is missing from the documentation | refs: #22999
 - b5c059a Merge pull request #22999 from jtand/fix_22707
 - 8486e17 Added retry_dns to minion doc.
- PR #22990: (*techhat*) Use the proper cloud conf variable @ 2015-04-23T17:48:07Z
 - 27dc877 Merge pull request #22990 from techhat/2014.7
 - d33bcbc Use the proper cloud conf variable
- PR #22976: (*multani*) Improve state_output documentation @ 2015-04-23T12:24:22Z
 - 13dff65 Merge pull request #22976 from multani/fix/state-output-doc
 - 19efd41 Improve state_output documentation
- PR #22955: (*terminalmage*) Fix regression introduced yesterday in dockerio module @ 2015-04-22T18:56:39Z
 - 89fa185 Merge pull request #22955 from terminalmage/dockerio-run-fix
 - b4472ad Fix regression introduced yesterday in dockerio module

- **PR #22954:** (*rallytime*) Backport #22909 to 2014.7 @ 2015-04-22T18:56:20Z
 - **PR #22909:** (*mguegan*) Fix compatibility with pkgin > 0.7 | refs: #22954
 - 46ef227 Merge pull request #22954 from rallytime/bp-22909
 - 70c1cd3 Fix compatibility with pkgin > 0.7
- **PR #22856:** (*jfindlay*) increase timeout and decrease tries for route53 records @ 2015-04-22T16:47:01Z
 - **ISSUE #18720:** (*Reiner030*) timeouts when setting Route53 records | refs: #22856
 - c9ae593 Merge pull request #22856 from jfindlay/route53_timeout
 - ba4a786 add route53 record sync wait, default=False
 - ea2fd50 increase timeout and tries for route53 records
- **PR #22946:** (*s0undt3ch*) Test with a more recent pip version to avoid a traceback @ 2015-04-22T16:25:17Z
 - a178d44 Merge pull request #22946 from s0undt3ch/2014.7
 - bc87749 Test with a more recent pip version to avoid a traceback
- **PR #22945:** (*garethgreenaway*) Fixes to scheduler @ 2015-04-22T16:25:00Z
 - **ISSUE #22571:** (*BoomerB*) same error message as on issue #18504 | refs: #22945
 - de339be Merge pull request #22945 from garethgreenaway/22571_2014_7_schedule_pillar_refresh_seconds_exceptions
 - bfa6d25 Fixing a reported issue when using a scheduled job from pillar with splay. `_seconds` element that acted as a backup of the actual seconds was being removed when pillar was refreshed and causing exceptions. This fix moves some splay related code out of the if else condition so it's checked whether the job is in the job queue or not.
- **PR #22887:** (*hvnsweeting*) fix #18843 @ 2015-04-22T15:47:05Z
 - **ISSUE #18843:** (*calvinhp*) State `user.present` will fail to create home if user exists and `homedir` doesn't
 - 12d2b91 Merge pull request #22887 from hvnsweeting/18843-fix-user-present-home
 - 7fe7b08 run `user.chhome` once to avoid any side-effect when run it twice
 - 19de995 clarify the usage of `home` arg
 - d6dc09a enhance doc, as `usermod` on ubuntu 12.04 will not CREATE home
 - 0ce4d7f refactor: force to use boolean
 - 849d19e log debug the creating dir process
 - c4e95b9 fix #18843: `usermod` won't create a dir if old home does not exist
- **PR #22930:** (*jfindlay*) `localemod.gen_locale` now always returns a boolean @ 2015-04-22T15:37:39Z
 - **ISSUE #21140:** (*holms*) `locale.present` state executed successfully, although originally fails | refs: #22930 #22829
 - **ISSUE #2417:** (*ffa*) Module standards | refs: #22829
 - **PR #22829:** (*F30*) Always return a boolean in `gen_locale()` | refs: #22930
 - b7de7bd Merge pull request #22930 from jfindlay/localegen_bool
 - 399399f `localemod.gen_locale` now always returns a boolean
- **PR #22933:** (*hvnsweeting*) add test for #18843 @ 2015-04-22T15:27:18Z
 - **ISSUE #18843:** (*calvinhp*) State `user.present` will fail to create home if user exists and `homedir` doesn't

- 11bcf14 Merge pull request #22933 from hvnsweeting/18843-test
- b13db32 add test for #18843
- PR #22925: (*rallytime*) Backport #22895 to 2014.7 | refs: #23113 @ 2015-04-22T02:30:26Z
 - PR #22895: (*aletourneau*) pam_tally counter was not reset to 0 after a succesfull login | refs: #22925
 - 6890752 Merge pull request #22925 from rallytime/bp-22895
 - 3852d96 Pylint fix
 - 90f7829 Fixed pylint issues
 - 5ebf159 Cleaned up pull request
 - a08ac47 pam_tally counter was not reset to 0 after a succesfull login
- PR #22914: (*cachedout*) Call proper returner function in jobs.list_jobs @ 2015-04-22T00:49:01Z
 - ISSUE #22790: (*whiteinge*) jobs.list_jobs runner tracebacks on `missing` argument | refs: #22914
 - eca37eb Merge pull request #22914 from cachedout/issue_22790
 - d828d6f Call proper returner function in jobs.list_jobs
- PR #22918: (*JaseFace*) Add a note to the git_pillar docs stating that GitPython is the only currently supported provider @ 2015-04-22T00:48:26Z
 - 44f3409 Merge pull request #22918 from JaseFace/git-pillar-provider-doc-note
 - 0aee5c2 Add a note to the git_pillar docs stating that GitPython is the only currently supported provider
- PR #22907: (*techhat*) Properly merge cloud configs to create profiles @ 2015-04-21T22:02:44Z
 - 31c461f Merge pull request #22907 from techhat/cloudconfig
 - 3bf4e66 Properly merge cloud configs to create profiles
- PR #22894: (*0xf10e*) Fix issue #22782 @ 2015-04-21T18:55:18Z
 - f093975 Merge pull request #22894 from 0xf10e/2014.7
 - 58fa24c Clarify doc on kwarg `roles` for user_present().
 - f0ae2eb Improve readability by renaming tenant_role
- PR #22902: (*rallytime*) Change state example to use proper kwarg @ 2015-04-21T18:50:47Z
 - ISSUE #12003: (*MarkusMuellerAU*) [state.dockerio] docker.run TypeError: run() argument after ** must be a mapping, not str | refs: #22902
 - c802ba7 Merge pull request #22902 from rallytime/docker_doc_fix
 - 8f70346 Change state example to use proper kwarg
- PR #22898: (*terminalmage*) dockerio: better error message for native exec driver @ 2015-04-21T18:02:58Z
 - 81771a7 Merge pull request #22898 from terminalmage/issue12003
 - c375309 dockerio: better error message for native exec driver
- PR #22897: (*rallytime*) Add param documentation for file.replace state @ 2015-04-21T17:31:04Z
 - ISSUE #22825: (*paolodina*) Issue using file.replace in state file | refs: #22897
 - e2ec4ec Merge pull request #22897 from rallytime/fix-22825
 - 9c51630 Add param documentation for file.replace state
- PR #22850: (*bersace*) Fix pillar and salt fileservers mixed @ 2015-04-21T17:04:33Z

- ISSUE #22844: (*bersace*) LocalClient file cache confuse pillar and state files | refs: #22850
- fd53889 Merge pull request #22850 from bersace/fix-pillar-salt-mixed
- 31b98e7 Initialize state file client after pillar loading
- f6bebb7 Use saltenv
- PR #22818: (*twangboy*) Added documentation regarding pip in windows @ 2015-04-21T03:58:59Z
 - 1380fec Merge pull request #22818 from twangboy/upd_pip_docs
 - cb999c7 Update pip.py
 - 3cc5c97 Added documentation regarding pip in windows
- PR #22872: (*rallytime*) Prevent stacktrace on os.path.exists in hosts module @ 2015-04-21T02:54:40Z
 - b2bf17f Merge pull request #22872 from rallytime/fix_hosts_stacktrace
 - c88a1ea Prevent stacktrace on os.path.exists in hosts module
- PR #22853: (*s0undt3ch*) Don't assume package installation order. @ 2015-04-21T02:42:41Z
 - 03af523 Merge pull request #22853 from s0undt3ch/2014.7
 - b62df62 Don't assume package installation order.
- PR #22877: (*s0undt3ch*) Don't fail on *make clean* just because the directory does not exist @ 2015-04-21T02:40:47Z
 - 9211e36 Merge pull request #22877 from s0undt3ch/hotfix/clean-docs-fix
 - 95d6887 Don't fail on *make clean* just because the directory does not exist
- PR #22873: (*thatch45*) Type check the version since it will often be numeric @ 2015-04-21T02:38:11Z
 - 5bdbd08 Merge pull request #22873 from thatch45/type_check
 - 53b8376 Type check the version since it will often be numeric
- PR #22870: (*twangboy*) Added ability to send a version with a space in it @ 2015-04-20T23:18:28Z
 - c965b0a Merge pull request #22870 from twangboy/fix_installer_again
 - 3f180cf Added ability to send a version with a space in it
- PR #22863: (*rallytime*) Backport #20974 to 2014.7 @ 2015-04-20T19:29:37Z
 - PR #20974: (*JohannesEbke*) Fix expr_match usage in salt.utils.check_whitelist_blacklist | refs: #22863
 - 2973eb1 Merge pull request #22863 from rallytime/bp-20974
 - 14913a4 Fix expr_match usage in salt.utils.check_whitelist_blacklist
- PR #22578: (*hvnsweeting*) gracefully handle when salt-minion cannot decrypt key @ 2015-04-20T15:24:45Z
 - c45b92b Merge pull request #22578 from hvnsweeting/2014-7-fix-compile-pillar
 - f75b24a gracefully handle when salt-minion cannot decrypt key
- PR #22800: (*terminalmage*) Improve error logging for pygit2 SSH-based remotes @ 2015-04-18T17:18:55Z
 - ISSUE #21979: (*yrdevops*) gitfs: error message not descriptive enough when libgit2 was compiled without libssh2 | refs: #22800
 - 900c7a5 Merge pull request #22800 from terminalmage/issue21979
 - 8f1c008 Clarify that for pygit2, receiving 0 objects means repo is up-to-date
 - 98885f7 Add information about libssh2 requirement for pygit2 ssh auth

- 09468d2 Fix incorrect log message
- 2093bf8 Adjust loglevels for gitfs errors
- 9d394df Improve error logging for pygit2 SSH-based remotes
- **PR #22813:** (*twangboy*) Updated instructions for building salt @ 2015-04-18T04:10:07Z
 - e99f2fd Merge pull request #22813 from twangboy/win_doc_fix
 - adc421a Fixed some formatting issues
 - 8901b3b Updated instructions for building salt
- **PR #22810:** (*basepi*) [2014.7] More msgpack gating for salt-ssh @ 2015-04-17T22:28:24Z
 - **ISSUE #22708:** (*Bilge*) salt-ssh file.accumulated error: NameError: global name `msgpack' is not defined | refs: #22810
 - fe1de89 Merge pull request #22810 from basepi/salt-ssh.more.msgpack.gating
 - d4da8e6 Gate msgpack in salt/modules/saltutil.py
 - 02303b2 Gate msgpack in salt/modules/data.py
 - d7e8741 Gate salt.states.file.py msgpack
- **PR #22803:** (*rallytime*) Allow map file to work with softlayer @ 2015-04-17T20:34:42Z
 - **ISSUE #17144:** (*xpender*) salt-cloud -m fails with softlayer | refs: #22803
 - 11df71e Merge pull request #22803 from rallytime/fix-17144
 - ce88b6a Allow map file to work with softlayer
- **PR #22807:** (*rallytime*) Add 2014.7.5 links to windows installation docs @ 2015-04-17T20:32:13Z
 - cd43a95 Merge pull request #22807 from rallytime/windows_docs_update
 - 5931a58 Replace all 4s with 5s
 - eadaead Add 2014.7.5 links to windows installation docs
- **PR #22795:** (*rallytime*) Added release note for 2014.7.5 release @ 2015-04-17T18:05:36Z
 - 0b295e2 Merge pull request #22795 from rallytime/release_notes
 - fde1fee Remove extra line
 - b19b95d Added release note for 2014.7.5 release
- **PR #22759:** (*twangboy*) Final edits to the batch files for running salt @ 2015-04-17T04:31:15Z
 - **ISSUE #22740:** (*loregordon*) New Windows installer assumes salt is installed to the current directory | refs: #22759
 - **PR #22754:** (*twangboy*) Removed redundant \ and " | refs: #22759
 - 3c91459 Merge pull request #22759 from twangboy/fix_bat_one_last_time
 - 075f82e Final edits to the batch files for running salt
- **PR #22760:** (*thatch45*) Fix issues with the syndic @ 2015-04-17T04:30:48Z
 - 20d3f2b Merge pull request #22760 from thatch45/syndic_fix
 - e2db624 Fix issues with the syndic not resolving the master when the interface is set
- **PR #22762:** (*twangboy*) Fixed version not showing in Add/Remove Programs @ 2015-04-17T04:29:46Z
 - 54c4584 Merge pull request #22762 from twangboy/fix_installer

- 4d25af8 Fixed version not showing in Add/Remove Programs

19.2.40 Salt 2014.7.8 Release Notes

Changes for v2014.7.7..v2014.7.8

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Changes:

- PR #28839: (*cachedout*) Revert #28740 @ 2015-11-12T22:54:28Z
 - PR #28740: (*MasterNayru*) Add missing S3 module import | refs: #28777
 - 4b8bdd0 Merge pull request #28839 from cachedout/revert_28740
 - 215b26c Revert #28740
- PR #28777: (*rallytime*) Back-port #28740 to 2014.7 @ 2015-11-11T18:00:00Z
 - PR #28740: (*MasterNayru*) Add missing S3 module import | refs: #28777
 - 76e69b4 Merge pull request #28777 from rallytime/bp-28740-2014.7
 - da5fac2 Back-port #28740 to 2014.7
- PR #28716: (*rallytime*) Back-port #28705 to 2014.7 @ 2015-11-10T16:15:03Z
 - PR #28705: (*cachedout*) Account for new headers class in tornado 4.3 | refs: #28716
 - 45c73eb Merge pull request #28716 from rallytime/bp-28705
 - 32e7bd3 Account for new headers class in tornado 4.3
- PR #28717: (*cachedout*) Add note about recommended umask @ 2015-11-09T23:26:20Z
 - ISSUE #28199: (*felskrone*) Non-standard umasks might break the master | refs: #28717
 - f4fe921 Merge pull request #28717 from cachedout/umask_note
 - 1874300 Add note about recommended umask
- PR #28461: (*cachedout*) Wrap all cache calls in state.sls in correct umask @ 2015-11-02T17:11:02Z
 - ISSUE #28455: (*zmalone*) highstate.cache is world readable, and contains secrets | refs: #28461
 - 4bf56ca Merge pull request #28461 from cachedout/issue_28455
 - 097838e Wrap all cache calls in state.sls in correct umask
- PR #28407: (*DmitryKuzmenko*) Don't request creds if auth with key. @ 2015-10-29T16:12:30Z
 - ISSUE #24910: (*bocig*) -T, --make-token flag does NOT work- LDAP Groups | refs: #28407
 - f3e61db Merge pull request #28407 from DSRCCompany/issues/24910_token_auth_fix_2014
 - b7b5bec Don't request creds if auth with key.

- **PR #27390:** (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()` @ 2015-10-05T18:09:33Z
 - d284eb1 Merge pull request #27390 from JaseFace/schedule-missing-enabled
 - 563db71 Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()` Prior to this, when `schedule.present` compares the existing schedule to the one crafted by this function, enabled will actually be removed at each run. `schedule.present` sees a modification needs to be made, and invokes `schedule.modify`, which does so with `enabled: True`, creating and endless loop of an `'enabled'` removal and addition.

19.2.41 Salt 2014.7.9 Release Notes

Changes for v2014.7.8..v2014.7.9

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

 - 85aa70a Merge pull request #29392 from jacobhammons/2014.7
 - d7f0db1 updated version number to not reference a specific build from the latest branch
- **PR #29296:** (*douardda*) Use process KillMode on Debian systems also @ 2015-12-01T16:00:16Z
 - **ISSUE #29295:** (*douardda*) systemd's service file should use the `'process'` KillMode option on Debian also | refs: #29296
 - d2fb210 Merge pull request #29296 from douardda/patch-3
 - d288539 Use process KillMode on Debian systems also

19.2.42 Salt 2014.1.0 Release Notes - Codename Hydrogen

Note: Due to a change in master to minion communication, 2014.1.0 minions are not compatible with older-version masters. Please upgrade masters first. More info on backwards-compatibility policy [here](#), under the "Upgrading Salt" subheading.

Note: A change in the grammar in the state compiler makes `module.run` in requisites illegal syntax. Its use is replaced simply with the word `module`. In other words you will need to change requisites like this:

```
require:  
  module.run: some_module_name
```

to:

```
require:  
  module: some_module_name
```

This is a breaking change. We apologize for the inconvenience, we needed to do this to remove some ambiguity in parsing requisites.

release 2014-02-24

The 2014.1.0 release of Salt is a major release which not only increases stability but also brings new capabilities in virtualization, cloud integration, and more. This release brings a great focus on the expansion of testing making roughly double the coverage in the Salt tests, and comes with many new features.

2014.1.0 is the first release to follow the new date-based release naming system. See the version numbers page for more details.

Major Features

Salt Cloud Merged into Salt

Salt Cloud is a tool for provisioning salted minions across various cloud providers. Prior to this release, Salt Cloud was a separate project but this marks its full integration with the Salt distribution. A Getting Started guide and additional documentation for Salt Cloud can be found [here](#):

Google Compute Engine

Alongside Salt Cloud comes new support for the Google Compute Engine. Salt Stack can now deploy and control GCE virtual machines and the application stacks that they run.

For more information on Salt Stack and GCE, please see [this blog post](#).

Documentation for Salt and GCE can be found [here](#).

Salt Virt

Salt Virt is a cloud controller that supports virtual machine deployment, inspection, migration, and integration with many aspects of Salt.

Salt Virt has undergone a major overhaul with this release and now supports many more features and includes a number of critical improvements.

Docker Integration

Salt now ships with *states* and an *execution module* to manage Docker containers.

Substantial Testing Expansion

Salt continues to increase its unit/regression test coverage. This release includes over 300 new tests.

BSD Package Management

BSD package management has been entirely rewritten. FreeBSD 9 and older now default to using `pkg_add`, while FreeBSD 10 and newer will use `pkgng`. FreeBSD 9 can be forced to use `pkgng`, however, by specifying the following option in the minion config file:

```
providers:
  pkg: pkgng
```

In addition, support for installing software from the ports tree has been added. See the documentation for the ports `state` and `execution module` for more information.

Network Management for Debian/Ubuntu

Initial support for management of network interfaces on Debian-based distros has been added. See the documentation for the `network state` and the `debian_ip` for more information.

IPv6 Support for iptables State/Module

The iptables `state` and `module` now have IPv6 support. A new parameter `family` has been added to the states and execution functions, to distinguish between IPv4 and IPv6. The default value for this parameter is `ipv4`, specifying `ipv6` will use `ip6tables` to manage firewall rules.

GitFS Improvements

Several performance improvements have been made to the `Git filesERVER backend`. Additionally, file states can now use any SHA1 commit hash as a fileserver environment:

```
/etc/httpd/httpd.conf:
file.managed:
- source: salt://webserver/files/httpd.conf
- saltenv: 45af879
```

This applies to the functions in the `cp module` as well:

```
salt '*' cp.get_file salt://readme.txt /tmp/readme.txt saltenv=45af879
```

MinionFS

This new fileserver backend allows files which have been pushed from the minion to the master (using `cp.push`) to be served up from the salt fileserver. The path for these files takes the following format:

```
salt://minion-id/path/to/file
```

`minion-id` is the id of the ``source" minion, the one from which the files were pushed to the master. `/path/to/file` is the full path of the file.

The [MinionFS Walkthrough](#) contains a more thorough example of how to use this backend.

saltenv

To distinguish between fileserver environments and execution functions which deal with environment variables, file-server environments are now specified using the `saltenv` parameter. `env` will continue to work, but is deprecated and will be removed in a future release.

Grains Caching

A caching layer has been added to the Grains system, which can help speed up minion startup. Disabled by default, it can be enabled by setting the minion config option `grains_cache`:

```
grains_cache: True

# Seconds before grains cache is considered to be stale.
grains_cache_expiration: 300
```

If set to `True`, the grains loader will read from/write to a msgpack-serialized file containing the grains data.

Additional command-line parameters have been added to `salt-call`, mainly for testing purposes:

- `--skip-grains` will completely bypass the grains loader when `salt-call` is invoked.
- `--refresh-grains-cache` will force the grains loader to bypass the grains cache and refresh the grains, writing a new grains cache file.

Improved Command Logging Control

When using the `cmd module`, either on the CLI or when developing Salt execution modules, a new keyword argument `output_loglevel` allows for greater control over how (or even if) the command and its output are logged. For example:

```
salt '*' cmd.run 'tail /var/log/messages' output_loglevel=debug
```

The package management modules (`apt`, `yumpkg`, etc.) have been updated to log the copious output generated from these commands at loglevel `debug`.

Note: To keep a command from being logged, `output_loglevel=quiet` can be used.

Prior to this release, this could be done using `quiet=True`. This argument is still supported, but will be removed in a future Salt release.

PagerDuty Support

Initial support for firing events via `PagerDuty` has been added. See the documentation for the `pagerduty` module.

Virtual Terminal

Sometimes the subprocess module is not good enough, and, in fact, not even `askpass` is. This virtual terminal is still in it's infant childhood, needs quite some love, and was originally created to replace `askpass`, but, while developing it, it immediately proved that it could do so much more. It's currently used by salt-cloud when bootstrapping salt on clouds which require the use of a password.

Proxy Minions

Initial basic support for Proxy Minions is in this release. Documentation can be found [here](#).

Proxy minions are a developing feature in Salt that enables control of devices that cannot run a minion. Examples include network gear like switches and routers that run a proprietary OS but offer an API, or "dumb" devices that just don't have the horsepower or ability to handle a Python VM.

Proxy minions can be difficult to write, so a simple REST-based example proxy is included. A Python bottle-based webserver can be found at <https://github.com/cro/salt-proxy-rest> as an endpoint for this proxy.

This is an ALPHA-quality feature. There are a number of issues with it currently, mostly centering around process control, logging, and inability to work in a masterless configuration.

Additional Bugfixes (Release Candidate Period)

Below are many of the fixes that were implemented in salt during the release candidate phase.

- Fix `mount.mounted` leaving conflicting entries in `fstab` ([issue 7079](#))
- Fix `mysql` returner serialization to use `json` ([issue 9590](#))
- Fix `ZMQError: Operation cannot be accomplished in current state errors` ([issue 6306](#))
- `Rbenv` and `ruby` improvements
- Fix quoting issues with `mysql` port ([issue 9568](#))
- Update `mount` module/state to support multiple swap partitions ([issue 9520](#))
- Fix `archive` state to work with `bsdtar`
- Clarify logs for minion ID caching
- Add numeric revision support to `git` state ([issue 9718](#))
- Update `master_uri` with `master_ip` ([issue 9694](#))
- Add comment to `Debian mod_repo` ([issue 9923](#))
- Fix potential undefined loop variable in `rabbitmq` state ([issue 8703](#))
- Fix for `salt-virt` runner to delete key on VM deletion
- Fix for `salt-run -d` to limit results to specific runner or function ([issue 9975](#))
- Add tracebacks to `jinja` renderer when applicable ([issue 10010](#))
- Fix parsing in `monit` module ([issue 10041](#))
- Fix `highstate` output from `syndic` minions ([issue 9732](#))
- Quiet logging when dealing with passwords/hashes ([issue 10000](#))
- Fix for multiple remotes in `git_pillar` ([issue 9932](#))

- Fix npm installed command ([issue 10109](#))
- Add safeguards for utf8 errors in zcbuildout module
- Fix compound commands ([issue 9746](#))
- Add systemd notification when master is started
- Many doc improvements

19.2.43 Salt 2014.1.1 Release Notes

release 2014-03-18

Version 2014.1.1 is a bugfix release for [2014.1.0](#). The changes include:

- Various doc fixes, including up-to-date Salt Cloud installation documentation.
- Renamed state.sls runner to state.orchestrate, to reduce confusion with the `state.sls` execution function
- Fix various bugs in the `dig` module ([issue 10367](#))
- Add retry for query on certain EC2 status codes ([issue 10154](#))
- Fix various bugs in `mongodb_user` state module ([issue 10430](#))
- Fix permissions on `~/.salt_token` ([issue 10422](#))
- Add PyObjects support
- Fix launchctl module crash with missing files
- Fix `saltutil.find_job` for Windows ([issue 10581](#))
- Fix OS detection for OpenSolaris ([issue 10601](#))
- Fix broken salt-ssh `key_deploy`
- Add support for multiline cron comments ([issue 10721](#))
- Fix timezone module for Arch ([issue 10789](#))
- Fix symlink support for `file.recurse` ([issue 10809](#))
- Fix multi-master bugs ([issue 10732](#) and [issue 10969](#))
- Fix `file.patch` to error when source file is unavailable ([issue 10380](#))
- Fix `pkg` to handle packages set as `purge` in `pkg.installed` ([issue 10719](#))
- Add `zmqversion` grain
- Fix highstate summary for masterless minions ([issue 10945](#))
- Fix `saltutil.find_job` for 2014.1 masters talking to 0.17 minions ([issue 11020](#))
- Fix `file.recurse` states with trailing slashes in source ([issue 11002](#))
- Fix `pkg.states` to allow `pkgname.x86_64` ([issue 7306](#))
- Make `iptables.states` set a default table for flush ([issue 11037](#))
- Added `iptables --reject-with` after final iptables call in `iptables.states` ([issue:10757](#))
- Fix improper passing of “family” in `iptables.states` ([issue 10774](#))
- Fix traceback in `iptables.insert` states ([issue 10988](#))
- Fix zombie processes ([issue 10867](#) and others)

- Fix batch mode to obey `--return` settings (issue 9146)
- Fix localclient issue that was causing batch mode breakage (issue 11094, issue 10470, and others)
- Multiple salt-ssh fixes
- FreeBSD: look in `/usr/local/etc/salt` for configuration by default, if installed using `pip --editable`.
- Add a `skip_suggestions` parameter to `pkg.installed` states which allows pre-flight check to be skipped (issue 11106)
- Fixed tag-based gitfs fileserver environments regression (issue 10956)
- Yum: fix cache of available pkgs not cleared when repos are changed (issue 11001)
- Yum: fix for plugin-provided repositories (i.e. RHN/Spacewalk) (issue 11145)
- Fix regression in `chocolatey.bootstrap` (issue 10541)
- Fix fail on unknown target in `jobs runner` (issue 11151)
- Don't log errors for commands which are expected to sometimes exit with non-zero exit status (issue 11154, issue 11090)
- Fix `test=True` CLI override of config option (issue 10877)
- Log `sysctl` key listing at loglevel TRACE (issue 10931)

19.2.44 Salt 2014.1.10 Release Notes

release 2014-08-01

Note: Version 2014.1.9 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.9.

Version 2014.1.10 is another bugfix release for *2014.1.0*. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

Salt 2014.1.10 fixes security issues documented by CVE-2014-3563: "Insecure tmp-file creation in seed.py, salt-ssh, and salt-cloud." Upgrading is recommended.

19.2.45 Salt 2014.1.11 Release Notes

release 2014-08-29

Version 2014.1.11 is another bugfix release for *2014.1.0*. Changes include:

- Fix for `minion_id` with byte-order mark (BOM) (issue 12296)
- Fix `runas` deprecation in `at` module
- Fix trailing slash behavior for `file.makedirs_` (issue 14019)

- Fix chocolatey path ([issue 13870](#))
- Fix git_pillar infinite loop issues ([issue 14671](#))
- Fix json outputter null case
- Fix for minion error if one of multiple masters are down ([issue 14099](#))

19.2.46 Salt 2014.1.12 Release Notes

release 2014-10-08

Version 2014.1.12 is another bugfix release for *2014.1.0*. Changes include:

- Fix scp_file always failing (which broke salt-cloud) ([issue 16437](#))
- Fix regression in pillar in masterless ([issue 16210](#), [issue 16416](#), [issue 16428](#))

19.2.47 Salt 2014.1.13 Release Notes

release 2014-10-14

Version 2014.1.13 is another bugfix release for *2014.1.0*. Changes include:

- Fix sftp_file by checking the exit status code of scp (which broke salt-cloud) ([issue 16599](#))

19.2.48 Salt 2014.1.2 Release Notes

release 2014-04-15

Version 2014.1.2 is another bugfix release for *2014.1.0*. The changes include:

- Fix username detection when su'ed to root on FreeBSD ([issue 11628](#))
- Fix minionfs backend for file.recurse states
- Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS ([issue 11822](#))
- Fix bug with specifying alternate home dir on user creation (FreeBSD) ([issue 11790](#))
- Don't reload site module on module refresh for MacOS
- Fix regression with running execution functions in Pillar SLS ([issue 11453](#))
- Fix some modules missing from Windows installer
- Don't log an error for yum commands that return nonzero exit status on non-failure ([issue 11645](#))
- Fix bug in rabbitmq state ([issue 8703](#))
- Fix missing ssh config options ([issue 10604](#))
- Fix top.sls ordering ([issue 10810](#) and [issue 11691](#))
- Fix salt-key --list all ([issue 10982](#))
- Fix win_servermanager install/remove function ([issue 11038](#))
- Fix interaction with tokens when running commands as root ([issue 11223](#))
- Fix overstate bug with find_job and **kwargs ([issue 10503](#))
- Fix saltenv for aptpkg.mod_repo from pkgrepo state

- Fix environment issue causing file caching problems (issue 11189)
- Fix bug in `__parse_key` in registry state (issue 11408)
- Add minion auth retry on rejection (issue 10763)
- Fix `publish_session` updating the encryption key (issue 11493)
- Fix for bad `AssertionError` raised by `GitPython` (issue 11473)
- Fix `debian_ip` to allow disabling and enabling networking on Ubuntu (issue 11164)
- Fix potential memory leak caused by saved (and unused) events (issue 11582)
- Fix exception handling in the MySQL module (issue 11616)
- Fix environment-related error (issue 11534)
- Include `psutil` on Windows
- Add `file.replace` and `file.search` to Windows (issue 11471)
- Add additional `file` module helpers to Windows (issue 11235)
- Add `pid` to `netstat` output on Windows (issue 10782)
- Fix Windows not caching new versions of installers in `winrepo` (issue 10597)
- Fix hardcoded md5 hashing
- Fix `kwargs` in `salt-ssh` (issue 11609)
- Fix file backup timestamps (issue 11745)
- Fix `stacktrace` on `sys.doc` with invalid `eauth` (issue 11293)
- Fix `git.latest` with `test=True` (issue 11595)
- Fix `file.check_perms` hardcoded `follow_symlinks` (issue 11387)
- Fix certain `pkg` states for RHEL5/Cent5 machines (issue 11719)

19.2.49 Salt 2014.1.3 Release Notes

release 2014-04-15

Version 2014.1.3 is another bugfix release for *2014.1.0*. It was created as a hotfix for a regression found in 2014.1.2, which was not distributed. The only change made was as follows:

- Fix regression that caused `saltutil.find_job` to fail, causing premature terminations of salt CLI commands.

Changes in the not-distributed 2014.1.2, also included in 2014.1.3:

- Fix username detection when `su`'ed to root on FreeBSD (issue 11628)
- Fix `minionfs` backend for `file.recurse` states
- Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS (issue 11822)
- Fix bug with specifying alternate home dir on user creation (FreeBSD) (issue 11790)
- Don't reload `site` module on module refresh for MacOS
- Fix regression with running execution functions in Pillar SLS (issue 11453)
- Fix some modules missing from Windows installer
- Don't log an error for `yum` commands that return nonzero exit status on non-failure (issue 11645)

- Fix bug in rabbitmq state ([issue 8703](#))
- Fix missing ssh config options ([issue 10604](#))
- Fix top.sls ordering ([issue 10810](#) and [issue 11691](#))
- Fix `salt-key --list all` ([issue 10982](#))
- Fix `win_servermanager` install/remove function ([issue 11038](#))
- Fix interaction with tokens when running commands as root ([issue 11223](#))
- Fix overstate bug with `find_job` and `**kwargs` ([issue 10503](#))
- Fix `saltenv` for `aptpkg.mod_repo` from `pkgrepo` state
- Fix environment issue causing file caching problems ([issue 11189](#))
- Fix bug in `__parse_key` in registry state ([issue 11408](#))
- Add minion auth retry on rejection ([issue 10763](#))
- Fix `publish_session` updating the encryption key ([issue 11493](#))
- Fix for bad `AssertionError` raised by `GitPython` ([issue 11473](#))
- Fix `debian_ip` to allow disabling and enabling networking on Ubuntu ([issue 11164](#))
- Fix potential memory leak caused by saved (and unused) events ([issue 11582](#))
- Fix exception handling in the MySQL module ([issue 11616](#))
- Fix environment-related error ([issue 11534](#))
- Include `psutil` on Windows
- Add `file.replace` and `file.search` to Windows ([issue 11471](#))
- Add additional `file` module helpers to Windows ([issue 11235](#))
- Add `pid` to `netstat` output on Windows ([issue 10782](#))
- Fix Windows not caching new versions of installers in `winrepo` ([issue 10597](#))
- Fix hardcoded md5 hashing
- Fix `kwargs` in `salt-ssh` ([issue 11609](#))
- Fix file backup timestamps ([issue 11745](#))
- Fix `stacktrace` on `sys.doc` with invalid `eauth` ([issue 11293](#))
- Fix `git.latest` with `test=True` ([issue 11595](#))
- Fix `file.check_perms` hardcoded `follow_symlinks` ([issue 11387](#))
- Fix certain `pkg` states for RHEL5/Cent5 machines ([issue 11719](#))

19.2.50 Salt 2014.1.4 Release Notes

release 2014-05-05

Version 2014.1.4 is another bugfix release for *2014.1.0*. Changes include:

- Fix `setup.py` dependency issue ([issue 12031](#))
- Fix handling for `IOErrors` under certain circumstances ([issue 11783](#) and [issue 11853](#))
- Fix fatal exception when `/proc/1/cgroup` is not readable ([issue 11619](#))

- Fix `os` grains for OpenSolaris (issue 11907)
- Fix `lvs.zero` module argument pass-through (issue 9001)
- Fix bug in `debian_ip` interaction with `network.system` state (issue 11164)
- Remove bad binary package verification code (issue 12177)
- Fix traceback in solaris package installation (issue 12237)
- Fix `file.directory` state symlink handling (issue 12209)
- Remove `external_ip` grain
- Fix `file.managed` makedirs issues (issue 10446)
- Fix hang on non-existent Windows drive letter for `file` module (issue 9880)
- Fix salt minion caching all users on the server (issue 9743)
- Add strftime formatting for `ps.boot_time` (issue 12428)

19.2.51 Salt 2014.1.5 Release Notes

release 2014-06-11

Version 2014.1.5 is another bugfix release for *2014.1.0*. Changes include:

- Add function for finding cached job on the minion
- Fix iptables save file location for Debian (issue 11730)
- Fix for minion caching jobs when master is down
- Bump default `syndic_wait` to 5 to fix syndic-related problems (issue 12262)
- Add OpenBSD, FreeBSD, and NetBSD support for `network.netstat` (issue 12121)
- Fix false positive error in logs for `makeconf` state (issue 9762)
- Fix for yum `fromrepo` package installs when repo is disabled by default (issue 12466)
- Fix for extra blank lines in `file.blockreplace` (issue 12422)
- Fix grain detection for OpenVZ guests (issue 11877)
- Fix `get_dns_servers` function for Windows `win_dns_client`
- Use system locale for ports package installations
- Use correct stop/restart procedure for Debian networking in `debian_ip` (issue 12614)
- Fix for `cmd_iter/cmd_iter_no_block` blocking issues (issue 12617)
- Fix traceback when syncing custom types (issue 12883)
- Fix cleaning directory symlinks in `file.directory`
- Add performance optimizations for `saltutil.sync_all` and `state.highstate`
- Fix possible error in `saltutil.running`
- Fix for `kmod` modules with dashes (issue 13239)
- Fix possible race condition for Windows minions in state module reloading (issue 12370)
- Fix bug with roster for `passwd` option that is loaded as a non-string object (issue 13249)
- Keep duplicate version numbers from showing up in `pkg.list_pkgs` output

- Fixes for Jinja renderer, timezone *module/state* (issue 12724)
- Fix `timedatectl` parsing for `systemd>=210` (issue 12728)
- Fix `saltenv` being written to YUM repo config files (issue 12887)
- Removed the deprecated external nodes classifier (originally accessible by setting a value for `external_nodes` in the master configuration file). Note that this functionality has been marked deprecated for some time and was replaced by the more general *master tops* system.
- More robust escaping of ldap filter strings.
- Fix trailing slash in `gitfs_root` causing files not to be available (issue 13185)

19.2.52 Salt 2014.1.6 Release Notes

`release` 2014-07-08

Version 2014.1.6 is another bugfix release for *2014.1.0*. Changes include:

- Fix extra `iptables --help` output (Sorry!) (issue 13648, issue 13507, issue 13527, issue 13607)
- Fix `mount.active` for Solaris
- Fix support for `allow-hotplug` statement in `debian_ip` network module
- Add `sqlite3` to esky builds
- Fix `jobs.active` output (issue 9526)
- Fix the `virtual` grain for Xen (issue 13534)
- Fix `_ext_nodes` unavailable on master (issue 13535)
- Fix `eauth` for batch mode (issue 9605)
- Fix force-related issues with `tomcat` support (issue 12889)
- Fix `KeyError` when cloud mapping
- Fix salt-minion restart loop in Windows (issue 12086)
- Fix detection of `service` virtual module on Fedora minions
- Fix traceback with missing `ipv4` grain (issue 13838)
- Fix issue in roots backend with invalid data in `mtime_map` (issue 13836)
- Fix traceback in `jobs.active` (issue 11151)
- Fix `master_tops` and `_ext_nodes` issue (issue 13535, issue 13673)

19.2.53 Salt 2014.1.7 Release Notes

`release` 2014-07-09

Version 2014.1.7 is another bugfix release for *2014.1.0*. Changes include:

- Fix batch mode regression (issue 14046)

This release was a hotfix release for the regression listed above which was present in the 2014.1.6 release. The changes included in 2014.1.6 are listed below:

- Fix extra `iptables --help` output (Sorry!) (issue 13648, issue 13507, issue 13527, issue 13607)
- Fix `mount.active` for Solaris

- Fix support for `allow-hotplug` statement in `debian_ip` network module
- Add `sqlite3` to esky builds
- Fix `jobs.active` output (issue 9526)
- Fix the `virtual` grain for Xen (issue 13534)
- Fix `eauth` for batch mode (issue 9605)
- Fix force-related issues with `tomcat` support (issue 12889)
- Fix `KeyError` when cloud mapping
- Fix salt-minion restart loop in Windows (issue 12086)
- Fix detection of `service` virtual module on Fedora minions
- Fix traceback with missing `ipv4` grain (issue 13838)
- Fix issue in roots backend with invalid data in `mtime_map` (issue 13836)
- Fix traceback in `jobs.active` (issue 11151)
- Fix `master_tops` and `_ext_nodes` issue (issue 13535, issue 13673)

19.2.54 Salt 2014.1.8 Release Notes

release 2014-07-30

Note: This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

Version 2014.1.8 is another bugfix release for *2014.1.0*. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

19.2.55 Salt 2014.1.9 Release Notes

release 2014-07-31

Note: This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

Note: Version 2014.1.8 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.8.

Version 2014.1.9 is another bugfix release for *2014.1.0*. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

19.2.56 Salt 0.10.0 Release Notes

release 2012-06-16

0.10.0 has arrived! This release comes with MANY bug fixes, and new capabilities which greatly enhance performance and reliability. This release is primarily a bug fix release with many new tests and many repaired bugs. This release also introduces a few new key features which were brought in primarily to repair bugs and some limitations found in some of the components of the original architecture.

Major Features

Event System

The Salt Master now comes equipped with a new event system. This event system has replaced some of the back end of the Salt client and offers the beginning of a system which will make plugging external applications into Salt. The event system relies on a local ZeroMQ publish socket and other processes can connect to this socket and listen for events. The new events can be easily managed via Salt's event library.

Unprivileged User Updates

Some enhancements have been added to Salt for running as a user other than root. These new additions should make switching the user that the Salt Master is running as very painless, simply change the `user` option in the master configuration and restart the master, Salt will take care of all of the particulars for you.

Peer Runner Execution

Salt has long had the peer communication system used to allow minions to send commands via the salt master. 0.10.0 adds a new capability here, now the master can be configured to allow for minions to execute Salt runners via the `peer_run` option in the salt master configuration.

YAML Parsing Updates

In the past the YAML parser for sls files would return the incorrect numbers when the file mode was set with a preceding 0. The YAML parser used in Salt has been modified to no longer convert these number into octal but to keep them as the correct value so that sls files can be a little cleaner to write.

State Call Data Files

It was requested that the minion keep a local cache of the most recent executed state run. This has been added and now with state runs the data is stored in a msgpack file in the minion's cachedir.

Turning Off the Job Cache

A new option has been added to the master configuration file. In previous releases the Salt client would look over the Salt job cache to read in the minion return data. With the addition of the event system the Salt client can now watch for events directly from the master worker processes.

This means that the job cache is no longer a hard requirement. Keep in mind though, that turning off the job cache means that historic job execution data cannot be retrieved.

Test Updates

Minion Swarms Are Faster

To continue our efforts with testing Salt's ability to scale the minionswarm script has been updated. The minion-swarm can now start up minions much faster than it could before and comes with a new feature allowing modules to be disabled, thus lowering the minion's footprint when making a swarm. These new updates have allows us to test

```
# python minionswarm.py -m 20 --master salt-master
```

Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.0, this is a very substantial update:

<https://github.com/saltstack/salt/issues?milestone=12&state=closed>

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.0 comes with a number of fixes for the minions and master greatly improving Salt stability.

19.2.57 Salt 0.10.1 Release Notes

release 2012-06-19

19.2.58 Salt 0.10.2 Release Notes

release 2012-07-30

0.10.2 is out! This release comes with enhancements to the pillar interface, cleaner ways to access the salt-call capabilities in the API, minion data caching and the event system has been added to salt minions.

There have also been updates to the ZeroMQ functions, many more tests (thanks to sponsors, the code sprint and many contributors) and a swath of bug fixes.

Major Features

Ext Pillar Modules

The ranks of available Salt modules directories sees a new member in 0.10.2. With the popularity of pillar a higher demand has arisen for `ext_pillar` interfaces to be more like regular Salt module additions. Now `ext_pillar` interfaces can be added in the same way as other modules, just drop it into the pillar directory in the salt source.

Minion Events

In 0.10.0 an event system was added to the Salt master. 0.10.2 adds the event system to the minions as well. Now event can be published on a local minion as well.

The minions can also send events back up to the master. This means that Salt is able to communicate individual events from the minions back up to the Master which are not associated with command.

Minion Data Caching

When pillar was introduced the landscape for available data was greatly enhanced. The minion's began sending grain data back to the master on a regular basis.

The new config option on the master called `minion_data_cache` instructs the Salt master to maintain a cache of the minion's grains and pillar data in the `cachedir`. This option is turned off by default to avoid hitting the disk more, but when enabled the cache is used to make grain matching from the salt command more powerful, since the minions that will match can be predetermined.

Backup Files

By default all files replaced by the `file.managed` and `file.recurse` states we simply deleted. 0.10.2 adds a new option. By setting the `backup` option to `minion` the files are backed up before they are replaced.

The backed up files are located in the `cachedir` under the `file_backup` directory. On a default system this will be at: `/var/cache/salt/file_backup`

Configuration files

`salt-master` and `salt-minion` automatically load additional configuration files from `master.d/*.conf` respective `minion.d/*.conf` where `master.d/minion.d` is a directory in the same directory as the main configuration file.

Salt Key Verification

A number of users complained that they had inadvertently deleted the wrong salt authentication keys. 0.10.2 now displays what keys are going to be deleted and verifies that they are the keys that are intended for deletion.

Key auto-signing

If `autosign_file` is specified in the configuration file incoming keys will be compared to the list of keynames in `autosign_file`. Regular expressions as well as globbing is supported.

The file must only be writable by the user otherwise the file will be ignored. To relax the permission and allow group write access set the `permissive_pki_access` option.

Module changes

Improved OpenBSD support

New modules for managing services and packages were provided by Joshua Elsasser to further improve the support for OpenBSD.

Existing modules like the `disk` module were also improved to support OpenBSD.

SQL Modules

The MySQL and PostgreSQL modules have both received a number of additions thanks to the work of Avi Marcus and Roman Imankulov.

ZFS Support on FreeBSD

A new ZFS module has been added by Kurtis Velarde for FreeBSD supporting various ZFS operations like creating, extending or removing zpools.

Augeas

A new Augeas module by Ulrich Dangel for editing and verifying config files.

Native Debian Service module

The support for the Debian was further improved with an new service module for Debian by Ahmad Khayyat supporting `disable` and `enable`.

Cassandra

Cassandra support has been added by Adam Garside. Currently only status and diagnostic information are supported.

Networking

The networking support for *RHEL* has been improved and supports bonding support as well as zeroconf configuration.

Monit

Basic monit support by Kurtis Velarde to control services via monit.

nzbget

Basic support for controlling nzbget by Joseph Hall

Bluetooth

Basic bluez support for managing and controlling Bluetooth devices. Supports scanning as well as pairing/unpairing by Joseph Hall.

Test Updates

Consistency Testing

Another testing script has been added. A bug was found in pillar when many minions generated pillar data at the same time. The new `consist.py` script in the `tests` directory was created to reproduce bugs where data should always be consistent.

Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.2, this is a very substantial update:

<https://github.com/saltstack/salt/issues?milestone=24&page=1&state=closed>

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.2 comes with a number of fixes for the minions and master greatly improving Salt stability.

19.2.59 Salt 0.10.3 Release Notes

release 2012-09-30

The latest taste of Salt has come, this release has many fixes and feature additions. Modifications have been made to make ZeroMQ connections more reliable, the beginning of the ACL system is in place, a new command line parsing system has been added, dynamic module distribution has become more environment aware, the new `master_finger` option and many more!

Major Features

ACL System

The new ACL system has been introduced. The ACL system allows for system users other than root to execute salt commands. Users can be allowed to execute specific commands in the same way that minions are opened up to the peer system.

The configuration value to open up the ACL system is called `client_acl` and is configured like so:

```
client_acl:
  fred:
    - test.*
    - pkg.list_pkgs
```

Where *fred* is allowed access to functions in the test module and to the `pkg.list_pkgs` function.

Master Finger Option

The *master_finger* option has been added to improve the security of minion provisioning. The *master_finger* option allows for the fingerprint of the master public key to be set in the configuration file to double verify that the master is valid. This option was added in response to a motivation to pre-authenticate the master when provisioning new minions to help prevent man in the middle attacks in some situations.

Salt Key Fingerprint Generation

The ability to generate fingerprints of keys used by Salt has been added to `salt-key`. The new option *finger* accepts the name of the key to generate and display a fingerprint for.

```
salt-key -F master
```

Will display the fingerprints for the master public and private keys.

Parsing System

Pedro Algavio, aka s0undt3ch, has added a substantial update to the command line parsing system that makes the help message output much cleaner and easier to search through. Salt parsers now have *--versions-report* besides usual *--version* info which you can provide when reporting any issues found.

Key Generation

We have reduced the requirements needed for *salt-key* to generate minion keys. You're no longer required to have salt configured and it's common directories created just to generate keys. This might prove useful if you're batch creating keys to pre-load on minions.

Startup States

A few configuration options have been added which allow for states to be run when the minion daemon starts. This can be a great advantage when deploying with Salt because the minion can apply states right when it first runs. To use startup states set the `startup_states` configuration option on the minion to *highstate*.

New Exclude Declaration

Some users have asked about adding the ability to ensure that other sls files or ids are excluded from a state run. The exclude statement will delete all of the data loaded from the specified sls file or will delete the specified id:

```
exclude:
- sls: http
- id: /etc/vimrc
```

Max Open Files

While we're currently unable to properly handle ZeroMQ's abort signals when the max open files is reached, due to the way that's handled on ZeroMQ's, we have minimized the chances of this happening without at least warning the user.

More State Output Options

Some major changes have been made to the state output system. In the past state return data was printed in a very verbose fashion and only states that failed or made changes were printed by default. Now two options can be passed to the master and minion configuration files to change the behavior of the state output. State output can be set to verbose (default) or non-verbose with the `state_verbose` option:

```
state_verbose: False
```

It is noteworthy that the `state_verbose` option used to be set to *False* by default but has been changed to *True* by default in 0.10.3 due to many requests for the change.

The next option to be aware of new and called `state_output`. This option allows for the state output to be set to *full* (default) or *terse*.

The *full* output is the standard state output, but the new *terse* output will print only one line per state making the output much easier to follow when executing a large state system.

```
state_output: terse
```

state.file.append Improvements

The salt state `file.append()` tries *not* to append existing text. Previously the matching check was being made line by line. While this kind of check might be enough for most cases, if the text being appended was multi-line, the check would not work properly. This issue is now properly handled, the match is done as a whole ignoring any white space addition or removal except inside commas. For those thinking that, in order to properly match over multiple lines, salt will load the whole file into memory, that's not true. For most cases this is not important but an erroneous order to read a 4GB file, if not properly handled, like salt does, could make salt chew that amount of memory. Salt has a buffered file reader which will keep in memory a maximum of 256KB and iterates over the file in chunks of 32KB to test for the match, more than enough, if not, explain your usage on a ticket. With this change, also `salt.modules.file.contains()`, `salt.modules.file.contains_regex()`, `salt.modules.file.contains_glob()` and `salt.utils.find` now do the searching and/or matching using the buffered chunks approach explained above.

Two new keyword arguments were also added, *makedirs*, and *source*. The first, *makedirs* will create the necessary directories in order to append to the specified file, of course, it only applies if we're trying to append to a non-existing file on a non-existing directory:

```
/tmp/salttest/file-append-makedirs:
  file.append:
    text: foo
    makedirs: True
```

The second, *source*, allows one to append the contents of a file instead of specifying the text.

```
/tmp/salttest/file-append-source:
file.append:
- source: salt://testfile
```

Security Fix

A timing vulnerability was uncovered in the code which decrypts the AES messages sent over the network. This has been fixed and upgrading is strongly recommended.

19.2.60 Salt 0.10.4 Release Notes

release 2012-10-23

Salt 0.10.4 is a monumental release for the Salt team, with two new module systems, many additions to allow granular access to Salt, improved platform support and much more.

This release is also exciting because we have been able to shorten the release cycle back to under a month. We are working hard to keep up the aggressive pace and look forward to having releases happen more frequently!

This release also includes a serious security fix and all users are very strongly recommended to upgrade. As usual, upgrade the master first, and then the minion to ensure that the process is smooth.

Major Features

External Authentication System

The new external authentication system allows for Salt to pass through authentication to any authentication system to determine if a user has permission to execute a Salt command. The Unix PAM system is the first supported system with more to come!

The external authentication system allows for specific users to be granted access to execute specific functions on specific minions. Access is configured in the master configuration file, and uses the new access control system:

```
external_auth:
  pam:
    thatch:
      - 'web*':
        - test.*
        - network.*
```

The configuration above allows the user *thatch* to execute functions in the test and network modules on minions that match the *web** target.

Access Control System

All Salt systems can now be configured to grant access to non-administrative users in a granular way. The old configuration continues to work. Specific functions can be opened up to specific minions from specific users in the case of external auth and client ACLs, and for specific minions in the case of the peer system.

Access controls are configured like this:

```
client_acl:
  fred:
    - web\*:
      - pkg.list_pkgs
      - test.*
      - apache.*
```

Target by Network

A new matcher has been added to the system which allows for minions to be targeted by network. This new matcher can be called with the `-S` flag on the command line and is available in all places that the matcher system is available. Using it is simple:

```
$ salt -S '192.168.1.0/24' test.ping
$ salt -S '192.168.1.100' test.ping
```

Nodegroup Nesting

Previously a nodegroup was limited by not being able to include another nodegroup, this restraint has been lifted and now nodegroups will be expanded within other nodegroups with the `N@` classifier.

Salt Key Delete by Glob

The ability to delete minion keys by glob has been added to `salt-key`. To delete all minion keys whose minion name starts with `'web'`:

```
$ salt-key -d 'web*'
```

Master Tops System

The `external_nodes` system has been upgraded to allow for modular subsystems to be used to generate the top file data for a highstate run.

The `external_nodes` option still works but will be deprecated in the future in favor of the new `master_tops` option.

Example of using `master_tops`:

```
master_tops:
  ext_nodes: cobbler-external-nodes
```

Next Level Solaris Support

A lot of work has been put into improved Solaris support by Romeo Theriault. Packaging modules (`pkgadd/pkgrm` and `pkgutil`) and states, cron support and user and group management have all been added and improved upon. These additions along with SMF (Service Management Facility) service support and improved Solaris grain detection in 0.10.3 add up to Salt becoming a great tool to manage Solaris servers with.

Security

A vulnerability in the security handshake was found and has been repaired, old minions should be able to connect to a new master, so as usual, the master should be updated first and then the minions.

Pillar Updates

The pillar communication has been updated to add some extra levels of verification so that the intended minion is the only one allowed to gather the data. Once all minions and the master are updated to salt 0.10.4 please activate pillar 2 by changing the *pillar_version* in the master config to 2. This will be set to 2 by default in a future release.

19.2.61 Salt 0.10.5 Release Notes

release 2012-11-15

Salt 0.10.5 is ready, and comes with some great new features. A few more interfaces have been modularized, like the outputter system. The job cache system has been made more powerful and can now store and retrieve jobs archived in external databases. The returner system has been extended to allow minions to easily retrieve data from a returner interface.

As usual, this is an exciting release, with many noteworthy additions!

Major Features

External Job Cache

The external job cache is a system which allows for a returner interface to also act as a job cache. This system is intended to allow users to store job information in a central location for longer periods of time and to make the act of looking up information from jobs executed on other minions easier.

Currently the external job cache is supported via the mongo and redis returners:

```
ext_job_cache: redis
redis.host: salt
```

Once the external job cache is turned on the new *ret* module can be used on the minions to retrieve return information from the job cache. This can be a great way for minions to respond and react to other minions.

OpenStack Additions

OpenStack integration with Salt has been moving forward at a blistering pace. The new *nova*, *glance*, and *keystone* modules represent the beginning of ongoing OpenStack integration.

The Salt team has had many conversations with core OpenStack developers and is working on linking to OpenStack in powerful new ways.

Wheel System

A new API was added to the Salt Master which allows the master to be managed via an external API. This new system allows Salt API to easily hook into the Salt Master and manage configs, modify the state tree, manage the pillar and

more. The main motivation for the wheel system is to enable features needed in the upcoming web UI so users can manage the master just as easily as they manage minions.

The wheel system has also been hooked into the external auth system. This allows specific users to have granular access to manage components of the Salt Master.

Render Pipes

Jack Kuan has added a substantial new feature. The render pipes system allows Salt to treat the render system like unix pipes. This new system enables sls files to be passed through specific render engines. While the default renderer is still recommended, different engines can now be more easily merged. So to pipe the output of Mako used in YAML use this shebang line:

```
#!/mako|yaml
```

Salt Key Overhaul

The Salt Key system was originally developed as only a CLI interface, but as time went on it was pressed into becoming a clumsy API. This release marks a complete overhaul of Salt Key. Salt Key has been rewritten to function purely from an API and to use the outputter system. The benefit here is that the outputter system works much more cleanly with Salt Key now, and the internals of Salt Key can be used much more cleanly.

Modular Outputters

The outputter system is now loaded in a modular way. This means that output systems can be more easily added by dropping a python file down on the master that contains the function *output*.

Gzip from Fileserver

Gzip compression has been added as an option to the `cp.get_file` and `cp.get_dir` commands. This will make file transfers more efficient and faster, especially over slower network links.

Unified Module Configuration

In past releases of Salt, the minions needed to be configured for certain modules to function. This was difficult because it required pre-configuring the minions. 0.10.5 changes this by making all module configs on minions search the master config file for values.

Now if a single database server is needed, then it can be defined in the master config and all minions will become aware of the configuration value.

Salt Call Enhancements

The `salt-call` command has been updated in a few ways. Now, `salt-call` can take the `--return` option to send the data to a returner. Also, `salt-call` now reports executions in the minion proc system, this allows the master to be aware of the operation `salt-call` is running.

Death to `pub_refresh` and `sub_timeout`

The old configuration values `pub_refresh` and `sub_timeout` have been removed. These options were in place to alleviate problems found in earlier versions of ZeroMQ which have since been fixed. The continued use of these options has proven to cause problems with message passing and have been completely removed.

Git Revision Versions

When running Salt directly from git (for testing or development, of course) it has been difficult to know exactly what code is being executed. The new versioning system will detect the git revision when building and how many commits have been made since the last release. A release from git will look like this:

```
0.10.4-736-gec74d69
```

Svn Module Addition

Anthony Cornehl (twinshadow) contributed a module that adds Subversion support to Salt. This great addition helps round out Salt's VCS support.

Noteworthy Changes

Arch Linux Defaults to Systemd

Arch Linux recently changed to use systemd by default and discontinued support for init scripts. Salt has followed suit and defaults to systemd now for managing services in Arch.

Salt, Salt Cloud and Openstack

With the releases of Salt 0.10.5 and Salt Cloud 0.8.2, OpenStack becomes the first (non-OS) piece of software to include support both on the user level (with Salt Cloud) and the admin level (with Salt). We are excited to continue to extend support of other platforms at this level.

19.2.62 Salt 0.11.0 Release Notes

`release` 2012-12-14

Salt 0.11.0 is here, with some highly sought after and exciting features. These features include the new overstate system, the reactor system, a new state run scope component called `__context__`, the beginning of the search system (still needs a great deal of work), multiple package states, the MySQL returner and a better system to arbitrarily reference outputters.

It is also noteworthy that we are changing how we mark release numbers. For the life of the project we have been pushing every release with features and fixes as point releases. We will now be releasing point releases for only bug fixes on a more regular basis and major feature releases on a slightly less regular basis. This means that the next release will be a bugfix only release with a version number of 0.11.1. The next feature release will be named 0.12.0 and will mark the end of life for the 0.11 series.

Major Features

OverState

The overstate system is a simple way to manage rolling state executions across many minions. The overstate allows for a state to depend on the successful completion of another state.

Reactor System

The new reactor system allows for a reactive logic engine to be created which can respond to events within a salted environment. The reactor system uses sls files to match events fired on the master with actions, enabling Salt to react to problems in an infrastructure.

Your load-balanced group of webservers is under extra load? Spin up a new VM and add it to the group. Your fileserver is filling up? Send a notification to your sysadmin on call. The possibilities are endless!

Module Context

A new component has been added to the module loader system. The module context is a data structure that can hold objects for a given scope within the module.

This allows for components that are initialized to be stored in a persistent context which can greatly speed up ongoing connections. Right now the best example can be found in the *cp* execution module.

Multiple Package Management

A long desired feature has been added to package management. By definition Salt States have always installed packages one at a time. On most platforms this is not the fastest way to install packages. Erik Johnson, aka terminalmage, has modified the package modules for many providers and added new capabilities to install groups of packages. These package groups can be defined as a list of packages available in repository servers:

```
python_pkgs:
  pkg.installed:
    - pkgs:
      - python-mako
      - whoosh
      - python-git
```

or specify based on the location of specific packages:

```
python_pkgs:
  pkg.installed:
    - sources:
      - python-mako: http://some-rpms.org/python-mako.rpm
      - whoosh: salt://whoosh/whoosh.rpm
      - python-git: ftp://companyserver.net/python-git.rpm
```

Search System

The bones to the search system have been added. This is a very basic interface that allows for search backends to be added as search modules. The first supported search module is the whoosh search backend. Right now only the

basic paths for the search system are in place, making this very experimental. Further development will involve improving the search routines and index routines for whoosh and other search backends.

The search system has been made to allow for searching through all of the state and pillar files, configuration files and all return data from minion executions.

Notable Changes

All previous versions of Salt have shared many directories between the master and minion. The default locations for keys, cached data and sockets has been shared by master and minion. This has created serious problems with running a master and a minion on the same systems. 0.11.0 changes the defaults to be separate directories. Salt will also attempt to migrate all of the old key data into the correct new directories, but if it is not successful it may need to be done manually. If your keys exhibit issues after updating make sure that they have been moved from `/etc/salt/pki` to `/etc/salt/pki/{master,minion}`.

The old setup will look like this:

```
/etc/salt/pki
|-- master.pem
|-- master.pub
|-- minions
|   |-- ragnarok.saltstack.net
|-- minions_pre
|-- minion.pem
|-- minion.pub
|-- minion_master.pub
|-- minions_pre
`-- minions_rejected
```

With the accepted minion keys in `/etc/salt/pki/minions`, the new setup places the accepted minion keys in `/etc/salt/pki/master/minions`.

```
/etc/salt/pki
|-- master
|   |-- master.pem
|   |-- master.pub
|   |-- minions
|   |   |-- ragnarok.saltstack.net
|   |-- minions_pre
|   |-- minions_rejected
|-- minion
|   |-- minion.pem
|   |-- minion.pub
|   |-- minion_master.pub
```

19.2.63 Salt 0.11.1 Release Notes

release 2012-12-19

19.2.64 Salt 0.12.0 Release Notes

release 2013-01-15

Another feature release of Salt is here! Some exciting additions are included with more ways to make salt modular and even easier management of the salt file server.

Major Features

Modular Fileserver Backend

The new modular fileserver backend allows for any external system to be used as a salt file server. The main benefit here is that it is now possible to tell the master to directly use a git remote location, or many git remote locations, automatically mapping git branches and tags to salt environments.

Windows is First Class!

A new Salt Windows installer is now available! Much work has been put in to improve Windows support. With this much easier method of getting Salt on your Windows machines, we hope even more development and progress will occur. Please file bug reports on the Salt GitHub repo issue tracker so we can continue improving.

One thing that is missing on Windows that Salt uses extensively is a software package manager and a software package repository. The Salt pkg state allows sys admins to install software across their infrastructure and across operating systems. Software on Windows can now be managed in the same way. The SaltStack team built a package manager that interfaces with the standard Salt pkg module to allow for installing and removing software on Windows. In addition, a software package repository has been built on top of the Salt fileserver. A small YAML file provides the information necessary for the package manager to install and remove software.

An interesting feature of the new Salt Windows software package repository is that one or more remote git repositories can supplement the master's local repository. The repository can point to software on the master's fileserver or on an HTTP, HTTPS, or ftp server.

New Default Outputter

Salt displays data to the terminal via the outputter system. For a long time the default outputter for Salt has been the python pretty print library. While this has been a generally reasonable outputter, it did have many failings. The new default outputter is called ``nested'', it recursively scans return data structures and prints them out cleanly.

If the result of the new nested outputter is not desired any other outputter can be used via the --out option, or the output option can be set in the master and minion configs to change the default outputter.

Internal Scheduler

The internal Salt scheduler is a new capability which allows for functions to be executed at given intervals on the minion, and for runners to be executed at given intervals on the master. The scheduler allows for sequences such as executing state runs (locally on the minion or remotely via an overstate) or continually gathering system data to be run at given intervals.

The configuration is simple, add the schedule option to the master or minion config and specify jobs to run, this in the master config will execute the state.over runner every 60 minutes:

```
schedule:
  overstate:
    function: state.over
    minutes: 60
```

This example for the minion configuration will execute a highstate every 30 minutes:

```
schedule:
  highstate:
    function: state.highstate
    minutes: 30
```

Optional DSL for SLS Formulas

Jack Kuan, our renderer expert, has created something that is astonishing. Salt, now comes with an optional Python based DSL, this is a very powerful interface that makes writing SLS files in pure python easier than it was with the raw py renderer. As usual this can be used with the renderer shebang line, so a single sls can be written with the DSL if pure python power is needed while keeping other sls files simple with YAML.

Set Grains Remotely

A new execution function and state module have been added that allows for grains to be set on the minion. Now grains can be set via a remote execution or via states. Use the *grains.present* state or the *grains.setval* execution functions.

Gentoo Additions

Major additions to Gentoo specific components have been made. The encompasses executions modules and states ranging from supporting the make.conf file to tools like layman.

19.2.65 Salt 0.12.1 Release Notes

release 2013-01-21

19.2.66 Salt 0.13.0 Release Notes

release 2013-02-12

The lucky number 13 has turned the corner! From CLI notifications when quitting a salt command, to substantial improvements on Windows, Salt 0.13.0 has arrived!

Major Features

Improved file.recurse Performance

The file.recurse system has been deployed and used in a vast array of situations. Fixes to the file state and module have led towards opening up new ways of running file.recurse to make it faster. Now the file.recurse state will download fewer files and will run substantially faster.

Windows Improvements

Minion stability on Windows has improved. Many file operations, including `file.recurse`, have been fixed and improved. The network module works better, to include `network.interfaces`. Both 32bit and 64bit installers are now available.

Nodegroup Targeting in Peer System

In the past, nodegroups were not available for targeting via the peer system. This has been fixed, allowing the new nodegroup `expr_form` argument for the `publish.publish` function:

```
salt-call publish.publish group1 test.ping expr_form=nodegroup
```

Blacklist Additions

Additions allowing more granular blacklisting are available in 0.13.0. The ability to blacklist users and functions in `client_acl` have been added, as well as the ability to exclude state formulas from the command line.

Command Line Pillar Embedding

Pillar data can now be embedded on the command line when calling `state.sls` and `state.highstate`. This allows for on the fly changes or settings to pillar and makes parameterizing state formulas even easier. This is done via the keyword argument:

```
salt '*' state.highstate pillar='{"cheese": "spam"}'
```

The above example will extend the existing pillar to hold the `cheese` key with a value of `spam`. If the `cheese` key is already specified in the minion's pillar then it will be overwritten.

CLI Notifications

In the past hitting `ctrl-C` and quitting from the `salt` command would just drop to a shell prompt, this caused confusion with users who expected the remote executions to also quit. Now a message is displayed showing what command can be used to track the execution and what the job id is for the execution.

Version Specification in Multiple-Package States

Versions can now be specified within multiple-package `pkg.installed` states. An example can be found below:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Noteworthy Changes

The configuration subsystem in Salt has been overhauled to make the `opts` dict used by Salt applications more portable, the problem is that this is an incompatible change with salt-cloud, and salt-cloud will need to be updated to the latest git to work with Salt 0.13.0. Salt Cloud 0.8.5 will also require Salt 0.13.0 or later to function.

The SaltStack team is sorry for the inconvenience here, we work hard to make sure these sorts of things do not happen, but sometimes hard changes get in.

19.2.67 Salt 0.13.1 Release Notes

release 2013-02-15

19.2.68 Salt 0.13.2 Release Notes

release 2013-03-13

19.2.69 Salt 0.13.3 Release Notes

release 2013-03-18

19.2.70 Salt 0.14.0 Release Notes

release 2013-03-23

Salt 0.14.0 is here! This release was held up primarily by PyCon, Scale, and illness, but has arrived! 0.14.0 comes with many new features and is breaking ground for Salt in the area of cloud management with the introduction of Salt providing basic cloud controller functionality.

Major Features

Salt - As a Cloud Controller

This is the first primitive inroad to using Salt as a cloud controller is available in 0.14.0. Be advised that this is alpha, only tested in a few very small environments.

The cloud controller is built using `kvm` and `libvirt` for the hypervisors. Hypervisors are autodetected as minions and only need to have `libvirt` running and `kvm` installed to function. The features of the Salt cloud controller are as follows:

- Basic vm discovery and reporting
- Creation of new virtual machines
- Seeding virtual machines with Salt via `qemu-nbd` or `libguestfs`
- Live migration (shared and non shared storage)
- Delete existing VMs

It is noteworthy that this feature is still Alpha, meaning that all rights are reserved to change the interface if needs be in future releases!

Libvirt State

One of the problems with libvirt is management of certificates needed for live migration and cross communication between hypervisors. The new `libvirt` state makes the Salt Master hold a CA and manage the signing and distribution of keys onto hypervisors, just add a call to the libvirt state in the sls formulas used to set up a hypervisor:

```
libvirt_keys:
  libvirt.keys
```

New get Functions

An easier way to manage data has been introduced. The pillar, grains, and config execution modules have been extended with the new `get` function. This function works much in the same way as the `get` method in a python dict, but with an enhancement, nested dict components can be extracted using a `:` delimiter.

If a structure like this is in pillar:

```
foo:
  bar:
    baz: quo
```

Extracting it from the raw pillar in an sls formula or file template is done this way:

```
{{ pillar['foo']['bar']['baz'] }}
```

Now with the new `get` function the data can be safely gathered and a default can be set allowing the template to fall back if the value is not available:

```
{{ salt['pillar.get']('foo:bar:baz', 'qux') }}
```

This makes handling nested structures much easier, and defaults can be cleanly set. This new function is being used extensively in the new formulae repository of salt sls formulas.

19.2.71 Salt 0.14.1 Release Notes

release 2013-04-13

19.2.72 Salt 0.15.0 Release Notes

release 2013-05-03

The many new features of Salt 0.15.0 have arrived! Salt 0.15.0 comes with many smaller features and a few larger ones.

These features range from better debugging tools to the new Salt Mine system.

Major Features

The Salt Mine

First there was the peer system, allowing for commands to be executed from a minion to other minions to gather data live. Then there was the external job cache for storing and accessing long term data. Now the middle ground is

being filled in with the Salt Mine. The Salt Mine is a system used to execute functions on a regular basis on minions and then store only the most recent data from the functions on the master, then the data is looked up via targets.

The mine caches data that is public to all minions, so when a minion posts data to the mine all other minions can see it.

IPV6 Support

0.13.0 saw the addition of initial IPV6 support but errors were encountered and it needed to be stripped out. This time the code covers more cases and must be explicitly enabled. But the support is much more extensive than before.

Copy Files From Minions to the Master

Minions have long been able to copy files down from the master file server, but until now files could not be easily copied from the minion up to the master.

A new function called `cp.push` can push files from the minions up to the master server. The uploaded files are then cached on the master in the `master cachedir` for each minion.

Better Template Debugging

Template errors have long been a burden when writing states and pillar. 0.15.0 will now send the compiled template data to the debug log, this makes tracking down the intermittent stage templates much easier. So running `state.sls` or `state.highstate` with `-l debug` will now print out the rendered templates in the debug information.

State Event Firing

The state system is now more closely tied to the master's event bus. Now when a state fails the failure will be fired on the master event bus so that the reactor can respond to it.

Major Syndic Updates

The Syndic system has been basically re-written. Now it runs in a completely asynchronous way and functions primarily as an event broker. This means that the events fired on the syndic are now pushed up to the higher level master instead of the old method used which waited for the client libraries to return.

This makes the syndic much more accurate and powerful, it also means that all events fired on the syndic master make it up the pipe as well making a reactor on the higher level master able to react to minions further downstream.

Peer System Updates

The Peer System has been updated to run using the client libraries instead of firing directly over the publish bus. This makes the peer system much more consistent and reliable.

Minion Key Revocation

In the past when a minion was decommissioned the key needed to be manually deleted on the master, but now a function on the minion can be used to revoke the calling minion's key:

```
$ salt-call saltutil.revoke_auth
```

Function Return Codes

Functions can now be assigned numeric return codes to determine if the function executed successfully. While not all functions have been given return codes, many have and it is an ongoing effort to fill out all functions that might return a non-zero return code.

Functions in Overstate

The overstate system was originally created to just manage the execution of states, but with the addition of return codes to functions, requisite logic can now be used with respect to the overstate. This means that an overstate stage can now run single functions instead of just state executions.

Pillar Error Reporting

Previously if errors surfaced in pillar, then the pillar would consist of only an empty dict. Now all data that was successfully rendered stays in pillar and the render error is also made available. If errors are found in the pillar, states will refuse to run.

Using Cached State Data

Sometimes states are executed purely to maintain a specific state rather than to update states with new configs. This is grounds for the new cached state system. By adding `cache=True` to a state call the state will not be generated fresh from the master but the last state data to be generated will be used. If no previous state data is available then fresh data will be generated.

Monitoring States

The new monitoring states system has been started. This is very young but allows for states to be used to configure monitoring routines. So far only one monitoring state is available, the `disk.status` state. As more capabilities are added to Salt UI the monitoring capabilities of Salt will continue to be expanded.

19.2.73 Salt 0.15.1 Release Notes

release 2013-05-08

The 0.15.1 release has been posted, this release includes fixes to a number of bugs in 0.15.1 and a three security patches.

Security Updates

A number of security issues have been resolved via the 0.15.1 release.

Path Injection in Minion IDs

Salt masters did not properly validate the id of a connecting minion. This can lead to an attacker uploading files to the master in arbitrary locations. In particular this can be used to bypass the manual validation of new unknown minions. Exploiting this vulnerability does not require authentication.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/5427b9438e452a5a8910d9128c6aafb45d8fd5d3>

<https://github.com/saltstack/salt/commit/7560908ee62351769c3cd43b03d74c1ca772cc52>

<https://github.com/saltstack/salt/commit/e200b8a7ff53780124e08d2bdefde7587e52bfca>

RSA Key Generation Fault

RSA key generation was done incorrectly, leading to very insecure keys. It is recommended to regenerate all RSA keys.

This issue can be used to impersonate Salt masters or minions, or decrypt any transferred data.

This issue can only be exploited by attackers who are able to observe or modify traffic between Salt minions and the legitimate Salt master.

A tool was included in 0.15.1 to assist in mass key regeneration, the `manage.regen_keys` runner.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/5dd304276ba5745ec21fc1e6686a0b28da29e6fc>

Command Injection Via `ext_pillar`

Arbitrary shell commands could be executed on the master by an authenticated minion through options passed when requesting a pillar.

Ext pillar options have been restricted to only allow safe external pillars to be called when prompted by the minion.

This issue affects Salt versions from 0.14.0 to 0.15.0.

This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/43d8c16bd26159d827d1a945c83ac28159ec5865>

19.2.74 Salt 0.15.2 Release Notes

release 2013-05-29

19.2.75 Salt 0.15.3 Release Notes

release 2013-06-01

19.2.76 Salt 0.16.0 Release Notes

release 2013-07-01

The 0.16.0 release is an exciting one, with new features in master redundancy, and a new, powerful requisite.

Major Features

Multi-Master

This new capability allows for a minion to be actively connected to multiple salt masters at the same time. This allows for multiple masters to send out commands to minions and for minions to automatically reconnect to masters that have gone down. A tutorial is available to help get started here:

[Multi Master Tutorial](#)

Prereq, the New Requisite

The new *prereq* requisite is very powerful! It allows for states to execute based on a state that is expected to make changes in the future. This allows for a change on the system to be preempted by another execution. A good example is needing to shut down a service before modifying files associated with it, allowing, for instance, a webserver to be shut down allowing a load balancer to stop sending requests while server side code is updated. In this case, the *prereq* will only run if changes are expected to happen in the prerequired state, and the prerequired state will always run after the *prereq* state and only if the *prereq* state succeeds.

Peer System Improvements

The peer system has been revamped to make it more reliable, faster, and like the rest of Salt, async. The peer calls when an updated minion and master are used together will be much faster!

Relative Includes

The ability to include an sls relative to the defined sls has been added, the new syntax is documented here:

Includes

More State Output Options

The `state_output` option in the past only supported *full* and *terse*, 0.16.0 add the *mixed* and *changes* modes further refining how states are sent to users' eyes.

Improved Windows Support

Support for Salt on Windows continues to improve. Software management on Windows has become more seamless with Linux/UNIX/BSD software management. Installed software is now recognized by the short names defined in the *repository SLS*. This makes it possible to run `salt '*' pkg.version firefox` and get back results from Windows and non-Windows minions alike.

When templating files on Windows, Salt will now correctly use Windows appropriate line endings. This makes it much easier to edit and consume files on Windows.

When using the `cmd` state the `shell` option now allows for specifying Windows Powershell as an alternate shell to execute `cmd.run` and `cmd.script`. This opens up Salt to all the power of Windows Powershell and its advanced Windows management capabilities.

Several fixes and optimizations were added for the Windows networking modules, especially when working with IPv6.

A system module was added that makes it easy to restart and shutdown Windows minions.

The Salt Minion will now look for its config file in `c:\salt\conf` by default. This means that it's no longer necessary to specify the `-C` option to specify the location of the config file when starting the Salt Minion on Windows in a terminal.

Multiple Targets for `pkg.removed`, `pkg.purged` States

Both *pkg.removed* and *pkg.purged* now support the `pkgs` argument, which allow for multiple packages to be targeted in a single state. This, as in *pkg.installed*, helps speed up these states by reducing the number of times that the package management tools (`apt`, `yum`, etc.) need to be run.

Random Times in Cron States

The temporal parameters in *cron.present* states (minute, hour, etc.) can now be randomized by using `random` instead of a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
cron.present:
  - user: root
  - minute: random
  - hour: 2
```

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Confirmation Prompt on Key Acceptance

When accepting new keys with `salt-key -a minion-id` or `salt-key -A`, there is now a prompt that will show the affected keys and ask for confirmation before proceeding. This prompt can be bypassed using the `-y` or `--yes` command line argument, as with other `salt-key` commands.

Support for Setting Password Hashes on BSD Minions

FreeBSD, NetBSD, and OpenBSD all now support setting passwords in `user.present` states.

19.2.77 Salt 0.16.1 Release Notes

release 2013-07-29

19.2.78 Salt 0.16.2 Release Notes

release 2013-08-01

Version 0.16.2 is a bugfix release for *0.16.0*, and contains a number of fixes.

Windows

- Only allow Administrator's group and SYSTEM user access to `C:\salt`. This eliminates a race condition where a non-admin user could modify a template or managed file before it is executed by the minion (which is running as an elevated user), thus avoiding a potential escalation of privileges. ([issue 6361](#))

Grains

- Fixed detection of `virtual` grain on OpenVZ hardware nodes
- Gracefully handle `lsb_release` data when it is enclosed in quotes
- LSB grains are now prefixed with `lsb_distrib_` instead of simply `lsb_`. The old naming is not preserved, so SLS may be affected.
- Improved grains detection on MacOS

Pillar

- Don't try to load `git_pillar` if not enabled in master config ([issue 6052](#))
- Functions `pillar.item` and `pillar.items` added for parity with `grains.item/grains.items`. The old function `pillar.data` is preserved for backwards compatibility.
- Fixed minion traceback when Pillar SLS is malformed ([issue 5910](#))

Peer Publishing

- More gracefully handle improperly quoted publish commands (issue 5958)
- Fixed traceback when timeout specified via the CLI fo *publish.publish*, *publish.full_data* (issue 5959)
- Fixed unintended change in output of *publish.publish* (issue 5928)

Minion

- Fixed salt-key usage in minionswarm script
- Quieted warning about SALT_MINION_CONFIG environment variable on minion startup and for CLI commands run via `salt-call` (issue 5956)
- Added minion config parameter *random_reauth_delay* to stagger re-auth attempts when the minion is waiting for the master to approve its public key. This helps prevent SYN flooding in larger environments.

User/Group Management

- Implement previously-ignored `unique` option for *user.present* states in FreeBSD
- Report in state output when a *group.present* state attempts to use a gid in use by another group
- Fixed regression that prevents a *user.present* state to set the password hash to the system default (i.e. an unset password)
- Fixed multiple *group.present* states with the same group (issue 6439)

File Management

- Fixed file.mkdir setting incorrect permissions (issue 6033)
- Fixed cleanup of source files for templates when `/tmp` is in `file_roots` (issue 6118)
- Fixed caching of zero-byte files when a non-empty file was previously cached at the same path
- Added HTTP authentication support to the cp module (issue 5641)
- Diffs are now suppressed when binary files are changed

Package/Repository Management

- Fixed traceback when there is only one target for *pkg.latest* states
- Fixed regression in detection of virtual packages (apt)
- Limit number of pkg database refreshes to once per *state.sls/state.highstate*
- YUM: Allow 32-bit packages with arches other than i686 to be managed on 64-bit systems (issue 6299)
- Fixed incorrect reporting in pkgrepo.managed states (issue 5517)
- Fixed 32-bit binary package installs on 64-bit RHEL-based distros, and added proper support for 32-bit packages on 64-bit Debian-based distros (issue 6303)
- Fixed issue where requisites were inadvertently being put into YUM repo files (issue 6471)

Service Management

- Fixed inaccurate reporting of results in *service.running* states when the service fails to start (issue 5894)
- Fixed handling of custom initscripts in RHEL-based distros so that they are immediately available, negating the need for a second state run to manage the service that the initscript controls

Networking

- Function `network.hwaddr` renamed to *network.hw_addr* to match *network.ip_addrs* and *network.ip_addrs6*. All three functions also now work without the underscore in the name, as well.
- Fixed traceback in *bridge.show* when interface is not present (issue 6326)

SSH

- Fixed incorrect result reporting for some *ssh_known_hosts.present* states
- Fixed inaccurate reporting when *ssh_auth.present* states are run with `test=True`, when `rsa/dss` is used for the `enc` param instead of `ssh-rsa/ssh-dss` (issue 5374)

pip

- Properly handle `-f` lines in pip freeze output
- Fixed regression in *pip.installed* states with specifying a requirements file (issue 6003)
- Fixed use of `editable` argument in *pip.installed* states (issue 6025)
- Deprecated `runas` parameter in execution function calls, in favor of `user`

MySQL

- Allow specification of *MySQL* connection arguments via the CLI, overriding/bypassing minion config params
- Allow *mysql_user.present* states to set a passwordless login (issue 5550)
- Fixed endless loop when *mysql.processlist* is run (issue 6297)

PostgreSQL

- Fixed traceback in *postgres.user_list* (issue 6352)

Miscellaneous

- Don't allow *npm states* to be used if *npm module* is not available
- Fixed *alternatives.install* states for which the target is a symlink (issue 6162)
- Fixed traceback in *sysbench module* (issue 6175)
- Fixed traceback in job cache
- Fixed tempfile cleanup for windows
- Fixed issue where SLS files using the *pydsl renderer* were not being run

- Fixed issue where returners were being passed incorrect information ([issue 5518](#))
- Fixed traceback when numeric args are passed to `cmd.script` states
- Fixed bug causing `cp.get_dir` to return more directories than expected ([issue 6048](#))
- Fixed traceback when `supervisord.running` states are run with `test=True` ([issue 6053](#))
- Fixed tracebacks when Salt encounters problems running `rbenv` ([issue 5888](#))
- Only make the `monit module` available if `monit` binary is present ([issue 5871](#))
- Fixed incorrect behavior of `img.mount_image`
- Fixed traceback in `tomcat.deploy_war` in Windows
- Don't re-write `/etc/fstab` if mount fails
- Fixed tracebacks when Salt encounters problems running `gem` ([issue 5886](#))
- Fixed incorrect behavior of `selinux.boolean` states ([issue 5912](#))
- `RabbitMQ`: Quote passwords to avoid symbols being interpolated by the shell ([issue 6338](#))
- Fixed tracebacks in `extfs.mkfs` and `extfs.tune` ([issue 6462](#))
- Fixed a regression with the `module.run` state where the `m_name` and `m_fun` arguments were being ignored ([issue 6464](#))

19.2.79 Salt 0.16.3 Release Notes

release 2013-08-09

Version 0.16.3 is another bugfix release for `0.16.0`. The changes include:

- Various documentation fixes
- Fix `proc` directory regression ([issue 6502](#))
- Properly detect `Linaro Linux` ([issue 6496](#))
- Fix regressions in `mount.mounted` ([issue 6522](#), [issue 6545](#))
- Skip malformed state requisites ([issue 6521](#))
- Fix regression in `gitfs` from bad import
- Fix for watching `prereq` states (including recursive requisite error) ([issue 6057](#))
- Fix `mod_watch` not overriding `prereq` ([issue 6520](#))
- Don't allow functions which compile states to be called within states ([issue 5623](#))
- Return error for malformed `top.sls` ([issue 6544](#))
- Fix traceback in `mysql.query`
- Fix regression in binary package installation for 64-bit packages on Debian-based Linux distros ([issue 6563](#))
- Fix traceback caused by running `cp.push` without having set `file_recv` in the master config file
- Fix scheduler configuration in `pillar` ([issue 6201](#))

19.2.80 Salt 0.16.4 Release Notes

release 2013-09-07

Version 0.16.4 is another bugfix release for *0.16.0*, likely to be the last before 0.17.0 is released. The changes include:

- Multiple documentation improvements/additions
- Added the `osfinger` and `osarch` grains
- Properly handle 32-bit packages for `debian32` on `x86_64` (issue 6607)
- Fix regression in `yum` package installation in CentOS 5 (issue 6677)
- Fix bug in `hg.latest` state that would erroneously delete directories (issue 6661)
- Fix bug related to `pid` not existing for `ps.top` (issue 6679)
- Fix regression in `MySQL returner` (issue 6695)
- Fix IP addresses grains (`ipv4` and `ipv6`) to include all addresses (issue 6656)
- Fix regression preventing authenticated FTP (issue 6733)
- Fix setting password for windows users (issue 6824)
- Fix `file.contains` on values YAML parses as non-string (issue 6817)
- Fix `file.get_gid`, `file.get_uid`, and `file.chown` for broken symlinks (issue 6826)
- Fix comment for service reloads in service state (issue 6851)

19.2.81 Salt 0.17.0 Release Notes

release 2013-09-26

The 0.17.0 release is a very exciting release of Salt, this brings to Salt some very powerful new features and advances. The advances range from the state system to the test suite, covering new transport capabilities and making states easier and more powerful, to extending Salt Virt and much more!

The 0.17.0 release will also be the last release of Salt to follow the old 0.XX.X numbering system, the next release of Salt will change the numbering to be date based following this format:

<Year>.<Month>.<Minor>

So if the release happens in November of 2013 the number will be 13.11.0, the first bugfix release will be 13.11.1 and so forth.

Major Features

Halite

The new Halite web GUI is now available on PyPI. A great deal of work has been put into Halite to make it fully event driven and amazingly fast. The Halite UI can be started from within the Salt Master (after being installed from PyPI), or standalone, and does not require an external database to run. It is very lightweight!

This initial release of Halite is primarily the framework for the UI and the communication systems, making it easy to extend and build the UI up. It presently supports watching the event bus and firing commands over Salt.

At this time, Halite is not available as a package, but installation documentation is available at: <http://docs.saltstack.com/topics/tutorials/halite.html>

Halite is, like the rest of Salt, Open Source!

Much more will be coming in the future of Halite!

Salt SSH

The new `salt-ssh` command has been added to Salt. This system allows for remote execution and states to be run over ssh. The benefit here being, that salt can run relying only on the ssh agent, rather than requiring a minion to be deployed.

The `salt-ssh` system runs states in a compatible way as Salt and states created and run with salt-ssh can be moved over to a standard salt deployment without modification.

Since this is the initial release of salt-ssh, there is plenty of room for improvement, but it is fully operational, not just a bootstrap tool.

Rosters

Salt is designed to have the minions be aware of the master and the master does not need to be aware of the location of the minions. The new salt roster system was created and designed to facilitate listing the targets for salt-ssh.

The roster system, like most of Salt, is a plugin system, allowing for the list of systems to target to be derived from any pluggable backend. The rosters shipping with 0.17.0 are flat and scan. Flat is a file which is read in via the salt render system and the scan roster does simple network scanning to discover ssh servers.

State Auto Order

This is a major change in how states are evaluated in Salt. State Auto Order is a new feature that makes states get evaluated and executed in the order in which they are defined in the sls file. This feature makes it very easy to see the finite order in which things will be executed, making Salt now, fully imperative AND fully declarative.

The requisite system still takes precedence over the order in which states are defined, so no existing states should break with this change. But this new feature can be turned off by setting `state_auto_order: False` in the master config, thus reverting to the old lexicographical order.

state.sls Runner

The `state.sls` runner has been created to allow for a more powerful system for orchestrating state runs and function calls across the salt minions. This new system uses the state system for organizing executions.

This allows for states to be defined that are executed on the master to call states on minions via `salt-run state.sls`.

Salt Thin

Salt Thin is an exciting new component of Salt, this is the ability to execute Salt routines without any transport mechanisms installed, it is a pure python subset of Salt.

Salt Thin does not have any networking capability, but can be dropped into any system with Python installed and then `salt-call` can be called directly. The Salt Thin system, is used by the `salt-ssh` command, but can still be used to just drop salt somewhere for easy use.

Event Namespacing

Events have been updated to be much more flexible. The tags in events have all been namespaced allowing easier tracking of event names.

Mercurial Fileserver Backend

The popular git fileserver backend has been joined by the mercurial fileserver backend, allowing the state tree to be managed entirely via mercurial.

External Logging Handlers

The external logging handler system allows for Salt to directly hook into any external logging system. Currently supported are sentry and logstash.

Jenkins Testing

The testing systems in Salt have been greatly enhanced, tests for salt are now executed, via jenkins.saltstack.com, across many supported platforms. Jenkins calls out to salt-cloud to create virtual machines on Rackspace, then the minion on the virtual machine checks into the master running on Jenkins where a state run is executed that sets up the minion to run tests and executes the test suite.

This now automates the sequence of running platform tests and allows for continuous destructive tests to be run.

Salt Testing Project

The testing libraries for salt have been moved out of the main salt code base and into a standalone codebase. This has been done to ease the use of the testing systems being used in salt based projects other than Salt itself.

StormPath External Authentication

The external auth system now supports the fantastic Stormpath cloud based authentication system.

LXC Support

Extensive additions have been added to Salt for LXC support. This included the backend libs for managing LXC containers. Addition into the salt-virt system is still in the works.

Mac OS X User/Group Support

Salt is now able to manage users and groups on Minions running Mac OS X. However, at this time user passwords cannot be managed.

Django ORM External Pillar

Pillar data can now be derived from Django managed databases.

Fixes from RC to release

- Multiple documentation fixes
- Add multiple source files + templating for *file.append* (issue 6905)
- Support systemctl configuration files in systemd<=207 (issue 7351)
- Add *file.search* and *file.replace*
- Fix cross-calling execution functions in provider overrides
- Fix locale override for postgres (issue 4543)
- Fix Raspbian identification for service/pkg support (issue 7371)
- Fix *cp.push* file corruption (issue 6495)
- Fix ALT Linux password hash specification (issue 3474)
- Multiple salt-ssh-related fixes and improvements

19.2.82 Salt 0.17.1 Release Notes

release 2013-10-17

Note: THIS RELEASE IS NOT COMPATIBLE WITH PREVIOUS VERSIONS. If you update your master to 0.17.1, you must update your minions as well. Sorry for the inconvenience -- this is a result of one of the security fixes listed below.

The 0.17.1 release comes with a number of improvements to salt-ssh, many bugfixes, and a number of security updates.

Salt SSH has been improved to be faster, more featureful and more secure. Since the original release of Salt SSH was primarily a proof of concept, it has been very exciting to see its rapid adoption. We appreciate the willingness of security experts to review Salt SSH and help discover oversights and ensure that security issues only exist for such a tiny window of time.

SSH Enhancements

Shell Improvements

Improvements to Salt SSH's communication have been added that improve routine execution regardless of the target system's login shell.

Performance

Deployment of routines is now faster and takes fewer commands to execute.

Security Updates

Be advised that these security issues all apply to a small subset of Salt users and mostly apply to Salt SSH.

Insufficient Argument Validation

This issue allowed for a user with limited privileges to embed executions inside of routines to execute routines that should be restricted. This applies to users using external auth or client ACL and opening up specific routines.

Be advised that these patches address the direct issue. Additional commits have been applied to help mitigate this issue from resurfacing.

MITM SSH attack in salt-ssh

SSH host keys were being accepted by default and not enforced on future SSH connections. These patches set SSH host key checking by default and can be overridden by passing the `-i` flag to `salt-ssh`.

CVE

CVE-2013-4436

Affected Versions

0.17.0

Michael Scherer, Red Hat

Insecure Usage of /tmp in salt-ssh

The initial release of salt-ssh used the /tmp directory in an insecure way. These patches not only secure usage of files under /tmp in salt-ssh, but also add checksum validation for all packages sent into the now secure locations on target systems.

YAML Calling Unsafe Loading Routine

It has been argued that this is not a valid security issue, as the YAML loading that was happening was only being called after an initial gateway filter in Salt has already safely loaded the YAML and would fail if non-safe routines were embedded. Nonetheless, the CVE was filed and patches applied.

Fix Reference

Version 0.17.1 is the first bugfix release for *0.17.0*. The changes include:

- Fix symbolic links in thin.tgz ([issue 7482](#))
- Pass env through to file.patch state ([issue 7452](#))
- Service provider fixes and reporting improvements ([issue 7361](#))
- Add `--priv` option for specifying salt-ssh private key
- Fix salt-thin's salt-call on setup tools installations ([issue 7516](#))
- Fix salt-ssh to support passwords with spaces ([issue 7480](#))
- Fix regression in wildcard includes ([issue 7455](#))
- Fix salt-call outputter regression ([issue 7456](#))
- Fix custom returner support for startup states ([issue 7540](#))
- Fix value handling in augeas ([issue 7605](#))
- Fix regression in apt ([issue 7624](#))
- Fix minion ID guessing to use `socket.getfqdn()` first ([issue 7558](#))
- Add minion ID caching ([issue 7558](#))
- Fix salt-key race condition ([issue 7304](#))
- Add `--include-all` flag to salt-key ([issue 7399](#))
- Fix custom grains in pillar (part of [issue 5716](#), [issue 6083](#))
- Fix race condition in salt-key ([issue 7304](#))
- Fix regression in minion ID guessing, prioritize `socket.getfqdn()` ([issue 7558](#))
- Cache minion ID on first guess ([issue 7558](#))
- Allow trailing slash in `file.directory` state
- Fix reporting of `file_roots` in pillar return ([issue 5449](#) and [issue 5951](#))
- Remove pillar matching for `mine.get` ([issue 7197](#))
- Sanitize args for multiple execution modules
- Fix `yumpkg mod_repo` functions to filter hidden args ([issue 7656](#))
- Fix conflicting IDs in state includes ([issue 7526](#))
- Fix `mysql_grants.absent` string formatting issue ([issue 7827](#))
- Fix `postgres.version` so it won't return None ([issue 7695](#))
- Fix for trailing slashes in `mount.mounted` state
- Fix rogue `AttributErrors` in the outputter system ([issue 7845](#))
- Fix for incorrect ssh key encodings resulting in incorrect key added ([issue 7718](#))

- Fix for pillar/grains naming regression in python renderer ([issue 7693](#))
- Fix args/kwargs handling in the scheduler ([issue 7422](#))
- Fix logfile handling for `file://`, `tcp://`, and `udp://` ([issue 7754](#))
- Fix error handling in config file parsing ([issue 6714](#))
- Fix RVM using sudo when running as non-root user ([issue 2193](#))
- Fix client ACL and underlying logging bugs ([issue 7706](#))
- Fix scheduler bug with returner ([issue 7367](#))
- Fix user management bug related to default groups ([issue 7690](#))
- Fix various salt-ssh bugs ([issue 7528](#))
- Many various documentation fixes

19.2.83 Salt 0.17.2 Release Notes

`release` 2013-11-14

Version 0.17.2 is another bugfix release for *0.17.0*. The changes include:

- Add ability to delete key with grains.delval ([issue 7872](#))
- Fix possible state compiler stack trace ([issue 5767](#))
- Fix architecture regression in yumpkg ([issue 7813](#))
- Use correct `ps` on Debian to prevent truncating ([issue 5646](#))
- Fix grains targeting for new grains ([issue 5737](#))
- Fix bug with merging in git_pillar ([issue 6992](#))
- Fix print_jobs duplicate results
- Fix apt version specification for pkg.install
- Fix possible KeyError from ext_job_cache missing option
- Fix auto_order for `-names` states ([issue 7649](#))
- Fix regression in new gitfs installs (directory not found error)
- Fix escape pipe issue on Windows for file.recurse ([issue 7967](#))
- Fix fileclient in case of master restart ([issue 7987](#))
- Try to output warning if CLI command malformed ([issue 6538](#))
- Fix `--out=quiet` to actually be quiet ([issue 8000](#))
- Fix for state.sls in salt-ssh ([issue 7991](#))
- Fix for MySQL grants ordering issue ([issue 5817](#))
- Fix traceback for certain missing CLI args ([issue 8016](#))
- Add ability to disable lspci queries on master ([issue 4906](#))
- Fail if sls defined in topfile does not exist ([issue 5998](#))
- Add ability to downgrade MySQL grants ([issue 6606](#))
- Fix ssh_auth.absent traceback ([issue 8043](#))

- Add upstart detection for Debian/Raspbian ([issue 8039](#))
- Fix ID-related issues ([issue 8052](#), [issue 8050](#), and others)
- Fix for jinja rendering issues ([issue 8066](#) and [issue 8079](#))
- Fix argument parsing in salt-ssh ([issue 7928](#))
- Fix some GPU detection instances ([issue 6945](#))
- Fix bug preventing includes from other environments in SLS files
- Fix for kwargs with dashes ([issue 8102](#))
- Fix salt.utils.which for windows '.exe' ([issue 7904](#))
- Fix apache.adduser without apachectl ([issue 8123](#))
- Fix issue with evaluating test kwarg in states ([issue 7788](#))
- Fix regression in salt.client.Caller() ([issue 8078](#))
- Fix apt-key silent failure
- Fix bug where cmd.script would try to run even if caching failed ([issue 7601](#))
- Fix apt pkg.latest regression ([issue 8067](#))
- Fix for mine data not being updated ([issue 8144](#))
- Fix for noarch packages in yum
- Fix a Xen detection edge case ([issue 7839](#))
- Fix windows __opts__ dictionary persistence ([issue 7714](#))
- Fix version generation for when it's part of another git repo ([issue 8090](#))
- Fix _handle_iorder stacktrace so that the real syntax error is shown ([issue 8114](#) and [issue 7905](#))
- Fix git.latest state when a commit SHA is used ([issue 8163](#))
- Fix various small bugs in yumpkg.py ([issue 8201](#))
- Fix for specifying identify file in git.latest ([issue 8094](#))
- Fix for --output-file CLI arg ([issue 8205](#))
- Add ability to specify shutdown time for system.shutdown ([issue 7833](#))
- Fix for salt version using non-salt git repo info ([issue 8266](#))
- Add additional hints at impact of pkgrepo states when test=True ([issue 8247](#))
- Fix for salt-ssh files not being owned by root ([issue 8216](#))
- Fix retry logic and error handling in fileserver (related to [issue 7755](#))
- Fix file.replace with test=True ([issue 8279](#))
- Add flag for limiting file traversal in fileserver ([issue 6928](#))
- Fix for extra mine processes ([issue 5729](#))
- Fix for unloading custom modules ([issue 7691](#))
- Fix for salt-ssh opts ([issue 8005](#) and [issue 8271](#))
- Fix compound matcher for grains ([issue 7944](#))
- Improve error reporting in ebuild module (related to [issue 5393](#))

- Add `dir_mode` to `file.managed` ([issue 7860](#))
- Improve traceroute support for FreeBSD and OS X ([issue 4927](#))
- Fix for matching minions under syndics ([issue 7671](#))
- Improve exception handling for missing ID ([issue 8259](#))
- Fix grain mismatch for ScientificLinux ([issue 8338](#))
- Add configuration option for `minion_id_caching`
- Fix open mode auth errors ([issue 8402](#))

19.2.84 Salt 0.17.3 Release Notes

release 2013-12-08

Note: 0.17.3 had some regressions which were promptly fixed in the 0.17.4 release. Please use 0.17.4 instead.

Version 0.17.3 is another bugfix release for *0.17.0*. The changes include:

- Fix some jinja render errors ([issue 8418](#))
- Fix `file.replace` state changing file ownership ([issue 8399](#))
- Fix state ordering with the PyDSL renderer ([issue 8446](#))
- Fix for new npm version ([issue 8517](#))
- Fix for pip state requiring name even with requirements file ([issue 8519](#))
- Fix yum logging to open terminals ([issue 3855](#))
- Add sane maxrunning defaults for scheduler ([issue 8563](#))
- Fix states duplicate key detection ([issue 8053](#))
- Fix SUSE patch level reporting ([issue 8428](#))
- Fix managed file creation umask ([issue 8590](#))
- Fix logstash exception ([issue 8635](#))
- Improve argument exception handling for salt command ([issue 8016](#))
- Fix pecl success reporting ([issue 8750](#))
- Fix launchctl module exceptions ([issue 8759](#))
- Fix argument order in `pw_user` module
- Add warnings for failing grains ([issue 8690](#))
- Fix hgfs problems caused by connections left open ([issue 8811](#) and [issue 8810](#))
- Add Debian iptables default for iptables-persistent package ([issue 8889](#))
- Fix installation of packages with dots in pkg name ([issue 8614](#))
- Fix noarch package installation on CentOS 6 ([issue 8945](#))
- Fix `portage_config.enforce_nice_config` ([issue 8252](#))
- Fix `salt.util.copyfile` umask usage ([issue 8590](#))
- Fix rescheduling of failed jobs ([issue 8941](#))

- Fix pkg on Amazon Linux (uses yumpkg5 now) (issue 8226)
- Fix conflicting options in postgres module (issue 8717)
- Fix ps modules for psutil >= 0.3.0 (issue 7432)
- Fix postgres module to return False on failure (issue 8778)
- Fix argument passing for args with pound signs (issue 8585)
- Fix pid of salt CLI command showing in status.pid output (issue 8720)
- Fix rvm to run gem as the correct user (issue 8951)
- Fix namespace issue in win_file module (issue 9060)
- Fix masterless state paths on windows (issue 9021)
- Fix timeout option in master config (issue 9040)

19.2.85 Salt 0.17.4 Release Notes

release 2013-12-10

Version 0.17.4 is another bugfix release for *0.17.0*. The changes include:

- Fix file.replace bug when replacement str is numeric (issue 9101)
- Fix regression in file.managed (issue 9131)
- Prevent traceback when job is None. (issue 9145)

19.2.86 Salt 0.17.5 Release Notes

release 2014-01-27

Version 0.17.5 is another bugfix release for *0.17.0*. The changes include:

- Fix user.present states with non-string fullname (issue 9085)
- Fix virt.init return value on failure (issue 6870)
- Fix reporting of file.blockreplace state when test=True
- Fix network.interfaces when used in cron (issue 7990)
- Fix bug in pkgrepo when switching to/from mirrorlist-based repo def (issue 9121)
- Fix infinite recursion when cache file is corrupted
- Add checking for rev and mirror/bare args in git.latest (issue 9107)
- Add cmd.watch alias (points to cmd.wait) (issue 8612)
- Fix stacktrace when prereq is not formed as a list (issue 8235)
- Fix stdin issue with lvsdisplay command (issue 9128)
- Add pre-check function for range matcher (issue 9236)
- Add exception handling for psutil for processes that go missing (issue 9274)
- Allow _in requisites to match both on ID and name (issue 9061)
- Fix multiple client timeout issues (issue 7157 and issue 9302, probably others)
- Fix ZMQError: Operation cannot be accomplished in current state errors (issue 6306)

- Multiple optimization in minion auth routines
- Clarify logs for minion ID caching

19.2.87 Salt 0.6.0 release notes

The Salt remote execution manager has reached initial functionality! Salt is a management application which can be used to execute commands on remote sets of servers.

The whole idea behind Salt is to create a system where a group of servers can be remotely controlled from a single master, not only can commands be executed on remote systems, but salt can also be used to gather information about your server environment.

Unlike similar systems, like Func and MCollective, Salt is extremely simple to setup and use, the entire application is contained in a single package, and the master and minion daemons require no running dependencies in the way that Func requires Certmaster and MCollective requires activeMQ.

Salt also manages authentication and encryption. Rather than using SSL for encryption, salt manages encryption on a payload level, so the data sent across the network is encrypted with fast AES encryption, and authentication uses RSA keys. This means that Salt is fast, secure, and very efficient.

Messaging in Salt is executed with ZeroMQ, so the message passing interface is built into salt and does not require an external ZeroMQ server. This also adds speed to Salt since there is no additional bloat on the networking layer, and ZeroMQ has already proven itself as a very fast networking system.

The remote execution in Salt is "Lazy Execution", in that once the command is sent the requesting network connection is closed. This makes it easier to detach the execution from the calling process on the master, it also means that replies are cached, so that information gathered from historic commands can be queried in the future.

Salt also allows users to make execution modules in Python. Writers of these modules should also be pleased to know that they have access to the impressive information gathered from PuppetLabs' Facter application, making Salt module more flexible. In the future I hope to also allow Salt to group servers based on Facter information as well.

All in all Salt is fast, efficient, and clean, can be used from a simple command line client or through an API, uses message queue technology to make network execution extremely fast, and encryption is handled in a very fast and efficient manner. Salt is also VERY easy to use and VERY easy to extend.

You can find the source code for Salt on my GitHub page, I have also set up a few wiki pages explaining how to use and set up Salt. If you are using Arch Linux there is a package available in the Arch Linux AUR.

Salt 0.6.0 Source: <https://cloud.github.com/downloads/saltstack/salt/salt-0.6.0.tar.gz>

GitHub page: <https://github.com/saltstack/salt>

Wiki: <https://github.com/saltstack/salt/wiki>

Arch Linux Package: <https://aur.archlinux.org/packages/salt-git/>

I am very open to contributions, for instance I need packages for more Linux distributions as well as BSD packages and testers.

Give Salt a try, this is the initial release and is not a 1.0 quality release, but it has been working well for me! I am eager to get your feedback!

19.2.88 Salt 0.7.0 release notes

I am pleased to announce the release of Salt 0.7.0!

This release marks what is the first stable release of salt, 0.7.0 should be suitable for general use.

0.7.0 Brings the following new features to Salt:

- Integration with Facter data from puppet labs
- Allow for matching minions from the salt client via Facter information
- Minion job threading, many jobs can be executed from the master at once
- Preview of master clustering support - Still experimental
- Introduce new minion modules for stats, virtualization, service management and more
- Add extensive logging to the master and minion daemons
- Add `sys.reload_functions` for dynamic function reloading
- Greatly improve authentication
- Introduce the `saltkey` command for managing public keys
- Begin backend development preparatory to introducing butter
- Addition of man pages for the core commands
- Extended and cleaned configuration

0.7.0 Fixes the following major bugs:

- Fix crash in minions when matching failed
- Fix configuration file lookups for the local client
- Repair communication bugs in encryption
- Numerous fixes in the minion modules

The next release of Salt should see the following features:

- Stabilize the cluster support
- Introduce a remote client for salt command tiers
- salt-ftp system for distributed file copies
- Initial support for ``butter''

Coming up next is a higher level management framework for salt called Butter. I want salt to stay as a simple and effective communication framework, and allow for more complicated executions to be managed via Butter.

Right now Butter is being developed to act as a cloud controller using salt as the communication layer, but features like system monitoring and advanced configuration control (a puppet manager) are also in the pipe.

Special thanks to Joseph Hall for the status and network modules, and thanks to Matthias Teege for tracking down some configuration bugs!

Salt can be downloaded from the following locations;

Source Tarball:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.7.0.tar.gz>

Arch Linux Package:

<https://aur.archlinux.org/packages/salt-git/>

Please enjoy the latest Salt release!

19.2.89 Salt 0.8.0 release notes

Salt 0.8.0 is ready for general consumption! The source tarball is available on GitHub for download:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.8.0.tar.gz>

A lot of work has gone into salt since the last release just 2 weeks ago, and salt has improved a great deal. A swath of new features are here along with performance and threading improvements!

The main new features of salt 0.8.0 are:

Salt-cp

Cython minion modules

Dynamic returners

Faster return handling

Lowered required Python version to 2.6

Advanced minion threading

Configurable minion modules

Salt-cp

The salt-cp command introduces the ability to copy simple files via salt to targeted servers. Using salt-cp is very simple, just call salt-cp with a target specification, the source file(s) and where to copy the files on the minions. For instance:

```
# salt-cp "*" /etc/hosts /etc/hosts
```

Will copy the local /etc/hosts file to all of the minions.

Salt-cp is very young, in the future more advanced features will be added, and the functionality will much more closely resemble the cp command.

Cython minion modules

Cython is an amazing tool used to compile Python modules down to c. This is arguably the fastest way to run Python code, and since pyzmq requires cython, adding support to salt for cython adds no new dependencies.

Cython minion modules allow minion modules to be written in cython and therefore executed in compiled c. Simply write the salt module in cython and use the file extension “.pyx” and the minion module will be compiled when the minion is started. An example cython module is included in the main distribution called cytest.pyx:

<https://github.com/saltstack/salt/blob/develop/salt/modules/cytest.pyx>

Dynamic Returners

By default salt returns command data back to the salt master, but now salt can return command data to any system. This is enabled via the new returners modules feature for salt. The returners modules take the return data and sends it to a specific module. The returner modules work like minion modules, so any returner can be added to the minions.

This means that a custom data returner can be added to communicate the return data so anything from MySQL, Redis, MongoDB, and more!

There are 2 simple stock returners in the returners directory:

<https://github.com/saltstack/salt/blob/develop/salt/returners>

The documentation on writing returners will be added to the wiki shortly, and returners can be written in pure Python, or in cython.

Configurable Minion Modules

Minion modules may need to be configured, now the options passed to the minion configuration file can be accessed inside of the minion modules via the `__opt__` dict.

Information on how to use this simple addition has been added to the wiki: [Writing modules](#)

The test module has an example of using the `__opts__` dict, and how to set default options:

<https://github.com/saltstack/salt/blob/develop/salt/modules/test.py>

Advanced Minion Threading

In 0.7.0 the minion would block after receiving a command from the master, now the minion will spawn a thread or multiprocess. By default Python threads are used because for general use they have proved to be faster, but the minion can now be configured to use the Python multiprocessing module instead. Using multiprocessing will cause executions that are CPU bound or would otherwise exploit the negative aspects of the Python GIL to run faster and more reliably, but simple calls will still be faster with Python threading. The configuration option can be found in the minion configuration file:

<https://github.com/saltstack/salt/blob/develop/conf/minion>

Lowered Supported Python to 2.6

The requirement for Python 2.7 has been removed to support Python 2.6. I have received requests to take the minimum Python version back to 2.4, but unfortunately this will not be possible, since the ZeroMQ Python bindings do not support Python 2.4.

Salt 0.8.0 is a very major update, it also changes the network protocol slightly which makes communication with older salt daemons impossible, your master and minions need to be upgraded together!

I could use some help bringing salt to the people! Right now I only have packages for Arch Linux, Fedora 14 and Gentoo. We need packages for Debian and people willing to help test on more platforms. We also need help writing more minion modules and returner modules. If you want to contribute to salt please hop on the mailing list and send in patches, make a fork on GitHub and send in pull requests! If you want to help but are not sure where you can, please email me directly or post to the mailing list!

I hope you enjoy salt, while it is not yet 1.0 salt is completely viable and usable!

-Thomas S. Hatch

19.2.90 Salt 0.8.7 release notes

It has been a month since salt 0.8.0, and it has been a long month! But Salt is still coming along strong. 0.8.7 has a lot of changes and a lot of updates. This update makes Salt's ZeroMQ back end better, strips Factor from the dependencies, and introduces interfaces to handle more capabilities.

Many of the major updates are in the background, but the changes should shine through to the surface. A number of the new features are still a little thin, but the back end to support expansion is in place.

I also recently gave a presentation to the Utah Python users group in Salt Lake City, the slides from this presentation are available here: <https://cloud.github.com/downloads/saltstack/salt/Salt.pdf>

The video from this presentation will be available shortly.

The major new features and changes in Salt 0.8.7 are:

- Revamp ZeroMQ topology on the master for better scalability
- State enforcement
- Dynamic state enforcement managers
- Extract the module loader into salt.loader
- Make Job ids more granular
- Replace Facter functionality with the new salt grains interface
- Support for “virtual” salt modules
- Introduce the salt-call command
- Better debugging for minion modules

The new ZeroMQ topology allows for better scalability, this will be required by the need to execute massive file transfers to multiple machines in parallel and state management. The new ZeroMQ topology is available in the aforementioned presentation.

0.8.7 introduces the capability to declare states, this is similar to the capabilities of Puppet. States in salt are declared via state data structures. This system is very young, but the core feature set is available. Salt states work around rendering files which represent Salt high data. More on the Salt state system will be documented in the near future.

The system for loading salt modules has been pulled out of the minion class to be a standalone module, this has enabled more dynamic loading of Salt modules and enables many of the updates in 0.8.7 –

<https://github.com/saltstack/salt/blob/develop/salt/loader.py>

Salt Job ids are now microsecond precise, this was needed to repair a race condition unveiled by the speed improvements in the new ZeroMQ topology.

The new grains interface replaces the functionality of Facter, the idea behind grains differs from Facter in that the grains are only used for static system data, dynamic data needs to be derived from a call to a salt module. This makes grains much faster to use, since the grains data is generated when the minion starts.

Virtual salt modules allows for a salt module to be presented as something other than its module name. The idea here is that based on information from the minion decisions about which module should be presented can be made. The best example is the pacman module. The pacman module will only load on Arch Linux minions, and will be called pkg. Similarly the yum module will be presented as pkg when the minion starts on a Fedora/RedHat system.

The new salt-call command allows for minion modules to be executed from the minion. This means that on the minion a salt module can be executed, this is a great tool for testing Salt modules. The salt-call command can also be used to view the grains data.

In previous releases when a minion module threw an exception very little data was returned to the master. Now the stack trace from the failure is returned making debugging of minion modules MUCH easier.

Salt is nearing the goal of 1.0, where the core feature set and capability is complete!

Salt 0.8.7 can be downloaded from GitHub here: <https://cloud.github.com/downloads/saltstack/salt/salt-0.8.7.tar.gz>

-Thomas S Hatch

19.2.91 Salt 0.8.8 release notes

Salt 0.8.8 is here! This release adds a great deal of code and some serious new features. The latest release can be downloaded here: <https://cloud.github.com/downloads/saltstack/salt/salt-0.8.8.tar.gz>

Improved Documentation has been set up for salt using sphinx thanks to the efforts of Seth House. This new documentation system will act as the back end to the salt website which is still under heavy development. The new sphinx documentation system has also been used to greatly clean up the salt manpages. The salt 7 manpage in particular now contains extensive information which was previously only in the wiki. The new documentation can be found at: <http://docs.saltstack.com/> We still have a lot to add, and when the domain is set up I will post another announcement.

More additions have been made to the ZeroMQ setup, particularly in the realm of file transfers. Salt 0.8.8 introduces a built in, stateless, encrypted file server which allows salt minions to download files from the salt master using the same encryption system used for all other salt communications. The main motivation for the salt file server has been to facilitate the new salt state system.

Much of the salt code has been cleaned up and a new cleaner logging system has been introduced thanks to the efforts of Pedro Algarvio. These additions will allow for much more flexible logging to be executed by salt, and fixed a great deal of my poor spelling in the salt docstrings! Pedro Algarvio has also cleaned up the API, making it easier to embed salt into another application.

The biggest addition to salt found in 0.8.8 is the new state system. The salt module system has received a new front end which allows salt to be used as a configuration management system. The configuration management system allows for system configuration to be defined in data structures. The configuration management system, or as it is called in salt, the “salt state system” supports many of the features found in other configuration managers, but allows for system states to be written in a far simpler format, executes at blazing speeds, and operates via the salt minion matching system. The state system also operates within the normal scope of salt, and requires no additional configuration to use.

The salt state system can enforce the following states with many more to come: Packages Files Services Executing commands Hosts

The system used to define the salt states is based on a data structure, the data structure used to define the salt states has been made to be as easy to use as possible. The data structure is defined by default using a YAML file rendered via a Jinja template. This means that the state definition language supports all of the data structures that YAML supports, and all of the programming constructs and logic that Jinja supports. If the user does not like YAML or Jinja the states can be defined in yamll-mako, json-jinja, or json-mako. The system used to render the states is completely dynamic, and any rendering system can be added to the capabilities of Salt, this means that a rendering system that renders XML data in a cheetah template, or whatever you can imagine, can be easily added to the capabilities of salt.

The salt state system also supports isolated environments, as well as matching code from several environments to a single salt minion.

The feature base for Salt has grown quite a bit since my last serious documentation push. As we approach 0.9.0 the goals are becoming very clear, and the documentation needs a lot of work. The main goals for 0.9.0 are to further refine the state system, fix any bugs we find, get Salt running on as many platforms as we can, and get the documentation filled out. There is a lot more to come as Salt moves forward to encapsulate a much larger scope, while maintaining supreme usability and simplicity.

If you would like a more complete overview of Salt please watch the Salt presentation: Slides: <https://cloud.github.com/downloads/saltstack/salt/Salt.pdf>

-Thomas S Hatch

19.2.92 Salt 0.8.9 Release Notes

Salt 0.8.9 has finally arrived! Unfortunately this is much later than I had hoped to release 0.8.9, life has been very crazy over the last month. But despite challenges, Salt has moved forward!

This release, as expected, adds few new features and many refinements. One of the most exciting aspect of this release is that the development community for salt has grown a great deal and much of the code is from contributors.

Also, I have filled out the documentation a great deal. So information on States is properly documented, and much of the documentation that was out of date has been filled in.

Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.8.9.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.8.9.tar.gz>

Here s the md5sum:

```
7d5aca4633bc22f59045f59e82f43b56
```

For instructions on how to set up Salt please see the *Installation* instructions.

New Features

Salt Run

A big feature is the addition of Salt run, the `salt-run` command allows for master side execution modules to be made that gather specific information or execute custom routines from the master.

Documentation for salt-run can be found *here*

Refined Outputters

One problem often complained about in salt was the fact that the output was so messy. Thanks to help from Jeff Schroeder a cleaner interface for the command output for the Salt CLI has been made. This new interface makes adding new printout formats easy and additions to the capabilities of minion modules makes it possible to set the printout mode or `outputter` for functions in minion modules.

Cross Calling Salt Modules

Salt modules can now call each other, the `__salt__` dict has been added to the predefined references in minion modules. This new feature is documented in the *modules documentation*.

Watch Option Added to Salt State System

Now in Salt states you can set the watch option, this will allow watch enabled states to change based on a change in the other defined states. This is similar to subscribe and notify statements in puppet.

Root Dir Option

Travis Cline has added the ability to define the option `root_dir` which allows the salt minion to operate in a subdir. This is a strong move in supporting the minion running as an unprivileged user

Config Files Defined in Variables

Thanks again to Travis Cline, the master and minion configuration file locations can be defined in environment variables now.

New Modules

Quite a few new modules, states, returners, and runners have been made.

New Minion Modules

apt

Support for apt-get has been added, this adds greatly improved Debian and Ubuntu support to Salt!

useradd and groupadd

Support for manipulating users and groups on Unix-like systems.

moosefs

Initial support for reporting on aspects of the distributed file system, MooseFS. For more information on MooseFS please see: <http://www.moosefs.org>

Thanks to Joseph Hall for his work on MooseFS support.

mount

Manage mounts and the fstab.

puppet

Execute puppet on remote systems.

shadow

Manipulate and manage the user password file.

ssh

Interact with ssh keys.

New States

user and group

Support for managing users and groups in Salt States.

mount

Enforce mounts and the fstab.

New Returners

mongo_return

Send the return information to a MongoDB server.

New Runners

manage

Display minions that are up or down.

19.2.93 Salt 0.9.0 Release Notes

release 2011-08-27

Salt 0.9.0 is here. This is an exciting release, 0.9.0 includes the new network topology features allowing peer salt commands and masters of masters via the syndic interface.

0.9.0 also introduces many more modules, improvements to the API and improvements to the ZeroMQ systems.

Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.0.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.0.tar.gz>

Here is the md5sum:

9a925da04981e65a0f237f2e77ddab37

For instructions on how to set up Salt please see the *Installation* instructions.

New Features

Salt Syndic

The new *Syndic interface* allows a master to be commanded via another higher level salt master. This is a powerful solution allowing a master control structure to exist, allowing salt to scale to much larger levels than before.

Peer Communication

0.9.0 introduces the capability for a minion to call a publication on the master and receive the return from another set of minions. This allows salt to act as a communication channel between minions and as a general infrastructure message bus.

Peer communication is turned off by default but can be enabled via the `peer` option in the master configuration file. Documentation on the new *Peer interface*.

Easily Extensible API

The minion and master classes have been redesigned to allow for specialized minion and master servers to be easily created. An example on how this is done for the master can be found in the `master.py` salt module:

<https://github.com/saltstack/salt/blob/develop/salt/master.py>

The `Master` class extends the `SMaster` class and set up the main master server.

The minion functions can now also be easily added to another application via the `SMinion` class, this class can be found in the `minion.py` module:

<https://github.com/saltstack/salt/blob/develop/salt/minion.py>

Cleaner Key Management

This release changes some of the key naming to allow for multiple master keys to be held based on the type of minion gathering the master key.

The `-d` option has also been added to the `salt-key` command allowing for easy removal of accepted public keys.

The `--gen-keys` option is now available as well for `salt-key`, this allows for a salt specific RSA key pair to be easily generated from the command line.

Improved 0MQ Master Workers

The 0MQ worker system has been further refined to be faster and more robust. This new system has been able to handle a much larger load than the previous setup. The new system uses the IPC protocol in 0MQ instead of TCP.

New Modules

Quite a few new modules have been made.

New Minion Modules

apache

Work directly with apache servers, great for managing balanced web servers

cron

Read out the contents of a systems crontabs

mdadm

Module to manage raid devices in Linux, appears as the `raid` module

mysql

Gather simple data from MySQL databases

ps

Extensive utilities for managing processes

publish

Used by the peer interface to allow minions to make publications

19.2.94 Salt 0.9.1 Release Notes

`release` 2011-08-29

19.2.95 Salt 0.9.2 Release Notes

`release` 2011-09-17

Salt 0.9.2 has arrived! 0.9.2 is primarily a bugfix release, the exciting component in 0.9.2 is greatly improved support for salt states. All of the salt states interfaces have been more thoroughly tested and the new salt-states git repo is growing with example of how to use states.

This release introduces salt states for early developers and testers to start helping us clean up the states interface and make it ready for the world!

0.9.2 also fixes a number of bugs found on Python 2.6.

Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.2.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.2.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

New Features

Salt-Call Additions

The salt-call command has received an overhaul, it now hooks into the outputter system so command output looks clean, and the logging system has been hooked into salt-call, so the `-l` option allows the logging output from salt minion functions to be displayed.

The end result is that the salt-call command can execute the state system and return clean output:

```
# salt-call state.highstate
```

State System Fixes

The state system has been tested and better refined. As of this release the state system is ready for early testers to start playing with. If you are interested in working with the state system please check out the (still very small) salt-states GitHub repo:

<https://github.com/saltstack/salt-states>

This git repo is the active development branch for determining how a clean salt-state database should look and act. Since the salt state system is still very young a lot of help is still needed here. Please fork the salt-states repo and help us develop a truly large and scalable system for configuration management!

Notable Bug Fixes

Python 2.6 String Formatting

Python 2.6 does not support format strings without an index identifier, all of them have been repaired.

Cython Loading Disabled by Default

Cython loading requires a development tool chain to be installed on the minion, requiring this by default can cause problems for most Salt deployments. If Cython auto loading is desired it will need to be turned on in the minion config.

19.2.96 Salt 0.9.3 Release Notes

release 2011-11-05

Salt 0.9.3 is finally arrived. This is another big step forward for Salt, new features range from proper FreeBSD support to fixing issues seen when attaching a minion to a master over the Internet.

The biggest improvements in 0.9.3 though can be found in the state system, it has progressed from something ready for early testers to a system ready to compete with platforms such as Puppet and Chef. The backbone of the state system has been greatly refined and many new features are available.

Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.3.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.3.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

New Features

WAN Support

Recently more people have been testing Salt minions connecting to Salt Masters over the Internet. It was found that Minions would commonly lose their connection to the master when working over the internet. The minions can now detect if the connection has been lost and reconnect to the master, making WAN connections much more reliable.

State System Fixes

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been found and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

Extend Declaration

The Salt States have also gained the `extend` declaration. This declaration allows for states to be cleanly modified in a post environment. Simply said, if there is an `apache.sls` file that declares the `apache` service, then another `sls` can include `apache` and then extend it:

```
include:
  - apache

extend:
  apache:
    service:
      - require:
        - pkg: mod_python
```

```
mod_python:
  pkg:
    - installed
```

The notable behavior with the extend functionality is that it literally extends or overwrites a declaration set up in another sls module. This means that Salt will behave as though the modifications were made directly to the apache sls. This ensures that the apache service in this example is directly tied to all requirements.

Highstate Structure Specification

This release comes with a clear specification of the Highstate data structure that is used to declare Salt States. This specification explains everything that can be declared in the Salt SLS modules.

The specification is extremely simple, and illustrates how Salt has been able to fulfill the requirements of a central configuration manager within a simple and easy to understand format and specification.

SheBang Renderer Switch

It came to our attention that having many renderers means that there may be a situation where more than one State Renderer should be available within a single State Tree.

The method chosen to accomplish this was something already familiar to developers and systems administrators, a SheBang. The Python State Renderer displays this new capability.

Python State Renderer

Until now Salt States could only be declared in yaml or json using Jinja or Mako. A new, very powerful, renderer has been added, making it possible to write Salt States in pure Python:

```
#!/py

def run():
    """
    Install the python-mako package
    """
    return {'include': ['python'],
           'python-mako': {'pkg': ['installed']}}
```

This renderer is used by making a run function that returns the Highstate data structure. Any capabilities of Python can be used in pure Python sls modules.

This example of a pure Python sls module is the same as this example in yaml:

```
include:
  - python

python-mako:
  pkg:
    - installed
```

FreeBSD Support

Additional support has been added for FreeBSD, this is Salt's first branch out of the Linux world and proves the viability of Salt on non-Linux platforms.

Salt remote execution already worked on FreeBSD, and should work without issue on any Unix-like platform. But this support comes in the form of package management and user support, so Salt States also work on FreeBSD now.

The new `freebsdpkg` module provides package management support for FreeBSD and the new `pw_user` and `pw_group` provide user and group management.

Module and State Additions

Cron Support

Support for managing the system crontab has been added, declaring a cron state can be done easily:

```
date > /tmp/datestamp:
cron:
  - present
  - user: fred
  - minute: 5
  - hour: 3
```

File State Additions

The file state has been given a number of new features, primarily the `directory`, `recurse`, `symlink`, and `absent` functions.

file.directory Make sure that a directory exists and has the right permissions.

```
/srv/fo:
file:
  - directory
  - user: root
  - group: root
  - mode: 1755
```

file.symlink Make a symlink.

```
/var/lib/www:
file:
  - symlink
  - target: /srv/www
  - force: True
```

file.recurse The `recurse` state function will recursively download a directory on the master file server and place it on the minion. Any change in the files on the master will be pushed to the minion. The `recurse` function is very powerful and has been tested by pushing out the full Linux kernel source.

```
/opt/code:
file:
  - recurse
  - source: salt://linux
```

file.absent Make sure that the file is not on the system, recursively deletes directories, files, and symlinks.

```
/etc/httpd/conf.d/somebogusfile.conf:
file:
- absent
```

Sysctl Module and State

The sysctl module and state allows for sysctl components in the kernel to be managed easily. the sysctl module contains the following functions:

sysctl.show Return a list of sysctl parameters for this minion

sysctl.get Return a single sysctl parameter for this minion

sysctl.assign Assign a single sysctl parameter for this minion

sysctl.persist Assign and persist a simple sysctl parameter for this minion

The sysctl state allows for sysctl parameters to be assigned:

```
vm.swappiness:
  sysctl:
    - present
    - value: 20
```

Kernel Module Management

A module for managing Linux kernel modules has been added. The new functions are as follows:

kmod.available Return a list of all available kernel modules

kmod.check_available Check to see if the specified kernel module is available

kmod.lsmod Return a dict containing information about currently loaded modules

kmod.load Load the specified kernel module

kmod.remove Unload the specified kernel module

The kmod state can enforce modules be either present or absent:

```
kvm_intel:
  kmod:
    - present
```

Ssh Authorized Keys

The ssh_auth state can distribute ssh authorized keys out to minions. Ssh authorized keys can be present or absent.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyYvLRBsJdD0o49CNfhLWHWXQRqul6rwL4KIuPrhY7hBw0tV7UNC7J9IZRN04iGod9C+
→xw6NtnQZVMcmZIre5Elrw30KgxcDNomjYFNHu0YaQLBBMosy0++tJe1KTAr3A2zGj2xbW09JhEzu8xvSdF8jRu0N5SRXPpzSyU
→x75wo1BDbVzeTlxWxgxhafj7P6Ncdv25Wz9wvc6ko/puww0b3rcLNqK+XCNJlsm/
→7lB8Q26iK5mRZzNsGeGwGTyzNIMBekGYQ5MRdIcPv5dBIP/1M6fQDEsAXQ==:
  ssh_auth:
    - present
    - user: frank
    - enc: dsa
    - comment: 'Frank's key'
```

19.2.97 Salt 0.9.4 Release Notes

release 2011-11-27

Salt 0.9.4 has arrived. This is a critical update that repairs a number of key bugs found in 0.9.3. But this update is not without feature additions as well! 0.9.4 adds support for Gentoo portage to the pkg module and state system. Also there are 2 major new state additions, the failhard option and the ability to set up finite state ordering with the order option.

This release also sees our largest increase in community contributions. These contributors have and continue to be the life blood of the Salt project, and the team continues to grow. I want to put out a big thanks to our new and existing contributors.

Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.4.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.4.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

New Features

Failhard State Option

Normally, when a state fails Salt continues to execute the remainder of the defined states and will only refuse to execute states that require the failed state.

But the situation may exist, where you would want all state execution to stop if a single state execution fails. The capability to do this is called *failhard*.

State Level Failhard

A single state can have a failhard set, this means that if this individual state fails that all state execution will immediately stop. This is a great thing to do if there is a state that sets up a critical config file and setting a require for each state that reads the config would be cumbersome. A good example of this would be setting up a package manager early on:

```
/etc/yum.repos.d/company.repo:
file:
- managed
- source: salt://company/yumrepo.conf
- user: root
- group: root
- mode: 644
- order: 1
- failhard: True
```

In this situation, the yum repo is going to be configured before other states, and if it fails to lay down the config file, than no other states will be executed.

Global Failhard

It may be desired to have failhard be applied to every state that is executed, if this is the case, then failhard can be set in the master configuration file. Setting failhard in the master configuration file will result in failing hard when any minion gathering states from the master have a state fail.

This is NOT the default behavior, normally Salt will only fail states that require a failed state.

Using the global failhard is generally not recommended, since it can result in states not being executed or even checked. It can also be confusing to see states failhard if an admin is not actively aware that the failhard has been set.

To use the global failhard set failhard: True in the master configuration

Finite Ordering of State Execution

When creating salt sls files, it is often important to ensure that they run in a specific order. While states will always execute in the same order, that order is not necessarily defined the way you want it.

A few tools exist in Salt to set up the correct state ordering, these tools consist of requisite declarations and order options.

The Order Option

Before using the order option, remember that the majority of state ordering should be done with requisite statements, and that a requisite statement will override an order option.

The order option is used by adding an order number to a state declaration with the option *order*:

```
vim:
  pkg:
    - installed
    - order: 1
```

By adding the order option to *1* this ensures that the vim package will be installed in tandem with any other state declaration set to the order *1*.

Any state declared without an order option will be executed after all states with order options are executed.

But this construct can only handle ordering states from the beginning. Sometimes you may want to send a state to the end of the line, to do this set the order to last:

```
vim:
  pkg:
    - installed
    - order: last
```

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been founds and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

Gentoo Support

Additional experimental support has been added for Gentoo. This is found in the contribution from Doug Renn, aka nestegg.

19.2.98 Salt 0.9.5 Release Notes

release 2012-01-15

Salt 0.9.5 is one of the largest steps forward in the development of Salt.

0.9.5 comes with many milestones, this release has seen the community of developers grow out to an international team of 46 code contributors and has many feature additions, feature enhancements, bug fixes and speed improvements.

Warning: Be sure to *read the upgrade instructions* about the switch to msgpack before upgrading!

Community

Nothing has proven to have more value to the development of Salt than the outstanding community that has been growing at such a great pace around Salt. This has proven not only that Salt has great value, but also the expandability of Salt is as exponential as I originally intended.

0.9.5 has received over 600 additional commits since 0.9.4 with a swath of new committers. The following individuals have contributed to the development of 0.9.5:

- Aaron Bull Schaefer
- Antti Kaihola
- Bas Tichelaar
- Brad Barden
- Brian Wagner
- Byron Clark
- Chris Scheller
- Christer Edwards
- Clint Savage
- Corey Quinn
- David Boucha
- Eivind Uggedal
- Eric Poelke
- Evan Borgstrom
- Jed Glazner

- Jeff Schroeder
- Jeffrey C. Ollie
- Jonas Buckner
- Kent Tenney
- Martin Schnabel
- Maxim Burgerhout
- Mitch Anderson
- Nathaniel Whiteinge
- Seth House
- Thomas S Hatch
- Thomas Schreiber
- Tor Hveem
- lzyeval
- syphernl

This makes 21 new developers since 0.9.4 was released!

To keep up with the growing community follow Salt on Ohloh (<http://www.ohloh.net/p/salt>), to join the Salt development community, fork Salt on GitHub, and get coding (<https://github.com/saltstack/salt>)!

Major Features

SPEED! Pickle to msgpack

For a few months now we have been talking about moving away from Python pickles for network serialization, but a preferred serialization format had not yet been found. After an extensive performance testing period involving everything from JSON to protocol buffers, a clear winner emerged. Message Pack (<http://msgpack.org/>) proved to not only be the fastest and most compact, but also the most ``salt like''. Message Pack is simple, and the code involved is very small. The msgpack library for Python has been added directly to Salt.

This move introduces a few changes to Salt. First off, Salt is no longer a ``noarch'' package, since the msgpack lib is written in C. Salt 0.9.5 will also have compatibility issues with 0.9.4 with the default configuration.

We have gone through great lengths to avoid backwards compatibility issues with Salt, but changing the serialization medium was going to create issues regardless. Salt 0.9.5 is somewhat backwards compatible with earlier minions. A 0.9.5 master can command older minions, but only if the `serial` config value in the master is set to `pickle`. This will tell the master to publish messages in pickle format and will allow the master to receive messages in both msgpack and pickle formats.

Therefore **the suggested methods for upgrading** are either to just upgrade everything at once, or:

1. Upgrade the master to 0.9.5
2. Set `serial` to `pickle` in the master config
3. Upgrade the minions
4. Remove the `serial` option from the master config

Since pickles can be used as a security exploit the ability for a master to accept pickles from minions at all will be removed in a future release.

C Bindings for YAML

All of the YAML rendering is now done with the YAML C bindings. This speeds up all of the sls files when running states.

Experimental Windows Support

David Boucha has worked tirelessly to bring initial support to Salt for Microsoft Windows operating systems. Right now the Salt Minion can run as a native Windows service and accept commands.

In the weeks and months to come Windows will receive the full treatment and will have support for Salt States and more robust support for managing Windows systems. This is a big step forward for Salt to move entirely outside of the Unix world, and proves Salt is a viable cross platform solution. Big Thanks to Dave for his contribution here!

Dynamic Module Distribution

Many Salt users have expressed the desire to have Salt distribute in-house modules, states, renderers, returners, and grains. This support has been added in a number of ways:

Modules via States

Now when salt modules are deployed to a minion via the state system as a file, then the modules will be automatically loaded into the active running minion - no restart required - and into the active running state. So custom state modules can be deployed and used in the same state run.

Modules via Module Environment Directories

Under the `file_roots` each environment can now have directories that are used to deploy large groups of modules. These directories sync modules at the beginning of a state run on the minion, or can be manually synced via the Salt module `salt.modules.saltutil.sync_all`.

The directories are named:

- `_modules`
- `_states`
- `_grains`
- `_renderers`
- `_returners`

The modules are pushed to their respective scopes on the minions.

Module Reloading

Modules can now be reloaded without restarting the minion, this is done by calling the `salt.modules.sys.reload_modules` function.

But wait, there's more! Now when a salt module of any type is added via states the modules will be automatically reloaded, allowing for modules to be laid down with states and then immediately used.

Finally, all modules are reloaded when modules are dynamically distributed from the salt master.

Enable / Disable Added to Service

A great deal of demand has existed for adding the capability to set services to be started at boot in the service module. This feature also comes with an overhaul of the service modules and initial systemd support.

This means that the `service state` can now accept `-enable: True` to make sure a service is enabled at boot, and `-enable: False` to make sure it is disabled.

Compound Target

A new target type has been added to the lineup, the compound target. In previous versions the desired minions could only be targeted via a single specific target type, but now many target specifications can be declared.

These targets can also be separated by and/or operators, so certain properties can be used to omit a node:

```
salt -C 'webserv* and G@os:Debian or E@db.*' test.ping
```

will match all minions with ids starting with webserv via a glob and minions matching the `os:Debian` grain. Or minions that match the `db.*` regular expression.

Node Groups

Often the convenience of having a predefined group of minions to execute targets on is desired. This can be accomplished with the new `nodegroups` feature. Nodegroups allow for predefined compound targets to be declared in the master configuration file:

```
nodegroups:
  group1: 'L@foo.domain.com,bar.domain.com,baz.domain.com and bl*.domain.com'
  group2: 'G@os:Debian and foo.domain.com'
```

And then used via the `-N` option:

```
salt -N group1 test.ping
```

Minion Side Data Store

The data module introduces the initial approach into storing persistent data on the minions, specific to the minions. This allows for data to be stored on minions that can be accessed from the master or from the minion.

The Minion datastore is young, and will eventually provide an interface similar to a more mature key/value pair server.

Major Grains Improvement

The Salt grains have been overhauled to include a massive amount of extra data. this includes hardware data, os data and salt specific data.

Salt -Q is Useful Now

In the past the salt query system, which would display the data from recent executions would be displayed in pure Python, and it was unreadable.

0.9.5 has added the outputter system to the `-Q` option, thus enabling the salt query system to return readable output.

Packaging Updates

Huge strides have been made in packaging Salt for distributions. These additions are thanks to our wonderful community where the work to set up packages has proceeded tirelessly.

FreeBSD

Salt on FreeBSD? There a port for that:

<http://svnweb.freebsd.org/ports/head/sysutils/py-salt/>

This port was developed and added by Christer Edwards. This also marks the first time Salt has been included in an upstream packaging system!

Fedora and Red Hat Enterprise

Salt packages have been prepared for inclusion in the Fedora Project and in EPEL for Red Hat Enterprise 5 and 6. These packages are the result of the efforts made by Clint Savage (herlo).

Debian/Ubuntu

A team of many contributors have assisted in developing packages for Debian and Ubuntu. Salt is still actively seeking inclusion in upstream Debian and Ubuntu and the package data that has been prepared is being pushed through the needed channels for inclusion.

These packages have been prepared with the help of:

- Corey
- Aaron Toponce
- and`

More to Come

We are actively seeking inclusion in more distributions. Primarily getting Salt into Gentoo, SUSE, OpenBSD, and preparing Solaris support are all turning into higher priorities.

Refinement

Salt continues to be refined into a faster, more stable and more usable application. 0.9.5 comes with more debug logging, more bug fixes and more complete support.

More Testing, More BugFixes

0.9.5 comes with more bugfixes due to more testing than any previous release. The growing community and the introduction a a dedicated QA environment have unearthed many issues that were hiding under the covers. This has further refined and cleaned the state interface, taking care of things from minor visual issues to repairing misleading data.

Custom Exceptions

A custom exception module has been added to throw salt specific exceptions. This allows Salt to give much more granular error information.

New Modules

data

The new data module manages a persistent datastore on the minion. Big thanks to bastichelaar for his help refining this module

freebsdmod

FreeBSD kernel modules can now be managed in the same way Salt handles Linux kernel modules.

This module was contributed thanks to the efforts of Christer Edwards

gentoo_service

Support has been added for managing services in Gentoo. Now Gentoo services can be started, stopped, restarted, enabled, disabled, and viewed.

pip

The pip module introduces management for pip installed applications. Thanks goes to whitinge for the addition of the pip module

rh_service

The rh_service module enables Red Hat and Fedora specific service management. Now Red Hat like systems come with extensive management of the classic init system used by Red Hat

saltutil

The saltutil module has been added as a place to hold functions used in the maintenance and management of salt itself. Saltutil is used to salt the salt minion. The saltutil module is presently used only to sync extension modules from the master server.

systemd

Systemd support has been added to Salt, now systems using this next generation init system are supported on systems running systemd.

virtualenv

The virtualenv module has been added to allow salt to create virtual Python environments. Thanks goes to whitinge for the addition of the virtualenv module

win_disk

Support for gathering disk information on Microsoft Windows minions The windows modules come courtesy of Utah_Dave

win_service

The win_service module adds service support to Salt for Microsoft Windows services

win_useradd

Salt can now manage local users on Microsoft Windows Systems

yumpkg5

The yumpkg module introduced in 0.9.4 uses the yum API to interact with the yum package manager. Unfortunately, on Red Hat 5 systems salt does not have access to the yum API because the yum API is running under Python 2.4 and Salt needs to run under Python 2.6.

The yumpkg5 module bypasses this issue by shelling out to yum on systems where the yum API is not available.

New States

mysql_database

The new mysql_database state adds the ability to systems running a mysql server to manage the existence of mysql databases.

The mysql states are thanks to syphernl

mysql_user

The mysql_user state enables mysql user management.

virtualenv

The virtualenv state can manage the state of Python virtual environments. Thanks to Whitinge for the virtualenv state

New Returners

cassandra_returner

A returner allowing Salt to send data to a cassandra server. Thanks to Byron Clark for contributing this returner

19.2.99 Salt 0.9.6 Release Notes

release 2012-01-21

Salt 0.9.6 is a release targeting a few bugs and changes. This is primarily targeting an issue found in the names declaration in the state system. But a few other bugs were also repaired, like missing support for grains in extmods.

Due to a conflict in distribution packaging msgpack will no longer be bundled with Salt, and is required as a dependency.

New Features

HTTP and ftp support in files.managed

Now under the source option in the file.managed state a HTTP or ftp address can be used instead of a file located on the salt master.

Allow Multiple Returners

Now the returner interface can define multiple returners, and will also return data back to the master, making the process less ambiguous.

Minion Memory Improvements

A number of modules have been taken out of the minion if the underlying systems required by said modules are not present on the minion system. A number of other modules need to be stripped out in this same way which should continue to make the minion more efficient.

Minions Can Locally Cache Return Data

A new option, cache_jobs, has been added to the minion to allow for all of the historically run jobs to cache on the minion, allowing for looking up historic returns. By default cache_jobs is set to False.

Pure Python Template Support For file.managed

Templates in the file.managed state can now be defined in a Python script. This script needs to have a run function that returns the string that needs to be in the named file.

19.2.100 Salt 0.9.7 Release Notes

release 2012-02-15

Salt 0.9.7 is here! The latest iteration of Salt brings more features and many fixes. This release is a great refinement over 0.9.6, adding many conveniences under the hood, as well as some features that make working with Salt much better.

A few highlights include the new Job system, refinements to the requisite system in states, the `mod_init` interface for states, external node classification, search path to managed files in the file state, and refinements and additions to dynamic module loading.

0.9.7 also introduces the long developed (and oft changed) unit test framework and the initial unit tests.

Major Features

Salt Jobs Interface

The new jobs interface makes the management of running executions much cleaner and more transparent. Building on the existing execution framework the jobs system allows clear introspection into the active running state of the running Salt interface.

The Jobs interface is centered in the new minion side proc system. The minions now store msgpack serialized files under `/var/cache/salt/proc`. These files keep track of the active state of processes on the minion.

Functions in the saltutil Module

A number of functions have been added to the saltutil module to manage and view the jobs:

`running` - Returns the data of all running jobs that are found in the proc directory.

`find_job` - Returns specific data about a certain job based on job id.

`signal_job` - Allows for a given jid to be sent a signal.

`term_job` - Sends a termination signal (SIGTERM, 15) to the process controlling the specified job.

`kill_job` Sends a kill signal (SIGKILL, 9) to the process controlling the specified job.

The jobs Runner

A convenience runner front end and reporting system has been added as well. The jobs runner contains functions to make viewing data easier and cleaner.

The jobs runner contains a number of functions...

active

The active function runs `saltutil.running` on all minions and formats the return data about all running jobs in a much more usable and compact format. The active function will also compare jobs that have returned and jobs that are still running, making it easier to see what systems have completed a job and what systems are still being waited on.

lookup_jid

When jobs are executed the return data is sent back to the master and cached. By default is is cached for 24 hours, but this can be configured via the `keep_jobs` option in the master configuration.

Using the `lookup_jid` runner will display the same return data that the initial job invocation with the salt command would display.

list_jobs

Before finding a historic job, it may be required to find the job id. `list_jobs` will parse the cached execution data and display all of the job data for jobs that have already, or partially returned.

External Node Classification

Salt can now use external node classifiers like Cobbler's `cobbler-ext-nodes`.

Salt uses specific data from the external node classifier. In particular the `classes` value denotes which sls modules to run, and the `environment` value sets to another environment.

An external node classification can be set in the master configuration file via the `external_nodes` option: <https://salt.readthedocs.io/en/latest/ref/configuration/master.html#external-nodes>

External nodes are loaded in addition to the top files. If it is intended to only use external nodes, do not deploy any top files.

State Mod Init System

An issue arose with the `pkg` state. Every time a package was run Salt would need to refresh the package database. This made systems with slower package metadata refresh speeds much slower to work with. To alleviate this issue the `mod_init` interface has been added to salt states.

The `mod_init` interface is a function that can be added to a state file. This function is called with the first state called. In the case of the `pkg` state, the `mod_init` function sets up a tag which makes the package database only refresh on the first attempt to install a package.

In a nutshell, the `mod_init` interface allows a state to run any command that only needs to be run once, or can be used to set up an environment for working with the state.

Source File Search Path

The file state continues to be refined, adding speed and capabilities. This release adds the ability to pass a list to the `source` option. This list is then iterated over until the source file is found, and the first found file is used.

The new syntax looks like this:

```
/etc/httpd/conf/httpd.conf:
  file:
    - managed
    - source:
      - salt://httpd/httpd.conf
      - http://myserver/httpd.conf: md5=8c1fe119e6f1fd96bc06614473509bf1
```

The source option can take sources in the list from the salt file server as well as an arbitrary web source. If using an arbitrary web source the checksum needs to be passed as well for file verification.

Refinements to the Requisite System

A few discrepancies were still lingering in the requisite system, in particular, it was not possible to have a `require` and a `watch` requisite declared in the same state declaration.

This issue has been alleviated, as well as making the requisite system run more quickly.

Initial Unit Testing Framework

Because of the module system, and the need to test real scenarios, the development of a viable unit testing system has been difficult, but unit testing has finally arrived. Only a small amount of unit testing coverage has been developed, much more coverage will be in place soon.

A huge thanks goes out to those who have helped with unit testing, and the contributions that have been made to get us where we are. Without these contributions unit tests would still be in the dark.

Compound Targets Expanded

Originally only support for `and` and `or` were available in the compound target. 0.9.7 adds the capability to negate compound targets with `not`.

Nodegroups in the Top File

Previously the nodegroups defined in the master configuration file could not be used to match nodes for states. The nodegroups support has been expanded and the nodegroups defined in the master configuration can now be used to match minions in the top file.

19.2.101 Salt 0.9.8 Release Notes

release 2012-03-21

Salt 0.9.8 is a big step forward, with many additions and enhancements, as well as a number of precursors to advanced future developments.

This version of Salt adds much more power to the command line, making the old hard timeout issues a thing of the past and adds keyword argument support. These additions are also available in the salt client API, making the available API tools much more powerful.

The new pillar system allows for data to be stored on the master and assigned to minions in a granular way similar to the state system. It also allows flexibility for users who want to keep data out of their state tree similar to 'external lookup' functionality in other tools.

A new way to extend requisites was added, the ``requisite in" statement. This makes adding requires or watch statements to external state decs much easier.

Additions to requisites making them much more powerful have been added as well as improved error checking for sls files in the state system. A new provider system has been added to allow for redirecting what modules run in the background for individual states.

Support for openSUSE has been added and support for Solaris has begun serious development. Windows support has been significantly enhanced as well.

The matcher and target systems have received a great deal of attention. The default behavior of grain matching has changed slightly to reflect the rest of salt and the compound matcher system has been refined.

A number of impressive features with keyword arguments have been added to both the CLI and to the state system. This makes states much more powerful and flexible while maintaining the simple configuration everyone loves.

The new batch size capability allows for executions to be rolled through a group of targeted minions a percentage or specific number at a time. This was added to prevent the "thundering herd" problem when targeting large numbers of minions for things like service restarts or file downloads.

Upgrade Considerations

Upgrade Issues

There was a previously missed oversight which could cause a newer minion to crash an older master. That oversight has been resolved so the version incompatibility issue will no longer occur. When upgrading to 0.9.8 make sure to upgrade the master first, followed by the minions.

Debian/Ubuntu Packages

The original Debian/Ubuntu packages were called salt and included all salt applications. New packages in the ppa are split by function. If an old salt package is installed then it should be manually removed and the new split packages need to be freshly installed.

On the master:

```
# apt-get purge salt
# apt-get install salt-{master,minion}
```

On the minions:

```
# apt-get purge salt
# apt-get install salt-minion
```

And on any Syndics:

```
# apt-get install salt-syndic
```

The official Salt PPA for Ubuntu is located at: <https://launchpad.net/~saltstack/+archive/salt>

Major Features

Pillar

Pillar offers an interface to declare variable data on the master that is then assigned to the minions. The pillar data is made available to all modules, states, sls files etc. It is compiled on the master and is declared using the existing renderer system. This means that learning pillar should be fairly trivial to those already familiar with salt states.

CLI Additions

The `salt` command has received a serious overhaul and is more powerful than ever. Data is returned to the terminal as it is received, and the salt command will now wait for all running minions to return data before stopping. This makes adding very large `--timeout` arguments completely unnecessary and gets rid of long running operations returning empty `{}` when the timeout is exceeded.

When calling salt via sudo, the user originally running salt is saved to the log for auditing purposes. This makes it easy to see who ran what by just looking through the minion logs.

The `salt-key` command gained the `-D` and `--delete-all` arguments for removing all keys. Be careful with this one!

Running States Without a Master

The addition of running states without a salt-master has been added to 0.9.8. This feature allows for the unmodified salt state tree to be read locally from a minion. The result is that the UNMODIFIED state tree has just become portable, allowing minions to have a local copy of states or to manage states without a master entirely.

This is accomplished via the new file client interface in Salt that allows for the `salt://` URI to be redirected to custom interfaces. This means that there are now two interfaces for the salt file server, calling the master or looking in a local, minion defined `file_roots`.

This new feature can be used by modifying the minion config to point to a local `file_roots` and setting the `file_client` option to `local`.

Keyword Arguments and States

State modules now accept the `**kwargs` argument. This results in all data in a sls file assigned to a state being made available to the state function.

This passes data in a transparent way back to the modules executing the logic. In particular, this allows adding arguments to the `pkg.install` module that enable more advanced and granular controls with respect to what the state is capable of.

An example of this along with the new `debconf` module for installing ldap client packages on Debian:

```
ldap-client-packages:
  pkg:
    - debconf: salt://debconf/ldap-client.ans
    - installed
    - names:
      - nslcd
      - libpam-ldapd
      - libnss-ldapd
```

Keyword Arguments and the CLI

In the past it was required that all arguments be passed in the proper order to the `salt` and `salt-call` commands. As of 0.9.8, keyword arguments can be passed in the form of `kwarg=argument`.

```
# salt -G 'type:dev' git.clone \
  repository=https://github.com/saltstack/salt.git cwd=/tmp/salt user=jeff
```

Matcher Refinements and Changes

A number of fixes and changes have been applied to the Matcher system. The most noteworthy is the change in the grain matcher. The grain matcher used to use a regular expression to match the passed data to a grain, but now defaults to a shell glob like the majority of match interfaces in Salt. A new option is available that still uses the old style regex matching to grain data called `grain-pcre`. To use regex matching in compound matches use the letter *P*.

For example, this would match any ArchLinux or Fedora minions:

```
# salt --grain-pcre 'os:(Arch:Fed).*' test.ping
```

And the associated compound matcher suitable for `top.sls` is *P*:

```
P@os:(Arch|Fed).*
```

NOTE: Changing the grains matcher from `pcre` to `glob` is backwards incompatible.

Support has been added for matching minions with Yahoo's range library. This is handled by passing range syntax with `-R` or `--range` arguments to salt.

More information at: <https://github.com/ytoolshed/range/wiki/%22yamlfile%22-module-file-spec>

Requisite `in`

A new means to updating requisite statements has been added to make adding watchers and requires to external states easier. Before 0.9.8 the only way to extend the states that were watched by a state outside of the `sls` was to use an `extend` statement:

```
include:
  - http
extend:
  apache:
    service:
      - watch:
        - pkg: tomcat
tomcat:
  pkg:
    - installed
```

But the new `Requisite in` statement allows for easier extends for requisites:

```
include:
  - http
tomcat:
  pkg:
    - installed
    - watch_in:
      - service: apache
```

`Requisite in` is part of the `extend` system, so still remember to always include the `sls` that is being extended!

Providers

Salt predetermines what modules should be mapped to what uses based on the properties of a system. These determinations are generally made for modules that provide things like package and service management. The apt module maps to pkg on Debian and the yum module maps to pkg on Fedora for instance.

Sometimes in states, it may be necessary for a non-default module to be used for the desired functionality. For instance, an Arch Linux system may have been set up with systemd support. Instead of using the default service module detected for Arch Linux, the systemd module can be used:

```
http:
  service:
    - running
    - enable: True
    - provider: systemd
```

Default providers can also be defined in the minion config file:

```
providers:
  service: systemd
```

When default providers are passed in the minion config, then those providers will be applied to all functionality in Salt, this means that the functions called by the minion will use these modules, as well as states.

Requisite Glob Matching

Requisites can now be defined with glob expansion. This means that if there are many requisites, they can be defined on a single line.

To watch all files in a directory:

```
http:
  service:
    - running
    - enable: True
    - watch:
      - file: /etc/http/conf.d/*
```

This example will watch all defined files that match the glob `/etc/http/conf.d/*`

Batch Size

The new batch size option allows commands to be executed while maintaining that only so many hosts are executing the command at one time. This option can take a percentage or a finite number:

```
salt '*' -b 10 test.ping
salt -G 'os:RedHat' --batch-size 25% apache.signal restart
```

This will only run `test.ping` on 10 of the targeted minions at a time and then restart `apache` on 25% of the minions matching `os:RedHat` at a time and work through them all until the task is complete. This makes jobs like rolling web server restarts behind a load balancer or doing maintenance on BSD firewalls using `carp` much easier with salt.

Module Updates

This is a list of notable, but non-exhaustive updates with new and existing modules.

Windows support has seen a flurry of support this release cycle. We've gained all new *file*, *network*, and *shadow* modules. Please note that these are still a work in progress.

For our ruby users, new *rvm* and *gem* modules have been added along with the *associated states*

The *virt* module gained basic Xen support.

The *yum* module gained Scientific Linux support.

The *pkg* module on Debian, Ubuntu, and derivatives force apt to run in a non-interactive mode. This prevents issues when package installation waits for confirmation.

A *pkg* module for openSUSE's zypper was added.

The *service* module on Ubuntu natively supports upstart.

A new *debconf* module was contributed by our community for more advanced control over deb package deployments on Debian based distributions.

The *mysql.user* state and *mysql* module gained a *password_hash* argument.

The *cmd* module and state gained a *shell* keyword argument for specifying a shell other than `/bin/sh` on Linux / Unix systems.

New *git* and *mercurial* modules have been added for fans of distributed version control.

In Progress Development

Master Side State Compiling

While we feel strongly that the advantages gained with minion side state compiling are very critical, it does prevent certain features that may be desired. 0.9.8 has support for initial master side state compiling, but many more components still need to be developed, it is hoped that these can be finished for 0.9.9.

The goal is that states can be compiled on both the master and the minion allowing for compilation to be split between master and minion. Why will this be great? It will allow storing sensitive data on the master and sending it to some minions without all minions having access to it. This will be good for handling ssl certificates on front-end web servers for instance.

Solaris Support

Salt 0.9.8 sees the introduction of basic Solaris support. The daemon runs well, but grains and more of the modules need updating and testing.

Windows Support

Salt states on windows are now much more viable thanks to contributions from our community! States for file, service, local user, and local group management are more fully fleshed out along with network and disk modules. Windows users can also now manage registry entries using the new `reg` module.

19.2.102 Salt 0.9.9 Release Notes

release 2012-04-27

0.9.9 is out and comes with some serious bug fixes and even more serious features. This release is the last major feature release before 1.0.0 and could be considered the 1.0.0 release candidate.

A few updates include more advanced kwargs support, the ability for salt states to more safely configure a running salt minion, better job directory management and the new state test interface.

Many new tests have been added as well, including the new minion swarm test that allows for easier testing of Salt working with large groups of minions. This means that if you have experienced stability issues with Salt before, particularly in larger deployments, that these bugs have been tested for, found, and killed.

Major Features

State Test Interface

Until 0.9.9 the only option when running states to see what was going to be changed was to print out the highstate with `state.show_highstate` and manually look it over. But now states can be run to discover what is going to be changed.

Passing the option `test=True` to many of the state functions will now cause the salt state system to only check for what is going to be changed and report on those changes.

```
salt '*' state.highstate test=True
```

Now states that would have made changes report them back in yellow.

State Syntax Update

A shorthand syntax has been added to sls files, and it will be the default syntax in documentation going forward. The old syntax is still fully supported and will not be deprecated, but it is recommended to move to the new syntax in the future. This change moves the state function up into the state name using a dot notation. This is in-line with how state functions are generally referred to as well:

The new way:

```
/etc/sudoers:
  file.present:
    - source: salt://sudo/sudoers
    - user: root
    - mode: 400
```

Use and Use_in Requisites

Two new requisite statements are available in 0.9.9. The `use` and `use_in` requisite and `requisite-in` allow for the transparent duplication of data between states. When a state ``uses" another state it copies the other state's arguments as defaults. This was created in direct response to the new network state, and allows for many network interfaces to be configured in the same way easily. A simple example:

```
root_file:
  file.absent:
    - name: /tmp/nothing
```

```
- user: root
- mode: 644
- group: root
- use_in:
  - file: /etc/vimrc

fred_file:
  file.absent:
    - name: /tmp/nothing
    - user: fred
    - group: marketing
    - mode: 660

/files/marketing/district7.rst:
  file.present:
    - source: salt://marketing/district7.rst
    - template: jinja
    - use:
      - file: fred_file

/etc/vimrc:
  file.present:
    - source: salt://edit/vimrc
```

This makes the 2 lower state decs inherit the options from their respectively ``used" state decs.

Network State

The new network state allows for the configuration of network devices via salt states and the ip salt module. This addition has been given to the project by Jeff Hutchins and Bret Palsson from Jive Communications.

Currently the only network configuration backend available is for Red Hat based systems, like Red Hat Enterprise, CentOS, and Fedora.

Exponential Jobs

Originally the jobs executed were stored on the master in the format: <cachedir>/jobs/jid/{minion ids} But this format restricted the number of jobs in the cache to the number of subdirectories allowed on the filesystem. Ext3 for instance limits subdirectories to 32000. To combat this the new format for 0.9.9 is: <cachedir>/jobs/jid_hash[:2]/jid_hash[2:]/{minion ids} So that now the number of maximum jobs that can be run before the cleanup cycle hits the job directory is substantially higher.

ssh_auth Additions

The original ssh_auth state was limited to accepting only arguments to apply to a public key, and the key itself. This was restrictive due to the way the we learned that many people were using the state, so the key section has been expanded to accept options and arguments to the key that over ride arguments passed in the state. This gives substantial power to using ssh_auth with names:

```
sshkeys:
  ssh_auth:
    - present
    - user: backup
```

```

- enc: ssh-dss
- options:
  - option1="value1"
  - option2="value2 flag2"
- comment: backup
- names:

```

LocalClient Additions

To follow up the recent additions in 0.9.8 of additional kwarg support, 0.9.9 also adds the capability to send kwarg into commands via a dict. This addition to the LocalClient api can be used like so:

```

import salt.client

client = salt.client.LocalClient('/etc/salt/master')
ret = client.cmd('*', 'cmd.run', ['ls -l'], kwarg={'cwd': '/etc'})

```

This update has been added to all cmd methods in the LocalClient class.

Better Self Salting

One problem faced with running Salt states, is that it has been difficult to manage the Salt minion via states, this is due to the fact that if the minion is called to restart while a state run is happening then the state run would be killed. 0.9.9 slightly changes the process scope of the state runs, so now when salt is executing states it can safely restart the salt-minion daemon.

In addition to daemonizing the state run, the apt module also daemonizes. This update makes it possible to cleanly update the salt-minion package on Debian/Ubuntu systems without leaving apt in an inconsistent state or killing

the active minion process mid-execution.

Wildcards for SLS Modules

Now, when including sls modules in include statements or in the top file, shell globs can be used. This can greatly simplify listing matched sls modules in the top file and include statements:

```
base:
  '*':
    - files*
    - core*
```

```
include:
  - users.dev.*
  - apache.ser*
```

External Pillar

Since the pillar data is just, data, it does not need to come expressly from the pillar interface. The external pillar system allows for hooks to be added making it possible to extract pillar data from any arbitrary external interface. The external pillar interface is configured via the `ext_pillar` option. Currently interfaces exist to gather external pillar data via hiera or via a shell command that sends yaml data to the terminal:

```
ext_pillar:
  - cmd_yaml: cat /etc/salt/ext.yaml
  - hiera: /etc/hiera.yaml
```

The initial external pillar interfaces and extra interfaces can be added to the file `salt/pillar.py`, it is planned to add more external pillar interfaces. If the need arises a new module loader interface will be created in the future to manage external pillar interfaces.

Single State Executions

The new `state.single` function allows for single states to be cleanly executed. This is a great tool for setting up a small group of states on a system or for testing out the behavior of single states:

```
salt '*' state.single user.present name=wade uid=2000
```

The test interface functions here as well, so changes can also be tested against as:

```
salt '*' state.single user.present name=wade uid=2000 test=True
```

New Tests

A few exciting new test interfaces have been added, the minion swarm allows not only testing of larger loads, but also allows users to see how Salt behaves with large groups of minions without having to create a large deployment.

Minion Swarm

The minion swarm test system allows for large groups of minions to be tested against easily without requiring large numbers of servers or virtual machines. The minion swarm creates as many minions as a system can handle and roots them in the /tmp directory and connects them to a master.

The benefit here is that we were able to replicate issues that happen only when there are large numbers of minions. A number of elusive bugs which were causing stability issues in masters and minions have since been hunted down. Bugs that used to take careful watch by users over several days can now be reliably replicated in minutes, and fixed in minutes.

Using the swarm is easy, make sure a master is up for the swarm to connect to, and then use the minionswarm.py script in the tests directory to spin up as many minions as you want. Remember, this is a fork bomb, don't spin up more than your hardware can handle!

```
python minionswarm.py -m 20 --master salt-master
```

Shell Tests

The new Shell testing system allows us to test the behavior of commands executed from a high level. This allows for the high level testing of salt runners and commands like salt-key.

Client Tests

Tests have been added to test the aspects of the client APIs and ensure that the client calls work, and that they manage passed data, in a desirable way.
