ignore_already_stopped Boolean flag that prevent execution to fail, if a container is already stopped.

fail_on_exit_status Boolean flag to report execution as failure if `exit_status` is different than 0.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **exit_status** - Exit status for the container
- **comment** - Only present if the container is already stopped

CLI Example:

```
salt myminion dockerng.wait mycontainer
```

14.6.83 salt.modules.dpkg

Support for DEB packages

salt.modules.dpkg.bin_pkg_info (*path, saltenv='base'*)

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.info(*packages)`

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

packages The names of the packages for which to return information.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
```

`salt.modules.dpkg.list_pkgs(*packages)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

```
Virtual package resolution requires aptitude. Because this function
uses dpkg, virtual packages will be reported as not installed.
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

`salt.modules.dpkg.unpurge(*packages)`

Change package selection for each package specified to `'install'`

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

14.6.84 salt.modules.drac

Manage Dell DRAC

`salt.modules.drac.change_password` (*username, password, uid=None*)

Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

`salt.modules.drac.create_user` (*username, password, permissions, users=None*)

Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.drac.delete_user` (*username, uid=None*)

Delete a user

CLI Example:

```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

`salt.modules.drac.email_alerts` (*action*)

Enable/Disable email alerts

CLI Example:

```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

`salt.modules.drac.list_users` ()

List all DRAC users

CLI Example:

```
salt dell drac.list_users
```

`salt.modules.drac.nameservers` (**ns*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```

`salt.modules.drac.network_info()`

Return Network Configuration

CLI Example:

```
salt dell drac.network_info
```

`salt.modules.drac.server_hardreset()`

Performs a reset (reboot) operation on the managed server.

CLI Example:

```
salt dell drac.server_hardreset
```

`salt.modules.drac.server_poweroff()`

Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

`salt.modules.drac.server_poweron()`

Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

`salt.modules.drac.server_pxe()`

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

`salt.modules.drac.server_reboot()`

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

`salt.modules.drac.set_network(ip, netmask, gateway)`

Configure Network

CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

`salt.modules.drac.set_permissions(username, permissions, uid=None)`

Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

`salt.modules.drac.set_snmp`(*community*)

Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

`salt.modules.drac.syslog`(*server, enable=True*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

`salt.modules.drac.system_info`()

Return System information

CLI Example:

```
salt dell drac.system_info
```

14.6.85 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

`salt.modules.dracr.change_password`(*username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None*)

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root` as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

salt.modules.dracr.create_user(*username, password, permissions, users=None, host=None, admin_username=None, admin_password=None*)

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.dracr.delete_user(*username, uid=None, host=None, admin_username=None, admin_password=None*)

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

salt.modules.dracr.deploy_password(*username, password, host=None, admin_username=None, admin_password=None, module=None*)

Change the QuickDeploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root` as UID 1, so if you can depend on that then setting the password is much quicker.

`salt.modules.dracr.deploy_snmp` (*snmp*, *host=None*, *admin_username=None*, *ad-*
min_password=None, *module=None*)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:

```
salt dell dracr.deploy_snmp SNMP_STRING
  host=<remote DRAC or CMC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

`salt.modules.dracr.email_alerts` (*action*, *host=None*, *admin_username=None*, *ad-*
min_password=None)

Enable/Disable email alerts

CLI Example:

```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

`salt.modules.dracr.get_chassis_datacenter` (*host=None*, *admin_username=None*, *ad-*
min_password=None)

Get the datacenter of the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
  admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_location` (*host=None*, *admin_username=None*, *ad-*
min_password=None)

Get the location of the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
  admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_name` (*host=None*, *admin_username=None*, *ad-*
min_password=None)

Get the name of a chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444
  admin_username=root admin_password=secret
```

`salt.modules.dracr.get_slotname` (*slot*, *host=None*, *admin_username=None*, *ad-*
min_password=None)

Get the name of a slot number in the chassis.

slot The number of the slot for which to obtain the name.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
admin_username=root admin_password=secret
```

salt.modules.dracr.idrac_general (*blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None*)

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the `idrac_password` kwarg.

Parameters

- **blade_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin_username** -- CMC username
- **admin_password** -- CMC password

Returns stdout if the retcode is 0, otherwise a standard `cmd.run_all` dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

salt.modules.dracr.list_slotnames (*host=None, admin_username=None, admin_password=None*)

List the names of all slots in the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
admin_username=root admin_password=secret
```

salt.modules.dracr.list_users (*host=None, admin_username=None, admin_password=None, module=None*)

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

salt.modules.dracr.nameservers (*ns, host=None, admin_username=None, admin_password=None, module=None*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
admin_username=root admin_password=calvin module=server-1
host=192.168.1.1
```

`salt.modules.dracr.network_info`(*host=None, admin_username=None, admin_password=None, module=None*)

Return Network Configuration

CLI Example:

```
salt dell dracr.network_info
```

`salt.modules.dracr.server_hardreset`(*host=None, admin_username=None, admin_password=None, module=None*)

Performs a reset (reboot) operation on the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

`salt.modules.dracr.server_power`(*status, host=None, admin_username=None, admin_password=None, module=None*)

status One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.server_poweroff`(*host=None, admin_username=None, admin_password=None, module=None*)

Powers down the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

`salt.modules.dracr.server_poweron`(*host=None, admin_username=None, admin_password=None, module=None*)

Powers up the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

`salt.modules.dracr.server_powerstatus` (*host=None, admin_username=None, admin_password=None, module=None*)

return the power status for the passed module

CLI Example:

```
salt dell dracr.server_powerstatus
```

`salt.modules.dracr.server_pxe` (*host=None, admin_username=None, admin_password=None*)

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

`salt.modules.dracr.server_reboot` (*host=None, admin_username=None, admin_password=None, module=None*)

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.set_chassis_datacenter` (*location, host=None, admin_username=None, admin_password=None*)

Set the location of the chassis.

location The name of the datacenter to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.set_chassis_location` (*location, host=None, admin_username=None, admin_password=None*)

Set the location of the chassis.

location The name of the location to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.set_chassis_name` (*name, host=None, admin_username=None, admin_password=None*)

Set the name of the chassis.

name The name to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
      admin_username=root admin_password=secret
```

salt.modules.dracr.set_network(*ip, netmask, gateway, host=None, admin_username=None, admin_password=None*)

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
      admin_username=root admin_password=calvin host=192.168.1.1
```

salt.modules.dracr.set_permissions(*username, permissions, uid=None, host=None, admin_username=None, admin_password=None*)

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
      [USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- `login` : Login to iDRAC
- `drac` : Configure iDRAC
- `user_management` : Configure Users
- `clear_logs` : Clear Logs
- `server_control_commands` : Execute Server Control Commands
- `console_redirection` : Access Console Redirection
- `virtual_media` : Access Virtual Media
- `test_alerts` : Test Alerts
- `debug_commands` : Execute Debug Commands

salt.modules.dracr.set_slotname(*slot, name, host=None, admin_username=None, admin_password=None*)

Set the name of a slot in a chassis.

slot The slot number to change.

name The name to set. Can only be 15 characters long.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
      admin_username=root admin_password=secret
```

`salt.modules.dracr.set_snmp`(*community*, *host=None*, *admin_username=None*, *admin_password=None*)

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

`salt.modules.dracr.syslog`(*server*, *enable=True*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by `False`

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

`salt.modules.dracr.system_info`(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Return System information

CLI Example:

```
salt dell dracr.system_info
```

`salt.modules.dracr.update_firmware`(*filename*, *host=None*, *admin_username=None*, *admin_password=None*)

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

`salt.modules.dracr.update_firmware_nfs_or_cifs`(*filename*, *share*, *host=None*, *admin_username=None*, *admin_password=None*)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe //IP-Address/
↪share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe IP-address:/share
```

14.6.86 salt.modules.drbd

DRBD administration module

`salt.modules.drbd.overview()`
Show status of the DRBD devices

CLI Example:

```
salt '*' drbd.overview
```

14.6.87 salt.modules.ebuild

Support for Portage

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

optdepends

- portage Python adapter

For now all package names *MUST* include the package category, i.e. 'vim' will not work, 'app-editors/vim' will.

`salt.modules.ebuild.check_db(*names, **kwargs)`
New in version 0.17.0.

Returns a dict containing the following information for each specified package:

- 1.A key `found`, which will be a boolean value denoting if a match was found in the package database.
- 2.If `found` is `False`, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in `category/pkgname` format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

`salt.modules.ebuild.check_extra_requirements(pkgname, pkgver)`
Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.1::
↳gentoo[nls,fortran]'
```

`salt.modules.ebuild.depclean(name=None, slot=None, fromrepo=None, pkgs=None)`

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

name The name of the package to be cleaned.

slot Restrict the remove to a specific slot. Ignored if `name` is `None`.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is `None`.

pkgs Clean multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

`salt.modules.ebuild.ex_mod_init`(*low*)

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for `/etc/portage/package.*` configuration files.

New in version 0.17.0: Initial automatic enforcement added when `pkg` is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

See also:

`ebuild.ex_mod_init` is called automatically when a state invokes a `pkg` state on a Gentoo system. [salt.states.pkg.mod_init\(\)](#)

`ebuild.ex_mod_init` uses `portage_config.enforce_nice_config` to do the lifting. [salt.modules.portage_config.enforce_nice_config\(\)](#)

CLI Example:

```
salt '*' pkg.ex_mod_init
```

`salt.modules.ebuild.install`(*name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to sync the portage tree before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a `tbz2` package manually, use the `sources` option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to sync the portage tree before installing.

version Install a specific version of the package, e.g. `1.0.9-r1`. Ignored if `pkgs` or `sources` is passed.

slot Similar to `version`, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if `pkgs` or `sources` or `version` is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

fromrepo Similar to `slot`, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if `pkgs` or `sources` or `version` is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

uses Similar to slot, but specifies a list of use flag. Ignored if ``pkgs`` or ``sources`` or ``version`` is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

pkgs A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo","bar","~category/package:slot::
↳repository[use]"]'
```

sources A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.tbz2"}, {"bar": "salt://bar.
↳tbz2"}]'
```

binhost has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.ebuild.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.ebuild.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.ebuild.list_upgrades(refresh=True, backtrack=3, **kwargs)`

List all available package upgrades.

refresh Whether or not to sync the portage tree before checking for upgrades.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.ebuild.porttree_matches(name)`

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. ``dev-python/paramiko``).

`salt.modules.ebuild.purge` (*name=None, slot=None, fromrepo=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a purge, this function calls `remove` followed by `depclean` to emulate a purge process
name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if `name` is `None`.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is `None`.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present.
 Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.ebuild.refresh_db` ()

Updates the portage tree (`emerge --sync`). Uses `eix-sync` if available.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.ebuild.remove` (*name=None, slot=None, fromrepo=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `emerge --unmerge`.

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if `name` is `None`.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is `None`.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present.
 Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.ebuild.update` (*pkg*, *slot=None*, *fromrepo=None*, *refresh=False*, *binhost=None*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Updates the passed package (`emerge --update package`)

slot Restrict the update to a particular slot. It will update to the latest version within the slot.

fromrepo Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured `binhost`. `force` - forces emerge to install the package from a `binhost` otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

`salt.modules.ebuild.upgrade` (*refresh=True*, *binhost=None*, *backtrack=3*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade (`emerge -uDN @world`)

binhost has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured `binhost`. `force` - forces emerge to install the package from a `binhost` otherwise it fails out.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.ebuild.upgrade_available` (*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.ebuild.version` (**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.ebuild.version_clean`(*version*)

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

`salt.modules.ebuild.version_cmp`(*pkg1*, *pkg2*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if *pkg1* < *pkg2*, 0 if *pkg1* == *pkg2*, and 1 if *pkg1* > *pkg2*. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

14.6.88 salt.modules.eix

Support for Eix

`salt.modules.eix.sync`()

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

`salt.modules.eix.update`()

Update the eix database

CLI Example:

```
salt '*' eix.update
```

14.6.89 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

depends `elasticsearch-py`

configuration This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'
```

```

elasticsearch:
  hosts:
    - '10.10.10.100:9200'
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'

```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

`salt.modules.elasticsearch.alias_create`(*indices, alias, hosts=None, body=None, profile=None*)

Create an alias for a specific index/indices

CLI example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_delete`(*indices, aliases, hosts=None, body=None, profile=None*)

Delete an alias of an index

CLI example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_exists`(*aliases, indices=None, hosts=None, profile=None*)

Return a boolean indicating whether given alias exists

CLI example:

```
salt myminion elasticsearch.alias_exists testindex
```

`salt.modules.elasticsearch.alias_get`(*indices=None, aliases=None, hosts=None, profile=None*)

Check for the existence of an alias and if it exists, return it

CLI example:

```
salt myminion elasticsearch.alias_get testindex
```

`salt.modules.elasticsearch.document_create`(*index, doc_type, body=None, id=None, hosts=None, profile=None*)

Create a document in a specified index

CLI example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{ }'
```

`salt.modules.elasticsearch.document_delete`(*index, doc_type, id, hosts=None, profile=None*)

Delete a document from an index

CLI example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUX-384m0Bug_
↪8U80wQZ
```

`salt.modules.elasticsearch.document_exists`(*index*, *id*, *doc_type*='all', *hosts*=None, *profile*=None)

Return a boolean indicating whether given document exists

CLI example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

`salt.modules.elasticsearch.document_get`(*index*, *id*, *doc_type*='all', *hosts*=None, *profile*=None)

Check for the existence of a document and if it exists, return it

CLI example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

`salt.modules.elasticsearch.index_create`(*index*, *body*=None, *hosts*=None, *profile*=None)

Create an index

CLI example:

```
salt myminion elasticsearch.index_create testindex
```

`salt.modules.elasticsearch.index_delete`(*index*, *hosts*=None, *profile*=None)

Delete an index

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

`salt.modules.elasticsearch.index_exists`(*index*, *hosts*=None, *profile*=None)

Return a boolean indicating whether given index exists

CLI example:

```
salt myminion elasticsearch.index_exists testindex
```

`salt.modules.elasticsearch.index_get`(*index*, *hosts*=None, *profile*=None)

Check for the existence of an index and if it exists, return it

CLI example:

```
salt myminion elasticsearch.index_get testindex
```

`salt.modules.elasticsearch.index_template_create`(*name*, *body*, *hosts*=None, *profile*=None)

Create an index template

CLI example:

```
salt myminion elasticsearch.index_template_create testindex_tmpl '{ "template":  
→ "logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

`salt.modules.elasticsearch.index_template_delete`(*name*, *hosts*=None, *profile*=None)

Delete an index template (type) along with its data

CLI example:

```
salt myminion elasticsearch.index_template_delete testindex_tmpl user
```

`salt.modules.elasticsearch.index_template_exists`(*name*, *hosts=None*, *profile=None*)
Return a boolean indicating whether given index template exists

CLI example:

```
salt myminion elasticsearch.index_template_exists testindex_templ
```

`salt.modules.elasticsearch.index_template_get`(*name*, *hosts=None*, *profile=None*)
Retrieve template definition of index or index/type

CLI example:

```
salt myminion elasticsearch.index_template_get testindex_templ user
```

`salt.modules.elasticsearch.mapping_create`(*index*, *doc_type*, *body*, *hosts=None*, *profile=None*)

Create a mapping in a given index

CLI example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : {
↪ "properties" : { "message" : { "type" : "string", "store" : true } } } }'
```

`salt.modules.elasticsearch.mapping_delete`(*index*, *doc_type*, *hosts=None*, *profile=None*)
Delete a mapping (type) along with its data

CLI example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

`salt.modules.elasticsearch.mapping_get`(*index*, *doc_type*, *hosts=None*, *profile=None*)
Retrieve mapping definition of index or index/type

CLI example:

```
salt myminion elasticsearch.mapping_get testindex user
```

14.6.90 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

`salt.modules.environ.get`(*key*, *default=""*)
Get a single salt process environment variable.
key String used as the key for environment lookup.
default If the key is not found in the environment, return this value. Default: ``
CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

`salt.modules.environ.has_value`(*key*, *value=None*)
Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key Must be a string. Used as key for environment lookup.

value: Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

`salt.modules.environ.item(keys, default='')`

Get one or more salt process environment variables. Returns a dict.

keys Either a string or a list of strings that will be used as the keys for environment lookup.

default If the key is not found in the environment, return this value. Default: ``

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

`salt.modules.environ.items()`

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

`salt.modules.environ.setenv(envIRON, false_unsets=False, clear_all=False, update_minion=False, permanent=False)`

Set multiple salt process environment variables from a dict. Returns a dict.

envIRON Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the `false_unsets` parameter for behavior when a value set to False.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

`salt.modules.environ.setval(key, val, false_unsets=False, permanent=False)`

Set a single salt process environment variable. Returns True on success.

key The environment key to set. Must be a string.

val The value to set. Must be a string or False. Refer to the `false_unsets` parameter for behavior when set to False.

false_unsets If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```

salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM

```

14.6.91 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

salt.modules.eselect.exec_action(*module*, *action*, *module_parameter=None*, *action_parameter=None*, *state_only=False*)

Execute an arbitrary action on a module.

module name of the module to be executed

action name of the module's action to be run

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

state_only don't return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```

salt '*' eselect.exec_action php update action_parameter='apache2'

```

salt.modules.eselect.get_current_target(*module*, *module_parameter=None*, *action_parameter=None*)

Get the currently selected target for the given module.

module name of the module to be queried for its current target

module_parameter additional params passed to the defined module

action_parameter additional params passed to the `show` action

CLI Example (current target of system-wide java-vm):

```

salt '*' eselect.get_current_target java-vm action_parameter='system'

```

CLI Example (current target of kernel symlink):

```

salt '*' eselect.get_current_target kernel

```

salt.modules.eselect.get_modules()

List available eselect modules.

CLI Example:

```

salt '*' eselect.get_modules

```

salt.modules.eselect.get_target_list(*module*, *action_parameter=None*)

List available targets for the given module.

module name of the module to be queried for its targets

action_parameter additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```

salt '*' eselect.get_target_list kernel

```

salt.modules.eselect.set_target(*module*, *target*, *module_parameter=None*, *action_parameter=None*)

Set the target for the given module. Target can be specified by index or name.

module name of the module for which a target should be set

target name of the target to be set for this module
module_parameter additional params passed to the defined module
action_parameter additional params passed to the defined action
CLI Example (setting target of system-wide java-vm):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of kernel symlink):

```
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

14.6.92 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

New in version 2015.8.4.

Depends: *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called `ch_config`, which looks up the function passed in the `command` parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd` `<vsphere-function-name>` syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

14.6.93 salt.modules.etcd_mod

Execution module to work with etcd

depends

- python-etcd

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

`salt.modules.etcd_mod.get`(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns `None` on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.ls`(*path='/'*, *profile=None*)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
```

`salt.modules.etcd_mod.rm`(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Delete a key from etcd. Returns `True` if the key was deleted, `False` if it wasn't and `None` if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.set`(*key*, *value*, *profile=None*, *ttl=None*, *directory=False*)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns `None` on failure.

CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/dir ' ' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

`salt.modules.etcd_mod.tree`(*path='/'*, *profile=None*)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns `None` on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

`salt.modules.etcd_mod.update` (*fields*, *path*='', *profile*=None)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
  'some': {
    'example': {
      'key': 'bar'
    }
  },
  'another': {
    'example': {
      'key': 'baz'
    }
  }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The `path` parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update '{"'/path/to/key': 'baz', '/another/key': 'bar'}"
salt myminion etcd.update '{"'/path/to/key': 'baz', '/another/key': 'bar'}"
↳profile=my_etcd_config
salt myminion etcd.update '{"'/path/to/key': 'baz', '/another/key': 'bar'}" path='/
↳some/root'
```

`salt.modules.etcd_mod.watch` (*key*, *recurse*=False, *profile*=None, *timeout*=0, *index*=None)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
```

14.6.94 salt.modules.ethtool module

Module for running ethtool command

New in version 2016.3.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

salt.modules.ethtool.set_coalesce(*devname*, ****kwargs**)

Changes the coalescing settings of the specified network device

CLI Example:

```

salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off]
↳[rx_usecs=N] [rx_frames=N]
  [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_
↳irq=N] [tx_frames_irq=N]
  [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_
↳usecs_low=N] [tx_frames_low=N]
  [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_high=N] [tx_
↳frames_high=N]
  [sample_interval=N]

```

salt.modules.ethtool.set_offload(*devname*, ****kwargs**)

Changes the offload parameters and other features of the specified network device

CLI Example:

```

salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on

```

salt.modules.ethtool.set_ring(*devname*, ****kwargs**)

Changes the rx/tx ring parameters of the specified network device

CLI Example:

```

salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]

```

salt.modules.ethtool.show_coalesce(*devname*)

Queries the specified network device for coalescing information

CLI Example:

```

salt '*' ethtool.show_coalesce <devname>

```

salt.modules.ethtool.show_driver(*devname*)

Queries the specified network device for associated driver information

CLI Example:

```

salt '*' ethtool.show_driver <devname>

```

salt.modules.ethtool.show_offload(*devname*)

Queries the specified network device for the state of protocol offload and other features

CLI Example:

```

salt '*' ethtool.show_offload <devname>

```

salt.modules.ethtool.show_ring(*devname*)

Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

14.6.95 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

`salt.modules.event.fire(data, tag)`

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data": "my event data"}' 'tag'
```

`salt.modules.event.fire_master(data, tag, preload=None)`

Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data": "my event data"}' 'tag'
```

`salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)`

Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.
- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
- **with_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.
- **with_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.
- **with_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.
- **with_env_opts** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.

- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via `sudo`. The following rule in `sudoers` will allow the `jenkins` user to run only the following command.

`/etc/sudoers` (allow preserving the environment):

```
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via `sudo` (preserve the environment):

```
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_
↳URL, GIT_BRANCH, GIT_COMMIT]
```

14.6.96 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.attributes` (*device*, *args=None*)
Return attributes from `dumpe2fs` for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

`salt.modules.extfs.blocks` (*device*, *args=None*)
Return block and inode info from `dumpe2fs` for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

`salt.modules.extfs.dump` (*device*, *args=None*)
Return all contents of `dumpe2fs` for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

`salt.modules.extfs.mkfs` (*device*, *fs_type*, ***kwargs*)
Create a file system on the specified device

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments

- force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- blocks_per_group**: number of blocks in a block group
- number_of_groups**: ext4 option for a virtual block group
- bytes_per_inode**: set the bytes/inode ratio
- inode_size**: size of the inode
- journal**: set to True to create a journal (default on ext3/4)
- journal_opts**: options for the fs journal (comma separated)
- blocks_file**: read bad blocks from file
- label**: label to apply to the file system
- reserved**: percentage of blocks reserved for super-user
- last_dir**: last mounted directory
- test**: set to True to not actually create the file system (mke2fs -n)
- number_of_inodes**: override default number of inodes
- creator_os**: override "creator operating system" field
- opts**: mount options (comma separated)
- revision**: set the filesystem revision (default 1)
- super**: write superblock and group descriptors only
- fs_type**: set the filesystem type (REQUIRED)
- usage_type**: how the filesystem is going to be used
- uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

`salt.modules.extfs.tune` (*device*, ***kwargs*)

Set attributes for the specified device (using `tune2fs`)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

- max**: max mount count
- count**: mount count
- error**: error behavior
- extended_opts**: extended options (comma separated)
- force**: force, even if there are errors (set to True)
- group**: group name or gid that can use the reserved blocks
- interval**: interval between checks
- journal**: set to True to create a journal (default on ext3/4)
- journal_opts**: options for the fs journal (comma separated)
- label**: label to apply to the file system
- reserved**: percentage of blocks reserved for super-user
- last_dir**: last mounted directory
- opts**: mount options (comma separated)
- feature**: set or clear a feature (comma separated)
- mmp_check**: mmp check interval
- reserved**: reserved blocks count
- quota_opts**: quota options (comma separated)
- time**: time last checked
- user**: user or uid who can use the reserved blocks
- uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

14.6.97 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

`salt.modules.file.access(path, mode)`

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.append(path, *args, **kwargs)`

New in version 0.9.5.

Append text to the end of a file

path path to file

***args** strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \
    "With all thine offerings thou shalt offer salt." \
    "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args="['cheese=spam','spam=cheese']"
```

`salt.modules.file.apply_template_on_contents(contents, template, context, defaults, saltenv)`

Return the contents after applying the templating engine

contents template string

template template format

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \
    contents='This is a {{ template }} string.' \
    template=jinja \
    "context={}" "defaults={'template': 'cool'}" \
    saltenv=base
```

`salt.modules.file.basename(path)`

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

`salt.modules.file.blockreplace`(*path*, *marker_start*='#-- start managed zone --', *marker_end*='#-- end managed zone --', *content*='', *append_if_not_found*=False, *prepend_if_not_found*=False, *backup*='.bak', *dry_run*=False, *show_changes*=True, *append_newline*=False)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

path Filesystem path to the file to be edited

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

content The content to be used between the two lines identified by `marker_start` and `marker_stop`.

append_if_not_found [False] If markers are not found and set to `True` then, the markers and content will be appended to the file.

prepend_if_not_found [False] If markers are not found and set to `True` then, the markers and content will be prepended to the file.

backup The file extension to use for a backup of the file if any edit is made. Set to `False` to skip making a backup.

dry_run Don't make any edits to the file.

show_changes Output a unified diff of the old file and the new file. If `False`, return a boolean if any changes were made.

append_newline: Append a newline to the content block. For more information see: <https://github.com/saltstack/salt/issues/33686>

New in version 2016.3.4.

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT
↳EDIT --' \
'#-- end managed zone foobar --' '$10.0.1.1 foo.foobar\n10.0.1.2 bar.foobar' True
```

`salt.modules.file.check_file_meta`(*name*, *sfn*, *source*, *source_sum*, *user*, *group*, *mode*, *saltenv*, *contents*=None)

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
↳{'hash_type': 'md5', 'hsum': <md5sum>} root, root, '755' base
```

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

name Path to file destination
sfn Template-processed source file contents
source URL to file source
source_sum File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

user Destination file user owner
group Destination file group owner
mode Destination file permissions mode
saltenv Salt environment used to resolve source files
contents File contents

`salt.modules.file.check_hash(path, file_hash)`

Check if a file matches the given hash string

Returns true if the hash matched, otherwise false. Raises ValueError if the hash was not formatted correctly.

path A file path

hash A string in the form <hash_type>:<hash_value>. For example:
 md5:e138491e9d5b97023cea823fe17bac22

CLI Example:

```
salt '*' file.check_hash /etc/fstab md5:<md5sum>
```

`salt.modules.file.check_managed(name, source, source_hash, source_hash_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip_verify=False, **kwargs)`

Check to see what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

`salt.modules.file.check_managed_changes(name, source, source_hash, source_hash_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, **kwargs)`

Return a dictionary of what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

`salt.modules.file.check_perms(name, ret, user, group, mode, follow_symlinks=False)`

Check the permissions on files and chown if needed

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400
```

Changed in version 2014.1.3: `follow_symlinks` option added

`salt.modules.file.chgrp`(*path, group*)

Change the group of a file

path path to the file or directory

group group owner

CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

`salt.modules.file.chown`(*path, user, group*)

Chown a file, pass the file the desired user and group

path path to the file or directory

user user owner

group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.comment`(*path, regex, char='#', backup='.bak'*)

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`)

char [#] The character to be inserted at the beginning of a line in order to comment it out

backup [.bak] The file will be backed up before edit with this file extension

Warning: This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspr
```

`salt.modules.file.comment_line`(*path, regex, char='#', cmnt=True, backup='.bak'*)

Comment or Uncomment a line in a text file.

Parameters

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with `^` that will find the line you wish to comment. Can be as simple as `^color =`
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is `#`
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is `.bak` Set to `False/None` to not keep a backup.

Returns boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the `pcspr` line in the `/etc/modules` file using the default `#` character and create a backup file named `modules.bak`

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

CLI Example:

The following example will uncomment the `log_level` setting in `minion` config file if it is set to either `warning`, `info`, or `debug` using the `#` character and create a backup file named `minion.bk`

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug)
↪' '#' False '.bk'
```

`salt.modules.file.contains`(*path*, *text*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.contains_glob`(*path*, *glob_expr*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given glob matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

`salt.modules.file.contains_regex`(*path*, *regex*, *lchar*='')

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the `lchar` argument (leading char) is specified, it will strip `lchar` from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

`salt.modules.file.copy`(*src*, *dst*, *recurse*=False, *remove_existing*=False)

Copy a file or directory from source to `dst`

In order to copy a directory, the `recurse` flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to `cp -r` on unix)

`remove_existing` will remove all files in the target directory, and then copy files from the source.

Note: The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
↪existing=True
```

`salt.modules.file.delete_backup`(*path*, *backup_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to delete, as found using *file.list_backups*

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.  
→txt 0
```

`salt.modules.file.directory_exists`(*path*)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

`salt.modules.file.dirname`(*path*)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.diskusage`(*path*)

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.extract_hash`(*hash_fn*, *hash_type='sha256'*, *file_name=''*, *source=''*,
source_hash_name=None)

Changed in version 2016.3.5: Prior to this version, only the *file_name* argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The *file.managed* state now also passes this function the source URI as well as the *source_hash_name* (if specified). In cases where *source_hash_name* is specified, it takes precedence over both the *file_name* and *source*. When it is not specified, *file_name* takes precedence over *source*. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when *source_hash_name* is specified. They will be used as fallback matches if there is no match to the *source_hash_name* value.

This routine is called from the *file.managed* state to pull a hash from a remote file. Regular expressions are used line by line on the *source_hash* file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
      ↪075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
      ↪20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

`salt.modules.file.file_exists(path)`

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

`salt.modules.file.find(path, *args, **kwargs)`

Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```
name      = path-glob           # case sensitive
iname     = path-glob           # case insensitive
regex     = path-regex          # case sensitive
iregex    = path-regex          # case insensitive
type      = file-types          # match any listed type
user      = users                # match any listed user
group     = groups              # match any listed group
size      = [+ -]number[size-unit] # default unit = byte
mtime     = interval            # modified since date
grep      = regex                # search file contents
```

and/or actions:

```
delete [= file-types]          # default type = 'f'
exec   = command [arg ...]     # where {} is replaced by pathname
print  [= print-opts]
```

and/or depth criteria:

```
maxdepth = maximum depth to transverse in path
mindepth  = minimum depth to transverse before checking files or directories
```

The default action is `print=path`

`path-glob`:

```
*          = match zero or more chars
?          = match any char
[abc]      = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]      = match chars x through y
```

```
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}           = match a or b or c
```

path-regex: a Python Regex (regular expression) pattern to match pathnames

file-types: a string of one or more of the following:

```
a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket
```

users: a space and/or comma separated list of user names and/or uids

groups: a space and/or comma separated list of group names and/or gids

size-unit:

```
b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes
```

interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]
```

where:

```
w: week
d: day
h: hour
m: minute
s: second
```

print-opts: a comma and/or space separated list of one or more of the following:

```
group: group name
md5:   MD5 digest of file contents
mode:  file permissions (as integer)
mtime: last modification time (as time_t)
name:  file basename
path:  file absolute path
size:  file size in bytes
type:  file type
user:  user name
```

CLI Examples:

```
salt '*' file.find / type=f name=*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=*. [0-9] mtime=+30d size=+10m delete
```

salt.modules.file.get_devmm(name)

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

`salt.modules.file.get_diff(minionfile, masterfile, saltenv='base')`

Return unified diff of file compared to file on master

CLI Example:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
```

`salt.modules.file.get_gid(path, follow_symlinks=True)`

Return the id of the group that owns a given file

path file or directory of which to get the gid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_group(path, follow_symlinks=True)`

Return the group that owns a given file

path file or directory of which to get the group

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)`

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- **It does not return a string on error.** The returned value of `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

path path to the file or directory

form desired sum format

chunk_size amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

`salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, saltenv, context, defaults, skip_verify=False, **kwargs)`

Return the managed file data for `file.managed`

name location where the file lives on the server

template template format

source managed source file

source_hash hash of the source file

source_hash_name When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

user Owner of file
group Group owner of file
mode Permissions of file
context Variables to add to the template context
defaults Default values of for context_dict
skip_verify If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.
↳conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

salt.modules.file.get_mode(path, follow_symlinks=True)

Return the mode of a file

path file or directory of which to get the mode

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: follow_symlinks option added

salt.modules.file.get_selinux_context(path)

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

salt.modules.file.get_source_sum(file_name='', source='', source_hash=None, source_hash_name=None, saltenv='base')

New in version 2016.11.0.

Used by *file.get_managed* to obtain the hash and hash type from the parameters specified below.

file_name Optional file name being managed, for matching with *file.extract_hash*.

New in version 2016.11.0.

source Source file, as used in *file* and other states. If source_hash refers to a file containing hashes, then this filename will be used to match a filename in that file. If the source_hash is a hash expression, then this argument will be ignored.

source_hash Hash file/expression, as used in *file* and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and *file.extract_hash* will be used to obtain a hash from it.

source_hash_name Specific file name to look for when source_hash refers to a remote file, used to disambiguate ambiguous matches.

New in version 2016.11.0.

saltenv [base] Salt fileserver environment from which to retrieve the source_hash. This value will only be used when source_hash refers to a file on the Salt fileserver (i.e. one beginning with salt://).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
↳gz source_hash=https://mydomain.tld/hashes.md5 source_hash_name=./dir2/foo.tar.
↳gz
```

```
salt.modules.file.get_sum(path, form='sha256')
```

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

path path to the file or directory

form desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

```
salt.modules.file.get_uid(path, follow_symlinks=True)
```

Return the id of the user that owns a given file

path file or directory of which to get the uid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

```
salt.modules.file.get_user(path, follow_symlinks=True)
```

Return the user that owns a given file

path file or directory of which to get the user

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

```
salt.modules.file.gid_to_group(gid)
```

Convert the group id to the group name on this system

gid gid to convert to a group name

CLI Example:

```
salt '*' file.gid_to_group 0
```

```
salt.modules.file.grep(path, pattern, *opts)
```

Grep for a string in the specified file

Note: This function's return value is slated for refinement in future versions of Salt

path Path to the file to be searched

Note: Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern Pattern to match. For example: `test`, or `a[0-5]`

opts Additional command-line flags to pass to the grep command. For example: `-v`, or `-i -B2`

Note: The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

salt.modules.file.group_to_gid(*group*)

Convert the group to the gid on this system

group group to convert to its gid

CLI Example:

```
salt '*' file.group_to_gid root
```

salt.modules.file.is_blkdev(*name*)

Check if a file exists and is a block device.

CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

salt.modules.file.is_chrdev(*name*)

Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

salt.modules.file.is_fifo(*name*)

Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

salt.modules.file.is_link(*path*)

Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

salt.modules.file.join(**args*)

Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
```

```
file:
- managed
- name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

`salt.modules.file.lchown`(*path, user, group*)

Chown a file, pass the file the desired user and group without following symlinks.

path path to the file or directory

user user owner

group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.line`(*path, content, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True*)

New in version 2015.8.0.

Edit a line in the configuration file. The `path` and `content` arguments are required, as well as passing in one of the `mode` options.

path Filesystem path to the file to be edited.

content Content of the line.

match Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` becomes the `content` value.

mode Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. This is based on the `content` argument.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

location Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

before Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

after Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited

version) in order to generate the diff.

backup Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds``.

quiet Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:      files dns" after="hosts:.*?"
↳ " mode='ensure'
```

Note: If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_
↳SPOOL=yes" mode="replace"
```

`salt.modules.file.link`(*src*, *path*)

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.list_backups`(*path*, *limit=None*)

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

limit Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.list_backups_dir`(*path*, *limit=None*)

Lists the previous versions of a directory backed up using Salt's *file state backup* system.

path The directory on the minion to check for backups

limit Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.lstat`(*path*)

New in version 2014.1.0.

Returns the `lstat` attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.makedirs`(*path*, *user=None*, *group=None*, *mode=None*)

Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.makedirs_perms` (*name*, *user=None*, *group=None*, *mode='0755'*)
 Taken and modified from `os.makedirs` to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

`salt.modules.file.manage_file` (*name*, *sfn*, *ret*, *source*, *source_sum*, *user*, *group*, *mode*, *saltenv*, *backup*, *makedirs=False*, *template=None*, *show_changes=True*, *contents=None*, *dir_mode=None*, *follow_symlinks=True*, *skip_verify=False*, *keep_mode=False*, ***kwargs*)

Checks the destination against what was retrieved with `get_managed` and makes the appropriate modifications (if necessary).

name location to place the file

sfn location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using `cp.cache_file`. If the hash sum of that file matches the `source_sum`, we do not transfer the file to the minion again.

This file is then grabbed and if it has `template` set, it renders the file to be placed into the correct place on the system using `salt.files.utils.copyfile()`

ret The initial state return data structure. Pass in `NONE` to use the default structure.

source file reference on the master

source_hash sum hash for source

user user owner

group group owner

backup backup_mode

makedirs make directories if they do not exist

template format of templating

show_changes Include diff in state return

contents: contents to be placed in the file

dir_mode mode for directories created with `makedirs`

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

keep_mode [False] If `True`, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '{ }' salt://httpd.conf
↳conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' base '{ }
```

Changed in version 2014.7.0: `follow_symlinks` option added

`salt.modules.file.mkdir` (*dir_path*, *user=None*, *group=None*, *mode=None*)

Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

`salt.modules.file.mknod`(*name, ntype, major=0, minor=0, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the `gnu mknod`.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

`salt.modules.file.mknod_blkdev`(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

`salt.modules.file.mknod_chrdev`(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

`salt.modules.file.mknod_fifo`(*name, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

`salt.modules.file.move`(*src, dst*)

Move a file or directory

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

`salt.modules.file.normpath`(*path*)

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

`salt.modules.file.open_files`(*by_pid=False*)
Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

`salt.modules.file.pardir`()
Return the relative parent directory path symbol for underlying OS
New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

`salt.modules.file.patch`(*originalfile, patchfile, options='', dry_run=False*)
New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile The full path to the file or directory to be patched

patchfile A patch file to apply to **originalfile**

options Options to pass to patch.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

`salt.modules.file.path_exists_glob`(*path*)
Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version Helium.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

`salt.modules.file.prepend`(*path, *args, **kwargs*)
New in version 2014.7.0.

Prepend text to the beginning of a file

path path to file

***args** strings to prepend to the file

CLI Example:

```
salt '*' file.prepend /etc/motd \
    "With all thine offerings thou shalt offer salt." \
    "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'

salt '*' file.prepend /etc/motd args="['cheese=spam','spam=cheese']"
```

`salt.modules.file.psed`(*path*, *before*, *after*, *limit*='', *backup*='.bak', *flags*='gMS', *escape_all*=False, *multi*=False)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited

before A pattern to find in order to replace with **after**

after Text that will replace **before**

limit [' '] An initial pattern to search for before searching for **before**

backup [.bak] The file will be backed up before edit with this file extension; **WARNING**: each time `sed/comment/uncomment` is called will overwrite this backup

flags [gMS]

Flags to modify the search. Valid values are:

- g: Replace all occurrences of the pattern, not just the first.
- I: Ignore case.
- L: Make \w, \W, \b, \B, \s and \S dependent on the locale.
- M: Treat multiple lines as a single line.
- S: Make . match all characters, including newlines.
- U: Make \w, \W, \b, \B, \d, \D, \s and \S dependent on Unicode.
- X: Verbose (whitespace is ignored).

multi: **False** If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.readdir`(*path*)

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

`salt.modules.file.readlink(path, canonicalize=False)`

New in version 2014.1.0.

Return the path that a symlink points to. If `canonicalize` is set to `True`, then it return the final target.

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.file.remove(path)`

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

`salt.modules.file.rename(src, dst)`

Rename a file or directory.

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

`salt.modules.file.replace(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True)`

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `search()`.

repl The replacement text

count [0] Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int) A list of flags defined in the [re module documentation](#). Each list item should be a string that will correlate to the human-friendly flag name. E.g., [`'IGNORECASE'`, `'MULTILINE'`]. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports `'MULTILINE'`).

bufsize (int or str) How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found [False] New in version 2014.7.0.

If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found [False] New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content New in version 2014.7.0.

Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

backup [.bak] The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

dry_run [False] If set to `True`, no changes will be made to the file, the function will just return the changes that would have been made (or a `True/False` value if `show_changes` is set to `False`).

search_only [False] If set to `true`, no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes [True] If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore_if_missing [False] New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

preserve_inode [True] New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using `backup` to create a backup copy).

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address:
→'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
→'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags='[MULTILINE,
→IGNORECASE]'
```

`salt.modules.file.restore_backup`(*path*, *backup_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to restore, as found using *file.list_backups*

CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

`salt.modules.file.restorecon`(*path*, *recursive=False*)

Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

`salt.modules.file.rmdir`(*path*)

New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

`salt.modules.file.search`(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore_if_missing=False*, *multiline=False*)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to `replace()`.

multiline If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.sed`(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape_all=False*, *negate_match=False*)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited

before A pattern to find in order to replace with `after`

after Text that will replace `before`

limit [' '] An initial pattern to search for before searching for `before`

backup [.bak] The file will be backed up before edit with this file extension; **WARNING**: each time `sed/comment/uncomment` is called will overwrite this backup

options [-r -e] Options to pass to `sed`

flags [g] Flags to modify the `sed` search; e.g., `i` for case-insensitive pattern matching

negate_match [False] Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.sed_contains`(*path*, *text*, *limit=''*, *flags='g'*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`. Utilizes `sed` to perform the search (line-wise search).

Note: the `p` flag will be added to any flags you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.seek_read(path, size, offset)`

New in version 2014.1.0.

Seek to a position on a file and read it

path path to file

seek amount to read at once

offset offset to start into the file

CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

`salt.modules.file.seek_write(path, data, offset)`

New in version 2014.1.0.

Seek to a position on a file and write to it

path path to file

data data to write to file

offset position in file to start writing

CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

`salt.modules.file.set_mode(path, mode)`

Set the mode of a file

path file or directory of which to set the mode

mode mode to set the path to

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.file.set_selinux_context(path, user=None, role=None, type=None, range=None)`

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <role> <type> <range>
```

`salt.modules.file.source_list(source, source_hash, saltenv)`

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum':  
→<md5sum>}' base
```

`salt.modules.file.stats(path, hash_type=None, follow_symlinks=True)`

Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.file.statvfs(path)`

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

`salt.modules.file.symlink`(*src*, *path*)

Create a symbolic link (symlink, soft link) to a file

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.file.touch`(*name*, *atime=None*, *mtime=None*)

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the `atime` and `mtime` if it already does.

atime: Access time in Unix epoch time

mtime: Last modification in Unix epoch time

CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

`salt.modules.file.truncate`(*path*, *length*)

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

path path to file

length offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

`salt.modules.file.uid_to_user`(*uid*)

Convert a uid to a user name

uid uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

`salt.modules.file.uncomment`(*path*, *regex*, *char='#*, *backup='.bak'*)

Deprecated since version 0.17.0: Use `replace()` instead.

Uncomment specified commented lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`).

char [#] The character to remove in order to uncomment a line

backup [.bak] The file will be backed up before edit with this file extension; **WARNING**: each time `sed/comment/uncomment` is called will overwrite this backup

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.user_to_uid`(*user*)

Convert user name to a uid

user user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.write`(*path*, **args*, ***kwargs*)

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

path path to file

***args** strings to write to the file

CLI Example:

```
salt '*' file.write /etc/motd \  
    "With all thine offerings thou shalt offer salt."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, *args*. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'  
  
salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

14.6.98 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

`salt.modules.firewalld.add_interface`(*zone*, *interface*, *permanent=True*)

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

`salt.modules.firewalld.add_masquerade`(*zone=None*, *permanent=True*)

Enable masquerade on a zone. If *zone* is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

`salt.modules.firewalld.add_port`(*zone*, *port*, *permanent=True*)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.add_port internal 443/tcp
```

`salt.modules.firewalld.add_port_fwd`(*zone, src, dest, proto='tcp', dstaddr='', permanent=True*)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.add_port_fwd public 80 443 tcp
```

`salt.modules.firewalld.add_rich_rule`(*zone, rule, permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_rich_rule zone 'rule'
```

`salt.modules.firewalld.add_service`(*service, zone=None, permanent=True*)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewallld.add_service ssh my_zone
```

`salt.modules.firewalld.add_service_port`(*service, port*)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_service_port zone 80
```

`salt.modules.firewalld.add_service_protocol`(*service, protocol*)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.add_service_protocol zone ssh
```

`salt.modules.firewalld.add_source`(*zone, source, permanent=True*)

Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.add_source zone 192.168.1.0/24
```

`salt.modules.firewalld.allow_icmp`(*zone, icmp, permanent=True*)

Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.allow_icmp zone echo-reply
```

salt.modules.firewalld.block_icmp(*zone, icmp, permanent=True*)

Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.block_icmp zone echo-reply
```

salt.modules.firewalld.default_zone()

Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewallld.default_zone
```

salt.modules.firewalld.delete_service(*name, restart=True*)

Delete an existing service

CLI Example:

```
salt '*' firewallld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.delete_service my_service False
```

salt.modules.firewalld.delete_zone(*zone, restart=True*)

Delete an existing zone

CLI Example:

```
salt '*' firewallld.delete_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.delete_zone my_zone False
```

salt.modules.firewalld.get_icmp_types(*permanent=True*)

Print predefined icmp types

CLI Example:

```
salt '*' firewallld.get_icmp_types
```

salt.modules.firewalld.get_interfaces(*zone, permanent=True*)

List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.get_interfaces zone
```

`salt.modules.firewalld.get_masquerade`(*zone=None, permanent=True*)
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.get_masquerade zone
```

`salt.modules.firewalld.get_rich_rules`(*zone, permanent=True*)
List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_rich_rules zone
```

`salt.modules.firewalld.get_service_ports`(*service*)
List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_ports zone
```

`salt.modules.firewalld.get_service_protocols`(*service*)
List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_protocols zone
```

`salt.modules.firewalld.get_services`(*permanent=True*)
Print predefined services

CLI Example:

```
salt '*' firewalld.get_services
```

`salt.modules.firewalld.get_sources`(*zone, permanent=True*)
List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_sources zone
```

`salt.modules.firewalld.get_zones`(*permanent=True*)
Print predefined zones

CLI Example:

```
salt '*' firewalld.get_zones
```

`salt.modules.firewalld.list_all`(*zone=None, permanent=True*)
List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewallld.list_all
```

List a specific zone

```
salt '*' firewallld.list_all my_zone
```

salt.modules.firewalld.list_icmp_block(*zone, permanent=True*)

List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_icmp_block zone
```

salt.modules.firewalld.list_port_fwd(*zone, permanent=True*)

List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_port_fwd public
```

salt.modules.firewalld.list_ports(*zone, permanent=True*)

List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_ports
```

salt.modules.firewalld.list_services(*zone=None, permanent=True*)

List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.list_services
```

List a specific zone

```
salt '*' firewallld.list_services my_zone
```

salt.modules.firewalld.list_zones(*permanent=True*)

List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewallld.list_zones
```

salt.modules.firewalld.make_permanent()

Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.make_permanent
```

`salt.modules.firewalld.new_service(name, restart=True)`

Add a new service

CLI Example:

```
salt '*' firewalld.new_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_service my_service False
```

`salt.modules.firewalld.new_zone(zone, restart=True)`

Add a new zone

CLI Example:

```
salt '*' firewalld.new_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

`salt.modules.firewalld.reload_rules()`

Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.reload
```

`salt.modules.firewalld.remove_interface(zone, interface, permanent=True)`

Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

`salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)`

Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewalld.remove_masquerade dmz
```

`salt.modules.firewalld.remove_port(zone, port, permanent=True)`

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.remove_port internal 443/tcp
```

`salt.modules.firewalld.remove_port_fwd`(*zone, src, dest, proto='tcp', dstaddr='', permanent=True*)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.remove_port_fwd public 80 443 tcp
```

`salt.modules.firewalld.remove_rich_rule`(*zone, rule, permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_rich_rule zone 'rule'
```

`salt.modules.firewalld.remove_service`(*service, zone=None, permanent=True*)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewallld.remove_service ssh dmz
```

`salt.modules.firewalld.remove_service_port`(*service, port*)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_service_port zone 80
```

`salt.modules.firewalld.remove_service_protocol`(*service, protocol*)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_service_protocol zone ssh
```

`salt.modules.firewalld.remove_source`(*zone, source, permanent=True*)

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.remove_source zone 192.168.1.0/24
```

`salt.modules.firewalld.set_default_zone(zone)`
Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```

`salt.modules.firewalld.version()`
Return version from firewall-cmd

CLI Example:

```
salt '*' firewalld.version
```

14.6.99 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.freebsd_sysctl.assign(name, value)`
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.freebsd_sysctl.get(name)`
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

`salt.modules.freebsd_sysctl.show(config_file=False)`
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

14.6.100 salt.modules.freebsdjail

The jail module for FreeBSD

`salt.modules.freebsdjail.fstab(jail)`
Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

`salt.modules.freebsdjail.get_enabled()`

Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

`salt.modules.freebsdjail.is_enabled()`

See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

`salt.modules.freebsdjail.restart(jail='')`

Restart the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.restart [<jail name>]
```

`salt.modules.freebsdjail.show_config(jail)`

Display specified jail's configuration

CLI Example:

```
salt '*' jail.show_config <jail name>
```

`salt.modules.freebsdjail.start(jail='')`

Start the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.start [<jail name>]
```

`salt.modules.freebsdjail.status(jail)`

See if specified jail is currently running

CLI Example:

```
salt '*' jail.status <jail name>
```

`salt.modules.freebsdjail.stop(jail='')`

Stop the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.stop [<jail name>]
```

`salt.modules.freebsdjail.sysctl()`

Dump all jail related kernel states (sysctl)

CLI Example:

```
salt '*' jail.sysctl
```

14.6.101 salt.modules.freebsdkernel

Module to manage FreeBSD kernel modules

`salt.modules.freebsd_kmod.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.freebsd_kmod.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available vmm
```

`salt.modules.freebsd_kmod.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded vmm
```

`salt.modules.freebsd_kmod.load(mod, persist=False)`

Load the specified kernel module

mod Name of the module to add

persist Write the module to `sysrc kld_modules` to make it load on system reboot

CLI Example:

```
salt '*' kmod.load bhyve
```

`salt.modules.freebsd_kmod.lsmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.freebsd_kmod.mod_list(only_persist=False)`

Return a list of the loaded module names

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.freebsd_kmod.remove(mod, persist=False)`

Remove the specified kernel module

CLI Example:

```
salt '*' kmod.remove vmm
```

14.6.102 salt.modules.freebsd_pkg

Remote package support using `pkg_add(1)`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported `pkg_add(1)`, but checked for the existence of a `pkgng` local database and, if found, would provide some of `pkgng`'s functionality. The rewrite of this module has removed all `pkgng` support, and moved it to the `pkgng` execution module. For versions `<= 0.17.0`, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use `pkgng` on a FreeBSD 9 system, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use `pkgng`.

```
providers:
  pkg: pkgng
```

More information on `pkgng` support can be found in the documentation for the `pkgng` module.

This module will respect the `PACKAGEROOT` and `PACKAGESITE` environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using `config.get` and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
freebsdpkg.PACKAGEROOT: ftp://ftp.freebsd.org/
freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-
↳ stable/Latest/
```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

```
salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
↳ FreeBSD/ports/ia64/packages-9-stable/Latest/
```

.. note::

These arguments can also be passed through in states:

```
.. code-block:: yaml
```

```
zsh:
  pkg.installed:
    - fromrepo: ftp://ftp2.freebsd.org/
```

`salt.modules.freebsdpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install package(s) using `pkg_add(1)`

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo or packageroot Specify a package repository from which to install. Overrides the system default, as well as the `PACKAGEROOT` environment variable.

packagesite Specify the exact directory from which to install the remote package. Overrides the `PACKAGE-SITE` environment variable, if present.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo"', '"bar"']
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.freebsdpkg.latest_version(*names, **kwargs)`

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.freebsdpkg.list_pkgs(versions_as_list=False, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.freebsdpkg.refresh_db()`

`pkg_add(1)` does not use a local database of available packages, so this function simply returns True. it exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.freebsdpkg.remove(name=None, pkgs=None, **kwargs)`

Remove packages using `pkg_delete(1)`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.freebsdpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

14.6.103 salt.modules.freebsdports

Install software from the FreeBSD ports(7) system

New in version 2014.1.0.

This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports` state to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

`salt.modules.freebsdports.config(name, reset=False, **kwargs)`

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use `ports.showconfig`.

name The port name, in category/name format

reset [False] If True, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

`salt.modules.freebsdports.deinstall(name)`

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

`salt.modules.freebsdports.install(name, clean=True)`

Install a port from the ports tree. Installs using `BATCH=yes` for non-interactive building. To set config options for a given port, use [ports.config](#).

clean [True] If True, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

Note: It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

`salt.modules.freebsdports.list_all()`

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

Warning: Takes a while to run, and returns a LOT of output

`salt.modules.freebsdports.rmconfig(name)`

Clear the cached options for the specified port; run a `make rmconfig`

name The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

`salt.modules.freebsdports.search(name)`

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'
salt '*' ports.search nmap
```

Warning: Takes a while to run

`salt.modules.freebsdports.showconfig`(*name*, *default=False*, *dict_return=False*)

Show the configuration options for a given port.

default [False] Show the default options for a port (not necessarily the same as the current configuration)

dict_return [False] Instead of returning the output of `make showconfig`, return the data in a dictionary

CLI Example:

```
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True
```

`salt.modules.freebsdports.update`(*extract=False*)

Update the ports tree

extract [False] If True, runs a `portsnap extract` after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```
salt '*' ports.update
```

14.6.104 salt.modules.freebsdservice

The service module for FreeBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.freebsdservice.available`(*name*)

Check that the given service is available.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.freebsdservice.disable`(*name*, ***kwargs*)

Disable the named service to start at boot

Arguments the same as for `enable()`

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.freebsdservice.disabled`(*name*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.freebsdservice.enable`(*name*, ***kwargs*)

Enable the named service to start at boot

name service name

config [/etc/rc.conf] Config file for managing service. If config value is empty string, then /etc/rc.conf.d/<service> used. See `man rc.conf(5)` for details.

Also `service.config` variable can be used to change default.

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.freebsdservice.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

name Service name

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.freebsdservice.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.freebsdservice.get_disabled()`

Return what services are available but not enabled to start at boot

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.freebsdservice.get_enabled()`

Return what services are set to run on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.freebsdservice.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.freebsdservice.reload(name)`

Restart the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.freebsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.freebsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.freebsdservice.status`(*name*, *sig=None*)

Return the status for a service (True or False).

name Name of service

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.freebsdservice.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.105 salt.modules.gem

Manage ruby gems.

`salt.modules.gem.install`(*gems*, *ruby=None*, *gem_bin=None*, *runas=None*, *version=None*, *rdoc=False*, *ri=False*, *pre_releases=False*, *proxy=None*, *source=None*)

Installs one or several gems.

Parameters

- **gems** -- string The gems to install
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s).
- **ri** -- boolean : False Generate RI documentation for the gem(s).
- **pre_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic.
Format: `http://hostname[{}]:port]`

source [None] Use the specified HTTP gem source server to download gem. Format: `http://hostname[{}]:port]`

CLI Example:

```
salt '*' gem.install vagrant
salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

`salt.modules.gem.list`(*prefix=''*, *ruby=None*, *runas=None*, *gem_bin=None*)

List locally installed gems.

Parameters

- **prefix** -- string : Only list gems when the name matches this prefix.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

`salt.modules.gem.list_upgrades` (*ruby=None, runas=None, gem_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

gem_bin [None] Full path to `gem` binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

runas [None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.sources_add` (*source_uri, ruby=None, runas=None, gem_bin=None*)

Add a gem source.

Parameters

- **source_uri** -- string The source URI to add.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.sources_list` (*ruby=None, runas=None, gem_bin=None*)

List the configured gem sources.

Parameters

- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_list
```

`salt.modules.gem.sources_remove` (*source_uri, ruby=None, runas=None, gem_bin=None*)

Remove a gem source.

Parameters

- **source_uri** -- string The source URI to remove.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_remove http://rubygems.org/
```

`salt.modules.gem.uninstall`(*gems*, *ruby=None*, *runas=None*, *gem_bin=None*)

Uninstall one or several gems.

Parameters

- **gems** -- string The gems to uninstall.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run `gem` as.

CLI Example:

```
salt '*' gem.uninstall vagrant
```

`salt.modules.gem.update`(*gems*, *ruby=None*, *runas=None*, *gem_bin=None*)

Update one or several gems.

Parameters

- **gems** -- string The gems to update.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run `gem` as.

CLI Example:

```
salt '*' gem.update vagrant
```

`salt.modules.gem.update_system`(*version=''*, *ruby=None*, *runas=None*, *gem_bin=None*)

Update rubygems.

Parameters

- **version** -- string : (newest) The version of rubygems to install.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run `gem` as.

CLI Example:

```
salt '*' gem.update_system
```

14.6.106 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.avail_platforms`()

Return which platforms are available

CLI Example:

```
salt myminion genesis.avail_platforms
```

```
salt.modules.genesis.bootstrap(platform, root, img_format='dir', fs_format='ext2',
                               fs_opts=None, arch=None, flavor=None, repo_url=None,
                               static_qemu=None, img_size=None, mount_dir=None,
                               pkg_cache=None, pkgs=None, exclude_pkgs=None,
                               epel_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-
                               release-6-8.noarch.rpm')
```

Create an image for a specific platform.

Please note that this function *MUST* be run as root, as images that are created make files belonging to root.

platform Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root Local path to create the root of the image filesystem.

img_format Which format to create the image in. By default, just copies files into a directory on the local filesystem (`dir`). Future support will exist for `sparse`.

fs_format When using a non-`dir` `img_format`, which filesystem to format the image to. By default, `ext2`.

fs_opts When using a non-`dir` `img_format`, a dict of opts may be specified.

arch Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, `wheezy` on Debian.

repo_url Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: <http://ftp.debian.org/debian/>)

static_qemu Local path to the static qemu binary required for this arch. (e.x.: `/usr/bin/qemu-amd64-static`)

pkg_confs The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size If `img_format` is not `dir`, then the size of the image must be specified.

mount_dir If `img_format` is not `dir`, then the image must be mounted somewhere. If the `mount_dir` is not specified, then it will be created at `/opt/salt-genesis.<random_uuid>`. This directory will be unmounted and removed when the process is finished.

pkg_cache This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs A list of packages to be installed on this image. For RedHat, this will include `yum`, `centos-release` and `iputils` by default.

exclude_pkgs A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
↳ flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

```
salt.modules.genesis.ldd_deps(filename, ret=None)
```

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash
```

```
salt.modules.genesis.mksls(fmt, src, dst=None)
```

Convert an installation file/script to an SLS file. Currently supports `kickstart`, `preseed`, and `autoyast`.

CLI Examples:

```
    salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart
    /path/to/kickstart.cfg /path/to/dest.sls
New in version Beryllium.
```

`salt.modules.genesis.pack`(*name*, *root*, *path=None*, *pack_format='tar'*, *compress='bzip2'*)
Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

`salt.modules.genesis.unpack`(*name*, *dest=None*, *path=None*, *pack_format='tar'*, *compress='bzip2'*)
Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

14.6.107 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.gentoo_service.available`(*name*)
Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.gentoo_service.disable`(*name*, ***kwargs*)
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.disabled`(*name*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

`salt.modules.gentoo_service.enable`(*name*, ***kwargs*)
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.enabled(name, **kwargs)`
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.get_all()`
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.gentoo_service.get_disabled()`
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.gentoo_service.get_enabled()`
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.gentoo_service.missing(name)`
The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.gentoo_service.reload_(name)`
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.gentoo_service.restart(name)`
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.gentoo_service.start(name)`
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.gentoo_service.status(name, sig=None)`
Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.gentoo_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.gentoo_service.zap(name)`

Resets service state

CLI Example:

```
salt '*' service.zap <service name>
```

14.6.108 salt.modules.gentoolkitmod

Support for Gentoolkit

`salt.modules.gentoolkitmod.eclean_dist` (*destructive=False*, *package_names=False*, *size_limit=0*, *time_limit=0*, *fetch_restricted=False*, *exclude_file='/etc/eclean/distfiles.exclude'*)

Clean obsolete portage sources

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with `destructive=True`

size_limit <size> Don't delete distfiles bigger than <size>. <size> is a size specification: ``10M" is ``ten megabytes", ``200K" is ``two hundreds kilobytes", etc. Units are: G, M, K and B.

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y" is ``one year", ``2w" is ``two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

fetch_restricted Protect fetch-restricted files. Only meaningful if used with `destructive=True`

exclude_file Path to exclusion file. Default is `/etc/eclean/distfiles.exclude` This is the same default `eclean-dist` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {<dist file>: <size>},
'deprecated': {<package>: <dist file>},
'saved': {<package>: <dist file>},
'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

`salt.modules.gentoolkitmod.eclean_pkg` (*destructive=False*, *package_names=False*, *time_limit=0*, *exclude_file='/etc/eclean/packages.exclude'*)

Clean obsolete binary packages

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with `destructive=True`

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y" is ``one year", ``2w" is ``two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

exclude_file Path to exclusion file. Default is `/etc/eclean/packages.exclude` This is the same default `eclean-pkg` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {<dist file>: <size>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

`salt.modules.gentoolkitmod.glsa_check_list(glsa_list)`

List the status of Gentoo Linux Security Advisories

glsa_list can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers `'all'` and `'affected'`

Returns a dict containing `glsa` ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
 'status': <glsa status>,
 'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

`salt.modules.gentoolkitmod.revdep_rebuild(lib=None)`

Fix up broken reverse dependencies

lib Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

14.6.109 salt.modules.git

Support for the Git SCM

`salt.modules.git.add(cwd, filename, opts='', user=None, password=None, ignore_retcode=False)`

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to `git-add(1)`

cwd The path to the git checkout

filename The location of the file/directory to add, relative to `cwd`

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

`salt.modules.git.archive(cwd, output, rev='HEAD', fmt=None, prefix=None, user=None, password=None, ignore_retcode=False, **kwargs)`

Changed in version 2015.8.0: Returns True if successful, raises an error if not.

Interface to [git-archive\(1\)](#), exports a tarball/zip file of the repository

cwd The path to be archived

Note: `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

output The path of the archive to be created

overwrite [False] Unless set to True, Salt will not overwrite an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

rev [HEAD] The revision from which to create the archive

format Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the [git-archive\(1\)](#) manpage explanation of the `--format` argument (as well as the CONFIGURATION section of the manpage) for further information.

New in version 2015.8.0.

fmt Replaced by `format` in version 2015.8.0

Deprecated since version 2015.8.0.

prefix Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

`salt.modules.git.branch`(*cwd*, *name=None*, *opts='`*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to `git-branch(1)`

cwd The path to the git checkout

name Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts Any additional options to add to the command line, in a single string

Note: To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/
↳mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

`salt.modules.git.checkout`(*cwd*, *rev=None*, *force=False*, *opts='`*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to `git-checkout(1)`

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=`

(as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

rev The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

force [False] Force a checkout even if there might be overwritten changes

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

`salt.modules.git.clone`(*cwd*, *url=None*, *name=None*, *opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *repository=None*, *saltenv='base'*)

Interface to `git-clone(1)`

cwd Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

url The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

name Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
↳git
```

`salt.modules.git.commit(cwd, message, opts='', user=None, password=None, filename=None, ignore_retcode=False)`

Interface to `git-commit(1)`

cwd The path to the git checkout

message Commit message

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

`salt.modules.git.config_get`(*key*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

Get the value of a key in the git configuration file

key The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

cwd The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to `True`

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all [False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

`salt.modules.git.config_get_regexp`(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

key Regex on which key names will be matched

value_regex If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

cwd The path to the git checkout

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

salt.modules.git.config_set(key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, **kwargs)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

key The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

value The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

add [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

multivar Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

global [False] If True, set a global variable

is_global [False] If True, set a global variable

Deprecated since version 2015.8.0: Use `global` instead

CLI Example:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

salt.modules.git.config_unset(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, **kwargs)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

key The name of the configuration key to unset

value_regex Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

all [False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

global [False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

`salt.modules.git.current_branch`(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

`salt.modules.git.describe`(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the `git-describe(1)` string (or the SHA1 hash if there are no tags) for the given revision.

cwd The path to the git checkout

rev [HEAD] The revision to describe

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.diff(cwd, item1=None, item2=None, opts='', user=None, password=None, no_index=False, cached=False, paths=None)`

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to `git-diff(1)`

cwd The path to the git checkout

item1 and item2 Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

no_index [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

Note: Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

cached [False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

Note: `item2` is ignored if this option is set to `True`.

paths File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
```

```

salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/
↳file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/
↳path/to/file2

```

`salt.modules.git.fetch`(*cwd*, *remote=None*, *force=False*, *refspecs=None*, *opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to `git-fetch(1)`

cwd The path to the git checkout

remote Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in `git-fetch(1)`).

New in version 2015.8.0.

force Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

refspecs Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

salt.modules.git.init(*cwd*, *bare=False*, *template=None*, *separate_git_dir=None*, *shared=None*, *opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to `git-init(1)`

cwd The path to the directory to be initialized

bare [False] If True, init a bare repository

New in version 2015.8.0.

template Set this argument to specify an alternate `template directory`

New in version 2015.8.0.

separate_git_dir Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

salt.modules.git.is_worktree(*cwd*, *user=None*, *password=None*)

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

cwd path to the worktree to be removed

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

`salt.modules.git.list_branches`(*cwd*, *remote=False*, *user=None*, *password=None*, *ignore_retcodes=False*)

New in version 2015.8.0.

Return a list of branches

cwd The path to the git checkout

remote [False] If True, list remote branches. Otherwise, local branches will be listed.

Warning: This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcodes [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.list_tags`(*cwd*, *user=None*, *password=None*, *ignore_retcodes=False*)

New in version 2015.8.0.

Return a list of tags

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcodes [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

`salt.modules.git.list_worktrees`(*cwd*, *stale=False*, *user=None*, *password=None*, ***kwargs*)

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all [False] If `True`, then return all worktrees tracked under `$GIT_DIR/worktrees`, including ones for which the `gitdir` is no longer present.

stale [False] If `True`, return *only* worktrees whose `gitdir` is no longer present.

Note: Only one of `all` and `stale` can be set to `True`.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.ls_remote`(*cwd=None, remote='origin', ref=None, opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base'*)

Interface to `git-ls-remote(1)`. Returns the upstream hash for a remote reference.

cwd The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

remote [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

ref The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`)

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts Any additional options to add to the command line, in a single string

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the [sshd\(8\)](#) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='-
↳-tags'
```

`salt.modules.git.merge`(*cwd*, *rev=None*, *opts='`*, *user=None*, *password=None*, *ignore_retcode=False*,
***kwargs*)

Interface to `git-merge(1)`

cwd The path to the git checkout

rev Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

branch The remote branch or revision to merge into the current branch Revision to merge into the current branch

Deprecated since version 2015.8.0: Use `rev` instead.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

```
salt.modules.git.merge_base(cwd, refs=None, octopus=False, is_ancestor=False, independent=False, fork_point=None, opts='', user=None, password=None, ignore_retcode=False, **kwargs)
```

New in version 2015.8.0.

Interface to `git-merge-base(1)`.

cwd The path to the git checkout

refs Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

all [False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

octopus [False] If True, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See [here](#) for a description of how these bases are determined.

Set `all` to True with this option to return all computed merge bases, otherwise only the ``best" will be returned.

is_ancestor [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

independent [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

fork_point If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, None is returned.

Note: At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to `git-merge-base(1)` and are not yet supported in Salt.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886 octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
  ↳ independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
salt myminion git.merge_base /path/to/repo refs=mybranch fork_point=upstream/
  ↳ master
```

salt.modules.git.merge_tree(*cwd*, *ref1*, *ref2*, *base=None*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to `git-merge-tree(1)`, shows the merge results and conflicts from a 3-way merge without touching the index.

cwd The path to the git checkout

ref1 First ref/commit to compare

ref2 Second ref/commit to compare

base The base tree to use for the 3-way-merge. If not provided, then `git.merge_base` will be invoked on `ref1` and `ref2` to determine the merge base to use.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

salt.modules.git.pull(*cwd*, *opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*)

Interface to `git-pull(1)`

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

`salt.modules.git.push`(*cwd*, *remote=None*, *ref=None*, *opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, ***kwargs*)

Interface to `git-push(1)`

cwd The path to the git checkout

remote Name of the remote to which the ref should being pushed

New in version 2015.8.0.

ref [master] Name of the ref to push

Note: Being a `refspec`, this argument can include a colon to define local and remote ref names.

branch Name of the ref to push

Deprecated since version 2015.8.0: Use `ref` instead

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.rebase`(*cwd*, *rev*='master', *opts*='', *user*=None, *password*=None, *ignore_retcode*=False)

Interface to `git-rebase(1)`

cwd The path to the git checkout

rev [master] The revision to rebase onto the current branch

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

`salt.modules.git.remote_get`(*cwd*, *remote*='origin', *user*=None, *password*=None, *redact_auth*=True, *ignore_retcode*=False)

Get the fetch and push URL for a specific remote

cwd The path to the git checkout
remote [origin] Name of the remote to query
user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

`salt.modules.git.remote_refs(url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base')`

New in version 2015.8.0.

Return the remote refs for the specified URL

url URL of the remote repository

heads [False] Restrict output to heads. Can be combined with `tags`.

tags [False] Restrict output to tags. Can be combined with `heads`.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
```

```
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None,
                           https_user=None, https_pass=None, push_url=None,
                           push_https_user=None, push_https_pass=None, ignore_retcode=False)
```

cwd The path to the git checkout

url Remote URL to set

remote [origin] Name of the remote to set

push_url If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

push_https_user Set HTTP Basic Auth user for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

push_https_pass Set HTTP Basic Auth password for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
  ↳ remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.git
  ↳ remote=upstream push_url=git@github.com:user/repo.git
```

```
salt.modules.git.remotes(cwd, user=None, password=None, redact_auth=True, ignore_retcode=False)
```

Get fetch and push URLs for each remote in a git checkout

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

`salt.modules.git.reset`(*cwd*, *opts*='', *user*=None, *password*=None, *ignore_retcode*=False)

Interface to `git-reset(1)`, returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the **opts** are preceded with a dash, it is necessary to precede them with **opts=** (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

`salt.modules.git.rev_parse`(*cwd*, *rev*=None, *opts*='', *user*=None, *password*=None, *ignore_retcode*=False)

New in version 2015.8.0.

Interface to `git-rev-parse(1)`

cwd The path to the git checkout

rev Revision to parse. See the [SPECIFYING REVISIONS](#) section of the `git-rev-parse(1)` manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the `git-rev-parse(1)` manpage.

opts Any additional options to add to the command line, in a single string

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

`salt.modules.git.revision(cwd, rev='HEAD', short=False, user=None, password=None, ignore_retcode=False)`

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd The path to the git checkout

rev [HEAD] The revision

short [False] If `True`, return an abbreviated SHA1 git hash

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.rm(cwd, filename, opts='', user=None, password=None, ignore_retcode=False)`

Interface to `git-rm(1)`

cwd The path to the git checkout

filename The location of the file/directory to remove, relative to `cwd`

Note: To remove a directory, `-r` must be part of the `opts` parameter.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

`salt.modules.git.stash(cwd, action='save', opts='', user=None, password=None, ignore_retcode=False)`

Interface to `git-stash(1)`, returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. 'save <stash comment>', 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run `git stash`.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

`salt.modules.git.status(cwd, user=None, password=None, ignore_retcode=False)`

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.status /path/to/repo
```

`salt.modules.git.submodule` (*cwd*, *command*, *opts*=',', *user*=None, *password*=None, *identity*=None, *ignore_retcode*=False, *saltenv*='base', ***kwargs*)

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to `git-submodule(1)`

cwd The path to the submodule

command Submodule command to run, see `git-submodule(1) <git submodule>` for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

init [False] If `True`, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to `update`.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/
↳repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

salt.modules.git.symbolic_ref(*cwd*, *ref*, *value=None*, *opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to `git-symbolic-ref(1)`

cwd The path to the git checkout

ref Symbolic ref to read/modify

value If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

opts Any additional options to add to the command line, in a single string

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

salt.modules.git.version(*versioninfo=False*)

New in version 2015.8.0.

Returns the version of Git installed on the minion

versioninfo [False] If True, return the version in a versioninfo list (e.g. [2, 5, 0])

CLI Example:

```
salt myminion git.version
```

```
salt.modules.git.worktree_add(cwd, worktree_path, ref=None, reset_branch=None, force=None,
                             detach=False, opts='', user=None, password=None, ignore_retcode=False, **kwargs)
```

New in version 2015.8.0.

Interface to `git-worktree(1)`, adds a worktree

cwd The path to the git checkout

worktree_path Path to the new worktree. Can be either absolute, or relative to `cwd`.

branch Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

ref Name of the ref on which to base the new worktree. If omitted, then `HEAD` is used, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

reset_branch [False] If `False`, then `git-worktree(1)` will fail to create the worktree if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new worktree.

force [False] By default, `git-worktree(1)` will not permit the same branch to be checked out in more than one worktree. Set this argument to `True` to override this.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21
↳ref=v2.1.9.3
```

```
salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts='',
                               user=None, password=None, ignore_retcode=False)
```

New in version 2015.8.0.

Interface to `git-worktree(1)`, prunes stale worktree administrative data from the gitdir

cwd The path to the main git checkout or a linked worktree

dry_run [False] If `True`, then this function will report what would have been pruned, but no changes will be made.

verbose [True] Report all changes made. Set to `False` to suppress this output.

expire Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the [git-config\(1\)](#) manpage.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to [git-worktree\(1\)](#) and are not yet supported in Salt.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.worktree_rm(cwd, user=None)`

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking [git.is_worktree](#). If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

Warning: There is no undoing this action. Be **VERY** careful before running this function.

cwd Path to the worktree to be removed

user Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

14.6.110 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

depends PyGithub python module

Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `github` key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

# optional: some functions require a repo_name, which
# can be set in the config file, or passed in at the CLI.
repo_name: my_repo
```

```
salt.modules.github.add_repo(name, description=None, homepage=None, private=None,
                             has_issues=None, has_wiki=None, has_downloads=None,
                             auto_init=None, gitignore_template=None, license_template=None,
                             profile='github')
```

Create a new github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visibility of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.

gitignore_template The desired language or platform for a `.gitignore`, e.g. ```Haskell```.

license_template The desired LICENSE template to apply, e.g. ```mit``` or ```mozilla```.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

```
salt.modules.github.add_team(name, description=None, repo_names=None, privacy=None, permis-
                             sion=None, profile='github')
```

Create a new Github team within an organization.

name The name of the team to be created.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be `secret` or `closed`.

permission The default permission for new repositories added to the team, can be `pull`, `push` or `admin`.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

```
salt.modules.github.add_team_member(name, team_name, profile='github')
```

Adds a team member to a team with `team_name`.

name The name of the team member to add.

team_name The name of the team of which to add the user.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_team_repo(repo_name, team_name, profile='github')`

Adds a repository to a team with `team_name`.

repo_name The name of the repository to add.

team_name The name of the team of which to add the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_user(name, profile='github')`

Add a GitHub user.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

`salt.modules.github.edit_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, profile='github')`

Updates an existing Github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visibility of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

`salt.modules.github.edit_team(name, description=None, privacy=None, permission=None, profile='github')`

Updates an existing Github team.

name The name of the team to be edited.

description The description of the team.

privacy The level of privacy for the team, can be `'secret'` or `'closed'`.

permission The default permission for new repositories added to the team, can be `'pull'`, `'push'` or `'admin'`.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

`salt.modules.github.get_issue` (*issue_number*, *repo_name=None*, *profile='github'*, *output='min'*)

Return information about a single issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue to retrieve.

repo_name The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

`salt.modules.github.get_issue_comments` (*issue_number*, *repo_name=None*, *profile='github'*, *since=None*, *output='min'*)

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue for which to retrieve comments.

repo_name The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

since Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

`salt.modules.github.get_issues` (*repo_name=None*, *profile='github'*, *milestone=None*, *state='open'*, *assignee=None*, *creator=None*, *mentioned=None*, *labels=None*, *sort='created'*, *direction='desc'*, *since=None*, *output='min'*, *per_page=None*)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

milestone The number of a GitHub milestone, or a string of either `*` or `none`.

If a number is passed, it should refer to a milestone by its number field. Use the `github.get_milestone` function to obtain a milestone's number.

If the string `*` is passed, issues with any milestone are accepted. If the string `none` is passed, issues without milestones are returned.

state Indicates the state of the issues to return. Can be either `open`, `closed`, or `all`. Default is `open`.

assignee Can be the name of a user. Pass in `none` (as a string) for issues with no assigned user or `*` for issues assigned to any user.

creator The user that created the issue.

mentioned A user that's mentioned in the issue.

labels A string of comma separated label names. For example, `bug,ui,@high`.

sort What to sort results by. Can be either `created`, `updated`, or `comments`. Default is `created`.
direction The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.
since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.
output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.
per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.
 CLI Example:

```
salt myminion github.get_issues my-github-repo
```

`salt.modules.github.get_milestone` (*number=None, name=None, repo_name=None, profile='github', output='min'*)

Return information about a single milestone in a named repository.

New in version 2016.11.0.

number The number of the milestone to retrieve. If provided, this option will be favored over `name`.

name The name of the milestone to retrieve.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

`salt.modules.github.get_milestones` (*repo_name=None, profile='github', state='open', sort='due_on', direction='asc', output='min', per_page=None*)

Return information about milestones for a given repository.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

state The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

sort What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

direction The direction of the sort. Either `asc` or `desc`. Default is `asc`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

`salt.modules.github.get_repo_info` (*repo_name, profile='github'*)

Return information for a given repo.

New in version 2016.11.0.

repo_name The name of the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

`salt.modules.github.get_team(name, profile='github')`

Returns the team details if a team with the given name exists, or None otherwise.

name The team name for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

`salt.modules.github.get_user(name, profile='github', user_details=False)`

Get a GitHub user by name.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

user_details Prints user information details. Defaults to `False`. If the user is already in the organization and `user_details` is set to `False`, the `get_user` function returns `True`. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

`salt.modules.github.is_team_member(name, team_name, profile='github')`

Returns True if the github user is in the team with `team_name`, or False otherwise.

name The name of the user whose membership to check.

team_name The name of the team to check membership in.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_members_without_mfa(profile='github', ignore_cache=False)`

List all members (in lower case) without MFA turned on.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

`salt.modules.github.list_private_repos(profile='github')`

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

`salt.modules.github.list_public_repos(profile='github')`

List public repositories within the organization.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

`salt.modules.github.list_repos` (*profile='github'*)

List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

`salt.modules.github.list_team_members` (*team_name, profile='github', ignore_cache=False*)

Gets the names of team members in lower case.

team_name The name of the team from which to list members.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_team_repos` (*team_name, profile='github', ignore_cache=False*)

Gets the names of team repos in lower case.

team_name The name of the team from which to list repos.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_teams` (*profile='github', ignore_cache=False*)

Lists all teams with the organization.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

`salt.modules.github.list_users` (*profile='github', ignore_cache=False*)

List all users within the organization.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

`salt.modules.github.remove_repo` (*name*, *profile*='github')

Remove a Github repository.

name The name of the repository to be removed.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

`salt.modules.github.remove_team` (*name*, *profile*='github')

Remove a github team.

name The name of the team to be removed.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_team_member` (*name*, *team_name*, *profile*='github')

Removes a team member from a team with *team_name*.

name The name of the team member to remove.

team_name The name of the team from which to remove the user.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_team_repo` (*repo_name*, *team_name*, *profile*='github')

Removes a repository from a team with *team_name*.

repo_name The name of the repository to remove.

team_name The name of the team of which to remove the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_user` (*name*, *profile*='github')

Remove a Github user by name.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_user github-handle
```

14.6.111 salt.modules.glance

Module for handling openstack glance calls.

optdepends

- glanceclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' glance.image_list profile=openstack1
```

salt.modules.glance.image_create(*name*, *location=None*, *profile=None*, *visibility=None*, *container_format='bare'*, *disk_format='raw'*, *protected=None*, *copy_from=None*, *is_public=None*)

Create an image (glance image-create)

CLI Example, old format:

```
salt '*' glance.image_create name=f16-jeos is_public=true \
  disk_format=qcow2 container_format=ovf \
  copy_from=http://berrange.fedorapeople.org/                images/2012-
↳ 02-29/f16-x86_64-openstack-sda.qcow2
```

CLI Example, new format resembling Glance API v2:

```
salt '*' glance.image_create name=f16-jeos visibility=public \
  disk_format=qcow2 container_format=ovf \
  copy_from=http://berrange.fedorapeople.org/                images/2012-
↳ 02-29/f16-x86_64-openstack-sda.qcow2
```

The parameter `visibility` defaults to `public` if neither `visibility` nor `is_public` is specified.

salt.modules.glance.image_delete(*id=None*, *name=None*, *profile=None*)

Delete an image (glance image-delete)

CLI Examples:

```
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

`salt.modules.glance.image_list` (*id=None, profile=None, name=None*)
Return a list of available images (glance image-list)

CLI Example:

```
salt '*' glance.image_list
```

`salt.modules.glance.image_schema` (*profile=None*)
Returns names and descriptions of the schema ``image``'s properties for this profile's instance of glance

CLI Example:

```
salt '*' glance.image_schema
```

`salt.modules.glance.image_show` (*id=None, name=None, profile=None*)
Return details about a specific image (glance image-show)

CLI Example:

```
salt '*' glance.image_show
```

`salt.modules.glance.image_update` (*id=None, name=None, profile=None, **kwargs*)
Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility ('public' or 'private')

CLI Example:

```
salt '*' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_update name=f16-jeos
```

`salt.modules.glance.schema_get` (*name, profile=None*)
Known valid names of schemas are:

- image
- images
- member
- members

CLI Example:

```
salt '*' glance.schema_get name=f16-jeos
```

14.6.112 salt.modules.glusterfs

Manage a glusterfs pool

`salt.modules.glusterfs.add_volume_bricks` (*name, bricks*)
Add brick(s) to an existing volume
name Volume name
bricks List of bricks to add to the volume

`salt.modules.glusterfs.create` (**args, **kwargs*)
Deprecated version of more consistently named `create_volume`

`salt.modules.glusterfs.create_volume`(*name*, *bricks*, *stripe=False*, *replica=False*, *device_vg=False*, *transport='tcp'*, *start=False*, *force=False*)

Create a glusterfs volume.

name Name of the gluster volume

bricks Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: `["<peer1>:<brick1>", "<peer2>:<brick2>"]`

stripe Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

replica Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

device_vg If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

transport Transport protocol to use, can be `'tcp'`, `'rdma'` or `'tcp,rdma'`

start Start the volume after creation

force Force volume creation, this works even if creating in root FS

CLI Example:

```
salt host1 glusterfs.create newvolume host1:/brick

salt gluster1 glusterfs.create vol2 ["gluster1:/export/vol2/brick",
↪ "gluster2:/export/vol2/brick"] replica=2 start=True
```

`salt.modules.glusterfs.delete`(**args*, ***kwargs*)

Deprecated version of more consistently named `delete_volume`

`salt.modules.glusterfs.delete_volume`(*target*, *stop=True*)

Deletes a gluster volume

target Volume to delete

stop Stop volume before delete if it is started, True by default

`salt.modules.glusterfs.info`(*name=None*)

New in version 2015.8.4.

Return gluster volume info.

name Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

`salt.modules.glusterfs.list_peers`()

Deprecated version of `peer_status()`, which returns the peered hostnames and some additional information.

CLI Example:

```
salt '*' glusterfs.list_peers
```

`salt.modules.glusterfs.list_volumes`()

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

`salt.modules.glusterfs.peer`(*name*)

Add another node into the peer list.

name The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer probe ftp2
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing): #if the ``peer" is the local host:
peer probe: success: on localhost not needed

```
#if the peer was just added: peer probe: success
```

```
#if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list
```

`salt.modules.glusterfs.peer_status()`

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2
```

```
Hostname: ftp2 Port: 24007 Uuid: cbc256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
```

```
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

`salt.modules.glusterfs.start_volume(name, force=False)`

Start a gluster volume.

name Volume name

force Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

`salt.modules.glusterfs.status(name)`

Check the status of a gluster volume.

name Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

`salt.modules.glusterfs.stop_volume(name, force=False)`

Stop a gluster volume.

name Volume name

force Force stop the volume .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

14.6.113 salt.modules.gnomedesktop

GNOME implementations

`salt.modules.gnomedesktop.get` (*schema=None, key=None, user=None, **kwargs*)
Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled
```

`salt.modules.gnomedesktop.getClockFormat` (***kwargs*)
Return the current clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

`salt.modules.gnomedesktop.getClockShowDate` (***kwargs*)
Return the current setting, if the date is shown in the clock

CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

`salt.modules.gnomedesktop.getIdleActivation` (***kwargs*)
Get whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

`salt.modules.gnomedesktop.getIdleDelay` (***kwargs*)
Return the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

`salt.modules.gnomedesktop.ping` (***kwargs*)
A test to ensure the GNOME module is loaded

CLI Example:

```
salt '*' gnome.ping user=<username>
```

`salt.modules.gnomedesktop.setClockFormat` (*clockFormat, **kwargs*)
Set the clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

`salt.modules.gnomedesktop.setClockShowDate` (*kvalue, **kwargs*)
Set whether the date is visible in the clock

CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleActivation(kvalue, **kwargs)`

Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleDelay(delaySeconds, **kwargs)`

Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

`salt.modules.gnomedesktop.set(schema=None, key=None, user=None, value=None, **kwargs)`

Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled value=False
```

14.6.114 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from key servers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

Note: The `python-gnupg` library and `gpg` binary are required to be installed.

`salt.modules.gpg.create_key(*args, **kwargs)`

Create a key in the GPG keychain

Note: GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the `rng-tools` package.

The `create_key` process takes awhile so increasing the timeout may be necessary, e.g. `-t 15`.

key_type The type of the primary key to generate. It must be capable of signing. `'RSA'` or `'DSA'`.

key_length The length of the primary key in bits.

name_real The real name of the user identity which is represented by the key.

name_comment A comment to attach to the user id.

name_email An email address for the user.

subkey_type The type of the secondary key to generate.

subkey_length The length of the secondary key in bits.

expire_date The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

```
salt.modules.gpg.decrypt(user=None, text=None, filename=None, output=None,
                        use_passphrase=False, gnupghome=None, bare=False)
```

Decrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

text The encrypted text to decrypt.

filename The encrypted filename to decrypt.

output The filename where the decrypted data will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'
```

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True
```

```
salt.modules.gpg.delete_key(keyid=None, fingerprint=None, delete_secret=False, user=None,
                           gnupghome=None)
```

Get a key from the GPG keychain

keyid The keyid of the key to be deleted.

fingerprint The fingerprint of the key to be deleted.

delete_secret Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E
```

```
salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
```

```
salt '*' gpg.delete_key keyid=3FAD9F1E user=username
```

```
salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

```
salt.modules.gpg.encrypt(user=None, recipients=None, text=None, filename=None, output=None,
                        sign=None, use_passphrase=False, gnupghome=None, bare=False)
```

Encrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

recipients The fingerprints for those recipient whom the data is being encrypted for.

text The text to encrypt.

filename The filename to encrypt.

output The filename where the signed file will be written, default is standard out.

sign Whether to sign, in addition to encrypt, the data. `True` to use default key or fingerprint to specify a different key to sign with.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:

```

salt '*' gpg.encrypt text='Hello there. How are you?'

salt '*' gpg.encrypt filename='/path/to/important.file'

salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True

```

`salt.modules.gpg.export_key` (*keyids=None, secret=False, user=None, gnupghome=None*)

Export a key from the GPG keychain

keyids The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.

secret Export the secret key identified by the `keyids` information passed.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.export_key keyids=3FAD9F1E

salt '*' gpg.export_key keyids=3FAD9F1E secret=True

salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username

```

`salt.modules.gpg.get_key` (*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.get_key keyid=3FAD9F1E

salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.get_secret_key` (*keyid=None, fingerprint=None, user=None, gnupghome=None*)

Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```

salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.import_key` (**args, **kwargs*)

Import a key from text or file

text The text containing to import.

filename The filename containing the key to import.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -----END
↳PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

`salt.modules.gpg.list_keys` (*user=None, gnupghome=None*)

List keys in GPG keychain

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.list_keys
```

`salt.modules.gpg.list_secret_keys` (*user=None, gnupghome=None*)

List secret keys in GPG keychain

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.list_secret_keys
```

`salt.modules.gpg.receive_keys` (**args, **kwargs*)

Receive key(s) from keyserver and add them to keychain

keyserver Keyserver to use for searching for GPG keys, defaults to `pgp.mit.edu`

keys The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'
salt '*' gpg.receive_keys keys="['3FAD9F1E', '3FBD9F2E']"
salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.search_keys` (*text, keyserver=None, user=None*)

Search keys from keyserver

text Text to search the keyserver for, e.g. email address, keyID or fingerprint.

keyserver Keyserver to use for searching for GPG keys, defaults to `pgp.mit.edu`.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.search_keys user@example.com
salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
↳user=username
```

```
salt.modules.gpg.sign(user=None, keyid=None, text=None, filename=None, output=None,
                    use_passphrase=False, gnupghome=None)
```

Sign message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

keyid The keyid of the key to set the trust level for, defaults to first key in the secret keyring.

text The text to sign.

filename The filename to sign.

output The filename where the signed file will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.sign text='Hello there. How are you?'
salt '*' gpg.sign filename='/path/to/important.file'
salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

```
salt.modules.gpg.trust_key(keyid=None, fingerprint=None, trust_level=None, user=None)
```

Set the trust level for a key in GPG keychain

keyid The keyid of the key to set the trust level for.

fingerprint The fingerprint of the key to set the trust level for.

trust_level The trust level to set for the specified key, must be one of the following: `expired`, `unknown`, `not_trusted`, `marginally`, `fully`, `ultimately`

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192'
↳ trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'
```

```
salt.modules.gpg.verify(text=None, user=None, filename=None, gnupghome=None)
```

Verify a message or file

text The text to verify.

filename The filename to verify.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
```

14.6.115 salt.modules.grains

Return/control aspects of the grains data

`salt.modules.grains.append`(*key*, *val*, *convert=False*, *delimiter=':'*)

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

key The grain key to be appended to

val The value to append to the grain key

convert If *convert* is True, convert non-list contents into a list. If *convert* is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.delval`(*key*, *destructive=False*)

New in version 0.17.0.

Delete a grain from the grains config file

key The grain key from which to delete the value.

destructive Delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.delval key
```

`salt.modules.grains.fetch`(*key*, *default=''*, *delimiter=':'*, *ordered=True*)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a `:` delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed:

```
pkg:apache
```

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
```

`salt.modules.grains.filter_by`(*lookup_dict*, *grain='os_family'*, *merge=None*, *default='default'*, *base=None*)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

Parameters

- **lookup_dict** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could be the name of a package on that particular OS.

Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

```
# this will render 'got some salt' if Minion ID begins from 'salt'
→ '
salt '*' grains.filter_by '{salt*: got some salt, default: salt
→ is not here}' id
```

- **grain** -- The name of a grain to match with the current system's grains. For example, the value of the `os_family` grain for the current system could be used to pull values from the `lookup_dict` dictionary.

Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).
- **default** -- default `lookup_dict`'s key used if the grain does not exist or if the grain value has no match on `lookup_dict`. If unspecified the value is `default`.

New in version 2014.1.0.

- **base** -- A lookup_dict key to use for a base dictionary. The grain-selected lookup_dict is merged over this and then finally the merge dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

New in version 2015.5.0.

CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}, J: K}'
↪ 'C'
# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}'
↪ 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

`salt.modules.grains.get`(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
```

`salt.modules.grains.get_or_set_hash`(name, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#%&^*(_=-+)

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don't need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.grains.has_value`(*key*)

Determine whether a named value exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

`salt.modules.grains.item`(*args, **kwargs)

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

`salt.modules.grains.items`(*sanitize=False*)

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

`salt.modules.grains.ls`()

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

`salt.modules.grains.remove`(*key, val, delimiter=':*)

New in version 0.17.0.

Remove a value from a list in the grains config file

key The grain key to remove.

val The value to remove.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

`salt.modules.grains.set`(*key*, *val*='', *force*=False, *destructive*=False, *delimiter*=':')

Set a key to an arbitrary value. It is used like `setval` but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **force** -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being `:`

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

`salt.modules.grains.setval`(*key*, *val*, *destructive*=False)

Set a grains value in the grains config file

key The grain key to be set.

val The value to set the grain key to.

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key '{"sub-key1': 'val1', 'sub-key2': 'val2'}"
```

`salt.modules.grains.setvals`(*grains*, *destructive*=False)

Set new grains values in the grains config file

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setvals '{"key1': 'val1', 'key2': 'val2'}"
```

14.6.116 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.groupadd.add`(*name*, *gid=None*, *system=False*, *root=None*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.groupadd.adduser`(*name*, *username*, *root=None*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar` as a member of an existing group `foo`, if not then adds it.

`salt.modules.groupadd.chgid`(*name*, *gid*, *root=None*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.groupadd.delete`(*name*, *root=None*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.groupadd.deluser`(*name*, *username*, *root=None*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar` from a group `foo`. If group is not present then returns True.

`salt.modules.groupadd.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.groupadd.info`(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.groupadd.members`(*name*, *members_list*, *root=None*)

Replaces members of the group with a provided list.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `foo`. foo:x:1234:user1,user2,user3,...

14.6.117 salt.modules.grub_legacy

Support for GRUB Legacy

`salt.modules.grub_legacy.conf()`

Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

`salt.modules.grub_legacy.version()`

Return server version from grub --version

CLI Example:

```
salt '*' grub.version
```

14.6.118 salt.modules.guestfs

Interact with virtual machine images via libguestfs

depends

- libguestfs

`salt.modules.guestfs.mount(location, access='rw', root=None)`

Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```

14.6.119 salt.modules.hadoop

Support for hadoop

maintainer Yann Jouanin <yann.jouanin@intelunix.fr>

maturity new

depends

platform linux

`salt.modules.hadoop.dfs(command=None, *args)`

Execute a command on DFS

CLI Example:

```
salt '*' hadoop.dfs ls /
```

`salt.modules.hadoop.dfs_absent(path)`

Check if a file or directory is absent on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

`salt.modules.hadoop.dfs_present` (*path*)

Check if a file or directory is present on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

`salt.modules.hadoop.namenode_format` (*force=None*)

Format a name node

```
salt '*' hadoop.namenode_format force=True
```

`salt.modules.hadoop.version` ()

Return version from hadoop version

CLI Example:

```
salt '*' hadoop.version
```

14.6.120 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

`salt.modules.haproxyconn.disable_server` (*name, backend, socket='/var/run/haproxy.sock'*)

Disable server in haproxy.

name Server to disable

backend haproxy backend, or all backends if ``*`` is supplied

socket haproxy stats socket

CLI Example:

```
salt '*' haproxy.disable_server db1.example.com mysql
```

`salt.modules.haproxyconn.enable_server` (*name, backend, socket='/var/run/haproxy.sock'*)

Enable Server in haproxy

name Server to enable

backend haproxy backend, or all backends if ``*`` is supplied

socket haproxy stats socket

CLI Example:

```
salt '*' haproxy.enable_server web1.example.com www
```

`salt.modules.haproxyconn.get_sessions` (*name, backend, socket='/var/run/haproxy.sock'*)

New in version 2016.11.0.

Get number of current sessions on server in backend (scur)

name Server name

backend haproxy backend

socket haproxy stats socket

CLI Example:

```
salt '*' haproxy.get_sessions web1.example.com www
```

`salt.modules.haproxyconn.get_weight` (*name, backend, socket='/var/run/haproxy.sock'*)

Get server weight

name Server name
backend haproxy backend
socket haproxy stats socket
 CLI Example:

```
salt '*' haproxy.get_weight web1.example.com www
```

salt.modules.haproxyconn.list_servers(*backend*, *socket='/var/run/haproxy.sock'*, *objectify=False*)

List servers in haproxy backend.

backend haproxy backend
socket haproxy stats socket
 CLI Example:

```
salt '*' haproxy.list_servers mysql
```

salt.modules.haproxyconn.set_state(*name*, *backend*, *state*, *socket='/var/run/haproxy.sock'*)

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to ``ready`` puts the server in normal mode, and the command is the equivalent of the ``enable server`` command. Setting the state to ``maint`` disables any traffic to the server as well as any health checks. This is the equivalent of the ``disable server`` command. Setting the mode to ``drain`` only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

name Server name
backend haproxy backend
state A string of the state to set. Must be `ready`, `drain`, or `maint`
 CLI Example:

```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

salt.modules.haproxyconn.set_weight(*name*, *backend*, *weight=0*, *socket='/var/run/haproxy.sock'*)

Set server weight

name Server name
backend haproxy backend
weight Server Weight
socket haproxy stats socket
 CLI Example:

```
salt '*' haproxy.set_weight web1.example.com www 13
```

salt.modules.haproxyconn.show_backends(*socket='/var/run/haproxy.sock'*)

Show HaProxy Backends

socket haproxy stats socket
 CLI Example:

```
salt '*' haproxy.show_backends
```

salt.modules.haproxyconn.show_frontends(*socket='/var/run/haproxy.sock'*)

Show HaProxy frontends

socket haproxy stats socket
 CLI Example:

```
salt '*' haproxy.show_frontends
```

14.6.121 salt.modules.hashutil

A collection of hashing and encoding functions

`salt.modules.hashutil.base64_b64decode` (*instr*)

Decode a base64-encoded string using the ``modern'' Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

`salt.modules.hashutil.base64_b64encode` (*instr*)

Encode a string as base64 using the ``modern'' Python interface.

Among other possible differences, the ``modern'' encoder does not include newline (`n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

`salt.modules.hashutil.base64_decodefile` (*instr*, *outfile*)

Decode a base64-encoded string and write the result to a file

New in version 2015.2.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/
↳binary_file'
```

`salt.modules.hashutil.base64_decodestring` (*instr*)

Decode a base64-encoded string using the ``legacy'' Python interface

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

`salt.modules.hashutil.base64_encodefile` (*fname*)

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The `file.decode` state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

`salt.modules.hashutil.base64_encodestring(instr)`

Encode a string as base64 using the ``legacy`` Python interface.

Among other possible differences, the ``legacy`` encoder includes a newline (`n`) character after every 76 characters and always at the end of the encoded string.

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

`salt.modules.hashutil.digest(instr, checksum='md5')`

Return a checksum digest for a string

instr A string

checksum [md5] The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.digest_file(infile, checksum='md5')`

Return a checksum digest for a file

infile A file path

checksum [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.hmac_signature(string, shared_secret, challenge_hmac)`

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'
↪ 'eBWf9bstXg+NIP5AOwppB5HMvZiYMPzEM9W5YmM/AmQ='
```

`salt.modules.hashutil.md5_digest(instr)`

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

`salt.modules.hashutil.sha256_digest(instr)`

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

`salt.modules.hashutil.sha512_digest(instr)`

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

14.6.122 salt.modules.hg

Support for the Mercurial SCM

salt.modules.hg.archive(*cwd, output, rev='tip', fmt=None, prefix=None, user=None*)

Export a tarball from the repository

cwd The path to the Mercurial repository

output The path to the archive tarball

rev: tip The revision to create an archive from

fmt: None Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

prefix [None] Prepend <prefix>/ to every filename in the archive

user [None] Run hg as a user other than what the minion runs as

If **prefix** is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

salt.modules.hg.clone(*cwd, repository, opts=None, user=None, identity=None*)

Clone a new repository

cwd The path to the Mercurial repository

repository The hg URI of the repository

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

salt.modules.hg.describe(*cwd, rev='tip', user=None*)

Mimic git describe and return an identifier for the given revision

cwd The path to the Mercurial repository

rev: tip The path to the archive tarball

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.describe /path/to/repo
```

salt.modules.hg.pull(*cwd, opts=None, user=None, identity=None, repository=None*)

Perform a pull on the given repository

cwd The path to the Mercurial repository

repository [None] Perform pull from the repository different from .hg/hgrc:[paths]:default

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

salt.modules.hg.revision (*cwd*, *rev='tip'*, *short=False*, *user=None*)
 Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)
cwd The path to the Mercurial repository
rev: tip The revision
short: False Return an abbreviated commit hash
user [None] Run hg as a user other than what the minion runs as
 CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

salt.modules.hg.status (*cwd*, *opts=None*, *user=None*)
 Show changed files of the given repository
cwd The path to the Mercurial repository
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as
 CLI Example:

```
salt '*' hg.status /path/to/repo
```

salt.modules.hg.update (*cwd*, *rev*, *force=False*, *user=None*)
 Update to a given revision
cwd The path to the Mercurial repository
rev The revision to update to
force [False] Force an update
user [None] Run hg as a user other than what the minion runs as
 CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

14.6.123 salt.modules.hipchat

Module for sending messages to hipchat.

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

It is possible to use a different API than <http://api.hipchat.com>, by specifying the API URL in config as *api_url*, or by passing the value directly.

For example:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

Custom API Example:

```
hipchat:
  api_url: http://api.hipchat.myteam.com
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v2
```

`salt.modules.hipchat.find_room`(*name*, *api_url=None*, *api_key=None*, *api_version=None*)

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The room object.

CLI Example:

```
salt '*' hipchat.find_room name="Development Room"

salt '*' hipchat.find_room name="Development Room" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

`salt.modules.hipchat.find_user`(*name*, *api_url=None*, *api_key=None*, *api_version=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The user object.

CLI Example:

```
salt '*' hipchat.find_user name="Thomas Hatch"

salt '*' hipchat.find_user name="Thomas Hatch" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

`salt.modules.hipchat.list_rooms`(*api_url=None*, *api_key=None*, *api_version=None*)

List all HipChat rooms.

Parameters

- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The room list.

CLI Example:

```
salt '*' hipchat.list_rooms

salt '*' hipchat.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=v1
```

`salt.modules.hipchat.list_users`(*api_url=None*, *api_key=None*, *api_version=None*)

List all HipChat users.

Parameters

- **api_url** -- The HipChat API URL, if not specified in the configuration.

- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The user list.

CLI Example:

```
salt '*' hipchat.list_users

salt '*' hipchat.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳version=v1
```

salt.modules.hipchat.send_message(*room_id, message, from_name, api_url=None, api_key=None, api_version=None, color='yellow', notify=False*)

Send a message to a HipChat room.

Parameters

- **room_id** -- The room id or room name, either will work.
- **message** -- The message to send to the HipChat room.
- **from_name** -- Specify who the message is from.
- **api_url** -- The HipChat api URL, if not specified in the configuration.
- **api_key** -- The HipChat api key, if not specified in the configuration.
- **api_version** -- The HipChat api version, if not specified in the configuration.
- **color** -- The color for the message, default: yellow.
- **notify** -- Whether to notify the room, default: False.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' hipchat.send_message room_id="Development Room" message="Build is done"
↳from_name="Build Server"

salt '*' hipchat.send_message room_id="Development Room" message="Build failed"
↳from_name="Build Server" color="red" notify=True
```

14.6.124 salt.modules.hosts

Manage the information in the hosts file

salt.modules.hosts.add_host(*ip, alias*)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

salt.modules.hosts.get_alias(*ip*)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

`salt.modules.hosts.get_ip(host)`

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

`salt.modules.hosts.has_pair(ip, alias)`

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

`salt.modules.hosts.list_hosts()`

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

`salt.modules.hosts.rm_host(ip, alias)`

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

`salt.modules.hosts.set_host(ip, alias)`

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

14.6.125 salt.modules.htpasswd

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the weutil module. This allows other functions that don't use htpasswd to use the weutil module name.

`salt.modules.htpasswd.useradd(pwfile, user, password, opts='', runas=None)`

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

pwfile Path to htpasswd file

user User name

password User password

opts Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas The system user to run htpasswd command with
CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.htpasswd.useradd_all`(*pwfile*, *user*, *password*, *opts=''*, *runas=None*)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

Deprecated since version Nitrogen.

pwfile Path to htpasswd file

user User name

password User password

opts Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas The system user to run htpasswd command with
CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.htpasswd.userdel`(*pwfile*, *user*, *runas=None*)

Delete a user from the specified htpasswd file.

pwfile Path to htpasswd file

user User name

runas The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

14.6.126 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.query`(*url*, ***kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```

salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST          params='key1=val1&
↳key2=val2'
salt '*' http.query http://somelink.com/ method=POST          data='<xml>
↳somecontent</xml>'

```

`salt.modules.http.update_ca_bundle` (*target=None, source=None, merge_files=None*)
Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```

salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem

```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```

salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem

```

`salt.modules.http.wait_for_successful_query` (*url, wait_for=300, **kwargs*)
Query a resource until a successful response, and decode the return data

CLI Example:

```

salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160

```

14.6.127 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.ifttt.trigger_event` (*event=None, **kwargs*)
Trigger a configured event in IFTTT.

Parameters `event` -- The name of the event to trigger.

Returns A dictionary with status, text, and error if result was failure.

14.6.128 salt.modules.ilo

Manage HP ILO

depends `hponcfg` (SmartStart Scripting Toolkit Linux Edition)

`salt.modules.ilo.change_password(username, password)`

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

`salt.modules.ilo.change_username(old_username, new_username)`

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

`salt.modules.ilo.configure_network(ip, netmask, gateway)`

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

`salt.modules.ilo.configure_snmp(community, snmp_port=161, snmp_trapport=161)`

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

`salt.modules.ilo.create_user(name, password, *privileges)`

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.

Supported privileges:

- ADMIN_PRIV Enables the user to administer user accounts.
- REMOTE_CONS_PRIV Enables the user to access the Remote Console functionality.
- RESET_SERVER_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL_MEDIA_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG_ILO_PRIV Enables the user to configure iLO settings.

`salt.modules.ilo.delete_ssh_key(username)`

Delete a users SSH key from the ILO

CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

`salt.modules.ilo.delete_user(username)`

Delete a user

CLI Example:

```
salt '*' ilo.delete_user damian
```

`salt.modules.ilo.disable_dhcp()`

Disable DHCP

CLI Example:

```
salt '*' ilo.disable_dhcp
```

`salt.modules.ilo.disable_ssh()`

Disable the SSH daemon

CLI Example:

```
salt '*' ilo.disable_ssh
```

`salt.modules.ilo.enable_dhcp()`

Enable DHCP

CLI Example:

```
salt '*' ilo.enable_dhcp
```

`salt.modules.ilo.enable_ssh()`

Enable the SSH daemon

CLI Example:

```
salt '*' ilo.enable_ssh
```

`salt.modules.ilo.get_user(username)`

Returns local user information, excluding the password

CLI Example:

```
salt '*' ilo.get_user damian
```

`salt.modules.ilo.global_settings()`

Show global settings

CLI Example:

```
salt '*' ilo.global_settings
```

`salt.modules.ilo.list_users()`

List all users

CLI Example:

```
salt '*' ilo.list_users
```

`salt.modules.ilo.list_users_info()`

List all users in detail

CLI Example:

```
salt '*' ilo.list_users_info
```

`salt.modules.ilo.network()`

Grab the current network settings

CLI Example:

```
salt '*' ilo.network
```

`salt.modules.ilo.set_http_port(port=80)`

Configure the port HTTP should listen on

CLI Example:

```
salt '*' ilo.set_http_port 8080
```

`salt.modules.ilo.set_https_port(port=443)`

Configure the port HTTPS should listen on

CLI Example:

```
salt '*' ilo.set_https_port 4334
```

`salt.modules.ilo.set_ssh_key(public_key)`

Configure SSH public keys for specific users

CLI Example:

```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

`salt.modules.ilo.set_ssh_port(port=22)`

Enable SSH on a user defined port

CLI Example:

```
salt '*' ilo.set_ssh_port 2222
```

14.6.129 salt.modules.img

Virtual machine image management tools

`salt.modules.img.bootstrap(location, size, fmt)`

HIGHLY EXPERIMENTAL Bootstrap a virtual machine image

location: The location to create the image

size: The size of the image to create in megabytes

fmt: The image format, raw or qcow2

CLI Example:

```
salt '*' img.bootstrap /srv/salt-images/host.qcow 4096 qcow2
```

`salt.modules.img.mount_image(location)`

Mount the named image and return the mount point

CLI Example:

```
salt '*' img.mount_image /tmp/foo
```

`salt.modules.img.umount_image(mnt)`

Unmount an image mountpoint

CLI Example:

```
salt '*' img.umount_image /mnt/foo
```

14.6.130 salt.modules.incron

Work with incron

`salt.modules.incron.list_tab(user)`

Return the contents of the specified user's in crontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.ls(user)`

This function is an alias of `list_tab`.

Return the contents of the specified user's in crontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.raw_incron(user)`

Return the contents of the user's in crontab

CLI Example:

```
salt '*' incron.raw_incron root
```

`salt.modules.incron.raw_system_incron()`

Return the contents of the system wide in crontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

`salt.modules.incron.rm(user, path, mask, cmd)`

This function is an alias of `rm_job`.

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.rm_job(user, path, mask, cmd)`

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.set_job(user, path, mask, cmd)`

Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ @$ $# $% $&'"
```

`salt.modules.incron.write_incron_file(user, path)`

Writes the contents of a file to a user's in crontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

`salt.modules.incron.write_incron_file_verbose`(*user, path*)

Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

14.6.131 salt.modules.influx

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

depends

- influxdb Python module (>= 3.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function user='influxadmin' password='s3cr1t'
```

would override `user` and `password` while still using the defaults for `host` and `port`.

`salt.modules.influx.alter_retention_policy`(*database, name, duration, replication, default=False, **client_args*)

Modify an existing retention policy.

name Name of the retention policy to modify.

database Name of the database for which the retention policy was defined.

duration New duration of given retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use ``INF'` for duration. The minimum retention period is 1 hour.

replication New replication of given retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

`salt.modules.influx.create_db`(*name, **client_args*)

Create a database.

name Name of the database to create.

CLI Example:

```
salt '*' influxdb.create_db <name>
```

salt.modules.influx.create_retention_policy(*database, name, duration, replication, default=False, **client_args*)

Create a retention policy.

database Name of the database for which the retention policy will be created.

name Name of the new retention policy.

duration Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

replication Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not the policy as default will be set as default.

CLI Example:

```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

salt.modules.influx.create_user(*name, password, admin=False, **client_args*)

Create a user.

name Name of the user to create.

password Password of the new user.

admin [False] Whether the user should have cluster administration privileges or not.

CLI Example:

```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

salt.modules.influx.db_exists(*name, **client_args*)

Checks if a database exists in InfluxDB.

name Name of the database to check.

CLI Example:

```
salt '*' influxdb.db_exists <name>
```

salt.modules.influx.drop_db(*name, **client_args*)

Drop a database.

name Name of the database to drop.

CLI Example:

```
salt '*' influxdb.drop_db <name>
```

salt.modules.influx.get_retention_policy(*database, name, **client_args*)

Get an existing retention policy.

database Name of the database for which the retention policy was defined.

name Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

salt.modules.influx.grant_admin_privileges(*name, **client_args*)

Grant cluster administration privileges to a user.

name Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

salt.modules.influx.grant_privilege(*database, privilege, username, **client_args*)

Grant a privilege on a database to a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of 'read', 'write' or 'all'.

username Name of the user to grant the privilege to.

salt.modules.influx.list_dbs(***client_args*)

List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

salt.modules.influx.list_users(***client_args*)

List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

salt.modules.influx.remove_user(*name, **client_args*)

Remove a user.

name Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

salt.modules.influx.retention_policy_exists(*database, name, **client_args*)

Check if retention policy with given name exists.

database Name of the database for which the retention policy was defined.

name Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

salt.modules.influx.revoke_admin_privileges(*name, **client_args*)

Revoke cluster administration privileges from a user.

name Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

salt.modules.influx.revoke_privilege(*database, privilege, username, **client_args*)

Revoke a privilege on a database from a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of 'read', 'write' or 'all'.

username Name of the user to grant the privilege to.

salt.modules.influx.set_user_password(*name, password, **client_args*)

Change password of a user.

name Name of the user for whom to set the password.

password New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

`salt.modules.influx.user_exists`(*name*, ***client_args*)

Check if a user exists.

name Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

`salt.modules.influx.user_info`(*name*, ***client_args*)

Get information about given user.

name Name of the user for which to get information.

CLI Example:

```
salt '*' influxdb.user_info <name>
```

14.6.132 salt.modules.infoblox

Module for managing Infoblox

Will look for pillar data `infoblox:server`, `infoblox:user`, `infoblox:password` if not passed to functions

New in version 2016.3.0.

depends

- requests

`salt.modules.infoblox.add_record`(*name*, *value*, *record_type*, *dns_view*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

add a record to an infoblox dns view

name the record name

value

the value for the entry can make use of infoblox functions for next available IP, like ``func:nextavailableip:10.1.0.0/24'`

record_type the record type (cname, a, host, etc)

dns_view the DNS view to add the record to

infoblox_server the infoblox server hostname (can also use the `infoblox:server` pillar)

infoblox_user the infoblox user to connect with (can also use the `infoblox:user` pillar)

infoblox_password the infoblox user's password (can also use the `infoblox:password` pillar)

infoblox_api_version the infoblox api version to use

sslVerify should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt 'myminion' infoblox.add_record alias.network.name canonical.network.name ↵
↵MyView
```

`salt.modules.infoblox.delete_record`(*name*, *dns_view*, *record_type*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

delete a record

name name of the record

dns_view the DNS view to remove the record from

record_type the record type (a, cname, host, etc)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
 CLI Example:

```
salt my-minion infoblox.delete_record some.dns.record MyInfobloxView A
↳sslVerify=False
```

salt.modules.infoblox.get_network(*network_name*, *network_view=None*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

get a network from infoblox

network_name The name of the network in IPAM
network_view The name of the network view the network belongs to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
 CLI Example:

```
salt myminion infoblox.get_network '10.0.0.0/8'
```

salt.modules.infoblox.get_record(*record_name*, *record_type='host'*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *dns_view=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

get a record from infoblox

record_name name of the record to search for
record_type type of record to search for (host, cname, a, etc...defaults to host)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
dns_view the infoblox DNS view to search, if not specified all views are searched
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
 CLI Example:

```
salt myminion infoblox.get_record some.host.com A sslVerify=False
```

salt.modules.infoblox.update_record(*name*, *value*, *dns_view*, *record_type*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

update an entry to an infoblox dns view

name the dns name
value the value for the record
record_type the record type (a, cname, etc)
dns_view the DNS view to add the record to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
infoblox_api_version the infoblox api version to use

`sslVerify` should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt '*' infoblox.update_record alias.network.name canonical.network.name
↳MyInfobloxView cname sslVerify=False
```

14.6.133 salt.modules.ini_manage

Edit ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

(for example /etc/sysctl.conf)

`salt.modules.ini_manage.get_option`(*file_name*, *section*, *option*, *separator*='=')

Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
      [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.get_section`(*file_name*, *section*, *separator*='=')

Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
      [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

`salt.modules.ini_manage.remove_option`(*file_name*, *section*, *option*, *separator*='=')

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
      [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.remove_section`(*file_name*, *section*, *separator*='=')

Remove a section in an ini file. Returns the removed section as dictionary, or `NONE` if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
      [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

`salt.modules.ini_manage.set_option`(*file_name*, *sections*=None, *separator*='=')

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name path of ini_file

sections [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options

separator [=] A character used to separate keys and values. Standard ini files use the ``=` character.

New in version 2016.11.0.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
      ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

14.6.134 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

`salt.modules.inspectlib.collector.is_alive`(*pidfile*)

Check if PID is still alive.

`salt.modules.inspectlib.collector.main`(*dbfile*, *pidfile*, *mode*)

Main analyzer routine.

salt.modules.inspectlib.dbhandle module

class `salt.modules.inspectlib.dbhandle.DBHandleBase`(*path*)

Handle for the *volatile* database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

close()
Close the database connection.

flush(*table*)
Flush the table.

open(*new=False*)
Init the database, if required.

purge()
Purge whole database.

salt.modules.inspectlib.exceptions module

exception salt.modules.inspectlib.exceptions.InspectorKiwiProcessorException
Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.InspectorQueryException
Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.InspectorSnapshotException
Snapshot exception.

exception salt.modules.inspectlib.exceptions.SIException
System information exception.

salt.modules.inspectlib.query module

class salt.modules.inspectlib.query.Query(*scope, cachedir=None*)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

class salt.modules.inspectlib.query.SysInfo(*systype*)
System information.

Module contents

class salt.modules.inspectlib.EnvLoader(*cachedir=None, piddir=None, pidfilename=None*)
Load environment.

14.6.135 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

salt.modules.introspect.enabled_service_owners()
Return which packages own each of the services that are currently enabled.

CLI Example:
salt myminion introspect.enabled_service_owners

salt.modules.introspect.running_service_owners(*exclude=(`'/dev'`, `'/home'`, `'/media'`, `'/proc'`, `'/run'`, `'/sys'`, `'/tmp'`, `'/var'`)*)
Determine which packages own the currently running services. By default, excludes files whose full path starts with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a new list to exclude.

CLI Example:

```
salt myminion introspect.running_service_owners
```

`salt.modules.introspect.service_highstate` (*requires=True*)

Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set `requires` to `False`.

CLI Example:

```
salt myminion introspect.service_highstate salt myminion introspect.service_highstate requires=False
```

14.6.136 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module `pyghmi`.

depends Python module `pyghmi`. You can install `pyghmi` using `pip`:

```
pip install pyghmi
```

configuration The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system
                    api_user=admin api_pass=pass
                    uid=1
```

`salt.modules.ipmi.create_user` (*uid, name, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs*)

create/ensure a user is created with provided settings.

Parameters

- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) * `callback` * `user` * `operator` * `administrator` * `proprietary` * `no_access`
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

CLI Examples:

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_
↳pass=nevertell
```

`salt.modules.ipmi.fast_connect_test(**kwargs)`

Returns True if connection success. This uses an aggressive timeout value!

Parameters **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Examples:

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

`salt.modules.ipmi.get_bootdev(**kwargs)`

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)`

:param kwargs:api_host='127.0.0.1' api_user='admin' api_pass='example' api_port=623

Parameters

- **channel** -- number [1:7]
- **read_mode** --
 - `non_volatile` = get non-volatile Channel Access
 - `volatile` = get present volatile (active) setting of Channel Access
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

return A Python dict with the following keys/values:

```
{
  alerting:
  per_msg_auth:
  user_level_auth:
  access_mode: { (ONE OF)
    0: 'disabled',
    1: 'pre_boot',
    2: 'always',
    3: 'shared'
  }
  privilege_level: { (ONE OF)
    1: 'callback',
    2: 'user',
    3: 'operator',
    4: 'administrator',
    5: 'proprietary',
  }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

`salt.modules.ipmi.get_channel_info(channel=14, **kwargs)`

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_kg=None

return channel session supports:

```
- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between
      single- and multi-session operation, as can occur with a
      serial/modem channel that supports connection mode auto-detect)
```

CLI Examples:

```
salt-call ipmi.get_channel_info
```

`salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)`

Get max users in channel

Parameters

- **channel** -- number [1:7]
- **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

Returns int -- often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

`salt.modules.ipmi.get_health(**kwargs)`

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_power(**kwargs)`

Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_sensor_data(**kwargs)`

Get sensor readings

Iterates sensor reading objects

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin

- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_user` (*uid*, *channel=14*, ***kwargs*)

Get user from uid and access on channel

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

return

```
name: (str)
uid: (int)
channel: (int)
access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator,
                        proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user uid=2
```

`salt.modules.ipmi.get_user_access` (*uid*, *channel=14*, ***kwargs*)

Get user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

return

```
channel_info:
  - max_user_count = maximum number of user IDs on this channel
  - enabled_users = count of User ID slots presently in use
  - users_with_fixed_names = count of user IDs with fixed names
access:
  - callback
  - link_auth
  - ipmi_msg
  - privilege_level: [reserved, callback, user, operator
                    administrator, proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user_access uid=2
```

`salt.modules.ipmi.get_user_name` (*uid*, *return_none_on_error=True*, ***kwargs*)

Get user name

Parameters

- **uid** -- user number [1:16]
- **return_none_on_error** -- return None on error
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

`salt.modules.ipmi.get_users` (*channel=14*, ***kwargs*)

get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:

- callback (bool)
- link_auth (bool)
- ipmi_msg (bool)
- privilege_level: (str)[callback, user, operator, administrator, proprietary, no_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

`salt.modules.ipmi.raw_command`(*netfn*, *command*, *bridge_request*=None, *data*=(), *retry*=True, *delay_xmit*=None, ***kwargs*)

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- **netfn** -- Net function number
- **command** -- Command value
- **bridge_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_kg=None

Returns dict -- The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

`salt.modules.ipmi.set_bootdev`(*bootdev*='default', *persist*=False, *uefiboot*=False, ***kwargs*)

Set boot device to use on next reboot

Parameters

- **bootdev** --
 - network: Request network boot
 - hd: Boot from hard drive
 - safe: Boot from hard drive, requesting `safe mode`
 - optical: boot from CD/DVD/BD drive
 - setup: Boot into setup utility
 - default: remove any IPMI directed boot device request
- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this

- **uefiboost** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no ``don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_key=None

Returns dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

```
salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile',
                                     alerting=False, per_msg_auth=False,
                                     user_level_auth=False, access_mode='always',
                                     privilege_update_mode='non_volatile', privilege_level='administrator', **kwargs)
```

Set channel access

Parameters

- **channel** -- number [1:7]
- **access_update_mode** --
 - `dont_change` = don't set or change Channel Access
 - `non_volatile` = set non-volatile Channel Access
 - `volatile` = set volatile (active) setting of Channel Access
- **alerting** --

PEF Alerting Enable/Disable

 - True = enable PEF Alerting
 - False = disable PEF Alerting on this channel

(Alert Immediate command can still be used to generate alerts)
- **per_msg_auth** --

Per-message Authentication

 - True = enable
 - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **user_level_auth** --

User Level Authentication Enable/Disable.

- True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
- False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **access_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
 - disabled = disabled for IPMI messaging
 - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
 - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
 - shared = same as always available, but BIOS typically leaves the serial port available for software use.
- **privilege_update_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
 - dont_change = don't set or change channel Privilege Level Limit
 - non_volatile = non-volatile Privilege Level Limit according
 - volatile = volatile setting of Privilege Level Limit
- **privilege_level** --

Channel Privilege Level Limit

 - reserved = unused
 - callback
 - user
 - operator
 - administrator
 - proprietary = used by OEM
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_key=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

`salt.modules.ipmi.set_identify` (*on=True, duration=600, **kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

CLI Examples:

```
salt-call ipmi.set_identify
```

`salt.modules.ipmi.set_power` (*state='power_on', wait=True, **kwargs*)

Request power state change

Parameters

- **name** --
 - `power_on` -- system turn on
 - `power_off` -- system turn off (without waiting for OS)
 - `shutdown` -- request OS proper shutdown
 - `reset` -- reset (without waiting for OS)
 - `boot` -- If system is off, then `on`, else `reset`
- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs** --
 - `api_host=127.0.0.1`
 - `api_user=admin`
 - `api_pass=example`
 - `api_port=623`
 - `api_kg=None`

Returns dict -- A dict describing the response retrieved

CLI Examples:

```
salt-call ipmi.set_power state=shutdown wait=True
```

`salt.modules.ipmi.set_user_access` (*uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs*)

Set user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** --
 - User Restricted to Callback
 - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
 - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in` to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
- **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging` refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
 - callback
 - user
 - operator
 - administrator
 - proprietary
 - no_access
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

`salt.modules.ipmi.set_user_name`(*uid*, *name*, ***kwargs*)
Set user name

Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16bytes)
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

`salt.modules.ipmi.set_user_password`(*uid*, *mode*='set_password', *password*=None, ***kwargs*)
Set user password and (modes)

Parameters

- **uid** -- id number of user. see: `get_names_uid()['name']`
- **mode** --
 - disable = disable user connections
 - enable = enable user connections
 - set_password = set or ensure password
 - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
 - api_host=127.0.0.1
 - api_user=admin
 - api_pass=example
 - api_port=623
 - api_kg=None

Returns True on success when mode = test_password, return False on bad password

CLI Example:

```
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
                                uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

`salt.modules.ipmi.user_delete`(*uid*, *channel*=14, ***kwargs*)

Delete user (helper)

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```
salt-call ipmi.user_delete uid=2
```

14.6.137 salt.modules.ipset

Support for ipset

salt.modules.ipset.add(*set=None, entry=None, family='ipv4', **kwargs*)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add setname 192.168.1.26
salt '*' ipset.add setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.check(*set=None, entry=None, family='ipv4'*)

Check that an entry exists in the specified set.

set The ipset name

entry An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

family IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

salt.modules.ipset.check_set(*set=None, family='ipv4'*)

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set setname
```

salt.modules.ipset.delete(*set=None, entry=None, family='ipv4', **kwargs*)

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.delete_set(*set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set

IPv6:
salt '*' ipset.delete_set custom_set family=ipv6
```

`salt.modules.ipset.flush` (*set=None, family='ipv4'*)
Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush

salt '*' ipset.flush set

IPv6:
salt '*' ipset.flush

salt '*' ipset.flush set
```

`salt.modules.ipset.list_sets` (*family='ipv4'*)
New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

`salt.modules.ipset.new_set` (*set=None, set_type=None, family='ipv4', comment=False, **kwargs*)
New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

`salt.modules.ipset.rename_set` (*set=None, new_set=None, family='ipv4'*)
New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

`salt.modules.ipset.test` (*set=None, entry=None, family='ipv4', **kwargs*)
Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2

IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

`salt.modules.ipset.version()`

Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

14.6.138 salt.modules.iptables

Support for iptables

`salt.modules.iptables.append(table='filter', chain=None, rule=None, family='ipv4')`

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.build_rule(table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs)`

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either a short option (*I*) or a long option (*--insert*). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with *-I* or *-D*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT
```

```

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='! 127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6

```

`salt.modules.iptables.check` (*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```

salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6

```

`salt.modules.iptables.check_chain` (*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```

salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6

```

`salt.modules.iptables.delete` (*table, chain=None, position=None, rule=None, family='ipv4'*)

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```

salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6

```

```
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.delete_chain`(*table='filter', chain=None, family='ipv4'*)
New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.flush`(*table='filter', chain='', family='ipv4'*)
Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT

IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

`salt.modules.iptables.get_policy`(*table='filter', chain=None, family='ipv4'*)
Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT

IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

`salt.modules.iptables.get_rules`(*family='ipv4'*)
Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules

IPv6:
salt '*' iptables.get_rules family=ipv6
```

`salt.modules.iptables.get_saved_policy`(*table='filter', chain=None, conf_file=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved

IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

```
salt.modules.iptables.get_saved_rules(conf_file=None, family='ipv4')
```

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules

IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

```
salt.modules.iptables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
```

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

```
salt.modules.iptables.new_chain(table='filter', chain=None, family='ipv4')
```

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

```
salt.modules.iptables.save(filename=None, family='ipv4')
```

Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

```
salt.modules.iptables.set_policy(table='filter', chain=None, policy=None, family='ipv4')
```

Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT
```

```
IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.version`(*family='ipv4'*)

Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

14.6.139 salt.modules.iwtools module

Support for Wireless Tools for Linux

`salt.modules.iwtools.list_interfaces`(*style=None*)

List all of the wireless interfaces

CLI Example:

```
salt minion iwtools.list_interfaces
```

`salt.modules.iwtools.scan`(*iface, style=None*)

List networks on a wireless interface

CLI Examples:

```
salt minion iwtools.scan wlp3s0 salt minion iwtools.scan wlp3s0 list
```

`salt.modules.iwtools.set_mode`(*iface, mode*)

List networks on a wireless interface

CLI Example:

```
salt minion iwtools.set_mode wlp3s0 Managed
```

14.6.140 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, `jboss_config` dictionary with the following properties must be passed:

- `cli_path`: the path to jboss-cli script, for example: ``/opt/jboss/jboss-7.0/bin/jboss-cli.sh'`
- `controller`: the IP address and port of controller, for example: `10.11.12.13:9999`
- `cli_user`: username to connect to jboss administration console if necessary
- `cli_password`: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

`salt.modules.jboss7.create_datasource` (*jboss_config*, *name*, *datasource_properties*, *profile=*`None`)

Create datasource in running jboss instance

jboss_config Configuration dictionary with properties specified above.

name Datasource name

datasource_properties

A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS`
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↳ ", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↳ "java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↳ "secret", "min-pool-size": 3, "use-java-context": True}'
```

`salt.modules.jboss7.create_simple_binding` (*jboss_config*, *binding_name*, *value*, *profile=*`None`)

Create a simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

value Binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding \
  '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", \
  "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password":
↳ "jbossadm"}' \
  my_binding_name my_binding_value
```

`salt.modules.jboss7.deploy` (*jboss_config*, *source_file*)

Deploy the application on the jboss instance from the local file system where minion is running.

jboss_config Configuration dictionary with properties specified above.

source_file Source file to deploy from

CLI Example:

```
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↳ test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↳ "cli_password": "jbossadm"}' /opt/deploy_files/my_deploy
```

`salt.modules.jboss7.list_deployments` (*jboss_config*)

List all deployments on the jboss instance

jboss_config

Configuration dictionary with properties specified above.

CLI Example:

```
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ ": "jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.read_datasource (*jboss_config*, *name*, *profile=None*)

Read datasource properties in the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile Profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.read_simple_binding (*jboss_config*, *binding_name*, *profile=None*)

Read jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_simple_binding '{"cli_path": "integration.modules.sysmod.
SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
"cli_user": "jbossadm", "cli_password": "jbossadm"}' my_binding_name
```

salt.modules.jboss7.reload (*jboss_config*, *host=None*)

Reload running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

CLI Example:

```
salt '*' jboss7.reload '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↳ test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↳ "cli_password": "jbossadm"}'
```

salt.modules.jboss7.remove_datasource (*jboss_config*, *name*, *profile=None*)

Remove an existing datasource from the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

salt.modules.jboss7.status (*jboss_config*, *host=None*, *server_config=None*)

Get status of running jboss instance.

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

server_config The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.stop_server` (*jboss_config, host=None*)

Stop running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in `host.xml`

CLI Example:

```
salt '*' jboss7.stop_server '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.undeploy` (*jboss_config, deployment*)

Undeploy the application from jboss instance

jboss_config Configuration dictionary with properties specified above.

deployment Deployment name to undeploy

CLI Example:

```
salt '*' jboss7.undeploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_deployment
```

`salt.modules.jboss7.update_datasource` (*jboss_config, name, new_properties, profile=None*)

Update an existing datasource in running jboss instance. If the property doesn't exist it will be created, if it does, it will be updated with the new value

jboss_config Configuration dictionary with properties specified above.

name Datasource name

new_properties

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS`
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_datasource '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name": "java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password": "secret", "min-pool-size": 3, "use-java-context": True}'
```

```
salt.modules.jboss7.update_simple_binding(jboss_config, binding_name, value, profile=None)
```

Update the simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be updated

value New binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳ "jbossadm", "cli_password": "jbossadm"}' my_binding_name my_binding_value
```

14.6.141 salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

Note: Following JBoss documentation (<https://developer.jboss.org/wiki/CommandLineInterface>): ``Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."`

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- **cli_path:** the path to jboss-cli script, for example: `"/opt/jboss/jboss-7.0/bin/jboss-cli.sh"`
- **controller:** the IP address and port of controller, for example: `10.11.12.13:9999`
- **cli_user:** username to connect to jboss administration console if necessary
- **cli_password:** password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

```
salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)
```

Execute a command against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

command Command to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionException exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.
↳SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳"jbossadm", "cli_password": "jbossadm"}' my_command
```

salt.modules.jboss7_cli.run_operation(*jboss_config*, *operation*, *fail_on_error*=True, *retries*=1)

Execute an operation against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

operation An operation to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionException exception if execution fails. If false, 'success' property of the returned dictionary is set to False

retries: Number of retries in case of ``JBAS012144: Could not connect to remote" error.

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.
↳SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↳"jbossadm", "cli_password": "jbossadm"}' my_operation
```

14.6.142 salt.modules.jenkins module

Module for controlling Jenkins

New in version 2016.3.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.jenkins.build_job(*name*=None, *parameters*=None)

Initiate a build for the provided job.

Parameters

- **name** -- The name of the job is check if it exists.
- **parameters** -- Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

salt.modules.jenkins.create_job(*name*=None, *config_xml*=None, *saltenv*='base')

Return the configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

`salt.modules.jenkins.delete_job`(*name=None*)

Return true is job is deleted successfully.

Parameters **name** -- The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

`salt.modules.jenkins.disable_job`(*name=None*)

Return true is job is disabled successfully.

Parameters **name** -- The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

`salt.modules.jenkins.enable_job`(*name=None*)

Return true is job is enabled successfully.

Parameters **name** -- The name of the job to enable.

Returns Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

`salt.modules.jenkins.get_job_config`(*name=None*)

Return the current job configuration for the provided job.

Parameters **name** -- The name of the job to return the configuration for.

Returns The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

`salt.modules.jenkins.get_job_info`(*name=None*)

Return information about the Jenkins job.

Parameters **name** -- The name of the job is check if it exists.

Returns Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

`salt.modules.jenkins.get_jobs`()

Return the currently configured jobs.

Returns The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```

`salt.modules.jenkins.get_version()`

Return version of Jenkins

Returns The version of Jenkins

CLI Example:

```
salt '*' jenkins.get_version
```

`salt.modules.jenkins.job_exists(name=None)`

Check whether the job exists in configured Jenkins jobs.

Parameters **name** -- The name of the job is check if it exists.

Returns True if job exists, False if job does not exist.

CLI Example:

```
salt '*' jenkins.job_exists jobname
```

`salt.modules.jenkins.job_status(name=None)`

Return the current status, enabled or disabled, of the job.

Parameters **name** -- The name of the job to return status for

Returns Return true if enabled or false if disabled.

CLI Example:

```
salt '*' jenkins.job_status jobname
```

`salt.modules.jenkins.plugin_installed(name)`

New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

Parameters **name** -- The name of the parameter to confirm installation.

Returns True if plugin exists, False if plugin does not exist.

CLI Example:

```
salt '*' jenkins.plugin_installed pluginName
```

`salt.modules.jenkins.update_job(name=None, config_xml=None, saltenv='base')`

Return the updated configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname
```

```
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

14.6.143 salt.modules.junos

Module for interfacing to Junos devices.

`salt.modules.junos.cli` (*command=None*)

Executes the CLI commands and reuturns the text output.

Usage:

```
salt 'device_name' junos.cli 'show version'
```

Options:

- `command`: The command that need to be executed on Junos CLI.

`salt.modules.junos.commit`()

To commit the changes loaded in the candidate configuration.

Usage:

```
salt 'device_name' junos.commit
```

`salt.modules.junos.diff`()

Gives the difference between the candidate and the current configuration.

Usage:

```
salt 'device_name' junos.diff
```

`salt.modules.junos.facts`()

Displays the facts gathered during the connection.

Usage:

```
salt 'device_name' junos.facts
```

`salt.modules.junos.facts_refresh`()

Reload the facts dictionary from the device. Usually only needed if the device configuration is changed by some other actor.

Usage:

```
salt 'device_name' junos.facts_refresh
```

`salt.modules.junos.file_copy` (*src=None, dest=None*)

Copies the file from the local device to the junos device.

Usage:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

Options

- `src`: The sorce path where the file is kept.
- `dest`: The destination path where the file will be copied.

`salt.modules.junos.install_config` (*path=None, **kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

Usage:

```
salt 'device_name' junos.install_config '/home/user/config.set' timeout=300
```

Options:

- path: Path where the configuration file is present.
- kwargs: keyworded arguments taken by load function of PyEZ

`salt.modules.junos.install_os` (*path=None, **kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

Usage:

```
salt 'device_name' junos.install_os '/home/user/junos_image.tgz' reboot=True
```

Options

- path: Path where the image file is present.
- kwargs: keyworded arguments to be given such as timeout, reboot etc

`salt.modules.junos.ping` ()

To check the connection with the device

Usage:

```
salt 'device_name' junos.ping
```

`salt.modules.junos.rollback` ()

To rollback the last committed configuration changes

Usage:

```
salt 'device_name' junos.rollback
```

`salt.modules.junos.rpc` (*cmd=None, dest=None, format='xml', *args, **kwargs*)

This function executes the rpc provided as arguments on the junos device. The returned data can be stored in a file whose destination can be specified with `dest` keyword in the arguments.

Usage:

```
salt 'device' junos.rpc 'get_config' 'text' filter='<configuration><system/></
↳configuration>'

salt 'device' junos.rpc 'get-interface-information' '/home/user/interface.log'
↳interface_name='lo0' terse=True
```

Options:

- cmd: the rpc to be executed
- dest: destination file where the rpc output is dumped
- format: the format in which the rpc reply must be stored in file specified in the dest (used only when dest is specified)
- args: other arguments as taken by rpc call of PyEZ
- kwargs: keyworded arguments taken by rpc call of PyEZ

`salt.modules.junos.set_hostname` (*hostname=None, commit_change=True*)

To set the name of the device.

Usage:

```
salt 'device_name' junos.set_hostname hostname=salt-device
```

Options:

- hostname: The name to be set.
- commit_change: Whether to commit the changes.(default=True)

`salt.modules.junos.shutdown` (*time=0*)
Shuts down the device after the given time.

Usage:

```
salt 'device_name' junos.shutdown 10
```

Options:

- time: Time in seconds after which the device should shutdown (default=0)

`salt.modules.junos.zeroize` ()
Resets the device to default factory settings

Usage:

```
salt 'device_name' junos.zeroize
```

14.6.144 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

`salt.modules.k8s.create_namespace` (*name, apiserver_url=None*)
New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: ..
code-block:: bash

```
kubectl create namespaces namespace-name
```

CLI Example:

```
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

`salt.modules.k8s.create_secret` (*namespace, name, sources, apiserver_url=None, force=False, update=False, saltenv='base'*)

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources
salt '*' k8s.create_secret namespace_name secret_name sources
http://kube-master.cluster.local
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename',
  ``file:///full/path/filename'',
  ``salt://secret/storage/file.txt'',
  ``http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```
{``nameit": ``/full/path/filename'', name2: ``salt://secret/storage/file.txt"}
```

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to ``true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://` path is used, this parameter can change the visibility of files

salt.modules.k8s.delete_secret (*namespace, name, apiserver_url=None, force=True*)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.
↳ local
```

salt.modules.k8s.get_labels (*node=None, apiserver_url=None*)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.get_namespaces (*namespace='', apiserver_url=None*)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:

```
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.get_secrets(*namespace, name='', apiserver_url=None, decode=False, brief=False*)
Get k8s namespaces

CLI Example:

```
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.local
```

salt.modules.k8s.label_absent(*name, node=None, apiserver_url=None*)

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.label_folder_absent(*name, node=None, apiserver_url=None*)

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.label_present(*name, value, node=None, apiserver_url=None*)

New in version 2016.3.0.

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.update_secret(*namespace, name, sources, apiserver_url=None, force=True, saltenv='base'*)

New in version 2016.3.0.

alias to k8s.create_secret with update=true

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url]
↳ [force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename',
 ``file:///full/path/filename",
 ``salt://secret/storage/file.txt",
 ``http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```
{`nameit`: `/full/path/filename', name2: ``salt://secret/storage/file.txt"}
```

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://` path is used, this parameter can change the visibility of files

14.6.145 salt.modules.kapacitor module

Kapacitor execution module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

salt.modules.kapacitor.define_task(name, tick_script, task_type='stream', database=None, retention_policy='default')

Define a task. Serves as both create/update.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a salt:// source.

task_type Task type. Defaults to `stream`

database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

retention_policy Which retention policy to fetch data from. Defaults to `default`.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

salt.modules.kapacitor.delete_task(name)

Delete a kapacitor task.

name Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

`salt.modules.kapacitor.disable_task(name)`

Disable a kapacitor task.

name Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

`salt.modules.kapacitor.enable_task(name)`

Enable a kapacitor task.

name Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

`salt.modules.kapacitor.get_task(name)`

Get a dict of data on a task.

name Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

`salt.modules.kapacitor.version(*args)`

Get the kapacitor version.

14.6.146 salt.modules.kerberos

Manage Kerberos KDC

configuration In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

`salt.modules.kerberos.create_keytab(name, keytab, enctypees=None)`

Create keytab

CLI Example:

```
salt 'kdc.example.com' host/host1.example.com host1.example.com.keytab
```

`salt.modules.kerberos.create_principal(name, enctypees=None)`

Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

`salt.modules.kerberos.delete_principal(name)`

Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

`salt.modules.kerberos.get_policy(name)`

Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

`salt.modules.kerberos.get_principal(name)`

Get princial details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

`salt.modules.kerberos.get_privs()`

Current privileges

CLI Example:

```
salt 'kdc.example.com' kerberos.get_privs
```

`salt.modules.kerberos.list_policies()`

List policies

CLI Example:

```
salt 'kdc.example.com' kerberos.list_policies
```

`salt.modules.kerberos.list_principals()`

Get all principals

CLI Example:

```
salt 'kde.example.com' kerberos.list_principals
```

14.6.147 salt.modules.key

Functions to view the minion's public key information

`salt.modules.key.finger()`

Return the minion's public key fingerprint

CLI Example:

```
salt '*' key.finger
```

`salt.modules.key.finger_master()`

Return the fingerprint of the master's public key on the minion.

CLI Example:

```
salt '*' key.finger_master
```

14.6.148 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.get_sys()

Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.get_x()

Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.set_sys(layout)

Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

salt.modules.keyboard.set_x(layout)

Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

14.6.149 salt.modules.keystone

Module for handling openstack keystone calls.

optdepends

- keystoneclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

OR (for token based authentication)

```
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

`salt.modules.keystone.api_version` (*profile=None*, ***connection_args*)

Returns the API version derived from endpoint's response.

CLI Example:

```
salt '*' keystone.api_version
```

`salt.modules.keystone.auth` (*profile=None*, ***connection_args*)

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```
salt '*' keystone.auth
```

`salt.modules.keystone.ec2_credentials_create` (*user_id=None*, *name=None*, *tenant_id=None*, *tenant=None*, *profile=None*, ***connection_args*)

Create EC2-compatible credentials for user per tenant

CLI Examples:

```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create user_
↳ id=c965f79c4f864eaaa9c3b41904e67082 tenant_
↳ id=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_delete` (*user_id=None*, *name=None*, *access_key=None*, *profile=None*, ***connection_args*)

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete 860f8c2c38ca4fab989f9bc56a061a64
↳ access_key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin access_
↳ key=5f66d2f24f604b8bb9cd28886106f442
```

```
salt.modules.keystone.ec2_credentials_get(user_id=None, name=None, access=None, profile=None, **connection_args)
```

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082
↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
↪access=722787eb540849158668370dc627ec5f
```

```
salt.modules.keystone.ec2_credentials_list(user_id=None, name=None, profile=None, **connection_args)
```

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack
```

```
salt.modules.keystone.endpoint_create(service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)
```

Create an endpoint for an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
↪'http://adminurl/url' region
salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public'
```

```
salt.modules.keystone.endpoint_delete(service, profile=None, **connection_args)
```

Delete endpoints of an Openstack service

CLI Examples:

```
salt '*' keystone.endpoint_delete nova
```

```
salt.modules.keystone.endpoint_get(service, profile=None, **connection_args)
```

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```
salt '*' keystone.endpoint_get nova
```

```
salt.modules.keystone.endpoint_list(profile=None, **connection_args)
```

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```
salt '*' keystone.endpoint_list
```

```
salt.modules.keystone.project_create(name, domain, description=None, enabled=True, profile=None, **connection_args)
```

Create a keystone project. Overrides keystone tenant_create from api V2. For keystone api V3.

New in version 2016.11.0.

name The project name, which must be unique within the owning domain.

domain The domain name.

description The project description.

enabled Enables or disables the project.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

salt.modules.keystone.project_delete(*project_id=None, name=None, profile=None, **connection_args*)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

salt.modules.keystone.project_get(*project_id=None, name=None, profile=None, **connection_args*)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

salt.modules.keystone.project_list(*profile=None, **connection_args*)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

salt.modules.keystone.project_update(*project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args*)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.
name The project name, which must be unique within the owning domain.
description The project description.
enabled Enables or disables the project.
profile Configuration profile - if configuration for multiple openstack accounts required.
 CLI Examples:

```
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin
↳email=admin@domain.com
```

salt.modules.keystone.role_create(*name*, *profile=None*, ***connection_args*)
 Create a named role.

CLI Example:

```
salt '*' keystone.role_create admin
```

salt.modules.keystone.role_delete(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)
 Delete a role (keystone role-delete)

CLI Examples:

```
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

salt.modules.keystone.role_get(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)
 Return a specific roles (keystone role-get)

CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

salt.modules.keystone.role_list(*profile=None*, ***connection_args*)
 Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

salt.modules.keystone.service_create(*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)
 Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

salt.modules.keystone.service_delete(*service_id=None*, *name=None*, *profile=None*, ***connection_args*)
 Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

`salt.modules.keystone.service_get`(*service_id=None, name=None, profile=None, **connection_args*)

Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

`salt.modules.keystone.service_list`(*profile=None, **connection_args*)

Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

`salt.modules.keystone.tenant_create`(*name, description=None, enabled=True, profile=None, **connection_args*)

Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

`salt.modules.keystone.tenant_delete`(*tenant_id=None, name=None, profile=None, **connection_args*)

Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

`salt.modules.keystone.tenant_get`(*tenant_id=None, name=None, profile=None, **connection_args*)

Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

`salt.modules.keystone.tenant_list`(*profile=None, **connection_args*)

Return a list of available tenants (keystone tenants-list)

CLI Example:

```
salt '*' keystone.tenant_list
```

`salt.modules.keystone.tenant_update`(*tenant_id=None, name=None, description=None, enabled=None, profile=None, **connection_args*)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:

```
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin
↳email=admin@domain.com
```

`salt.modules.keystone.token_get` (*profile=None, **connection_args*)
Return the configured tokens (keystone token-get)

CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

`salt.modules.keystone.user_create` (*name, password, email, tenant_id=None, enabled=True, profile=None, project_id=None, description=None, **connection_args*)

Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.
↳org tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True
```

`salt.modules.keystone.user_delete` (*user_id=None, name=None, profile=None, **connection_args*)

Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

`salt.modules.keystone.user_get` (*user_id=None, name=None, profile=None, **connection_args*)
Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

`salt.modules.keystone.user_list` (*profile=None, **connection_args*)
Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

`salt.modules.keystone.user_password_update` (*user_id=None, name=None, password=None, profile=None, **connection_args*)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
↳password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082
↳password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

```
salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None,
                                     role_id=None, role=None, profile=None, project_id=None,
                                     project_name=None, **connection_args)
```

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↳id=7167a092ece84bae8cead4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

```
salt.modules.keystone.user_role_list(user_id=None, tenant_id=None, user_name=None,
                                       tenant_name=None, profile=None, project_id=None,
                                       project_name=None, **connection_args)
```

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
↳id=7167a092ece84bae8cead4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

```
salt.modules.keystone.user_role_remove(user_id=None, user=None, tenant_id=None, ten-
                                       ant=None, role_id=None, role=None, profile=None,
                                       project_id=None, project_name=None, **connec-
                                       tion_args)
```

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654
↳tenant_id=7167a092ece84bae8cead4bf9d15bb3b role_
↳id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

```
salt.modules.keystone.user_update(user_id=None, name=None, email=None, enabled=None, ten-
                                   ant=None, profile=None, project=None, description=None,
                                   **connection_args)
```

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082
↳name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname
↳email=newemail@domain.com
```

```
salt.modules.keystone.user_verify_password(user_id=None, name=None, password=None,
                                             profile=None, **connection_args)
```

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082
↳password=foobar
```

14.6.150 salt.modules.kmod

Module to manage Linux kernel modules

`salt.modules.kmod.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.kmod.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

`salt.modules.kmod.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

`salt.modules.kmod.load(mod, persist=False)`

Load the specified kernel module

mod Name of module to add

persist Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

`salt.modules.kmod.lsmmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmmod
```

`salt.modules.kmod.mod_list(only_persist=False)`

Return a list of the loaded module names

only_persist Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.kmod.remove(mod, persist=False, comment=True)`

Remove the specified kernel module

mod Name of module to remove

persist Also remove module from /etc/modules

comment If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

14.6.151 salt.modules.launchctl

Module for the management of MacOS systems that use launchd/launchctl

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

depends

- plistlib Python module

`salt.modules.launchctl.available`(*job_label*)

Check that the given service is available.

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.launchctl.disabled`(*job_label*, *runas=None*)

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service label>
```

`salt.modules.launchctl.enabled`(*job_label*, *runas=None*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service label>
```

`salt.modules.launchctl.get_all`()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.launchctl.missing`(*job_label*)

The inverse of `service.available` Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.launchctl.restart`(*job_label*, *runas=None*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

`salt.modules.launchctl.start`(*job_label*, *runas=None*)

Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

`salt.modules.launchctl.status`(*job_label*, *runas=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service label>
```

`salt.modules.launchctl.stop`(*job_label*, *runas=None*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

14.6.152 salt.modules.layman

Support for Layman

`salt.modules.layman.add`(*overlay*)

Add the given overlay from the cached remote list to your locally installed overlays. Specify `ALL` to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

`salt.modules.layman.delete`(*overlay*)

Remove the given overlay from the your locally installed overlays. Specify `ALL` to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```

`salt.modules.layman.list_all`()

List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:

```
salt '*' layman.list_all
```

`salt.modules.layman.list_local`()

List the locally installed overlays.

Return a list of installed overlays:

CLI Example:

```
salt '*' layman.list_local
```

`salt.modules.layman.sync` (*overlay='ALL'*)

Update the specified overlay. Use `ALL' to synchronize all overlays. This is the default if no overlay is specified.
overlay Name of the overlay to sync. (Defaults to `ALL')

CLI Example:

```
salt '*' layman.sync
```

14.6.153 salt.modules.ldap3

Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the *ldapmod* execution module.

depends

- `ldap` Python module

exception `salt.modules.ldap3.LDAPError` (*message, cause=None*)

Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

Variables **cause** -- backend exception object, if applicable

`salt.modules.ldap3.add` (*connect_spec, dn, attributes*)

Add an entry to an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **attributes** -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

Returns True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.add "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret',
  },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

`salt.modules.ldap3.change` (*connect_spec, dn, before, after*)

Modify an entry in an LDAP database.

This does the same thing as `modify()`, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

Returns True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.change "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
before="{ 'example_value': 'before_val' }"
after="{ 'example_value': 'after_val' }"
```

`salt.modules.ldap3.connect(connect_spec=None)`

Connect and optionally bind to an LDAP server.

Parameters **connect_spec** -- This can be an LDAP connection object returned by a previous call to `connect()` (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- **'backend'** Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only `'ldap'` is supported at the moment.
- **'url'** Optional; defaults to `'ldapi:///'`. URL to the LDAP server.
- **'bind'** Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:
 - **'method'** Optional; defaults to `None`. The authentication method to use. Valid values include but are not necessarily limited to `'simple'`, `'sasl'`, and `None`. If `None`, an anonymous connection is made. Available methods depend on the chosen backend.
 - **'mechanism'** Optional; defaults to `'EXTERNAL'`. The SASL mechanism to use. Ignored unless the method is `'sasl'`. Available methods depend on the chosen backend and the server's capabilities.
 - **'credentials'** Optional; defaults to `None`. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is `'sasl'`.

For the `'ldap'` backend, this is a dictionary. If `None`, an empty dict is used. Keys:

- * **'args'** Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
- * **'kwargs'** Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
- **'dn'** Optional; defaults to an empty string. The distinguished name to bind.
- **'password'** Optional; defaults to an empty string. Password for binding. Ignored if the method is `'sasl'`.
- **'tls'** Optional; defaults to `None`. A backend-specific object containing settings to override default TLS behavior.

For the `'ldap'` backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If `None`, an empty dict is used. Possible keys:

- **'starttls'** If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
- **'cacertdir'** Set the path of the directory containing CA certificates.
- **'cacertfile'** Set the pathname of the CA certificate file.
- **'certfile'** Set the pathname of the certificate file.
- **'cipher_suite'** Set the allowed cipher suite.
- **'crlcheck'** Set the CRL evaluation strategy. Valid values are `'none'`, `'peer'`, and `'all'`.
- **'crlfile'** Set the pathname of the CRL file.
- **'dhfile'** Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
- **'keyfile'** Set the pathname of the certificate key file.
- **'newctx'** If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
- **'protocol_min'** Set the minimum protocol version.
- **'random_file'** Set the pathname of the random file when `/dev/random` and `/dev/urandom` are not available.
- **'require_cert'** Set the certificate validation policy. Valid values are `'never'`, `'hard'`, `'demand'`, `'allow'`, and `'try'`.
- **'opts'** Optional; defaults to `None`. A backend-specific object containing options for the backend.

For the `'ldap'` backend, this is a dictionary of OpenLDAP options to set. If `None`, an empty dict is used. Each key is the name of an OpenLDAP option constant without the `'LDAP_OPT_'` prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest `with` statements.

CLI example:

```
salt '*' ldap3.connect "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'dn': 'cn=admin,dc=example,dc=com',
    'password': 'secret'}
}"
```

`salt.modules.ldap3.delete`(*connect_spec*, *dn*)

Delete an entry from an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.

Returns True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.delete "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

`salt.modules.ldap3.modify`(*connect_spec*, *dn*, *directives*)

Modify an entry in an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form (*op*, *attr*, *vals*), where:
 - *op* identifies the modification operation to perform. One of:
 - * `'add'` to add one or more values to the attribute
 - * `'delete'` to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
 - * `'replace'` to replace all of the attribute's values with zero or more new values
 - *attr* names the attribute to modify
 - *vals* is an iterable of values to add or delete

Returns True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.modify "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
```

```
'method': 'simple',
  'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
directives="('add', 'example', ['example_val'])"
```

`salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)`

Search an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
 - **'subtree'** Search the base and all of its descendants.
 - **'base'** Search only the base itself.
 - **'onelevel'** Search only the base's immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
- **attrlist** -- Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- **attrsonly** -- If non-zero, don't return any attribute values.

Returns a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI example:

```
salt '*' ldap3.search "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'dn': 'cn=admin,dc=example,dc=com',
    'password': 'secret',
  },
}" "base='dc=example,dc=com'"
```

14.6.154 salt.modules.ldapmod

Salt interface to LDAP commands

depends

- ldap Python module

configuration In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

Warning: At the moment this module only recommends connection to LDAP services listening on `localhost`. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

`salt.modules.ldapmod.search`(*filter*, *dn=None*, *scope=None*, *attrs=None*, ***kwargs*)

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1,
            'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
                        {'saltKeyValue': ['ntpserver=ntp.acme.local',
                                           'foo=myfoo'],
                         'saltState': ['foo', 'bar']}]},
            'time': {'human': '1.2ms', 'raw': '0.00123'}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb
scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

14.6.155 salt.modules.linux_acl

Support for Linux File Access Control Lists

`salt.modules.linux_acl.delfacl`(*acl_type*, *acl_name=''*, **args*, ***kwargs*)

Remove specific ACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

`salt.modules.linux_acl.getfacl(*args, **kwargs)`
Return (extremely verbose) map of ACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

`salt.modules.linux_acl.modfacl(acl_type, acl_name='', perms='', *args, **kwargs)`
Add or modify a ACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
```

`salt.modules.linux_acl.version()`
Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

`salt.modules.linux_acl.wipefacls(*args, **kwargs)`
Remove all ACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

14.6.156 salt.modules.linux_ip module

The networking module for Non-RH/Deb Linux distros

`salt.modules.linux_ip.down(iface, iface_type=None)`
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.linux_ip.get_interface(iface)`
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.linux_ip.get_routes(iface=None)`
Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

`salt.modules.linux_ip.up`(*iface*, *iface_type=None*)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

14.6.157 salt.modules.linux_lvm

Support for Linux LVM2

`salt.modules.linux_lvm.fullversion`()
Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

`salt.modules.linux_lvm.lvcreate`(*lvname*, *vgname*, *size=None*, *extents=None*, *snapshot=None*,
pv=None, *thinvolume=False*, *thinpool=False*, ***kwargs*)
Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name    vg_name size=10G
salt '*' lvm.lvcreate new_volume_name    vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot       vg_name snapshot=volume_name size=3G
```

New in version to_complete.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name  vg_name size=20G
↳thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
↳thinvolume=True
```

`salt.modules.linux_lvm.lvdisplay`(*lvname=''*)
Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

`salt.modules.linux_lvm.lvremove`(*lvname*, *vgname*)
Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvrmove lvname vgname force=True
```

`salt.modules.linux_lvm.lvresize` (*size, lvpath*)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
```

`salt.modules.linux_lvm.pvcreate` (*devices, override=True, **kwargs*)

Set a physical device to be used as an LVM physical volume

override Skip devices, if they are already an LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

`salt.modules.linux_lvm.pvdisplay` (*pvname='', real=False*)

Return information about the physical volume(s)

pvname physical device name

real dereference any symlinks and report the real device

New in version 2015.8.7.

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

`salt.modules.linux_lvm.pvremove` (*devices, override=True*)

Remove a physical device being used as an LVM physical volume

override Skip devices, if they are already not used as an LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.version` ()

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

`salt.modules.linux_lvm.vgcreate` (*vgname, devices, **kwargs*)

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

`salt.modules.linux_lvm.vgdisplay` (*vgname=''*)

Return information about the volume group(s)

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

`salt.modules.linux_lvm.vgextend` (*vgname, devices*)

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

`salt.modules.linux_lvm.vgremove`(*vgname*)

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

14.6.158 salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.assign`(*name, value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.default_config`()

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd \geq 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

`salt.modules.linux_sysctl.get`(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

`salt.modules.linux_sysctl.persist`(*name, value, config=None*)

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using `sysctl.default_config`.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.show`(*config_file=False*)

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

14.6.159 salt.modules.localemod

Module for managing locales on POSIX-like systems.

`salt.modules.localemod.avail(locale)`

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

`salt.modules.localemod.gen_locale(locale, **kwargs)`

Generate a locale. Options:

New in version 2014.7.0.

Parameters locale -- Any locale listed in `/usr/share/i18n/locales` or `/usr/share/i18n/SUPPORTED` for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8' # Debian/Gentoo only
```

`salt.modules.localemod.get_locale()`

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

`salt.modules.localemod.list_avail()`

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

`salt.modules.localemod.set_locale(locale)`

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

14.6.160 salt.modules.locate

Module for using the locate utilities

`salt.modules.locate.locate(pattern, database='', limit=0, **kwargs)`

Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
```

```
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

`salt.modules.locate.stats()`

Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

`salt.modules.locate.updatedb()`

Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

`salt.modules.locate.version()`

Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

14.6.161 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

`salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf')`

Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

`salt.modules.logadm.rotate(name, pattern=False, count=False, age=False, size=False, copy=True, conf_file='/etc/logadm.conf')`

Set up pattern for logging.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
```

`salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf')`

Show parsed configuration

CLI Example:

```
salt '*' logadm.show_conf
```

14.6.162 salt.modules.logrotate

Module for managing logrotate.

`salt.modules.logrotate.set`(*key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.show_conf`(*conf_file='/etc/logrotate.conf'*)

Show parsed configuration

CLI Example:

```
salt '*' logrotate.show_conf
```

14.6.163 salt.modules.lvs

Support for LVS (Linux Virtual Server)

`salt.modules.lvs.add_server`(*protocol=None*, *service_address=None*, *server_address=None*,
packet_forward_method='dr', *weight=1*, ***kwargs*)

Add a real server to a virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.add_service`(*protocol=None*, *service_address=None*, *scheduler='wlc'*)

Add a virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.check_server` (*protocol=None, service_address=None, server_address=None, **kwargs*)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.check_service` (*protocol=None, service_address=None, **kwargs*)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

`salt.modules.lvs.clear` ()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

`salt.modules.lvs.delete_server` (*protocol=None, service_address=None, server_address=None*)

Delete the realserver from the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

server_address The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.delete_service` (*protocol=None, service_address=None*)

Delete the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

`salt.modules.lvs.edit_server` (*protocol=None, service_address=None, server_address=None, packet_forward_method=None, weight=None, **kwargs*)

Edit a real server to a virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.edit_service` (*protocol=None, service_address=None, scheduler=None*)

Edit the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.get_rules` ()

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

`salt.modules.lvs.list` (*protocol=None, service_address=None*)

List the virtual server table if `service_address` is not specified. If a `service_address` is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

`salt.modules.lvs.zero` (*protocol=None, service_address=None*)

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

14.6.164 salt.modules.lxc

Control Linux Containers via Salt

depends lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

`salt.modules.lxc.apply_network_profile` (*name, network_profile, nic_opts=None, path=None*)

New in version 2015.5.0.

Apply a network profile to a container

network_profile profile name or default values (dict)

nic_opts values to override in defaults (dict) indexed by nic card names

path path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
salt 'minion' lxc.apply_network_profile web1 \
    "{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:yy' } }"
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
    "{eth0: {disable: true}}"
```

`salt.modules.lxc.attachable`(*name*, *path=None*)

Return True if the named container can be attached to via the lxc-attach command

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

`salt.modules.lxc.bootstrap`(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *path=None*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)

Install and configure salt in a container.

config Minion configuration options. By default, the `master` option is set to the target host's master.

approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `True`

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

pub_key Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

priv_key Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url url, content or filepath to the salt bootstrap script

bootstrap_args salt bootstrap script arguments

bootstrap_shell shell to execute the script into

install Whether to attempt a full installation of salt-minion if needed.

force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
    [approve_key=(True|False)] [install=(True|False)]
```

`salt.modules.lxc.clone`(*name*, *orig*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container as a clone of another container

name Name of the container

orig Name of the original container to be cloned

profile Profile to use in container cloning (see `lxc.get_container_profile`). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

Container Cloning Arguments

snapshot Use Copy On Write snapshots (LVM)

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.
network_profile Network profile to use for container

New in version 2015.8.0.

nic_opts give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

`salt.modules.lxc.cloud_init`(*name*, *vm_*=None, ***kwargs*)

Thin wrapper to `lxc.init` to be used from the saltcloud `lxc` driver

name Name of the container may be None and then guessed from saltcloud mapping

vm_ saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

`salt.modules.lxc.cloud_init_interface`(*name*, *vm_*=None, ***kwargs*)

Interface between `salt.cloud.lxc` driver and `lxc.init` *vm_* is a mapping of vm opts in the salt.cloud format as documented for the `lxc` driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly `lxc.init`

Warning: BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name name of the lxc container to create

pub_key public key to preseed the minion with. Can be the keycontent or a filepath

priv_key private key to preseed the minion with. Can be the keycontent or a filepath

path path to the container parent directory (default: `/var/lib/lxc`)

New in version 2015.8.0.

profile profile selection

network_profile network profile selection

nic_opts per interface settings compatibles with network profile (`ipv4/ipv6/link/gateway/mac/netmask`)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
           'gateway': None, (default)
           'link': 'br0', (default)
           'gateway': None, (default)
           'netmask': '', (default)
           'ip': '22.1.4.25'}}
```

unconditional_install given to `lxc.bootstrap` (see relative doc)

force_install given to `lxc.bootstrap` (see relative doc)

config any extra argument for the salt minion config

dnsservers dns servers to set inside the container

autostart autostart the container at boot time

password administrative password for the container

bootstrap_delay delay before launching bootstrap script at Container init

Warning: Legacy but still supported options:

from_container which container we use as a template when running `lxc.clone`

image which template do we use when we are using `lxc.create`. This is the default mode unless you specify something in `from_container`

backing which backing store to use. Values can be: `overlayfs`, `dir`(default), `lvm`, `zfs`, `brtfs`

fstype When using a blockdevice level backing store, which filesystem to use on

size When using a blockdevice level backing store, which size for the filesystem to use on

snapshot Use snapshot when cloning the container source

vgname if using LVM: `vgname`

lvname if using LVM: `lvname`

ip ip for the primary nic

mac mac address for the primary nic

netmask netmask for the primary nic (`24`) = `vm_.get('netmask', '24')`

bridge bridge for the primary nic (`lxcbr0`)

gateway network gateway for the container

additional_ips additional ips which will be wired on the main bridge (`br0`) which is connected to internet. Be aware that you may use manual virtual mac addresses provided by your provider (online, ovh, etc). This is a list of mappings `{ip: '', mac: '', netmask:''}` Set gateway to `None` and an interface with a gateway to escape from another interface that `eth0`. eg:

```
- {'mac': '00:16:3e:01:29:40',
   'gateway': None, (default)
   'link': 'br0', (default)
   'netmask': '', (default)
   'ip': '22.1.4.25'}
```

users administrative users for the container default: `[root]` and `[root, ubuntu]` on `ubuntu`

default_nic name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.copy_to`(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

name Container name

source File to be copied to the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

dest Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

makedirs : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

salt.modules.lxc.create(*name*, *config=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container.

name Name of the container

config The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).

profile Profile to use in container creation (see [lxc.get_container_profile](#)). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

network_profile Network profile to use for container

New in version 2015.5.0.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the [lxc.images](#) function.

options Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{"dist": "centos", "release": "6", "arch": "amd64"}'
```

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

fstype Filesystem type to use on LVM logical volume

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

vgname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

nic_opts give extra opts overriding network profile values

path parent path for the container creation (default: `/var/lib/lxc`)

zfsroot Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: `tank/lxc`)

New in version 2015.8.0.

salt.modules.lxc.destroy(*name*, *stop=False*, *path=None*)

Destroy the named container.

Warning: Destroys all data associated with the container.

path path to the container parent directory (default: `/var/lib/lxc`)

New in version 2015.8.0.

stop [False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy` (1), and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.edit_conf`(*conf_file*, *out_format*='simple', *read_only*=False, *lxc_config*=None, ***kwargs*)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

out_format: Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

read_only: return only the edited configuration without applying it to the underlying lxc configuration file

lxc_config: List of dict containing lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in `simple` format, meaning an unordered dict (which may not represent the actual file order). Passing in an `out_format` of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented \
  lxc_config='[{"lxc.network.name": "eth0", \
    "lxc.network.ipv4": "1.2.3.4"}, \
    {"lxc.network.name": "eth2", \
    "lxc.network.ipv4": "1.2.3.5"}, \
    {"lxc.network.gateway": "1.2.3.1"}]'
```

`salt.modules.lxc.exists`(*name*, *path*=None)

Returns whether the named container exists.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

`salt.modules.lxc.freeze`(*name*, ***kwargs*)

Freeze the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

start [False] If True and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

`salt.modules.lxc.get_container_profile` (*name=None, **kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
  ubuntu:
    template: ubuntu
    backing: lvm
    vgname: lxc
    size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

`salt.modules.lxc.get_network_profile` (*name=None, **kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use network profiles.

Warning: The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.get_parameter` (*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

path path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.get_root_path` (*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.images` (*dist=None*)

New in version 2015.5.0.

List the available images for LXC's download template.

dist [None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.info` (*name*, *path=None*)

Returns information about a container

path path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

`salt.modules.lxc.init` (*name*, *config=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *cpu=None*, *autostart=True*, *password=None*, *password_encrypted=None*, *users=None*, *dnsservers=None*, *searchdomains=None*, *bridge=None*, *gateway=None*, *pub_key=None*, *priv_key=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*, *bootstrap_url=None*, ***kwargs*)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name Name of the container
image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.
cpus Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored
cpuset Explicitly define the cpus this container will be bound to
cpushare cgroups cpu shares
autostart autostart container on reboot
memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

gateway the ipv4 gateway to use the default does nothing more than lxcutils does
bridge the bridge to use the default does nothing more than lxcutils does
network_profile Network profile to use for the container

New in version 2015.5.0.

nic_opts Extra options for network interfaces, will override

```
{ "eth0": { "hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329" }}
```

or

```
{ "eth0": { "hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329" }}
```

users Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

password Set the initial password for the users defined in the `users` parameter

password_encrypted [False] Set to True to denote a password hash instead of a plaintext password

New in version 2015.5.0.

profile A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

start Start the newly-created container

dnsservers list of dns servers to set in the container, default [] (no setting)

seed Seed the container with the minion config. Default: True

install If salt-minion is not already installed, install it. Default: True

config Optional config parameters. By default, the id is set to the name of the container.

master salt master (default to minion's master)

master_port salt master port (default to minion's master port)

pub_key Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

priv_key Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

approve_key If explicit preseeding is not used; Attempt to request key approval from the master. Default: True

path path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

clone_from Original from which to use a clone operation to create the container. Default: None

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url See `lxc.bootstrap`

bootstrap_shell See `lxc.bootstrap`

bootstrap_args See `lxc.bootstrap`

force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
    [nic=nic_profile] [profile=lxc_profile] \
    [nic_opts=nic_opts] [start=(True|False)] \
    [seed=(True|False)] [install=(True|False)] \
    [config=minion_config] [approve_key=(True|False)] \
    [clone_from=original] [autostart=True] \
    [priv_key=/path_or_content] [pub_key=/path_or_content] \
    [bridge=lxcbr0] [gateway=10.0.3.1] \
    [dnsservers[dns1,dns2]] \
    [users=[foo]] [password='secret'] \
    [password_encrypted=(True|False)]
```

salt.modules.lxc.list (*extra=False, limit=None, path=None*)

List containers classified by state

extra Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *lxc.info*.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

salt.modules.lxc.ls (*active=None, cache=True, path=None*)

Return a list of the containers available on the minion

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

active If True, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

salt.modules.lxc.read_conf (*conf_file, out_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

out_format: set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

salt.modules.lxc.reboot (*name, path=None*)

Reboot a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

salt.modules.lxc.reconfigure(*name*, *cpu*=None, *cpuset*=None, *cpushare*=None, *memory*=None, *profile*=None, *network_profile*=None, *nic_opts*=None, *bridge*=None, *gateway*=None, *autostart*=None, *utsname*=None, *rootfs*=None, *path*=None, ***kwargs*)

Reconfigure a container.

This only applies to a few property

name Name of the container.

utsname utsname of the container.

New in version 2016.3.0.

rootfs rootfs of the container.

New in version 2016.3.0.

cpu Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares.

autostart autostart container on reboot

memory cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

nic Network interfaces profile (defined in config or pillar).

nic_opts Extra options for network interfaces, will override

```
{ "eth0": { "mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329" }}
```

or

```
{ "eth0": { "mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329" }}
```

path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{ 'eth1': { 'mac': '00:16:↪3e:dd:ee:44' } }" memory=4
```

salt.modules.lxc.restart(*name*, *path*=None, *lxc_config*=None, *force*=False)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name The name of the container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

force [False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

`salt.modules.lxc.retcode`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.5.0.

Run `cmd.retcode` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

`salt.modules.lxc.run`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.8.0.

Run `cmd.run` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

name Name of the container in which to run the command

cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

chroot_fallback if the container is not running, try to run the command using `chroot` default: `false`

keep_env [`http_proxy,https_proxy,no_proxy`] A list of env vars to preserve. May be passed as comma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

```
salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
python_shell=True, output_loglevel='debug', use_vt=False, path=None,
ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,
https_proxy, no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_all` within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

Warning: Many shell builtins do not work, failing with `stderr` similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in `stderr` if the command being run does not exist.

name Name of the container in which to run the command

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

keep_env [`http_proxy,https_proxy,no_proxy`] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
python_shell=True, output_loglevel='debug', use_vt=False, path=None,
ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,
https_proxy, no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name Name of the container in which to run the command

cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None,
                           python_shell=True, output_loglevel='debug', use_vt=False, path=None,
                           ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,
                           https_proxy, no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stdout` within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

name Name of the container in which to run the command

cmd Command to run

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.lxc.running_systemd`(*name*, *cache=True*, *path=None*)

Determine if systemd is running
path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

`salt.modules.lxc.search_lxc_bridge`()

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

`salt.modules.lxc.search_lxc_bridges`()

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

`salt.modules.lxc.set_dns`(*name*, *dnsservers=None*, *searchdomains=None*, *path=None*)

Changed in version 2015.5.0: The `dnsservers` and `searchdomains` parameters can now be passed as a comma-separated list.

Update `/etc/resolv.conf`

path

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

`salt.modules.lxc.set_parameter`(*name*, *parameter*, *value*, *path=None*)

Set the value of a cgroup parameter for a container.

path path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

`salt.modules.lxc.set_password`(*name*, *users*, *password*, *encrypted=True*, *path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

users Comma-separated list (or python list) of users to change password

password Password to set for the specified user(s)

encrypted [True] If true, password must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↳0fXtJ0PcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCB0qgbfdKQSFnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.start(*name*, ***kwargs*)

Start the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

salt.modules.lxc.state(*name*, *path=None*)

Returns the state of a container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

salt.modules.lxc.stop(*name*, *kill=False*, *path=None*, *use_vt=None*)

Stop the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

kill: False Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to False

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

salt.modules.lxc.systemd_running_state(*name*, *path=None*)

Get the operational state of a systemd based container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

salt.modules.lxc.templates()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

salt.modules.lxc.test_bare_started_state(*name*, *path=None*)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

salt.modules.lxc.test_sd_started_state(*name*, *path=None*)

Test if a systemd container is fully started

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

salt.modules.lxc.unfreeze(*name*, *path=None*, *use_vt=None*)

Unfreeze the named container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

salt.modules.lxc.update_lxc_conf(*name*, *lxc_conf*, *lxc_conf_unset*, *path=None*)

Edit LXC configuration options

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \  
  lxc_conf="{['network.ipv4.ip':'10.0.3.5']}" \  
  lxc_conf_unset=["lxc.utsname"]
```

salt.modules.lxc.version()

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

salt.modules.lxc.wait_started(*name*, *path=None*, *timeout=300*)

Check that the system has fully initied

This is actually very important for systemD based containers

see <https://github.com/saltstack/salt/issues/23847>

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

salt.modules.lxc.write_conf(*conf_file, conf*)

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
  {'lxc.utsname': '$CONTAINER_NAME'},
  '# This is a commented line\n',
  '\n',
  {'lxc.mount': '$CONTAINER_FSTAB'},
  {'lxc.rootfs': {'comment': 'This is another test',
                  'value': 'This is another test'}},
  '\n',
  {'lxc.network.type': 'veth'},
  {'lxc.network.flags': 'up'},
  {'lxc.network.link': 'br0'},
  {'lxc.network.mac': '$CONTAINER_MACADDR'},
  {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
  {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
  out_format=commented
```

14.6.165 salt.modules.mac_assistive module

This module allows you to manage assistive access on OS X minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

salt.modules.mac_assistive.enable(*app_id, enabled=True*)

Enable or disable an existing assistive access application.

app_id The bundle ID or command to set assistive access status.

enabled Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

salt.modules.mac_assistive.enabled(*app_id*)

Check if a bundle ID or command is listed in assistive access and enabled.

app_id The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.install`(*app_id*, *enable=True*)

Install a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to install for assistive access.

enabled Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.installed`(*app_id*)

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.remove`(*app_id*)

Remove a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

14.6.166 salt.modules.mac_brew module

Homebrew for Mac OS X

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install is not available`), see [here](#).

`salt.modules.mac_brew.available_version`(*names, **kwargs)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew.info_installed`(*names)

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names The names of the packages for which to return information.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.mac_brew.install`(*name=None, pkgs=None, taps=None, options=None, **kwargs*)

Install the passed package(s) with `brew install`

name The name of the formula to be installed. Note that this parameter is ignored if ``pkgs`` is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

taps Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
```

options Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if ``pkgs`` is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
↪options='["--with-fpm"]'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

Returns a dict containing the new package names and versions:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew.latest_version`(**names, **kwargs*)

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew.list_pkgs`(*versions_as_list=False, **kwargs*)

List the packages currently installed in a dict:

```
{<package_name>: '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew.list_upgrades` (*refresh=True, **kwargs*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_brew.refresh_db` ()

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.mac_brew.remove` (*name=None, pkgs=None, **kwargs*)

Removes packages with `brew uninstall`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.mac_brew.upgrade` (*refresh=True*)

Upgrade outdated, unpinned brews.

refresh Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_brew.upgrade_available` (*pkg*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_brew.version` (**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

14.6.167 salt.modules.mac_defaults module

Set defaults on Mac OS

salt.modules.mac_defaults.delete(*domain, key, user=None*)

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

domain The name of the domain to delete from

key The key of the given domain to delete

user The user to delete the defaults with

salt.modules.mac_defaults.read(*domain, key, user=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

domain The name of the domain to read from

key The key of the given domain to read from

user The user to write the defaults to

salt.modules.mac_defaults.write(*domain, key, value, type='string', user=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain The name of the domain to write to

key The key of the given domain to write to

value The value to write to the given key

type The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user The user to write the defaults to

14.6.168 salt.modules.mac_desktop module

Mac OS X implementations of various commands in the ``desktop`` interface

salt.modules.mac_desktop.get_output_volume()

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

`salt.modules.mac_desktop.lock()`

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

`salt.modules.mac_desktop.say(*words)`

Say some words.

words The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

`salt.modules.mac_desktop.screensaver()`

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

`salt.modules.mac_desktop.set_output_volume(volume)`

Set the volume of sound.

volume The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

14.6.169 salt.modules.mac_group

Manage groups on Mac OS 10.7+

`salt.modules.mac_group.add(name, gid=None, **kwargs)`

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.mac_group.adduser(group, name)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar` as a member of an existing group `foo`, if not then adds it.

`salt.modules.mac_group.chgid(name, gid)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.mac_group.delete(name)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.mac_group.deluser(group, name)`

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar` from a group `foo`. If group is not present then returns True.

`salt.modules.mac_group.getent(refresh=False)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.mac_group.info(name)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.mac_group.members(name, members_list)`

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `foo`.

14.6.170 salt.modules.mac_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

`salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')`

Get the default keychain

user The user to check the default keychain of

domain The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

`salt.modules.mac_keychain.get_friendly_name(cert, password)`

Get the friendly name of the given certificate

cert The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

salt.modules.mac_keychain.get_hash(*name, password=None*)

Returns the hash of a certificate in the keychain.

name The name of the certificate (which you can get from `keychain.get_friendly_name`) or the location of a p12 file.

password The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.install(*cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None*)

Install a certificate

cert The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

keychain The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.list_certs(*keychain='/Library/Keychains/System.keychain'*)

List all of the installed certificates

keychain The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

CLI Example:

```
salt '*' keychain.list_certs
```

salt.modules.mac_keychain.set_default_keychain(*keychain, domain='user', user=None*)

Set the default keychain

keychain The location of the keychain to set as default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

salt.modules.mac_keychain.uninstall(*cert_name, keychain='/Library/Keychains/System.keychain', keychain_password=None*)

Uninstall a certificate from a keychain

cert_name The name of the certificate to remove

keychain The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.unlock_keychain(*keychain*, *password*)

Unlock the given keychain with the password

keychain The keychain to unlock

password The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

14.6.171 salt.modules.mac_package module

Install pkg, dmg and .app applications on Mac OS X minions.

salt.modules.mac_package.get_mpkg_ids(*mpkg*)

Attempt to get the package IDs from a mounted .mpkg file

Parameters **mpkg** (*str*) -- The location of the mounted mpkg file

Returns List of package IDs

Return type *list*

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

salt.modules.mac_package.get_pkg_id(*pkg*)

Attempt to get the package ID from a .pkg file

Parameters **pkg** (*str*) -- The location of the pkg file

Returns List of all of the package IDs

Return type *list*

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

salt.modules.mac_package.install(*pkg*, *target='LocalSystem'*, *store=False*, *allow_untrusted=False*)

Install a pkg file

Parameters

- **pkg** (*str*) -- The package to install
- **target** (*str*) -- The target in which to install the package to
- **store** (*bool*) -- Should the package be installed as if it was from the store?
- **allow_untrusted** (*bool*) -- Allow the installation of untrusted packages?

Returns A dictionary containing the results of the installation

Return type *dict*

CLI Example:

```
salt '*' macpackage.install test.pkg
```

`salt.modules.mac_package.install_app(app, target='/Applications/')`

Install an app file by moving it into the specified Applications directory

Parameters

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is ``/Applications/``

Returns The results of the rsync command

Return type *str*

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

`salt.modules.mac_package.installed_pkgs()`

Return the list of installed packages on the machine

Returns List of installed packages

Return type *list*

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

`salt.modules.mac_package.mount(dmg)`

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters **dmg** (*str*) -- The location of the dmg file to mount

Returns

Tuple containing the results of the command along with the mount point

Return type *tuple*

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

`salt.modules.mac_package.uninstall_app(app)`

Uninstall an app file by removing it from the Applications directory

Parameters **app** (*str*) -- The location of the .app file

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

`salt.modules.mac_package.unmount(mountpoint)`

Attempt to unmount a dmg file from a temporary location

Parameters **mountpoint** (*str*) -- The location of the mount point

Returns The results of the hutil detach command

Return type *str*

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

14.6.172 salt.modules.mac_pkgutil module

Installer support for OS X.

Installer is the native .pkg/.mpkg package manager for OS X.

`salt.modules.mac_pkgutil.forget(package_id)`

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

Warning: DO NOT use this command to fix broken package design

Parameters `package_id (str)` -- The name of the package to forget

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.install(source, package_id)`

Install a .pkg from an URI or an absolute path.

Parameters

- **source (str)** -- The path to a package.

- **package_id (str)** -- The package ID

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.
↳apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.is_installed(package_id)`

Returns whether a given package id is installed.

Returns True if installed, otherwise False

Return type `bool`

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.list()`

List the installed packages.

Returns A list of installed packages

Return type `list`

CLI Example:

```
salt '*' pkgutil.list
```

14.6.173 salt.modules.mac_ports module

Support for MacPorts under Mac OSX.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use

```
salt-run jobs.active
```

on the master to check for potentially long-running calls to `port`.

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg apt-get` than simply `apt-get update`.

`salt.modules.mac_ports.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) with `port install`

name The name of the formula to be installed. Note that this parameter is ignored if `pkgs` is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version Specify a version to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant Specify a variant to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↳osxkeychain+doc+pcr'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo','bar']
salt '*' pkg.install pkgs=['foo@1.2','bar']
salt '*' pkg.install pkgs=['foo@1.2+ssl','bar@2.3']
```

Returns a dict containing the new package names and versions:

```
{<package>: {'old': <old-version>,
             'new': <new-version>}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_ports.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation

Options:

refresh Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_ports.list_upgrades(refresh=True, **kwargs)`

Check whether or not an upgrade is available for all packages

Options:

refresh Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_ports.refresh_db()`

Update ports with port selfupdate

`salt.modules.mac_ports.remove(name=None, pkgs=None, **kwargs)`

Removes packages with port uninstall.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.mac_ports.upgrade(refresh=True)`

Run a full upgrade using MacPorts `port upgrade outdated`

Options:

refresh Update ports with port selfupdate

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',  
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_ports.upgrade_available(pkg, refresh=True)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_ports.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>  
salt '*' pkg.version <package1> <package2> <package3>
```

14.6.174 salt.modules.mac_power module

Module for editing power settings on Mac OS X

New in version 2016.3.0.

`salt.modules.mac_power.get_computer_sleep()`

Display the amount of idle time until the computer sleeps.

Returns A string representing the sleep settings for the computer

Return type `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_computer_sleep
```

`salt.modules.mac_power.get_display_sleep()`

Display the amount of idle time until the display sleeps.

Returns A string representing the sleep settings for the display

Return type `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_display_sleep
```

`salt.modules.mac_power.get_harddisk_sleep()`

Display the amount of idle time until the hard disk sleeps.

Returns A string representing the sleep settings for the hard disk

Return type `str`

CLI Example:

```
..code-block:: bash  
salt '*' power.get_harddisk_sleep
```

`salt.modules.mac_power.get_restart_freeze()`

Displays whether 'restart on freeze' is on or off if supported

Returns A string value representing the ``restart on freeze" settings

Return type *string*

CLI Example:

```
salt '*' power.get_restart_freeze
```

salt.modules.mac_power.get_restart_power_failure()

Displays whether `restart on power failure' is on or off if supported

Returns A string value representing the ``restart on power failure" settings

Return type *string*

CLI Example:

```
salt '*' power.get_restart_power_failure
```

salt.modules.mac_power.get_sleep()

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk :rtype: dict

CLI Example:

```
salt '*' power.get_sleep
```

salt.modules.mac_power.get_sleep_on_power_button()

Displays whether `allow power button to sleep computer' is on or off if supported

Returns A string value representing the ``allow power button to sleep computer" settings :rtype: string

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

salt.modules.mac_power.get_wake_on_modem()

Displays whether `wake on modem' is on or off if supported

Returns A string value representing the ``wake on modem" settings

Return type *str*

CLI Example:

```
salt '*' power.get_wake_on_modem
```

salt.modules.mac_power.get_wake_on_network()

Displays whether `wake on network' is on or off if supported

Returns A string value representing the ``wake on network" settings

Return type *string*

CLI Example:

```
salt '*' power.get_wake_on_network
```

salt.modules.mac_power.set_computer_sleep(*minutes*)

Set the amount of idle time until the computer sleeps. Pass ``Never" of ``Off" to never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or ``Never" or ``Off"

Ptype int, str

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

`salt.modules.mac_power.set_display_sleep(minutes)`

Set the amount of idle time until the display sleeps. Pass ``Never`` or ``Off`` to never sleep.

Parameters `minutes` -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

Ptype `int, str`

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

`salt.modules.mac_power.set_harddisk_sleep(minutes)`

Set the amount of idle time until the harddisk sleeps. Pass ``Never`` or ``Off`` to never sleep.

Parameters `minutes` -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

Ptype `int, str`

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

`salt.modules.mac_power.set_restart_freeze(enabled)`

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably an OS X bug. The functions remains in case they ever fix the bug.

Parameters `enabled` (`bool`) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_restart_freeze True
```

`salt.modules.mac_power.set_restart_power_failure(enabled)`

Set whether or not the computer will automatically restart after a power failure.

Parameters `enabled` (`bool`) -- True to enable, False to disable. ``On`` and ``Off`` are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

`salt.modules.mac_power.set_sleep(minutes)`

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass ``Never`` or ``Off`` for computers that should never sleep.

Parameters `minutes` -- Can be an integer between 1 and 180 or ``Never`` or ``Off``

Ptype `int, str`

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

`salt.modules.mac_power.set_sleep_on_power_button(enabled)`

Set whether or not the power button can sleep the computer.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

`salt.modules.mac_power.set_wake_on_modem(enabled)`

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

`salt.modules.mac_power.set_wake_on_network(enabled)`

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' power.set_wake_on_network True
```

14.6.175 salt.modules.mac_service module

The service module for Mac OS X .. versionadded:: 2016.3.0

`salt.modules.mac_service.available(name)`

Check that the given service is available.

Parameters **name** (*str*) -- The name of the service

Returns True if the service is available, otherwise False

Return type *bool*

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.mac_service.disable(name, runas=None)`

Disable a launchd service. Raises an error if the service fails to be disabled

Parameters

- **name** (*str*) -- Service label, file name, or full path

- **runas** (*str*) -- User to run launchctl commands

Returns True if successful or if the service is already disabled

Return type *bool*

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

`salt.modules.mac_service.disabled`(*name*, *runas=None*)

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands

Returns True if the specified service is NOT enabled, otherwise False

Return type `bool`

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

`salt.modules.mac_service.enable`(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns True if successful or if the service is already enabled

Return type `bool`

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

`salt.modules.mac_service.enabled`(*name*, *runas=None*)

Check if the specified service is enabled

Parameters

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

Returns True if the specified service enabled, otherwise False

Return type `bool`

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

`salt.modules.mac_service.get_all`(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services available or enabled

Return type `list`

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.mac_service.get_enabled`(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services enabled on the system

Return type `list`

CLI Example:

```
salt '*' service.get_enabled
salt '*' service.get_enabled running=True
```

`salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)`

Run a launchctl command and raise an error if it fails

Parameters

- **sub_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

Returns True if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

Return type bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

`salt.modules.mac_service.list(name=None, runas=None)`

Run launchctl list and return the output

Parameters

- **name** (*str*) -- The name of the service to list
- **runas** (*str*) -- User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

`salt.modules.mac_service.missing(name)`

The inverse of `service.available` Check that the given service is not available.

Parameters **name** (*str*) -- The name of the service

Returns True if the service is not available, otherwise False

Return type bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.mac_service.restart(name, runas=None)`

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns True if successful

Return type bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

`salt.modules.mac_service.show(name)`

Show properties of a launchctl service

Parameters `name` (*str*) -- Service label, file name, or full path

Returns The service information if the service is found

Return type `dict`

CLI Example:

```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist # full
↳path
```

`salt.modules.mac_service.start(name, runas=None)`

Start a launchd service. Raises an error if the service fails to start

Note: To start a service in Mac OS X the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** (*str*) -- Service label, file name, or full path

- **runas** (*str*) -- User to run launchctl commands

Returns True if successful or if the service is already running

Return type `bool`

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

`salt.modules.mac_service.status(name, sig=None, runas=None)`

Return the status for a service.

Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be any part of the service name or a regex expression.

- **sig** (*str*) -- Find the service with status.pid instead. Note that name must still be provided.

- **runas** (*str*) -- User to run launchctl commands

Returns The PID for the service if it is running, otherwise an empty string

Return type `str`

CLI Example:

```
salt '*' service.status cups
```

`salt.modules.mac_service.stop(name, runas=None)`

Stop a launchd service. Raises an error if the service fails to stop

Note: Though `service.stop` will unload a service in Mac OS X, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

Parameters

- **name** (*str*) -- Service label, file name, or full path

- **runas** (*str*) -- User to run launchctl commands
- Returns** True if successful or if the service is already stopped
Return type `bool`

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

14.6.176 salt.modules.mac_shadow module

New in version 2016.3.0.

Manage Mac OSX local directory passwords and policies.

Note that it is usually better to apply password policies through the creation of a configuration profile.

salt.modules.mac_shadow.del_password(*name*)

Deletes the account password

Parameters **name** (*str*) -- The user name of the account

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.mac_shadow.get_account_created(*name*)

Get the date/time the account was created

Parameters **name** (*str*) -- the username of the account

Returns the date/time the account was created (yyyy-mm-dd hh:mm:ss)

Return type `str`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

salt.modules.mac_shadow.get_change(*name*)

Gets the date on which the password expires

Parameters **name** (*str*) -- the name of the user account

Returns The date the password will expire

Return type `str`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

salt.modules.mac_shadow.get_expire(*name*)

Gets the date on which the account expires

Parameters **name** (*str*) -- the name of the user account

Returns the date the account expires

Return type `str`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

`salt.modules.mac_shadow.get_last_change(name)`

Get the date/time the account was changed

Parameters `name` (*str*) -- the username of the account

Returns the date/time the account was modified (yyyy-mm-dd hh:mm:ss)

Return type `str`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

`salt.modules.mac_shadow.get_login_failed_count(name)`

Get the the number of failed login attempts

Parameters `name` (*str*) -- the username of the account

Returns The number of failed login attempts

Return type `int`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

`salt.modules.mac_shadow.get_login_failed_last(name)`

Get the date/time of the last failed login attempt

Parameters `name` (*str*) -- the username of the account

Returns the date/time of the last failed login attempt on this account

(yyyy-mm-dd hh:mm:ss) :rtype: `str`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

`salt.modules.mac_shadow.get_maxdays(name)`

Get the maximum age of the password

Parameters `name` (*str*) -- the username of the account

Returns the maximum age of the password in days

Return type `int`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

`salt.modules.mac_shadow.info(name)`

Return information for the specified user

Parameters `name` (*str*) -- the username

Returns A dictionary containing the user's shadow information

Return type `dict`

CLI Example:

```
salt '*' shadow.info admin
```

`salt.modules.mac_shadow.set_change(name, date)`

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- **name** (*str*) -- the name of the user account
- **date** (*date*) -- the date the password will expire. Must be in mm/dd/yyyy

format.

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

`salt.modules.mac_shadow.set_expire(name, date)`

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- **name** (*str*) -- the name of the user account
- **date** (*datetime*) -- the date the account will expire. Format must be

mm/dd/yyyy

Returns True if successful, False if not

Return type `bool`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

`salt.modules.mac_shadow.set_inactdays(name, days)`

Set the number of inactive days before the account is locked. Not available in OS X

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns Will always return False until OSX supports this feature.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

`salt.modules.mac_shadow.set_maxdays(name, days)`

Set the maximum age of the password in days

Parameters

- **name** (*str*) -- the username of the account
- **days** (*int*) -- the maximum age of the account in days

Returns True if successful, False if not

Return type `bool`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

`salt.modules.mac_shadow.set_mindays(name, days)`

Set the minimum password age in days. Not available in OS X.

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns Will always return False until OSX supports this feature.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

`salt.modules.mac_shadow.set_password(name, password)`

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service

Parameters **password** (*str*) -- The plaintext password to set

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

`salt.modules.mac_shadow.set_warndays(name, days)`

Set the number of days before the password expires that the user will start to see a warning. Not available in OS X

Parameters

- **name** (*str*) -- The user name

- **days** (*int*) -- The number of days

Returns Will always return False until OSX supports this feature.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

14.6.177 salt.modules.mac_softwareupdate module

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.download(name)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters **name** (*str*) -- The update to download.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)`

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

Parameters **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.

Parameters **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.

Return type *list*

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.get_catalog()`

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns The catalog being used for update lookups

Return type `str`

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

`salt.modules.mac_softwareupdate.ignore(name)`

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so 'SecUpd2014-001-1.0' becomes 'SecUpd2014-001'. It will be removed automatically if present. An update is successfully ignored when it no longer shows up after `list_updates`.

Parameters **name** -- The name of the update to add to the ignore list.

Ptype `str`

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

`salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False)`

List all available updates.

Parameters

- **recommended** (`bool`) -- Show only recommended updates.

- **restart** (`bool`) -- Show only updates that require a restart.

Returns Returns a dictionary containing the updates

Return type `dict`

CLI Example:

```
salt '*' softwareupdate.list_available
```

`salt.modules.mac_softwareupdate.list_downloads()`

Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded

Return type `list`

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

`salt.modules.mac_softwareupdate.list_ignored()`

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the `softwareupdate` command works.

Returns The list of ignored updates

Return type `list`

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

`salt.modules.mac_softwareupdate.reset_catalog()`

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

`salt.modules.mac_softwareupdate.reset_ignored()`

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns True if the list was reset, Otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

`salt.modules.mac_softwareupdate.schedule_enable(enable)`

Enable/disable automatic update scheduling.

Parameters **enable** -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned. :type: bool str

Returns True if scheduling is enabled, False if disabled

Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

`salt.modules.mac_softwareupdate.schedule_enabled()`

Check the status of automatic update scheduling.

Returns True if scheduling is enabled, False if disabled - True: Automatic checking is on, - False: Automatic checking is off,

Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

`salt.modules.mac_softwareupdate.set_catalog(url)`

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters **url** (*str*) -- The url to the update catalog

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

`salt.modules.mac_softwareupdate.update(name)`

Install a named update.

Parameters **name** (*str*) -- The name of the of the update to install.

Returns True if successfully updated, otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

`salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)`

Install all available updates. Returns a dictionary containing the name of the update and the status of its

installation.

Parameters **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.

Parameters **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned. `rtype: dict` - True: The update was installed. - False: The update was not installed.

CLI Example:

```
salt '*' softwareupdate.update_all
```

`salt.modules.mac_softwareupdate.update_available`(*name*)

Check whether or not an update is available with a given name.

Parameters **name** (*str*) -- The name of the update to look for

Returns True if available, False if not

Return type `bool`

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

14.6.178 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

`salt.modules.mac_user.add`(*name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.mac_user.chfullname`(*name, fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

`salt.modules.mac_user.chgid`(*name, gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.mac_user.chgroups`(*name, groups, append=False*)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append Instead of removing user from groups not included in the **groups** parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

salt.modules.mac_user.chhome(*name, home, **kwargs*)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

salt.modules.mac_user.chshell(*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.mac_user.chuid(*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.mac_user.delete(*name, remove=False, force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.mac_user.disable_auto_login()

New in version 2016.3.0.

Disables auto login on the machine

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' user.disable_auto_login
```

salt.modules.mac_user.enable_auto_login(*name*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

Parameters **name** (*str*) -- The user account use for auto login

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

salt.modules.mac_user.get_auto_login()

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False

Return type str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

`salt.modules.mac_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.mac_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.mac_user.list_groups`(*name*)

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.mac_user.list_users`()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.mac_user.primary_group`(*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.mac_user.rename`(*name, new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

14.6.179 salt.modules.mac_sysctl module

Module for viewing and modifying sysctl parameters

`salt.modules.mac_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.mac_sysctl.get(name)`

Return a single sysctl parameter for this minion

name The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)`

Assign and persist a simple sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

config The location of the sysctl configuration file.

apply_change Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

`salt.modules.mac_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

14.6.180 salt.modules.mac_system module

New in version 2016.3.0.

System module for sleeping, restarting, and shutting down the system on Mac OS X.

Warning: Using this module will enable `atrun` on the system if it is disabled.

`salt.modules.mac_system.get_boot_arch()`

Get the kernel architecture setting from `com.apple.Boot.plist`

Returns A string value representing the boot architecture setting

Return type `str`

CLI Example:

```
salt '*' system.get_boot_arch
```

`salt.modules.mac_system.get_computer_name()`

Gets the computer name

Returns The computer name

Return type `str`

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.mac_system.get_disable_keyboard_on_lock()`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns True if disable keyboard on lock is on, False if off

Return type `bool`

CLI Example:

```
..code-block:: bash
    salt '*' system.get_disable_keyboard_on_lock
```

`salt.modules.mac_system.get_remote_events()`

Displays whether remote apple events are on or off.

Returns True if remote apple events are on, False if off

Return type `bool`

CLI Example:

```
salt '*' system.get_remote_events
```

`salt.modules.mac_system.get_remote_login()`

Displays whether remote login (SSH) is on or off.

Returns True if remote login is on, False if off

Return type `bool`

CLI Example:

```
salt '*' system.get_remote_login
```

`salt.modules.mac_system.get_restart_delay()`

Get the number of seconds after which the computer will start up after a power failure.

Returns A string value representing the number of seconds the system will delay restart after power loss :rtype: str

CLI Example:

```
salt '*' system.get_restart_delay
```

`salt.modules.mac_system.get_startup_disk()`

Displays the current startup disk

Returns The current startup disk

Return type `str`

CLI Example:

```
salt '*' system.get_startup_disk
```

`salt.modules.mac_system.get_subnet_name()`

Gets the local subnet name

Returns The local subnet name

Return type `str`

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.halt(at_time=None)`

Halt a running system

Parameters `at_time` (`str`) -- Any valid *at* expression. For example, some valid at

expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.list_startup_disks()`

List all valid startup disks on the system.

Returns A list of valid startup disks

Return type *list*

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.restart(at_time=None)`

Restart the system

Parameters **at_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note:: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

`salt.modules.mac_system.set_boot_arch(arch='default')`

Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: This command fails with the following error:

```
changes to kernel architecture failed to save!
```

The setting is not updated. This is either an apple bug, not available on the test system, or a result of system files now being locked down in OS X (SIP Protection).

Parameters **arch** (*str*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include: - i386 - x86_64 - default

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' system.set_boot_arch i386
```

`salt.modules.mac_system.set_computer_name(name)`

Set the computer name

Parameters **name** (*str*) -- The new computer name

Returns True if successful, False if not

Return type *bool*

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

`salt.modules.mac_system.set_disable_keyboard_on_lock`(*enable*)

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

`salt.modules.mac_system.set_remote_events`(*enable*)

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' system.set_remote_events On
```

`salt.modules.mac_system.set_remote_login`(*enable*)

Set the remote login (SSH) to either on or off.

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On" and ``Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' system.set_remote_login True
```

`salt.modules.mac_system.set_restart_delay`(*seconds*)

Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:

```
Error,IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

<http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html>

Parameters **seconds** (*int*) -- The number of seconds. Must be a multiple of 30

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' system.set_restart_delay 180
```

`salt.modules.mac_system.set_startup_disk`(*path*)

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters **path** (*str*) -- The valid startup disk path

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

`salt.modules.mac_system.set_subnet_name(name)`

Set the local subnet name

Parameters `name (str)` -- The new local subnet name

Note: Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type `bool`

CLI Example:

```
The following will be set as 'Mikes-Mac'  
salt '*' system.set_subnet_name "Mike's Mac"
```

`salt.modules.mac_system.shutdown(at_time=None)`

Shutdown the system

Parameters `at_time (str)` -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.shutdown  
salt '*' system.shutdown 'now + 1 hour'
```

`salt.modules.mac_system.sleep(at_time=None)`

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters `at_time (str)` -- Any valid *at* expression. For example, some valid *at* expressions could be: - noon - midnight - fri - 9:00 AM - 2:30 PM tomorrow - now + 10 minutes

Note: If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: ``14:00``

CLI Example:

```
salt '*' system.sleep  
salt '*' system.sleep '10:00 PM'
```

14.6.181 salt.modules.mac_timezone module

Module for editing date/time settings on Mac OS X

New in version 2016.3.0.

`salt.modules.mac_timezone.get_date()`

Displays the current date

Returns the system date

Return type `str`

CLI Example:

```
salt '*' timezone.get_date
```

`salt.modules.mac_timezone.get_hwclock()`
Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.mac_timezone.get_offset()`
Displays the current time zone offset
Returns The current time zone offset
Return type `str`

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.mac_timezone.get_time()`
Get the current system time.
Returns The current time in 24 hour format
Return type `str`

CLI Example:

```
salt '*' timezone.get_time
```

`salt.modules.mac_timezone.get_time_server()`
Display the currently set network time server.
Returns the network time server
Return type `str`

CLI Example:

```
salt '*' timezone.get_time_server
```

`salt.modules.mac_timezone.get_using_network_time()`
Display whether network time is on or off
Returns True if network time is on, False if off
Return type `bool`

CLI Example:

```
salt '*' timezone.get_using_network_time
```

`salt.modules.mac_timezone.get_zone()`
Displays the current time zone
Returns The current time zone
Return type `str`

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.mac_timezone.get_zonecode()`
Displays the current time zone abbreviated code
Returns The current time zone code
Return type `str`

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.mac_timezone.list_zones()`

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

Returns a list of time zones

Return type *list*

CLI Example:

```
salt '*' timezone.list_zones
```

`salt.modules.mac_timezone.set_date(date)`

Set the current month, day, and year

Parameters **date** (*str*) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns True if successful, False if not

Return type *bool*

Raises SaltInvocationError on Invalid Date format

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

`salt.modules.mac_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.mac_timezone.set_time(time)`

Sets the current time. Must be in 24 hour format.

Parameters **time** (*str*) -- The time to set in 24 hour format.

The value must be double quoted. ie: ``17:46``

Returns True if successful, False if not

Return type *bool*

Raises SaltInvocationError on Invalid Time format

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

`salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')`

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters **time_server** -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the OS X default of `time.apple.com` :type: str

Returns True if successful, False if not

Return type *bool*

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

`salt.modules.mac_timezone.set_using_network_time(enable)`

Set whether network time is on or off.

Parameters **enable** -- True to enable, False to disable. Can also use `on` or `off`

Type str bool

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

`salt.modules.mac_timezone.set_zone(time_zone)`

Set the local time zone. Use `timezone.list_zones` to list valid `time_zone` arguments

Parameters **time_zone** (*str*) -- The time zone to apply

Returns True if successful, False if not

Return type bool

Raises SaltInvocationError on Invalid Timezone

Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

`salt.modules.mac_timezone.zone_compare(time_zone)`

Compares the given timezone name with the system timezone name.

Returns True if they are the same, False if not

Return type bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

14.6.182 salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

`salt.modules.mac_xattr.clear(path)`

Causes the all attributes on the file/directory to be removed

Parameters **path** (*str*) -- The file(s) to get attributes from

Returns True if successful, otherwise False

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.delete(path, attribute)`

Removes the given attribute from the file

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be deleted from the

file/directory

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.list`(*path*, ***kwargs*)

List all of the extended attributes on the given file/directory

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file :rtype: dict

Raises `CommandExecutionError` on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.read`(*path*, *attribute*, ***kwargs*)

Read the given attributes on the given file/directory

Parameters

- **path** (*str*) -- The file to get attributes from
- **attribute** (*str*) -- The attribute to read
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute

Return type `str`

Raises `CommandExecutionError` on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.write`(*path*, *attribute*, *value*, ***kwargs*)

Causes the given attribute name to be assigned the given value

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be written to the file/directory
- **value** (*str*) -- The value to assign to the given attribute
- **hex** (*bool*) -- Set the values with forced hexadecimal values

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

14.6.183 salt.modules.makeconf

Support for modifying make.conf under Gentoo

`salt.modules.makeconf.append_cflags`(*value*)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

`salt.modules.makeconf.append_cxxflags`(*value*)

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

`salt.modules.makeconf.append_emerge_default_opts`(*value*)

Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.append_features`(*value*)

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

`salt.modules.makeconf.append_gentoo_mirrors`(*value*)

Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.append_makeopts` (*value*)

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

`salt.modules.makeconf.append_var` (*var*, *value*)

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.cflags_contains` (*value*)

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

`salt.modules.makeconf.chost_contains` (*value*)

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.cxxflags_contains` (*value*)

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

`salt.modules.makeconf.emerge_default_opts_contains` (*value*)

Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

`salt.modules.makeconf.features_contains(value)`

Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

`salt.modules.makeconf.gentoo_mirrors_contains(value)`

Verify if GENTOO_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.get_cflags()`

Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

`salt.modules.makeconf.get_chost()`

Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

`salt.modules.makeconf.get_cxxflags()`

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

`salt.modules.makeconf.get_emerge_default_opts()`

Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

`salt.modules.makeconf.get_features()`

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

`salt.modules.makeconf.get_gentoo_mirrors()`

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

`salt.modules.makeconf.get_makeopts()`

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

`salt.modules.makeconf.get_sync()`

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

`salt.modules.makeconf.get_var(var)`

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

`salt.modules.makeconf.makeopts_contains(value)`

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

`salt.modules.makeconf.remove_var(var)`

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

`salt.modules.makeconf.set_cflags`(*value*)

Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_chost`(*value*)

Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.set_cxxflags`(*value*)

Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_emerge_default_opts`(*value*)

Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.set_gentoo_mirrors`(*value*)

Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.set_makeopts`(*value*)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

`salt.modules.makeconf.set_sync`(*value*)

Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

`salt.modules.makeconf.set_var`(*var*, *value*)

Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.sync_contains`(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

`salt.modules.makeconf.trim_cflags`(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

`salt.modules.makeconf.trim_cxxflags`(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

`salt.modules.makeconf.trim_emerge_default_opts`(*value*)

Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.trim_features`(*value*)

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

`salt.modules.makeconf.trim_gentoo_mirrors`(*value*)

Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.trim_makeopts`(*value*)

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

`salt.modules.makeconf.trim_var`(*var*, *value*)

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.var_contains`(*var*, *value*)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

14.6.184 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.marathon.app`(*id*)

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

`salt.modules.marathon.apps`()

Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

`salt.modules.marathon.has_app`(*id*)

Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

`salt.modules.marathon.info`()

Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

`salt.modules.marathon.restart_app(id, restart=False, force=True)`

Restart the current server configuration for the specified app.

Parameters

- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

`salt.modules.marathon.rm_app(id)`

Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

`salt.modules.marathon.update_app(id, config)`

Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

14.6.185 salt.modules.match

The match module allows for match routines to be run and determine target specs

`salt.modules.match.compound(tgt, minion_id=None)`

Return True if the minion ID matches the given compound target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

`salt.modules.match.data(tgt)`

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

`salt.modules.match.filter_by(lookup, expr_form='compound', minion_id=None)`

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

`salt.modules.match.glob(tgt, minion_id=None)`

Return True if the minion ID matches the given glob target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

`salt.modules.match.grain(tgt, delimiter=':')`

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.grain_pcre(tgt, delimiter=':')`

Return True if the minion matches the given `grain_pcre` target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.ipcidr(tgt)`

Return True if the minion matches the given `ipcidr` target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
- match: ipcidr
- nodeclass: internal
```

`salt.modules.match.list`(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given list target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.pcre`(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given pcre target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.pillar`(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter=
↳ '|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.pillar_pcre`(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.\.com\/.*\.git' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

14.6.186 salt.modules.mdadm

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm.assemble`(*name*, *devices*, *test_mode=False*, ***kwargs*)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name The name of the array to assemble.

devices The list of devices comprising the array to assemble.

kwargs Optional arguments to be passed to mdadm.

returns

test_mode=True: Prints out the full command.

test_mode=False (Default): Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

`salt.modules.mdadm.create`(*name*, *level*, *devices*, *metadata='default'*, *test_mode=False*, ***kwargs*)

Create a RAID device.

Changed in version 2014.7.0.

Warning: Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde  
↪']" test_mode=True
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name The name of the array to create.

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

metadata Version of metadata to use when creating the array.

kwargs Optional arguments to be passed to mdadm.

returns

test_mode=True: Prints out the full command.

test_mode=False (Default): Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in ``resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the mdadm(8) manpage

salt.modules.mdadm.destroy(*device*)

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

salt.modules.mdadm.detail(*device='/dev/md0'*)

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

salt.modules.mdadm.list()

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

salt.modules.mdadm.save_config()

Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: <http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored>

CLI Example:

```
salt '*' raid.save_config
```

salt.modules.mdadm.stop()

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

14.6.187 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform smartos

salt.modules.mdata.delete(*keyname)

Delete metadata

prop [string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get(*keyname)

Get metadata

keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list()

List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.put(keyname, val)

Put metadata

prop [string] name of property

val [string] value to set

CLI Example:

```
salt '*' mdata.list
```

14.6.188 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

salt.modules.memcached.decrement(key, delta=1, host='127.0.0.1', port=11211)

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

`salt.modules.memcached.delete`(*key*, *host*=`127.0.0.1`, *port*=11211, *time*=0)
Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

`salt.modules.memcached.get`(*key*, *host*=`127.0.0.1`, *port*=11211)
Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

`salt.modules.memcached.increment`(*key*, *delta*=1, *host*=`127.0.0.1`, *port*=11211)
Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

`salt.modules.memcached.replace`(*key*, *value*, *host*=`127.0.0.1`, *port*=11211, *time*=0, *min_compress_len*=0)
Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of [memcached.add](#)

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

`salt.modules.memcached.set`(*key*, *value*, *host*=`127.0.0.1`, *port*=11211, *time*=0, *min_compress_len*=0)
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

`salt.modules.memcached.status`(*host*=`127.0.0.1`, *port*=11211)
Get memcached status

CLI Example:

```
salt '*' memcached.status
```

14.6.189 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

`salt.modules.mine.delete`(*fun*)
Remove specific function contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

`salt.modules.mine.flush`()
Remove all mine contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.flush
```

`salt.modules.mine.get`(*tgt, fun, expr_form='glob', exclude_minion=False*)

Get data from the mine based on the target, function and `expr_form`

Targets can be matched based on any standard matching system that can be matched on the master via these keywords:

```
glob
pcre
grain
grain_pcre
compound
pillar
pillar_pcre
```

Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.

exclude_minion Excludes the current minion from the result set

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from an SLS file using the `saltutil.runner` module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

`salt.modules.mine.get_docker`(*interfaces=None, cidrs=None, with_container_id=False*)

Get all mine data for `'docker.get_containers'` and run an aggregation routine. The `'interfaces'` parameter allows for specifying which network interfaces to select ip addresses from. The `'cidrs'` parameter allows for specifying a list of cidrs which the ip address must match.

with_container_id Boolean, to expose `container_id` in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24
↪", "172.17.42.0/24"]'
```

`salt.modules.mine.send`(*func, *args, **kwargs*)

Send a specific function to the mine.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
```

`salt.modules.mine.update` (*clear=False*)

Execute the configured functions and send the data back up to the master. The functions to be executed are merged from the master config, pillar and minion config under the option *mine_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

`salt.modules.mine.valid`()

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

14.6.190 salt.modules.minion module

Module to provide information about minions

`salt.modules.minion.kill` (*timeout=15*)

Kill the salt minion.

timeout int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI example:

```
>$ salt minion[12] minion.kill
minion1:
-----
  killed:
    7874
  retcode:
    0
minion2:
-----
  killed:
    29071
  retcode:
    0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: 0 is success, anything else is a failure.

`salt.modules.minion.list`()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as `salt-key -L`

CLI Example:

```
salt 'master' minion.list
```

`salt.modules.minion.restart()`

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an `argv` list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the `argv` of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from `argv` then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
>$ salt minion[12] minion.restart
minion1:
-----
comment:
  - Restart using process argv:
  -   /home/omniture/install/bin/salt-minion
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
killed:
  10070
restart:
-----
stderr:
stdout:
retcode:
  0
minion2:
-----
comment:
  - Using configuration minion_restart_command:
  -   /home/omniture/install/bin/salt-minion
  -   --not-an-option
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
  - Restart failed
killed:
  10896
restart:
-----
stderr:
  Usage: salt-minion

  salt-minion: error: no such option: --not-an-option
stdout:
retcode:
  64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

14.6.191 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.get_str` (*length=20*)

New in version 2014.7.0.

Returns a random string of the specified length.

length [20] Any valid number of bytes.

CLI Example:

```
salt '*' random.get_str 128
```

`salt.modules.mod_random.hash` (*value, algorithm='sha512'*)

New in version 2014.7.0.

Encodes a value with the specified encoder.

value The value to be hashed.

algorithm [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.rand_int` (*start=1, end=10*)

Returns a random integer number between the start and end number.

start [1] Any valid integer number

end [10] Any valid integer number

CLI Example:

```
salt '*' random.rand_int 1 10
```

`salt.modules.mod_random.seed` (*range=10, hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

hash: None Any hashable object.

range: 10 Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

`salt.modules.mod_random.shadow_hash` (*crypt_salt=None, password=None, algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.

crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm [sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5alt' 'MyP@asswd' md5
```

`salt.modules.mod_random.str_encode` (*value, encoder='base64'*)

New in version 2014.7.0.

value The value to be encoded.

encoder [base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

14.6.192 salt.modules.modjk

Control Modjk via the Apache Tomcat ``Status" worker (<http://tomcat.apache.org/connectors-doc/reference/status.html>)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or *pillar*.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

salt.modules.modjk.bulk_activate (*workers, lbn, profile='default'*)

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.bulk_disable (*workers, lbn, profile='default'*)

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.bulk_recover (*workers, lbn, profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-profile

```

`salt.modules.modjk.bulk_stop`(*workers, lbn, profile='default'*)
Stop all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile

```

`salt.modules.modjk.dump_config`(*profile='default'*)
Dump the original configuration that was loaded from disk

CLI Examples:

```

salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile

```

`salt.modules.modjk.get_running`(*profile='default'*)
Get the current running config (not from disk)

CLI Examples:

```

salt '*' modjk.get_running
salt '*' modjk.get_running other-profile

```

`salt.modules.modjk.lb_edit`(*lbn, settings, profile='default'*)
Edit the loadbalancer settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```

salt '*' modjk.lb_edit loadbalancer1 '{"v1r': 1, 'v1t': 60}"
salt '*' modjk.lb_edit loadbalancer1 '{"v1r': 1, 'v1t': 60}" other-profile

```

`salt.modules.modjk.list_configured_members`(*lbn, profile='default'*)
Return a list of member workers from the configuration files

CLI Examples:

```

salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile

```

`salt.modules.modjk.recover_all`(*lbn, profile='default'*)
Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```

salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile

```

`salt.modules.modjk.reset_stats(lbn, profile='default')`

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

`salt.modules.modjk.version(profile='default')`

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

`salt.modules.modjk.worker_activate(worker, lbn, profile='default')`

Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_disable(worker, lbn, profile='default')`

Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')`

Edit the worker settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vWF': 500, 'vWD': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vWF': 500, 'vWD': 60}" other-
↪profile
```

`salt.modules.modjk.worker_recover(worker, lbn, profile='default')`

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_status(worker, profile='default')`

Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

`salt.modules.modjk.worker_stop` (*worker, lbn, profile='default'*)
Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.workers` (*profile='default'*)
Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

14.6.193 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

`salt.modules.mongodb.db_exists` (*name, user=None, password=None, host=None, port=None, authdb=None*)

Checks if a database exists in MongoDB

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.db_list` (*user=None, password=None, host=None, port=None, authdb=None*)
List all MongoDB databases

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

`salt.modules.mongodb.db_remove` (*name, user=None, password=None, host=None, port=None, authdb=None*)

Remove a MongoDB database

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.find` (*collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Find an object or list of objects in a collection

CLI Example:

```
salt '*' mongodb.find mycollection '[{"foo": "FOO", "bar": "BAR"}]' <user>
↳<password> <host> <port> <database>
```

`salt.modules.mongodb.insert`(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.insert '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM"}]' mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.remove`(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.remove mycollection '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM"}]' <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.update_one`(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Update an object into a collection http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one

New in version 2016.11.0.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_create`(*name*, *passwd*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Create a Mongodb user

CLI Example:

```
salt '*' mongodb.user_create <name> <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_exists`(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Checks if a user exists in Mongodb

CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_grant_roles`(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Grant one or many roles to a Mongodb user

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe ['readWrite'] dbname admin adminpwd
↳localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe [{'role': 'readWrite', 'db': 'dbname'}] dbname admin adminpwd localhost 27017
```

`salt.modules.mongodb.user_list`(*user=None, password=None, host=None, port=None, database='admin', authdb=None*)

List users of a MongoDB database

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_remove`(*name, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Remove a MongoDB user

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_revoke_roles`(*name, roles, database, user=None, password=None, host=None, port=None, authdb=None*)

Revoke one or many roles to a MongoDB user

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin adminpwd
↳ localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db": "dbname"}
↳ ], [{"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

`salt.modules.mongodb.user_roles_exists`(*name, roles, database, user=None, password=None, host=None, port=None, authdb=None*)

Checks if a user of a MongoDB database has specified roles

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin adminpwd
↳ localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '[{"role": "readWrite", "db": "dbname"}
↳ ], [{"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

14.6.194 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

`salt.modules.monit.configtest`()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

`salt.modules.monit.id`(*reset=False*)

New in version 2016.3.0.

Return monit unique id.

reset [False] Reset current id and generate a new id when it's True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

salt.modules.monit.monitor(*name*)
monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

salt.modules.monit.reload()
New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

salt.modules.monit.restart(*name*)
Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

salt.modules.monit.start(*name*)
CLI Example:

```
salt '*' monit.start <service name>
```

salt.modules.monit.status(*svc_name=''*)
Display a process status from monit

CLI Example:

```
salt '*' monit.status  
salt '*' monit.status <service name>
```

salt.modules.monit.stop(*name*)
Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

salt.modules.monit.summary(*svc_name=''*)
Display a summary from monit

CLI Example:

```
salt '*' monit.summary  
salt '*' monit.summary <service name>
```

salt.modules.monit.unmonitor(*name*)
Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

`salt.modules.monit.validate()`

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

`salt.modules.monit.version()`

New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

14.6.195 salt.modules.moosefs

Module for gathering and managing information about MooseFS

`salt.modules.moosefs.dirinfo(path, opts=None)`

Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n][h|H]]
```

`salt.modules.moosefs.fileinfo(path)`

Return information on a file located on the Moose

CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

`salt.modules.moosefs.getgoal(path, opts=None)`

Return goal(s) for a file or directory

CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n][h|H][r]]
```

`salt.modules.moosefs.mounts()`

Return a list of current MooseFS mounts

CLI Example:

```
salt '*' moosefs.mounts
```

14.6.196 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.active` (*extended=False*)

List the active mounts.

CLI Example:

```
salt '*' mount.active
```

`salt.modules.mount.automaster` (*config='/etc/auto_salt'*)

List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

`salt.modules.mount.fstab` (*config='/etc/fstab'*)

Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

`salt.modules.mount.is_fuse_exec` (*cmd*)

Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

`salt.modules.mount.is_mounted` (*name*)

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

`salt.modules.mount.mount` (*name, device, mkmnt=False, fstype='', opts='defaults', user=None, util='mount'*)

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.remount` (*name, device, mkmnt=False, fstype='', opts='defaults', user=None*)

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.rm_automaster` (*name, device, config='/etc/auto_salt'*)

Remove the mount point from the auto_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_fstab`(*name*, *device*, *config*='/etc/fstab')

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_vfstab`(*name*, *device*, *config*='/etc/vfstab')

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

`salt.modules.mount.set_automaster`(*name*, *device*, *fstype*, *opts*='', *config*='/etc/auto_salt', *test*=False, ***kwargs*)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.set_fstab`(*name*, *device*, *fstype*, *opts*='defaults', *dump*=0, *pass_num*=0, *config*='/etc/fstab', *test*=False, *match_on*='auto', ***kwargs*)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.set_vfstab`(*name*, *device*, *fstype*, *opts*='-`', *device_fsck*='-`', *pass_fsck*='-`', *mount_at_boot*='yes', *config*='/etc/vfstab', *test*=False, *match_on*='auto', ***kwargs*)

..verionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

`salt.modules.mount.swapoff`(*name*)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

`salt.modules.mount.swapon`(*name*, *priority*=None)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

`salt.modules.mount.swaps()`

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

`salt.modules.mount.umount(name, device=None, user=None, util='mount')`

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

`salt.modules.mount.vfstab(config='/etc/vfstab')`

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

14.6.197 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: ''
```

The default for the port is `1433` and for the database is `` (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

`salt.modules.mssql.db_exists(database_name, **kwargs)`

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

`salt.modules.mssql.db_list(**kwargs)`

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

`salt.modules.mssql.db_remove(database_name, **kwargs)`

Drops a specific database from the MS SQL server. It will not drop any of `master`, `model`, `msdb` or `tempdb`.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

`salt.modules.mssql.login_exists(login, **kwargs)`

Find if a login exists in the MS SQL server.

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

`salt.modules.mssql.role_create(role, owner=None, **kwargs)`

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba
```

`salt.modules.mssql.role_exists(role, **kwargs)`

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

`salt.modules.mssql.role_list(**kwargs)`

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

`salt.modules.mssql.role_remove(role, **kwargs)`

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

`salt.modules.mssql.tsq_query(query, **kwargs)`

Run a SQL query and return query result as list of tuples, or a list of dictionaries if `as_dict` was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsq_query 'SELECT @@version as version' as_dict=True
```

`salt.modules.mssql.user_create`(*username*, *new_login_password=None*, ***kwargs*)
Creates a new user. If *new_login_password* is not specified, the user will be created without a login.

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME [new_login_
↳password=PASSWORD]
```

`salt.modules.mssql.user_exists`(*username*, ***kwargs*)
Find if an user exists in a specific database on the MS SQL server.

Note: *database* argument is mandatory

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

`salt.modules.mssql.user_list`(***kwargs*)
Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

`salt.modules.mssql.user_remove`(*username*, ***kwargs*)
Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

`salt.modules.mssql.version`(***kwargs*)
Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

14.6.198 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.list_plugins`()
List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

`salt.modules.munin.run`(*plugins*)
Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

`salt.modules.munin.run_all()`

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

14.6.199 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- MySQLdb Python module

Note: On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

configuration In order to connect to MySQL, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: `'charset'` connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined [here](#). Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.alter_db(name, character_set=None, collate=None, **connection_args)`
 Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s; query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.db_check(name, table=None, **connection_args)`

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.db_create(name, character_set=None, collate=None, **connection_args)`

Adds a databases to the MySQL server.

name The name of the database to manage

character_set The character set, if left empty the MySQL default will be used

collate The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'  
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.db_exists(*name*, ***connection_args*)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

salt.modules.mysql.db_get(*name*, ***connection_args*)

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME,DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

salt.modules.mysql.db_list(***connection_args*)

Return a list of databases of a MySQL server using the output from the `SHOW DATABASES` query.

CLI Example:

```
salt '*' mysql.db_list
```

salt.modules.mysql.db_optimize(*name*, *table=None*, ***connection_args*)

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

salt.modules.mysql.db_remove(*name*, ***connection_args*)

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

salt.modules.mysql.db_repair(*name*, *table=None*, ***connection_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

salt.modules.mysql.db_tables(*name*, ***connection_args*)

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

salt.modules.mysql.free_slave(***connection_args*)

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

`salt.modules.mysql.get_master_status(**connection_args)`

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

`salt.modules.mysql.get_slave_status(**connection_args)`

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': '',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': '',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': '',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
                     'Master_SSL_Allowed': 'No',
                     'Master_SSL_CA_File': '',
                     'Master_SSL_CA_Path': '',
                     'Master_SSL_Cert': '',
                     'Master_SSL_Cipher': '',
                     'Master_SSL_Key': '',
                     'Master_SSL_Verify_Server_Cert': 'No',
                     'Master_Server_Id': 1,
                     'Master_User': 'replu',
                     'Read_Master_Log_Pos': 107,
                     'Relay_Log_File': 'klo-relay-bin.000071',
                     'Relay_Log_Pos': 253,
                     'Relay_Log_Space': 553,
                     'Relay_Master_Log_File': 'mysql-bin.000021',
                     'Replicate_Do_DB': '',
                     'Replicate_Do_Table': '',
                     'Replicate_Ignore_DB': '',
                     'Replicate_Ignore_Server_Ids': '',
                     'Replicate_Ignore_Table': '',
                     'Replicate_Wild_Do_Table': '',
                     'Replicate_Wild_Ignore_Table': '',
                     'Seconds_Behind_Master': 0,
                     'Skip_Counter': 0,
                     'Slave_IO_Running': 'Yes',
                     'Slave_IO_State': 'Waiting for master to send event',
```

```
'Slave_SQL_Running': 'Yes',
'Until_Condition': 'None',
'Until_Log_File': '',
'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

`salt.modules.mysql.grant_add`(*grant*, *database*, *user*, *host*='localhost', *grant_option*=False, *escape*=True, *ssl_option*=False, ***connection_args*)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:

```
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*' 'frank'
↪ 'localhost'
```

`salt.modules.mysql.grant_exists`(*grant*, *database*, *user*, *host*='localhost', *grant_option*=False, *escape*=True, ***connection_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*'
↪ 'frank' 'localhost'
```

`salt.modules.mysql.grant_revoke`(*grant*, *database*, *user*, *host*='localhost', *grant_option*=False, *escape*=True, ***connection_args*)

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank'
↪ 'localhost'
```

`salt.modules.mysql.processlist`(***connection_args*)

Retrieves the processlist from the MySQL server via ``SHOW FULL PROCESSLIST``.

Returns: a list of dicts, with each dict representing a process:

```
{'Command': 'Query', 'Host': 'localhost', 'Id': 39, 'Info': 'SHOW FULL PROCESSLIST',
'Rows_examined': 0, 'Rows_read': 1, 'Rows_sent': 0, 'State': None, 'Time': 0, 'User': 'root', 'db':
'mysql'}
```

CLI Example:

```
salt '*' mysql.processlist
```

`salt.modules.mysql.query`(*database*, *query*, ***connection_args*)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
 'query time': {'human': '1.0ms', 'raw': '0.001'},
 'results': ((1L, 'User 1', Decimal('110.000000')),
             (2L, 'User 2', Decimal('215.636756')),
             (3L, 'User 3', Decimal('0.040000'))),
 'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')['results'
  ↳][0][0] }}
```

`salt.modules.mysql.quote_identifier` (*identifier*, *for_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by `` character and escaping this character inside. It also means doubling the `%` character for MySQLdb internal usage.

Parameters

- **identifier** -- the table, column or database identifier
- **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape ``_`` and ``%`` characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (*my_%db.**) but not for table level grants (*my_%db.`foo`*)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar`'
```

`salt.modules.mysql.showglobal` (***connection_args*)

Retrieves the show global variables from the minion.

Returns:: show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

`salt.modules.mysql.showvariables(**connection_args)`

Retrieves the show variables from the minion.

Returns: show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

`salt.modules.mysql.slave_lag(**connection_args)`

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

`salt.modules.mysql.status(**connection_args)`

Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:

```
salt '*' mysql.status
```

`salt.modules.mysql.tokenize_grant(grant)`

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.* TO
↳ 'testuser'@'localhost'"
```

`salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)`

Change password for a MySQL user

host Host for which this user/password combo applies

password The password to set for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

```
salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None,
                               allow_passwordless=False, unix_socket=False, password_column=None, **connection_args)
```

Creates a MySQL user

host Host for which this user/password combo applies

password The password to use for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

unix_socket If True and allow_passwordless is True then will be used unix_socket auth plugin. New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

```
salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None,
                               passwordless=False, unix_socket=False, password_column=None,
                               **connection_args)
```

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'
```

```
salt.modules.mysql.user_grants(user, host='localhost', **connection_args)
```

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```
salt '*' mysql.user_grants 'frank' 'localhost'
```

```
salt.modules.mysql.user_info(user, host='localhost', **connection_args)
```

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

```
salt.modules.mysql.user_list(**connection_args)
```

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

`salt.modules.mysql.user_remove`(*user*, *host*='localhost', ***connection_args*)
Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

`salt.modules.mysql.version`(***connection_args*)
Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

14.6.200 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use `--local` when using `salt-call` for extra security. Also consider using just the salt runner `nacl` when encrypting pillar passwords.

The `nacl` lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *key* or *keyfile* you can use:

```
salt-call --local nacl.keygen keyfile=/root/.nacl
```

Now with your key, you can encrypt some data:

```
salt-call --local nacl.enc mypass keyfile=/root/.nacl
DRB7Q6/X5gGSRCTpZyxS6hX05LnIJIJ4ivbmUlbWj0lLUA+uaVyvou3vJ4=
```

To decrypt the data:

```
salt-call --local nacl.dec data='DRB7Q6/
→X5gGSRCTpZyxS6hX05LnIJIJ4ivbmUlbWj0lLUA+uaVyvou3vJ4=' keyfile=/root/.nacl
mypass
```

The following optional configurations can be defined in the minion or master config. Avoid storing the config in pillars!

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
  key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
  keyfile: /root/.nacl
```

When the key is defined in the master config you can use it from the `nacl` runner:

```
salt-run nacl.enc 'myotherpass'
```

Now you can create a pillar with protected data like:

```
pillarexample:
  user: root
  password: {{ salt.nacl.dec('DRB7Q6/
↳X5gGSRCTpZyxS6hX05LnIJIJ4ivbmUlWj0l1UA+uaVyvou3vJ4=') }}
```

Or do something interesting with grains like:

```
salt-call nacl.enc minionname:dbrole
AL24Z2C50lkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/CksWM809yskLwH2AGVLoEXI5jAa

salt minionname grains.setval role 'AL24Z2C50lkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/
↳CksWM809yskLwH2AGVLoEXI5jAa'

{%- set r = grains.get('role') %}
{%- set role = None %}
{%- if r and 'nacl.dec' in salt %}
  {%- set r = salt['nacl.dec'](r,keyfile='/root/.nacl').split(':') %}
  {%- if opts['id'] == r[0] %}
    {%- set role = r[1] %}
  {%- endif %}
{%- endif %}
base:
  {%- if role %}
    '{{ opts['id'] }}':
      - {{ role }}
  {%- endif %}
```

Multi-line text items like certificates require a bit of extra work. You have to strip the new lines and replace them with ``\n`` characters. Certificates specifically require some leading white space when calling `nacl.enc` so that the ``--`` in the first line (commonly `----BEGIN CERTIFICATE----`) doesn't get interpreted as an argument to `nacl.enc`. For instance if you have a certificate file that lives in `cert.crt`:

```
cert=$(cat cert.crt |awk '{printf "%s\n", $0} END {print ""}'); salt-run nacl.enc "
↳$cert"
```

Pillar data should look the same, even though the secret will be quite long. However, when calling multiline encrypted secrets from pillar in a state, use the following format to avoid issues with `/n` creating extra whitespace at the beginning of each line in the cert file:

```
secret.txt:
  file.managed:
    - template: jinja
    - user: user
    - group: group
    - mode: 700
    - contents: "{{{- salt['pillar.get']('secret') }}"
```

The ``{{-`` will tell jinja to strip the whitespace from the beginning of each of the new lines.

`salt.modules.nacl.dec` (*data*, ***kwargs*)

Takes a key generated from `nacl.keygen` and decrypt some data.

CLI Examples:

```
salt-call --local nacl.dec pEXHQM6cuaF7A=
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
↳nLTIqXwnU+iD1uIlg4NoeeYcCFpd9k='
```

```
salt.modules.nacl.enc(data, **kwargs)
```

Takes a key generated from *nacl.keygen* and encrypt some data.

CLI Examples:

```
salt-call --local nacl.enc datatoenc
salt-call --local nacl.enc datatoenc keyfile=/root/.nacl
salt-call --local nacl.enc datatoenc key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

```
salt.modules.nacl.keygen(keyfile=None)
```

Use libnacl to generate a private key

CLI Examples:

```
salt-call --local nacl.keygen
salt-call --local nacl.keygen keyfile=/root/.nacl
salt-call --local --out=newline_values_only nacl.keygen > /root/.nacl
```

14.6.201 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

```
salt.modules.nagios.list_plugins()
```

List all the nagios plugins

CLI Example:

```
salt '*' nagios.list_plugins
```

```
salt.modules.nagios.retcode(plugin, args='', key_name=None)
```

Run one nagios plugin and return retcode of the execution

```
salt.modules.nagios.retcode_pillar(pillar_name)
```

Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```
-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

`salt.modules.nagios.run(plugin, args='')`

Run nagios plugin and return all the data execution with `cmd.run`

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

`salt.modules.nagios.run_all(plugin, args='')`

Run nagios plugin and return all the data execution with `cmd.run_all`

`salt.modules.nagios.run_all_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of `cmd.run_all` The pillar have to be in this format:

```
-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of `cmd.run` The pillar have to be in this format:

```
-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
-----
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

14.6.202 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

salt.modules.nagios_rpc.host_status (*hostname=None, **kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:

hostname The hostname to check the status of the service in Nagios.

numeric Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

salt.modules.nagios_rpc.service_status (*hostname=None, service=None, **kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:

hostname The hostname to check the status of the service in Nagios.

service The service to check the status of in Nagios.

numeric Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
↳ numeric=False
```

14.6.203 salt.modules.napalm_bgp module

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

salt.modules.napalm_bgp.config (*group=None, neighbor=None*)

Provides the BGP configuration on the device.

Parameters

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration.

If the group parameter is not specified, the neighbor setting will be ignored. :return: A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-
↳GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about
↳BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
  'PEERS-GROUP-NAME': {
    'type' : u'external',
    'description' : u'Here we should have a nice description',
    'apply_groups' : [u'BGP-PREFIX-LIMIT'],
    'import_policy' : u'PUBLIC-PEER-IN',
    'export_policy' : u'PUBLIC-PEER-OUT',
    'remove_private' : True,
    'multipath' : True,
    'multihop_ttl' : 30,
    'neighbors' : {
      '192.168.0.1': {
        'description' : 'Facebook [CDN]',
```

- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors # all neighbors
salt '*' bgp.neighbors 172.17.17.1 # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```
{
  'default': {
    8121: [
      {
        'up' : True,
        'local_as' : 13335,
        'remote_as' : 8121,
        'local_address' : u'172.101.76.1',
        'local_address_configured' : True,
        'local_port' : 179,
        'remote_address' : u'192.247.78.0',
        'router_id' : u'192.168.0.1',
        'remote_port' : 58380,
        'multihop' : False,
        'import_policy' : u'4-NTT-TRANSIT-IN',
        'export_policy' : u'4-NTT-TRANSIT-OUT',
        'input_messages' : 123,
        'output_messages' : 13,
        'input_updates' : 123,
        'output_updates' : 5,
        'messages_queued_out' : 23,
        'connection_state' : u'Established',
        'previous_connection_state' : u'EstabSync',
        'last_event' : u'RecvKeepAlive',
        'suppress_4byte_as' : False,
        'local_as_prepend' : False,
        'holdtime' : 90,
        'configured_holdtime' : 90,
        'keepalive' : 30,
        'configured_keepalive' : 30,
        'active_prefix_count' : 132808,
        'received_prefix_count' : 566739,
        'accepted_prefix_count' : 566479,
```

```

        'suppressed_prefix_count' : 0,
        'advertise_prefix_count'  : 0,
        'flap_count'              : 27
    }
]
}
}

```

14.6.204 salt.modules.napalm_network module

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy `napalm`.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_network.arp(interface='', ipaddr='', macaddr='')`

NAPALM returns a list of dictionaries with details of the ARP entries.

Parameters

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

Returns List of the entries in the ARP table

CLI Example:

```

salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'

```

Example output:

```

[
  {
    'interface' : 'MgmtEth0/RSP0/CPU0/0',
    'mac'       : '5c:5e:ab:da:3c:f0',
    'ip'        : '172.17.17.1',
    'age'       : 1454496274.84
  },
  {
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac'      : '66:0e:94:96:e0:ff',
    'ip'       : '172.17.17.2',
    'age'      : 1435641582.49
  }
]

```

```
}
]
```

`salt.modules.napalm_network.cli(*commands)`

Returns a dictionary with the raw output of all commands passed as arguments.

Parameters `commands` -- list of commands to be executed on the device

Returns a dictionary with the mapping between each command and its raw output

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

Example output:

```
{
  u'show version and haiku': u'Hostname: re0.edge01.arn01
                             Model: mx480
                             Junos: 13.3R6.5
                             Help me, Obi-Wan
                             I just saw Episode Two
                             You're my only hope
                             ',
  u'show chassis fan' : u'Item          Status  RPM    Measurement
  ↪intermediate-speed   Top Rear Fan      OK      3840    Spinning atⓧ
  ↪intermediate-speed   Bottom Rear Fan   OK      3840    Spinning atⓧ
  ↪intermediate-speed   Top Middle Fan    OK      3900    Spinning atⓧ
  ↪intermediate-speed   Bottom Middle Fan OK      3840    Spinning atⓧ
  ↪intermediate-speed   Top Front Fan     OK      3810    Spinning atⓧ
  ↪intermediate-speed   Bottom Front Fan  OK      3840    Spinning atⓧ
  '
}
```

`salt.modules.napalm_network.commit()`

Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

`salt.modules.napalm_network.compare_config()`

Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

`salt.modules.napalm_network.config_changed()`

Will prompt if the configuration has been changed.

Returns A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

`salt.modules.napalm_network.config_control()`

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns A tuple with a boolean that specifies if the config was changed/committed/rolledback on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

`salt.modules.napalm_network.connected()`

Specifies if the proxy succeeded to connect to the network device.

CLI Example:

```
salt '*' net.connected
```

`salt.modules.napalm_network.discard_config()`

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

`salt.modules.napalm_network.environment()`

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```
{
  'fans': {
    'Bottom Rear Fan': {
      'status': True
    },
    'Bottom Middle Fan': {
      'status': True
    },
    'Top Middle Fan': {
      'status': True
    },
    'Bottom Front Fan': {
      'status': True
    },
    'Top Front Fan': {
      'status': True
    },
    'Top Rear Fan': {
      'status': True
    }
  },
  'memory': {
    'available_ram': 16349,
```

```

    'used_ram': 4934
  },
  'temperature': {
    'FPC 0 Exhaust A': {
      'is_alert': False,
      'temperature': 35.0,
      'is_critical': False
    }
  },
  'cpu': {
    '1': {
      '%usage': 19.0
    },
    '0': {
      '%usage': 35.0
    }
  }
}

```

salt.modules.napalm_network.facts()

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os_version - String with the OS version running on the device.
- serial_number - Serial number of the device
- interface_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```

{
  'os_version': u'13.3R6.5',
  'uptime': 10117140,
  'interface_list': [
    'lc-0/0/0',
    'pfe-0/0/0',
    'pfh-0/0/0',
    'xe-0/0/0',
    'xe-0/0/1',
    'xe-0/0/2',
    'xe-0/0/3',
    'gr-0/0/10',
    'ip-0/0/10'
  ],
  'vendor': u'Juniper',
  'serial_number': u'JN131356FBFA',
  'model': u'MX480',
  'hostname': u're0.edge05.sydney01',
  'fqdn': u're0.edge05.sydney01'
}

```

salt.modules.napalm_network.interfaces()

Returns details of the interfaces on the device.

Returns Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
  u'Management1': {
    'is_up': False,
    'is_enabled': False,
    'description': u'',
    'last_flapped': -1,
    'speed': 1000,
    'mac_address': u'dead:beef:dead',
  },
  u'Ethernet1': {
    'is_up': True,
    'is_enabled': True,
    'description': u'foo',
    'last_flapped': 1429978575.1554043,
    'speed': 1000,
    'mac_address': u'beef:dead:beef',
  }
}
```

`salt.modules.napalm_network.ipaddrs()`

Returns IP addresses configured on the device.

Returns A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys `ipv4` and `ipv6` (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
  u'FastEthernet8': {
    u'ipv4': {
      u'10.66.43.169': {
        'prefix_length': 22
      }
    }
  },
  u'Loopback555': {
    u'ipv4': {
      u'192.168.1.1': {
        'prefix_length': 24
      }
    },
    u'ipv6': {
      u'1::1': {
        'prefix_length': 64
      }
    }
  }
}
```

```

    },
    u'2001:DB8:1::1': {
        'prefix_length': 64
    },
    u'FE80::3': {
        'prefix_length': u'N/A'
    }
}
}
}
}

```

`salt.modules.napalm_network.lldp(interface='')`

Returns a detailed view of the LLDP neighbors.

Parameters **interface** -- interface name to filter on

Returns A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```

salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'

```

Example output:

```

{
  'TenGigE0/0/0/8': [
    {
      'parent_interface': u'Bundle-Ether8',
      'interface_description': u'TenGigE0/0/0/8',
      'remote_chassis_id': u'8c60.4f69.e96c',
      'remote_system_name': u'switch',
      'remote_port': u'Eth2/2/1',
      'remote_port_description': u'Ethernet2/2/1',
      'remote_system_description': u'Cisco Nexus Operating System (NX-OS)
↳ Software 7.1(0)N1(1a)
      TAC support: http://www.cisco.com/tac
      Copyright (c) 2002-2015, Cisco Systems, Inc. All rights reserved.',
      'remote_system_capab': u'B, R',
      'remote_system_enable_capab': u'B'
    }
  ]
}

```

`salt.modules.napalm_network.load_config(filename=None, text=None, test=False, commit=True, replace=False)`

Populates the candidate configuration. It can be loaded from a file or from a string. If you send both a filename and a string containing the configuration, the file takes precedence.

If you use this method the existing configuration will be merged with the candidate configuration once you commit the changes.

Be aware that by default this method will commit the configuration. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

Parameters

- **filename** -- Path to the file containing the desired configuration. By default is `None`.
- **text** -- String containing the desired configuration.

- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.
- **replace** -- Load and replace the configuration. Default: `False`.

Returns a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below) * **comment** (str): a message for the user * `already_configured` (bool): flag to check if there were no changes applied * **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False
```

Example output:

```
{
  'comment': 'Configuration discarded.',
  'already_configured': False,
  'result': True,
  'diff': '[edit interfaces xe-0/0/5]+ description "Adding a description";'
}
```

`salt.modules.napalm_network.load_template` (*template_name*, *template_source=None*, *template_path=None*, *test=False*, *commit=True*, *replace=False*, ***template_vars*)

Renders a configuration template (Jinja) and loads the result on the device.

By default will commit the changes. To force a dry run, set `test=True`.

Parameters

- **template_name** -- Identifies the template name.
- **(optional)** (*template_path*) -- Inline config template to be rendered and loaded on the device.
- **(optional)** -- Specifies the absolute path to a different directory for the configuration templates. If not specified, by default will use the default templates defined in NAPALM.
- **test** -- Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.
- **replace** -- Load and replace the configuration.

- **template_vars** -- Dictionary with the arguments to be used when the template is rendered.

Returns a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% endif %}
```

CLI Example:

```
salt '*' net.load_template ntp_peers peers=[192.168.0.1] # uses NAPALM default
↳ templates
salt '*' net.load_template set_hostname template_source='system { domain-name {
↳ {domain_name}}; }'
domain_name='test.com'
salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'
↳ # will commit
salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'
↳ test=True # dry run
```

Example output:

```
{
  'comment': '',
  'already_configured': False,
  'result': True,
  'diff': '[edit system]+ host-name edge01.bjm01'
}
```

`salt.modules.napalm_network.mac` (`address=''`, `interface=''`, `vlan=0`)

Returns the MAC Address Table on the device.

Parameters

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

Returns A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
  {
    'mac'      : '00:1c:58:29:4a:71',
    'interface' : 'xe-3/0/2',
    'static'    : False,
    'active'    : True,
    'moves'     : 1,
    'vlan'      : 10,
    'last_move' : 1454417742.58
  },
  {
    'mac'      : '8c:60:4f:58:e1:c1',
    'interface' : 'xe-1/0/1',
    'static'    : False,
    'active'    : True,
    'moves'     : 2,
    'vlan'      : 42,
    'last_move' : 1453191948.11
  }
]
```

`salt.modules.napalm_network.ping(destination, source='', ttl=0, timeout=0, size=0, count=0)`

Executes a ping on the network device and returns a dictionary as a result.

Parameters

- **destination** -- Hostname or IP address of remote host
- **source** -- Source address of echo request
- **ttl** -- IP time-to-live value (IPv6 hop-limit value) (1..255 hops)
- **timeout** -- Maximum wait time after sending final packet (seconds)
- **size** -- Size of request packets (0..65468 bytes)
- **count** -- Number of ping requests to send (1..2000000000 packets)

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

`salt.modules.napalm_network.rollback()`

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

`salt.modules.napalm_network.traceroute(destination, source='', ttl=0, timeout=0)`

Calls the method `traceroute` from the NAPALM driver object and returns a dictionary with the result of the `traceroute` command executed on the device.

Parameters

- **destination** -- Hostname or address of remote host
- **source** -- Source address to use in outgoing traceroute packets
- **ttl** -- IP maximum time-to-live value (or IPv6 maximum hop-limit value)
- **timeout** -- Number of seconds to wait for response (seconds)

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

14.6.205 salt.modules.napalm_ntp module

NAPALM NTP

Manages NTP on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

NTP peers management state

New in version 2016.11.0.

`salt.modules.napalm_ntp.delete_peers(*peers, **options)`

Removes NTP peers configured on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but
↳ does not commit
```

`salt.modules.napalm_ntp.delete_servers(*servers, **options)`

Removes NTP servers configured on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers

- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False # preserves the changes,
↳but does not commit
```

`salt.modules.napalm_ntp.peers()`

Returns a list the NTP peers configured on the network device.

Returns configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
  '192.168.0.1',
  '172.17.17.1',
  '172.17.17.2',
  '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.servers()`

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

`salt.modules.napalm_ntp.set_peers(*peers, **options)`

Configures a list of NTP peers on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False # preserves the changes, but
↳does not commit
```

```
salt.modules.napalm_ntp.set_servers(*servers, **options)
```

Configures a list of NTP servers on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default *test* is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when

the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the changes, but
↳ does not commit
```

```
salt.modules.napalm_ntp.stats(peer=None)
```

Returns a dictionary containing synchronization details of the NTP peers.

Parameters peer -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
  {
    'remote'       : u'188.114.101.4',
    'referenceid'  : u'188.114.100.1',
    'synchronized' : True,
    'stratum'      : 4,
```

```
'type'          : u'-',
'when'          : u'107',
'hostpoll'      : 256,
'reachability'  : 377,
'delay'         : 164.228,
'offset'        : -13.866,
'jitter'        : 2.695
}
]
```

14.6.206 salt.modules.napalm_probes module

NAPALM Probes

Manages RPM/SLA probes on the network device.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm proxy minion*
- *NET basic features*

See also:

Probes configuration management state

New in version 2016.11.0.

salt.modules.napalm_probes.config()

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
  'probe1': {
    'test1': {
      'probe_type' : 'icmp-ping',
      'target'     : '192.168.0.1',
      'source'     : '192.168.0.2',
      'probe_count' : 13,
      'test_interval' : 3
    },
    'test2': {
      'probe_type' : 'http-ping',
      'target'     : '172.17.17.1',
    }
  }
}
```

```

        'source'      : '192.17.17.2',
        'probe_count' : 5,
        'test_interval': 60
    }
}

```

`salt.modules.napalm_probes.delete_probes` (*probes*, *test=False*, *commit=True*)

Removes RPM/SLA probes from the network device. Calls the configuration template `delete_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters `probes` -- Dictionary with a similar format as the output dictionary of the function `config()`,

where the details are not necessary. `:param test`: Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device. `:param commit`: Commit? (default: `True`) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises `MergeConfigException` -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below) * `comment` (str): a message for the user * `already_configured` (bool): flag to check if there were no changes applied * `diff` (str): returns the config changes applied

Input example:

```

probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}

```

`salt.modules.napalm_probes.results` ()

Provides the results of the measurements of the RPM/SLA probes.

`:return` a dictionary with the results of the probes.

CLI Example:

```

salt '*' probes.results

```

Output example:

```

{
    'probe1': {
        'test1': {
            'last_test_min_delay' : 63.120,
            'global_test_min_delay' : 62.912,
            'current_test_avg_delay' : 63.190,
            'global_test_max_delay' : 177.349,

```

```

        'current_test_max_delay': 63.302,
        'global_test_avg_delay' : 63.802,
        'last_test_avg_delay'   : 63.438,
        'last_test_max_delay'   : 65.356,
        'probe_type'            : 'icmp-ping',
        'rtt'                    : 63.138,
        'last_test_loss'        : 0,
        'round_trip_jitter'     : -59.0,
        'target'                 : '192.168.0.1',
        'source'                 : '192.168.0.2'
        'probe_count'           : 15,
        'current_test_min_delay': 63.138
    },
    'test2': {
        'last_test_min_delay'    : 176.384,
        'global_test_min_delay'  : 169.226,
        'current_test_avg_delay': 177.098,
        'global_test_max_delay'  : 292.628,
        'current_test_max_delay': 180.055,
        'global_test_avg_delay'  : 177.959,
        'last_test_avg_delay'    : 177.178,
        'last_test_max_delay'    : 184.671,
        'probe_type'            : 'icmp-ping',
        'rtt'                    : 176.449,
        'last_test_loss'        : 0,
        'round_trip_jitter'     : -34.0,
        'target'                 : '172.17.17.1',
        'source'                 : '172.17.17.2'
        'probe_count'           : 15,
        'current_test_min_delay': 176.402
    }
}

```

`salt.modules.napalm_probes.schedule_probes` (*probes*, *test=False*, *commit=True*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them. This method calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`,

where the details are not necessary. `:param test`: Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device. `:param commit`: Commit? (default: `True`) Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case

there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below) * `comment` (str): a message for the user * `already_configured` (bool): flag to check if there were no changes applied * `diff` (str): returns the config changes applied

Input example:

```
probes = {
  'new_probe':{
    'new_test1': {},
    'new_test2': {}
  }
}
```

`salt.modules.napalm_probes.set_probes`(*probes*, *test=False*, *commit=True*)

Configures RPM/SLA probes on the device. Calls the configuration template `set_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes.
Default: `False`

and will commit the changes on the device. `:param commit: Commit? (default: True)` Sometimes it is not needed to commit the config immediately

after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure.
In case

there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below) * **comment** (str): a message for the user * **already_configured** (bool): flag to check if there were no changes applied * **diff** (str): returns the config changes applied

Input example - via state/script:

```
probes = {
  'new_probe':{
    'new_test1': {
      'probe_type'   : 'icmp-ping',
      'target'       : '192.168.0.1',
      'source'       : '192.168.0.2',
      'probe_count'  : 13,
      'test_interval': 3
    },
    'new_test2': {
      'probe_type'   : 'http-ping',
      'target'       : '172.17.17.1',
      'source'       : '192.17.17.2',
      'probe_count'  : 5,
      'test_interval': 60
    }
  }
}
set_probes(probes)
```

CLI Example - to push cahnges on the fly (not recommended):

```
salt 'junos_minion' probes.set_probes "{ 'new_probe': { 'new_test1': { 'probe_type':
↳ 'icmp-ping', 'target': '192.168.0.1', 'source': '192.168.0.2', 'probe_
↳ count': 13, 'test_interval': 3 } } }" test=True
```

Output example - for the CLI example above:

```
junos_minion:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:
  [edit services rpm]
  probe transit { ... }
+  probe new_probe {
+    test new_test1 {
+      probe-type icmp-ping;
+      target address 192.168.0.1;
+      probe-count 13;
+      test-interval 3;
+      source-address 192.168.0.2;
+    }
+  }
result:
  True
```

14.6.207 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends netaddr

salt.modules.netaddress.cidr_broadcast(*cidr*)
Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.cidr_netmask(*cidr*)
Get the netmask address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips(*cidr*)
Get a list of IP addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips_ipv6(*cidr*)
Get a list of IPv6 addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

14.6.208 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.netbsd_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.get(name)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

14.6.209 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.netbsdservice.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.netbsdservice.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.netbsdservice.disabled(name)`
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.netbsdservice.enable(name, **kwargs)`
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.netbsdservice.enabled(name, **kwargs)`
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.netbsdservice.force_reload(name)`
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.netbsdservice.get_all()`
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.netbsdservice.get_disabled()`
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.netbsdservice.get_enabled()`
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.netbsdservice.missing(name)`
The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.netbsdservice.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.netbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.netbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.netbsdservice.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.netbsdservice.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.210 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends

- nsnitro Python module

Note: You can install nsnitro using:

```
pip install nsnitro
```

configuration This module accepts connection configuration details either as parameters, or as configuration settings in `/etc/salt/minion` on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples Calls relying on configuration passed using /etc/salt/minion, grains, or pillars: .. code-block:: bash

```
salt-call netcaler.server_exists server_name
```

Calls passing configuration as opts .. code-block:: bash

```
salt-call netcaler.server_exists server_name netcaler_host=1.2.3.4
netcaler_user=username netcaler_pass=password salt-call netcaler.server_exists
server_name netcaler_host=1.2.3.5 netcaler_user=username2
netcaler_pass=password2 salt-call netcaler.server_enable server_name2
netcaler_host=1.2.3.5
```

`salt.modules.netcaler.server_add(s_name, s_ip, s_state=None, **connection_args)`

Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netcaler.server_add 'serverName' 'serverIpAddress'
salt '*' netcaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

`salt.modules.netcaler.server_delete(s_name, **connection_args)`

Delete a server

CLI Example:

```
salt '*' netcaler.server_delete 'serverName'
```

`salt.modules.netcaler.server_disable(s_name, **connection_args)`

Disable a server globally

CLI Example:

```
salt '*' netcaler.server_disable 'serverName'
```

`salt.modules.netcaler.server_enable(s_name, **connection_args)`

Enables a server globally

CLI Example:

```
salt '*' netcaler.server_enable 'serverName'
```

`salt.modules.netcaler.server_enabled(s_name, **connection_args)`

Check if a server is enabled globally

CLI Example:

```
salt '*' netcaler.server_enabled 'serverName'
```

`salt.modules.netcaler.server_exists(s_name, ip=None, s_state=None, **connection_args)`

Checks if a server exists

CLI Example:

```
salt '*' netcaler.server_exists 'serverName'
```

`salt.modules.netcaler.server_update(s_name, s_ip, **connection_args)`

Update a server's attributes

CLI Example:

```
salt '*' netcaler.server_update 'serverName' 'serverIP'
```

`salt.modules.netcaler.service_disable`(*s_name*, *s_delay=None*, ***connection_args*)

Disable a service

CLI Example:

```
salt '*' netcaler.service_disable 'serviceName'
salt '*' netcaler.service_disable 'serviceName' 'delayInSeconds'
```

`salt.modules.netcaler.service_enable`(*s_name*, ***connection_args*)

Enable a service

CLI Example:

```
salt '*' netcaler.service_enable 'serviceName'
```

`salt.modules.netcaler.service_exists`(*s_name*, ***connection_args*)

Checks if a service exists

CLI Example:

```
salt '*' netcaler.service_exists 'serviceName'
```

`salt.modules.netcaler.service_up`(*s_name*, ***connection_args*)

Checks if a service is UP

CLI Example:

```
salt '*' netcaler.service_up 'serviceName'
```

`salt.modules.netcaler.servicegroup_add`(*sg_name*, *sg_type='HTTP'*, ***connection_args*)

Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:

```
salt '*' netcaler.servicegroup_add 'serviceGroupName'
salt '*' netcaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

`salt.modules.netcaler.servicegroup_delete`(*sg_name*, ***connection_args*)

Delete a new service group

CLI Example:

```
salt '*' netcaler.servicegroup_delete 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_exists`(*sg_name*, *sg_type=None*, ***connection_args*)

Checks if a service group exists

CLI Example:

```
salt '*' netcaler.servicegroup_exists 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_server_add`(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_add 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_delete`(*sg_name*, *s_name*, *s_port*, ****connection_args**)

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_disable`(*sg_name*, *s_name*, *s_port*, ****connection_args**)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_enable`(*sg_name*, *s_name*, *s_port*, ****connection_args**)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_exists`(*sg_name*, *s_name*, *s_port=None*, ****connection_args**)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_exists 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_up`(*sg_name*, *s_name*, *s_port*, ****connection_args**)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_up 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.vserver_add`(*v_name*, *v_ip*, *v_port*, *v_type*, ****connection_args**)

Add a new lb vserver

CLI Example:

```
salt '*' netcaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
↳ 'vserverType'
salt '*' netcaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

`salt.modules.netcaler.vserver_delete`(*v_name*, ****connection_args**)

Delete a lb vserver

CLI Example:

```
salt '*' netcaler.vserver_delete 'vserverName'
```

`salt.modules.netcaler.vserver_exists`(*v_name*, *v_ip=None*, *v_port=None*, *v_type=None*,
***connection_args*)

Checks if a vserver exists

CLI Example:

```
salt '*' netcaler.vserver_exists 'vserverName'
```

`salt.modules.netcaler.vserver_servicegroup_add`(*v_name*, *sg_name*, ***connection_args*)
Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_servicegroup_delete`(*v_name*, *sg_name*, ***connection_args*)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_servicegroup_exists`(*v_name*, *sg_name*, ***connection_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_sslcert_add`(*v_name*, *sc_name*, ***connection_args*)
Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_delete`(*v_name*, *sc_name*, ***connection_args*)
Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_exists`(*v_name*, *sc_name*, ***connection_args*)
Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

14.6.211 salt.modules.network

Module for gathering and managing network information

`salt.modules.network.active_tcp()`

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

`salt.modules.network.arp()`

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

`salt.modules.network.calc_net(ip_addr, netmask=None)`

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

`salt.modules.network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

`salt.modules.network.convert_cidr(cidr)`

returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

`salt.modules.network.default_route(family=None)`

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.default_route
```

`salt.modules.network.dig(host)`

Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.network.get_bufsize(iface)`

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

`salt.modules.network.get_hostname()`

Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.network.get_route(ip)`

Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.ifacestartswith(cidr)`

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

`salt.modules.network.in_subnet(cidr)`

Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.network.interface`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

`salt.modules.network.interface_ip`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

`salt.modules.network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.network.ip_addrs`(*interface=None, include_loopback=False, cidr=None, type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="10.0.0.0/8"` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type='private'`.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ip_addrs6`(*interface=None, include_loopback=False, cidr=None*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.ip_in_subnet`(*ip_addr, cidr*)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

`salt.modules.network.ipaddrs`(*interface=None, include_loopback=False, cidr=None, type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="10.0.0.0/8"` will return only the addresses

which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type`='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ipaddrs6` (*interface=None, include_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. `::1` is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.iphexval` (*ip*)

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

`salt.modules.network.is_loopback` (*ip_addr*)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

`salt.modules.network.is_private` (*ip_addr*)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.network.mod_bufsize` (*iface, *args, **kwargs*)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

`salt.modules.network.mod_hostname` (*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

`salt.modules.network.netstat()`

Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.ping(host, timeout=False, return_boolean=False)`

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.reverse_ip(ip_addr)`

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes(family=None)`

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.subnets(interfaces=None)`

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.subnets6()`

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.network.traceroute(host)`

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)`

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

14.6.212 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
```

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

`salt.modules.neutron.add_gateway_router` (*router, ext_network, profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **router** -- ID or name of the router
- **ext_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

Returns Added Gateway router information

`salt.modules.neutron.add_interface_router` (*router, subnet, profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns Added interface information

`salt.modules.neutron.create_firewall_rule` (*protocol, action, profile=None, **kwargs*)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
      tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
      source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
      ADDRESS source_port=SOURCE_PORT
      destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters

- **protocol** -- Protocol for the firewall rule, choose ``tcp``;``udp``;``icmp`` or ``None``.
- **action** -- Action for the firewall rule, choose ``allow`` or ``deny``.
- **tenant_id** -- The owner tenant ID. (Optional)

- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

`salt.modules.neutron.create_floatingip` (*floating_network*, *port=None*, *profile=None*)
Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created floatingIP information

`salt.modules.neutron.create_ikepolicy` (*name*, *profile=None*, ***kwargs*)
Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
      phase1_negotiation_mode=main auth_algorithm=sha1
      encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)

- **kwargs** --

Returns Created IKE policy information

`salt.modules.neutron.create_ipsec_site_connection`(*name*, *ipsecpolicy*, *ikepolicy*, *vpnservice*, *peer_cidrs*, *peer_address*, *peer_id*, *psk*, *admin_state_up=True*, *profile=None*, ***kwargs*)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
ipsecpolicy-name ikepolicy-name vpnservice-name
192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPsec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default:bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default:1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created IPsec site connection information

`salt.modules.neutron.create_ipsecpolicy`(*name*, *profile=None*, ***kwargs*)

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
transform_protocol=esp auth_algorithm=sha1
encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters

- **name** -- Name of the IPsec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)

- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPsec lifetime attribute. default: seconds (Optional)
- **value** -- IPsec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created IPsec policy information

`salt.modules.neutron.create_network`(*name*, *router_ext=None*, *admin_state_up=True*, *network_type=None*, *physical_network=None*, *segmentation_id=None*, *shared=None*, *profile=None*)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created network information

`salt.modules.neutron.create_port`(*name*, *network*, *device_id=None*, *admin_state_up=True*, *profile=None*)

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)

- **profile** -- Profile to build on (Optional)

Returns Created port information

`salt.modules.neutron.create_router` (*name*, *ext_network=None*, *admin_state_up=True*, *profile=None*)

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created router information

`salt.modules.neutron.create_security_group` (*name=None*, *description=None*, *profile=None*)

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
↳description='Security group for servers'
```

Parameters

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group information

`salt.modules.neutron.create_security_group_rule` (*security_group*, *remote_group_id=None*, *direction='ingress'*, *protocol=None*, *port_range_min=None*, *port_range_max=None*, *ether-type='IPv4'*, *profile=None*)

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group** -- Security group name or ID to add rule
- **remote_group_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** -- Starting port range (Optional)
- **port_range_max** -- Ending port range (Optional)

- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group rule information

`salt.modules.neutron.create_subnet`(*network*, *cidr*, *name=None*, *ip_version=4*, *profile=None*)
Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters

- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. `192.168.1.0/24`)
- **name** -- Name of the subnet to create (Optional)
- **ip_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created subnet information

`salt.modules.neutron.create_vpnservice`(*subnet*, *router*, *name*, *admin_state_up=True*, *profile=None*)
Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

Parameters

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created VPN service information

`salt.modules.neutron.delete_firewall_rule`(*firewall_rule*, *profile=None*)
Deletes the specified *firewall_rule*

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_floatingip`(*floatingip_id*, *profile=None*)
Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_ikepolicy` (*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_ipsec_site_connection` (*ipsec_site_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters

- **ipsec_site_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_ipsecpolicy` (*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters

- **ipsecpolicy** -- ID or name of IPsec policy to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_network` (*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters

- **network** -- ID or name of network to delete

- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_port(port, profile=None)`

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters

- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_quota(tenant_id, profile=None)`

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters

- **tenant_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

Returns True(Delete succeed) or False(Delete failed)

`salt.modules.neutron.delete_router(router, profile=None)`

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

Parameters

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_security_group(security_group, profile=None)`

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)`

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_subnet` (*subnet*, *profile=None*)

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_vpnservice` (*vpnservice*, *profile=None*)

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.get_quotas_tenant` (*profile=None*)

Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns Quotas information

`salt.modules.neutron.list_agents` (*profile=None*)

List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

Parameters **profile** -- Profile to build on (Optional)

Returns agents message.

`salt.modules.neutron.list_extensions` (*profile=None*)

Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of extensions

`salt.modules.neutron.list_firewall_rules` (*profile=None*)

Fetches a list of all firewall rules for a tenant CLI Example:

```
salt '*' neutron.list_firewall_rules
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of firewall rules

`salt.modules.neutron.list_firewalls` (*profile=None*)

Fetches a list of all firewalls for a tenant CLI Example:

```
salt '*' neutron.list_firewalls
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of firewalls

`salt.modules.neutron.list_floatingips` (*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of floatingIP

`salt.modules.neutron.list_ikepolicies` (*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of IKE policy

`salt.modules.neutron.list_ipsec_site_connections` (*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of IPsec site connection

`salt.modules.neutron.list_ipsecpolicies` (*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of IPsec policy

`salt.modules.neutron.list_l3_agent_hosting_routers` (*router, profile=None*)

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

`salt.modules.neutron.list_networks` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of network

`salt.modules.neutron.list_ports` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of port

`salt.modules.neutron.list_quotas` (*profile=None*)

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)

Returns List of quotas

`salt.modules.neutron.list_routers` (*profile=None*)

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of router

`salt.modules.neutron.list_security_group_rules(profile=None)`

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of security group rule

`salt.modules.neutron.list_security_groups(profile=None)`

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of security group

`salt.modules.neutron.list_subnets(profile=None)`

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of subnet

`salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)`

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

Parameters

- **retrieve_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

Returns List of VPN service

`salt.modules.neutron.remove_gateway_router(router, profile=None)`

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

Parameters

- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.remove_interface_router` (*router, subnet, profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.show_firewall` (*firewall, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

Parameters

- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns firewall information

`salt.modules.neutron.show_firewall_rule` (*firewall_rule, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters

- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns firewall rule information

`salt.modules.neutron.show_floatingip` (*floatingip_id, profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns Floating IP information

`salt.modules.neutron.show_ikepolicy` (*ikepolicy, profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns IKE policy information

`salt.modules.neutron.show_ipsec_site_connection` (*ipsec_site_connection*, *profile=None*)
Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters

- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns IPsec site connection information

`salt.modules.neutron.show_ipsecpolicy` (*ipsecpolicy*, *profile=None*)
Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters

- **ipsecpolicy** -- ID or name of IPsec policy to look up
- **profile** -- Profile to build on (Optional)

Returns IPsec policy information

`salt.modules.neutron.show_network` (*network*, *profile=None*)
Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters

- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns Network information

`salt.modules.neutron.show_port` (*port*, *profile=None*)
Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters

- **port** -- ID or name of port to look up

- **profile** -- Profile to build on (Optional)

Returns Port information

`salt.modules.neutron.show_quota`(*tenant_id*, *profile=None*)

Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters

- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns Quota information

`salt.modules.neutron.show_router`(*router*, *profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

Parameters

- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

Returns Router information

`salt.modules.neutron.show_security_group`(*security_group*, *profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters

- **security_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

Returns Security group information

`salt.modules.neutron.show_security_group_rule`(*security_group_rule_id*, *profile=None*)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

Returns Security group rule information

`salt.modules.neutron.show_subnet`(*subnet*, *profile=None*)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters

- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns Subnet information

`salt.modules.neutron.show_vpnservice` (*vpnservice*, *profile=None*, ***kwargs*)
Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns VPN service information

`salt.modules.neutron.update_firewall_rule` (*firewall_rule*, *protocol=None*, *action=None*, *name=None*, *description=None*, *ip_version=None*, *source_ip_address=None*, *destination_ip_address=None*, *source_port=None*, *destination_port=None*, *shared=None*, *enabled=None*, *profile=None*)

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
↳action=ACTION
    name=NAME description=DESCRIPTION ip_version=IP_VERSION
    source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↳ADDRESS
    source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
↳enabled=ENABLED
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose ``tcp``, ``udp``, ``icmp`` or ``None``. (Optional)
- **action** -- Action for the firewall rule, choose ``allow`` or ``deny``. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)

- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

`salt.modules.neutron.update_floatingip` (*floatingip_id*, *port*, *profile=None*)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information

`salt.modules.neutron.update_network` (*network*, *name*, *profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

`salt.modules.neutron.update_port` (*port*, *name*, *admin_state_up=True*, *profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

`salt.modules.neutron.update_quota` (*tenant_id*, *subnet=None*, *router=None*, *network=None*, *floatingip=None*, *port=None*, *security_group=None*, *security_group_rule=None*, *profile=None*)

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
network=10 floatingip=30 port=30
```

Parameters

- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated quota

`salt.modules.neutron.update_router` (*router*, *name=None*, *admin_state_up=None*, *profile=None*, ***kwargs*)

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
      admin_state_up=True
```

Parameters

- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Value of updated router information

`salt.modules.neutron.update_security_group` (*security_group*, *name=None*, *description=None*, *profile=None*)

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name new-
      ↪security-group-name
```

Parameters

- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated security group information

`salt.modules.neutron.update_subnet`(*subnet, name, profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns Value of updated subnet information

`salt.modules.neutron.update_vpnservice`(*vpnservice, desc, profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns Value of updated VPN service information

14.6.213 salt.modules.nfs3

Module for managing NFS version 3.

`salt.modules.nfs3.del_export`(*exports='/etc/exports', path=None*)

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

`salt.modules.nfs3.list_exports`(*exports='/etc/exports'*)

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

14.6.214 salt.modules.nftables

Support for nftables

`salt.modules.nftables.append`(*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.build_rule`(*table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs*)

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

`salt.modules.nftables.check`(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.check_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```

salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6

```

`salt.modules.nftables.check_table` (*table=None, family='ipv4'*)

Check for the existence of a table

CLI Example:

```

salt '*' nftables.check_table nat

```

`salt.modules.nftables.delete` (*table, chain=None, position=None, rule=None, family='ipv4'*)

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```

salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6

```

`salt.modules.nftables.delete_chain` (*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```

salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6

```

`salt.modules.nftables.delete_table` (*table, family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```

salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6

```

`salt.modules.nftables.flush` (*table='filter', chain='', family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

`salt.modules.nftables.get_rule_handle` (*table='filter', chain=None, rule=None, family='ipv4'*)

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.get_rules` (*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules

salt '*' nftables.get_rules family=ipv6
```

`salt.modules.nftables.get_saved_rules` (*conf_file=None, family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

`salt.modules.nftables.insert` (*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept'

IPv6:
```

```

salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept' \
    family=ipv6

```

`salt.modules.nftables.new_chain`(*table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```

salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6

```

`salt.modules.nftables.new_table`(*table, family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```

salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6

```

`salt.modules.nftables.save`(*filename=None, family='ipv4'*)

Save the current in-memory rules to disk

CLI Example:

```

salt '*' nftables.save /etc/nftables

```

`salt.modules.nftables.version`()

Return version from nftables --version

CLI Example:

```

salt '*' nftables.version

```

14.6.215 salt.modules.nginx

Support for nginx

`salt.modules.nginx.build_info()`

Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

`salt.modules.nginx.configtest()`

test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

`salt.modules.nginx.signal(signal=None)`

Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

`salt.modules.nginx.status(url='http://127.0.0.1/status')`

Return the data from an Nginx status page as a dictionary. <http://wiki.nginx.org/HttpStubStatusModule>

url The URL of the status page. Defaults to `'http://127.0.0.1/status'`

CLI Example:

```
salt '*' nginx.status
```

`salt.modules.nginx.version()`

Return server version from `nginx -v`

CLI Example:

```
salt '*' nginx.version
```

14.6.216 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```

openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'

```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

salt.modules.nova.boot (*name, flavor_id=0, image_id=0, profile=None, timeout=300*)

Boot (create) a new instance

name Name of the new instance (must be first)

flavor_id Unique integer ID for the flavor

image_id Unique integer ID for the image

timeout How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from `nova.flavor_list` and `nova.image_list`

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

salt.modules.nova.delete (*instance_id, profile=None*)

Delete an instance

instance_id ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

salt.modules.nova.flavor_create (*name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None*)

Add a flavor to nova (nova flavor-create). The following parameters are required:

name Name of the new flavor (must be first)

flavor_id Unique integer ID for the new flavor

ram Memory size in MB

disk Disk size in GB

vcpus Number of vcpus

CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10
↪vcpus=1
```

`salt.modules.nova.flavor_delete` (*flavor_id*, *profile=None*)
Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

`salt.modules.nova.flavor_list` (*profile=None*)
Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

`salt.modules.nova.image_list` (*name=None*, *profile=None*)
Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

`salt.modules.nova.image_meta_delete` (*image_id=None*, *name=None*, *keys=None*, *profile=None*)
Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

`salt.modules.nova.image_meta_set` (*image_id=None*, *name=None*, *profile=None*, ***kwargs*)
Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 ↗ cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

`salt.modules.nova.keypair_add` (*name*, *pubfile=None*, *pubkey=None*, *profile=None*)
Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile='/home/myuser/.ssh/id_rsa.pub'
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

`salt.modules.nova.keypair_delete` (*name*, *profile=None*)
Delete a keypair from nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey'
```

`salt.modules.nova.keypair_list` (*profile=None*)
Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

`salt.modules.nova.list` (*profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_list` function.

CLI Example:

```
salt '*' nova.list
```

`salt.modules.nova.lock` (*instance_id, profile=None*)

Lock an instance

instance_id ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

`salt.modules.nova.resume` (*instance_id, profile=None*)

Resume an instance

instance_id ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

`salt.modules.nova.secgroup_create` (*name, description, profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

`salt.modules.nova.secgroup_delete` (*name, profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

`salt.modules.nova.secgroup_list` (*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

`salt.modules.nova.server_by_name` (*name, profile=None*)

Return information about a server

name Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

`salt.modules.nova.server_list` (*profile=None*)

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

`salt.modules.nova.server_list_detailed`(*profile=None*)

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

`salt.modules.nova.server_show`(*server_id, profile=None*)

Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

`salt.modules.nova.show`(*server_id, profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_show` function.

CLI Example:

```
salt '*' nova.show
```

`salt.modules.nova.suspend`(*instance_id, profile=None*)

Suspend an instance

instance_id ID of the instance to be suspended

CLI Example:

```
salt '*' nova.suspend 1138
```

`salt.modules.nova.volume_attach`(*name, server_name, device='/dev/xvdb', profile=None, timeout=300*)

Attach a block storage volume

name Name of the new volume to attach

server_name Name of the server to attach to

device Name of the device on the server

profile Profile to build on

CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/
dev/xvdb' profile=openstack
```

`salt.modules.nova.volume_create`(*name, size=100, snapshot=None, voltype=None, profile=None*)

Create a block storage volume

name Name of the new volume (must be first)

size Volume size

snapshot Block storage snapshot id

voltype Type of storage

profile Profile to build on

CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

`salt.modules.nova.volume_delete`(*name, profile=None*)

Destroy the volume

name Name of the volume

profile Profile to build on

CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

`salt.modules.nova.volume_detach`(*name*, *profile=None*, *timeout=300*)

Attach a block storage volume

name Name of the new volume to attach

server_name Name of the server to detach from

profile Profile to build on

CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

`salt.modules.nova.volume_list`(*search_opts=None*, *profile=None*)

List storage volumes

search_opts Dictionary of search options

profile Profile to use

CLI Example:

```
salt '*' nova.volume_list search_opts={"display_name": "myblock"}
↪ profile=openstack
```

`salt.modules.nova.volume_show`(*name*, *profile=None*)

Create a block storage volume

name Name of the volume

profile Profile to use

CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

14.6.217 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.cache_clean`(*path=None*, *runas=None*, *env=None*)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

path The cache subpath to delete, or None to clear the entire cache

runas The user to run NPM with

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_list`(*path=None*, *runas=None*, *env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

path The cache subpath to list, or None to list the entire cache

runas The user to run NPM with

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

salt.modules.npm.cache_path (*runas=None, env=None*)

List path of the NPM cache directory.

runas The user to run NPM with

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_path
```

salt.modules.npm.install (*pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

pkg A package name in any format accepted by NPM, including a version identifier

pkgs A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

dir The target directory in which to install the package, or `None` for global installation

runas The user to run NPM with

registry The NPM registry to install the package from.

New in version 2014.7.0.

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.

silent Whether or not to run NPM install with `--silent` flag.

New in version 2016.3.0.

dry_run Whether or not to run NPM install with `--dry-run` flag.

New in version 2015.8.4.

silent Whether or not to run NPM install with `--silent` flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

salt.modules.npm.list (*pkg=None, dir=None, runas=None, env=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg Limit package listing by name

dir The directory whose packages will be listed, or `None` for global installation

runas The user to run NPM with

New in version 2014.7.0.

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.

CLI Example:

```
salt '*' npm.list
```

`salt.modules.npm.uninstall`(*pkg*, *dir=None*, *runas=None*, *env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

pkg A package name in any format accepted by NPM

dir The target directory from which to uninstall the package, or None for global installation

runas The user to run NPM with

env Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

14.6.218 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

`systemd-nspawn(1)` is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running `systemd >= 219` will place new containers in `/var/lib/machines`, while those running `systemd < 219` will place them in `/var/lib/container`.

`salt.modules.nspawn.bootstrap_container`(*name*, *dist=None*, *version=None*)

Bootstrap a container from package servers, if `dist` is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

`salt.modules.nspawn.bootstrap_salt`(*name*, *config=None*, *approve_key=True*, *install=True*,
pub_key=None, *priv_key=None*, *bootstrap_url=None*,
force_install=False, *unconditional_install=False*,
bootstrap_delay=None, *bootstrap_args=None*, *bootstrap_shell=None*)

Bootstrap a container from package servers, if `dist` is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

`salt.modules.nspawn.copy_to`(*name*, **args*, ***kwargs*)

Copy a file from the host into a container

name Container name

source File to be copied to the container

dest Destination on the container. Must be an absolute path.

overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the `dest` argument, an error will be raised.

makedirs : False

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.disable`(*name*, **args*, ***kwargs*)

Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.enable`(*name*, **args*, ***kwargs*)

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.exists`(*name*)

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

`salt.modules.nspawn.info`(*name*, ***kwargs*)

Return info about a container

Note: The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

start [False] If True, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

`salt.modules.nspawn.list_all`()

Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

`salt.modules.nspawn.list_running`()

Lists running nspawn containers

Note: `nspawn.list` also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_stopped()`

Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.pid(name, *args, **kwargs)`

Returns the PID of a container

name Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

`salt.modules.nspawn.poweroff(name)`

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `nspawn.poweroff`.

Note: `machinectl poweroff` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.pull_dkr(url, name, index)`

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

Note: Requires `systemd >= 219`

url URL from which to download the container

name Name for the new container

index URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

`salt.modules.nspawn.pull_raw(url, name, verify=False)`

Execute a `machinectl pull-raw` to download a .qcow2 or raw disk image, and add it to `/var/lib/machines` as a new container.

Note: Requires `systemd >= 219`

url URL from which to download the container

name Name for the new container

verify [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image

verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/linux/
↳ releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz
↳ fedora21
```

`salt.modules.nspawn.pull_tar(url, name, verify=False)`

Execute a `machinectl pull-raw` to download a `.tar` container image, and add it to `/var/lib/machines` as a new container.

Note: Requires `systemd >= 219`

url URL from which to download the container

name Name for the new container

verify [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.
↳ 01.tar.gz arch2
```

`salt.modules.nspawn.reboot(name, *args, **kwargs)`

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

Note: `machinectl reboot` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will instead restart the container via `systemctl`.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.remove(name, *args, **kwargs)`

Remove the named container

Warning: This function will remove all data associated with the container. It will not, however, remove the `btrfs` subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

stop [False] If `True`, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.retcode`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.retcode` within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

`salt.modules.nspawn.run`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.run` within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console.

keep_env [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

`salt.modules.nspawn.run_all`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.run_all` within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

`salt.modules.nspawn.run_stderr`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.run_stderr` within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

`salt.modules.nspawn.run_stdout`(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run `cmd.run_stdout` within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.nspawn.start`(*name*, **args*, ***kwargs*)
Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

`salt.modules.nspawn.state`(*name*, **args*, ***kwargs*)
Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.terminate`(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

Note: `machinectl terminate` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

14.6.219 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for [salt.proxy.nxos](#).

`salt.modules.nxos.cmd`(*command*, **args*, ***kwargs*)
run commands from `__proxy__ salt.proxy.nxos`
command function from `salt.proxy.nxos` to run
args positional args to pass to `command` function
kwargs key word arguments to pass to `command` function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$!kjsdfoi$blahblahblah
↳ encrypted=True
```

`salt.modules.nxos.system_info`()

Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

14.6.220 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. `server_ip` and `server_port` params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

depends pypureomapi Python module

salt.modules.omapi.add_host(*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *super-
sede_host=False*)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

salt.modules.omapi.delete_host(*mac=None*, *name=None*)

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

14.6.221 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.assign(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.get(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.persist(*name*, *value*, *config='/etc/sysctl.conf'*)

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.show(*config_file=False*)

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

14.6.222 salt.modules.openbsdpkg

Package support for OpenBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.openbsdpkg.install` (*name=None, pkgs=None, sources=None, **kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
```

`salt.modules.openbsdpkg.latest_version` (**names, **kwargs*)

The available version of the package in the repository

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

`salt.modules.openbsdpkg.list_pkgs` (*versions_as_list=False, **kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.openbsdpkg.purge` (*name=None, pkgs=None, **kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

```

`salt.modules.openbsdpkg.remove`(*name=None*, *pkgs=None*, ***kwargs*)

Remove a single package with `pkg_delete`

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

```

`salt.modules.openbsdpkg.version`(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

```

14.6.223 salt.modules.openbsdrctl

The `rctl` service module for OpenBSD

`salt.modules.openbsdrctl.available`(*name*)

Return True if the named service is available.

CLI Example:

```

salt '*' service.available sshd

```

`salt.modules.openbsdrctl.disable`(*name*, ***kwargs*)

Disable the named service to not start at boot.

CLI Example:

```

salt '*' service.disable <service name>

```

`salt.modules.openbsdrctl.disabled`(*name*)

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```

salt '*' service.disabled <service name>

```

`salt.modules.openbsdrctl.enable`(*name*, ***kwargs*)

Enable the named service to start at boot.

flags [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

salt.modules.openbsdrctl.enabled(*name*, ***kwargs*)

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).
Return False otherwise.

name Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

salt.modules.openbsdrctl.get_all()

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdrctl.get_disabled()

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdrctl.get_enabled()

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdrctl.missing(*name*)

The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.openbsdrctl.reload(*name*)

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.openbsdrctl.restart(*name*)

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.openbsdrctl.start(*name*)

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdcctl.status`(*name*, *sig=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdcctl.stop`(*name*)

Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.224 salt.modules.openbsdservice

The service module for OpenBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.openbsdservice.available`(*name*)

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdservice.disabled`(*name*)

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdservice.enabled`(*name*, ***kwargs*)

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.openbsdservice.get_all`()

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdservice.get_disabled()`

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdservice.get_enabled()`

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdservice.missing(name)`

New in version 2014.7.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdservice.reload(name)`

New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdservice.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdservice.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.225 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

`salt.modules.openstack_config.delete(filename, section, parameter)`

Delete a value from an OpenStack configuration file.

filename The full path to the configuration file

section The section from which to delete the parameter

parameter The parameter to delete

CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.get(filename, section, parameter)`

Get a value from an OpenStack configuration file.

filename The full path to the configuration file

section The section from which to search for the parameter

parameter The parameter to return

CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.set(filename, section, parameter, value)`

Set a value in an OpenStack configuration file.

filename The full path to the configuration file

section The section in which the parameter will be set

parameter The parameter to change

value The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

14.6.226 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.openvswitch.bridge_create(br, may_exist=True)`

Creates a new bridge.

Parameters

- **br** -- A string - bridge name
- **may_exist** -- Bool, if False - attempting to create a bridge that exists returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_create br0
```

`salt.modules.openvswitch.bridge_delete`(*br*, *if_exists=True*)

Deletes bridge and all of its ports.

Parameters

- **br** -- A string - bridge name
- **if_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_delete br0
```

`salt.modules.openvswitch.bridge_exists`(*br*)

Tests whether bridge exists as a real or fake bridge.

Returns True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_exists br0
```

`salt.modules.openvswitch.bridge_list`()

Lists all existing real and fake bridges.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_list
```

`salt.modules.openvswitch.interface_get_options`(*port*)

Port's interface's optional parameters.

Parameters **port** -- A string - port name.

Returns String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_options tap0
```

`salt.modules.openvswitch.interface_get_type`(*port*)

Type of port's interface.

Parameters **port** -- A string - port name.

Returns String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_type tap0
```

`salt.modules.openvswitch.port_add`(*br*, *port*, *may_exist=False*)

Creates on bridge a new port named port.

Returns True on success, else False.

Parameters

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may_exist** -- Bool, if False - attempting to create a port that exists returns False.

New in version 2016.3.0.

```
CLI Example: .. code-block:: bash
salt '*' openvswitch.port_add br0 8080
```

`salt.modules.openvswitch.port_create_gre`(*br, port, id, remote*)

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

Returns True on success, else False.

New in version 2016.3.0.

```
CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10
```

`salt.modules.openvswitch.port_create_vlan`(*br, port, id*)

Isolate VM traffic using VLANs.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.

Returns True on success, else False.

New in version 2016.3.0.

```
CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

`salt.modules.openvswitch.port_create_vxlan`(*br, port, id, remote, dst_port=None*)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns True on success, else False.

New in version 2016.3.0.

```
CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

`salt.modules.openvswitch.port_get_tag`(*port*)

Lists tags of the port.

Parameters **port** -- A string - port name.

Returns List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_get_tag tap0
```

`salt.modules.openvswitch.port_list(br)`

Lists all of the ports within bridge.

Parameters **br** -- A string - bridge name.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_list br0
```

`salt.modules.openvswitch.port_remove(br, port, if_exists=True)`

Deletes port.

Parameters

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if_exists** -- Bool, if False - attempting to delete a port that does not exist returns False. (Default True)

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_remove br0 8080
```

14.6.227 salt.modules.opkg module

Support for Opkg

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

Note: For version comparison support, the `opkg-utils` package must be installed.

`salt.modules.opkg.available_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.del_repo`(*alias*)

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

`salt.modules.opkg.file_dict`(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.file_list`(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.get_repo`(*alias*)

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo alias
```

`salt.modules.opkg.hold`(*name=None, pkgs=None, sources=None, **kwargs*)

Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.opkg.install`(*name=None, refresh=False, pkgs=None, sources=None, **kwargs*)

Install the passed package, add `refresh=True` to update the `opkg` database.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
```

sources A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.\ndeb"}]
```

install_recommends Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{'package': {'old': 'old-version',\n             'new': 'new-version'}}
```

salt.modules.opkg.latest_version(**names, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>\nsalt '*' pkg.latest_version <package name>\nsalt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.list_pkgs(*versions_as_list=False, **kwargs*)

List the packages currently installed in a dict:

```
{'package_name': 'version'}
```

CLI Example:

```
salt '*' pkg.list_pkgs\nsalt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.list_repos()

Lists all repos on `/etc/opkg/*.conf`

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.list_upgrades(*refresh=True*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.mod_repo(*alias, **kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

alias alias by which opkg refers to the repo.

uri the URI to the repo.

compressed defines (True or False) if the index file is compressed

enabled enable or disable (True or False) repository but do not remove if disabled.

refresh enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo alias uri=http://new/uri
salt '*' pkg.mod_repo alias enabled=False
```

`salt.modules.opkg.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.opkg.refresh_db()`

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:

- True: Database updated successfully
- False: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)`

Remove packages using opkg `remove`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.opkg.unhold`(*name=None, pkgs=None, sources=None, **kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.opkg.upgrade`(*refresh=True*)

Upgrades all packages via `opkg upgrade`

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.opkg.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.opkg.version`(**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.opkg.version_cmp`(*pkg1, pkg2, ignore_epoch=False*)

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

14.6.228 salt.modules.oracle

Oracle DataBase connection module

maintainer Vladimir Bormotov <bormotov@gmail.com>

maturity new

depends cx_Oracle

platform all

configuration module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle.dbs: list of known based
oracle.dbs.<db>.uri: connection credentials in format:
    user/password@host[:port]/sid[ as {sysdba|sysoper}]
```

salt.modules.oracle.client_version()

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs(*dbs)

Show databases configuration from pillar. Filter by **args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()

Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

Note: at first `_connect()` NLS_LANG will forced to ``.AL32UTF8'`

salt.modules.oracle.show_pillar(item=None)

Show Pillar segment oracle.* and subitem with notation ``item:subitem''

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

`salt.modules.oracle.version(*dbs)`
Server Version (select banner from v\$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

14.6.229 salt.modules.osquery

Support for OSQuery - <https://osquery.io>.

New in version 2015.8.0.

`salt.modules.osquery.acpi_tables(attrs=None, where=None)`
Return acpi_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

`salt.modules.osquery.alf(attrs=None, where=None)`
Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

`salt.modules.osquery.alf_exceptions(attrs=None, where=None)`
Return alf_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

`salt.modules.osquery.alf_explicit_auths(attrs=None, where=None)`
Return alf_explicit_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

`salt.modules.osquery.alf_services(attrs=None, where=None)`
Return alf_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

`salt.modules.osquery.apps(attrs=None, where=None)`
Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

`salt.modules.osquery.apt_sources` (*attrs=None, where=None*)

Return apt_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

`salt.modules.osquery.arp_cache` (*attrs=None, where=None*)

Return arp_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

`salt.modules.osquery.block_devices` (*attrs=None, where=None*)

Return block_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

`salt.modules.osquery.certificates` (*attrs=None, where=None*)

Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

`salt.modules.osquery.chrome_extensions` (*attrs=None, where=None*)

Return chrome_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

`salt.modules.osquery.cpuuid` (*attrs=None, where=None*)

Return cpuuid information from osquery

CLI Example:

```
salt '*' osquery.cpuuid
```

`salt.modules.osquery.crontab` (*attrs=None, where=None*)

Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

`salt.modules.osquery.deb_packages` (*attrs=None, where=None*)

Return deb_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

`salt.modules.osquery.etc_hosts` (*attrs=None, where=None*)

Return etc_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

`salt.modules.osquery.etc_services` (*attrs=None, where=None*)

Return etc_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

`salt.modules.osquery.file` (*attrs=None, where=None*)

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

`salt.modules.osquery.file_changes` (*attrs=None, where=None*)

Return file_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

`salt.modules.osquery.firefox_addons` (*attrs=None, where=None*)

Return firefox_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

`salt.modules.osquery.groups` (*attrs=None, where=None*)

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

`salt.modules.osquery.hardware_events` (*attrs=None, where=None*)

Return hardware_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

`salt.modules.osquery.hash` (*attrs=None, where=None*)

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

`salt.modules.osquery.homebrew_packages` (*attrs=None, where=None*)

Return homebrew_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

`salt.modules.osquery.interface_addresses` (*attrs=None, where=None*)
Return interface_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

`salt.modules.osquery.interface_details` (*attrs=None, where=None*)
Return interface_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

`salt.modules.osquery.iokit_devicetree` (*attrs=None, where=None*)
Return iokit_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

`salt.modules.osquery.iokit_registry` (*attrs=None, where=None*)
Return iokit_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

`salt.modules.osquery.kernel_extensions` (*attrs=None, where=None*)
Return kernel_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

`salt.modules.osquery.kernel_info` (*attrs=None, where=None*)
Return kernel_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

`salt.modules.osquery.kernel_integrity` (*attrs=None, where=None*)
Return kernel_integrity information from osquery

CLI Example:

```
salt '*' osquery.kernel_integrity
```

`salt.modules.osquery.kernel_modules` (*attrs=None, where=None*)
Return kernel_modules information from osquery

CLI Example:

```
salt '*' osquery.kernel_modules
```

`salt.modules.osquery.keychain_items` (*attrs=None, where=None*)
Return keychain_items information from osquery

CLI Example:

```
salt '*' osquery.keychain_items
```

`salt.modules.osquery.last` (*attrs=None, where=None*)

Return last information from osquery

CLI Example:

```
salt '*' osquery.last
```

`salt.modules.osquery.launchd` (*attrs=None, where=None*)

Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

`salt.modules.osquery.listening_ports` (*attrs=None, where=None*)

Return listening_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

`salt.modules.osquery.logged_in_users` (*attrs=None, where=None*)

Return logged_in_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

`salt.modules.osquery.memory_map` (*attrs=None, where=None*)

Return memory_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

`salt.modules.osquery.mounts` (*attrs=None, where=None*)

Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

`salt.modules.osquery.nfs_shares` (*attrs=None, where=None*)

Return nfs_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

`salt.modules.osquery.nvram` (*attrs=None, where=None*)

Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

`salt.modules.osquery.os_version` (*attrs=None, where=None*)

Return `os_version` information from `osquery`

CLI Example:

```
salt '*' osquery.os_version
```

`salt.modules.osquery.osquery_extensions` (*attrs=None, where=None*)

Return `osquery_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_extensions
```

`salt.modules.osquery.osquery_flags` (*attrs=None, where=None*)

Return `osquery_flags` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_flags
```

`salt.modules.osquery.osquery_info` (*attrs=None, where=None*)

Return `osquery_info` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_info
```

`salt.modules.osquery.osquery_registry` (*attrs=None, where=None*)

Return `osquery_registry` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_registry
```

`salt.modules.osquery.passwd_changes` (*attrs=None, where=None*)

Return `passwd_changes` information from `osquery`

CLI Example:

```
salt '*' osquery.passwd_changes
```

`salt.modules.osquery.pci_devices` (*attrs=None, where=None*)

Return `pci_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.pci_devices
```

`salt.modules.osquery.preferences` (*attrs=None, where=None*)

Return `preferences` information from `osquery`

CLI Example:

```
salt '*' osquery.preferences
```

`salt.modules.osquery.process_envs` (*attrs=None, where=None*)

Return `process_envs` information from `osquery`

CLI Example:

```
salt '*' osquery.process_envs
```

`salt.modules.osquery.process_memory_map` (*attrs=None, where=None*)

Return process_memory_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

`salt.modules.osquery.process_open_files` (*attrs=None, where=None*)

Return process_open_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

`salt.modules.osquery.process_open_sockets` (*attrs=None, where=None*)

Return process_open_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

`salt.modules.osquery.processes` (*attrs=None, where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

`salt.modules.osquery.quarantine` (*attrs=None, where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

`salt.modules.osquery.query` (*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

`salt.modules.osquery.routes` (*attrs=None, where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

`salt.modules.osquery.rpm_packages` (*attrs=None, where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

`salt.modules.osquery.safari_extensions` (*attrs=None, where=None*)

Return `safari_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.safari_extensions
```

`salt.modules.osquery.shared_memory` (*attrs=None, where=None*)

Return `shared_memory` information from `osquery`

CLI Example:

```
salt '*' osquery.shared_memory
```

`salt.modules.osquery.shell_history` (*attrs=None, where=None*)

Return `shell_history` information from `osquery`

CLI Example:

```
salt '*' osquery.shell_history
```

`salt.modules.osquery.smbios_tables` (*attrs=None, where=None*)

Return `smbios_tables` information from `osquery`

CLI Example:

```
salt '*' osquery.smbios_tables
```

`salt.modules.osquery.startup_items` (*attrs=None, where=None*)

Return `startup_items` information from `osquery`

CLI Example:

```
salt '*' osquery.startup_items
```

`salt.modules.osquery.suid_bin` (*attrs=None, where=None*)

Return `suid_bin` information from `osquery`

CLI Example:

```
salt '*' osquery.suid_bin
```

`salt.modules.osquery.system_controls` (*attrs=None, where=None*)

Return `system_controls` information from `osquery`

CLI Example:

```
salt '*' osquery.system_controls
```

`salt.modules.osquery.time` (*attrs=None*)

Return `time` information from `osquery`

CLI Example:

```
salt '*' osquery.time
```

`salt.modules.osquery.usb_devices` (*attrs=None, where=None*)

Return `usb_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.usb_devices
```

`salt.modules.osquery.users` (*attrs=None, where=None*)

Return users information from osquery

CLI Example:

```
salt '*' osquery.users
```

`salt.modules.osquery.version` ()

Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

`salt.modules.osquery.xattr_where_from` (*attrs=None, where=None*)

Return xattr_where_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

`salt.modules.osquery.xprotect_entries` (*attrs=None, where=None*)

Return xprotect_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

`salt.modules.osquery.xprotect_reports` (*attrs=None, where=None*)

Return xprotect_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

14.6.230 salt.modules.pacman

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

`salt.modules.pacman.file_dict` (**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacman.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacman.group_diff(name)`

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with `yumpkg.group_diff` for easy support of `state.pkg.group_installed`

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

`salt.modules.pacman.group_info(name)`

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

`salt.modules.pacman.group_list()`

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.pacman.install(name=None, refresh=False, sysupgrade=False, pkgs=None, sources=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (pacman `-S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

sysupgrade Whether or not to upgrade the system packages before installing.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {"bar": "1.2.3-4"}]
salt '*' pkg.install pkgs=['foo', {"bar": "<1.2.3-4"}]
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"}, {"bar": "salt://bar.pkg.tar.xz"}]
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

`salt.modules.pacman.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacman.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacman.list_upgrades(refresh=False, root=None, **kwargs)`

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacman.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` `<salt.modules.yumpkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

`salt.modules.pacman.purge` (*name=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc name` The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.pacman.refresh_db` (*root=None*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pacman.remove` (*name=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pacman.upgrade` (*refresh=False, root=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now

used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a `pacman -Syu`

refresh Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacman.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacman.version`(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

14.6.231 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rFWf2214
  pagerduty.subdomain: mysubdomain
```

`salt.modules.pagerduty.create_event`(*service_key=None*, *description=None*, *details=None*, *incident_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
  ↪profile=my-pagerduty-account
```

The following parameters are required:

service_key This key can be found by using `pagerduty.list_services`.

description This is a short description of the event.

details This can be a more detailed description of the event.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.modules.pagerduty.list_escalation_policies` (*profile=None, api_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.modules.pagerduty.list_incidents` (*profile=None, api_key=None*)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

`salt.modules.pagerduty.list_maintenance_windows` (*profile=None, api_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account
```

`salt.modules.pagerduty.list_policies` (*profile=None, api_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.modules.pagerduty.list_schedules` (*profile=None, api_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

`salt.modules.pagerduty.list_services` (*profile=None, api_key=None*)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

`salt.modules.pagerduty.list_users` (*profile=None, api_key=None*)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```

`salt.modules.pagerduty.list_windows` (*profile=None, api_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account
```

14.6.232 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty'.

For example:

```
pagerduty:
  pagerduty.api_key: F3Rbyjbve43rFWf2214
  pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see <https://developer.pagerduty.com/documentation/rest>

salt.modules.pagerduty_util.create_or_update_resource (*resource_name*, *identifier_fields*, *data*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as `diff(state_information, object_returned_from_pagerduty)`, and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the `state_information`, comparing the matching values in the `object_returned_from_pagerduty`, and update any values that differ.

examples

```
create_or_update_resource(`user", [{"id":"name","email"}]) create_or_update_resource(`escalation_policies", [{"id":"name"}], diff=my_diff_function)
```

salt.modules.pagerduty_util.delete_resource (*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

delete any pagerduty resource

Helper method for absent()

example

```
delete_resource(`users", key, [{"id":"name","email"}]) # delete by id or name or email
```

salt.modules.pagerduty_util.get_escalation_policies (*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List escalation_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

salt.modules.pagerduty_util.get_resource (*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of `identifier_fields`. So, for example, you can look up users by email address or name by calling:

```
get_resource(`users', key, ['name', `email'], ...)
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into `__context__`), then brute force searching through the list and trying to match any of the `identifier_fields`. The `__context__` cache is purged after any create, update or delete to the resource.

```
salt.modules.pagerduty_util.get_schedules(profile='pagerduty',          subdomain=None,
                                         api_key=None)
```

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.get_schedules
```

```
salt.modules.pagerduty_util.get_services(profile='pagerduty',        subdomain=None,
                                         api_key=None)
```

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.get_services
```

```
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
```

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.get_users
```

```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty',
                                             subdomain=None, api_key=None, **kwargs)
```

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `delete_resource()` and formats the result as a salt state return value.

example

```
resource_absent(`users`, ["id","name","email"])
```

```
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None,
                                             profile='pagerduty', subdomain=None,
                                             api_key=None, **kwargs)
```

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `create_or_update_resource()` and formats the result as a salt state return value.

example

```
resource_present(`users`, ["id","name","email"])
```

14.6.233 salt.modules.pam

Support for pam

```
salt.modules.pam.read_file(file_name)
```

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

14.6.234 salt.modules.parallels module

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the `prlctl` commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the [Parallels Desktop Reference Guide](#).

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceeding double dash `--` as necessary):

New in version 2016.3.0.

`salt.modules.parallels.clone`(*name*, *new_name*, *linked=False*, *template=False*, *runas=None*)

Clone a VM

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **new_name** (*str*) -- Name of the new VM
- **linked** (*bool*) -- Create a linked virtual machine.
- **template** (*bool*) -- Create a virtual machine template instead of a real virtual machine.
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

`salt.modules.parallels.delete`(*name*, *runas=None*)

Delete a VM

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.delete_snapshot`(*name*, *snap_name*, *runas=None*, *all=False*)

Delete a snapshot

Note: Deleting a snapshot from which other snapshots are dervied will not delete the derived snapshots

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshot will be deleted
- **snap_name** (*str*) -- Name/ID of snapshot to delete

- **runas** (*str*) -- The user that the prlctl command will be run as
- **all** (*bool*) -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True
↳ runas=macdev
```

salt.modules.parallels.exec(*name, command, runas=None*)

Run a command on a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose exec will be returned
- **command** (*str*) -- Command to run on the VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.exists(*name, runas=None*)

Query whether a VM exists

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.list_snapshots(*name, snap_name=None, tree=False, names=False, runas=None*)

List the snapshots

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots will be listed
- **snap_id** (*str*) -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) -- List snapshots in tree format rather than tabular format
- **names** (*bool*) -- List snapshots as ID, name pairs
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

`salt.modules.parallels.list_vms` (*name=None, info=False, all=False, args=None, runas=None, template=False*)

List information about the VMs

Parameters

- **name** (*str*) -- Name/ID of VM to list
Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) -- List extra information
- **all** (*bool*) -- List all non-template VMs
- **args** (*tuple*) -- Additional arguments given to `prctl list`
- **runas** (*str*) -- The user that the `prctl` command will be run as
- **template** (*bool*) -- List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms '-o uuid,status' all=True runas=macdev
```

`salt.modules.parallels.prctl` (*sub_cmd, args=None, runas=None*)

Execute a `prctl` command

Parameters

- **sub_cmd** (*str*) -- `prctl` subcommand to execute
- **args** (*str*) -- The arguments supplied to `prctl <sub_cmd>`
- **runas** (*str*) -- The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.prctl user list runas=macdev
salt '*' parallels.prctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prctl capture 'macvm --file macvm.display.png' runas=macdev
```

`salt.modules.parallels.prlsruvctl` (*sub_cmd, args=None, runas=None*)

Execute a `prlsruvctl` command

New in version 2016.11.0.

Parameters

- **sub_cmd** (*str*) -- `prlsruvctl` subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlsruvctl <sub_cmd>`
- **runas** (*str*) -- The user that the `prlsruvctl` command will be run as

Example:

```
salt '*' parallels.prlsruvctl info runas=macdev
salt '*' parallels.prlsruvctl usb list runas=macdev
salt -- '*' parallels.prlsruvctl set '--mem-limit auto' runas=macdev
```

`salt.modules.parallels.reset` (*name, runas=None*)

Reset a VM by performing a hard shutdown and then a restart

Parameters

- **name** (*str*) -- Name/ID of VM to reset
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

`salt.modules.parallels.restart`(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** (*str*) -- Name/ID of VM to restart
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

`salt.modules.parallels.revert_snapshot`(*name*, *snap_name*, *runas=None*)

Revert a VM to a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to revert to a snapshot
- **snap_name** (*str*) -- Name/ID of snapshot to revert to
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

`salt.modules.parallels.snapshot`(*name*, *snap_name=None*, *desc=None*, *runas=None*)

Create a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to take a snapshot of
- **snap_name** (*str*) -- Name of snapshot
- **desc** (*str*) -- Description of snapshot
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean
↳install with updates' runas=macdev
```

`salt.modules.parallels.snapshot_id_to_name`(*name*, *snap_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_id** (*str*) -- ID of the snapshot
- **strict** (*bool*) -- Raise an exception if a name cannot be found for the given `snap_id`
- **runas** (*str*) -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66
↳runas=macdev
```

`salt.modules.parallels.snapshot_name_to_id`(*name*, *snap_name*, *strict=False*, *runas=None*)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_name** (*str*) -- Name of the snapshot
- **strict** (*bool*) -- Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) -- The user that the prlctl command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

`salt.modules.parallels.start`(*name*, *runas=None*)

Start a VM

Parameters

- **name** (*str*) -- Name/ID of VM to start
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

`salt.modules.parallels.status`(*name*, *runas=None*)

Status of a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose status will be returned
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

`salt.modules.parallels.stop`(*name*, *kill=False*, *runas=None*)

Stop a VM

Parameters

- **name** (*str*) -- Name/ID of VM to stop
- **kill** (*bool*) -- Perform a hard shutdown
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

14.6.235 salt.modules.parted

Module for managing partitions on POSIX-like systems.

depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for parted(8) for more information, or the online docs at:

http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for sfdisk(8).

salt.modules.parted.align_check(*device, part_type, partition*)

Check if partition satisfies the alignment constraint of *part_type*. Type must be ``minimal" or ``optimal".

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

salt.modules.parted.check(*device, minor*)

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

salt.modules.parted.cp(*device, from_minor, to_minor*)

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

salt.modules.parted.exists(*device=''*)

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted.get_block_device()

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

salt.modules.parted.get_id(*device, minor*)

Prints the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted.list(*device*, *unit=None*)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted.mkfs(*device*, *fs_type*)

Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of ``ext2``, ``fat32``, ``fat16``, ``linux-swap`` or ``reiserfs`` (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted.mklabel(*device*, *label_type*)

Create a new disklabel (partition table) of label_type.

Type should be one of ``aix``, ``amiga``, ``bsd``, ``dvh``, ``gpt``, ``loop``, ``mac``, ``msdos``, ``pc98``, or ``sun``.

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted.mkpart(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of ``primary``, ``logical``, or ``extended``.

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted.mkpartfs(*device*, *part_type*, *fs_type*, *start*, *end*)

Make a <part_type> partition with a new filesystem of <fs_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part_type> should be one of ``primary``, ``logical``, or ``extended``. <fs_type> must be one of ``ext2``, ``fat32``, ``fat16``, ``linux-swap`` or ``reiserfs`` (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

salt.modules.parted.name(*device*, *partition*, *name*)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted.probe`(*devices)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted.rescue`(device, start, end)

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted.resize`(device, minor, start, end)

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. `resize` never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted.rm`(device, minor)

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted.set`(device, minor, flag, state)

Changes a flag on the partition with number <minor>.

A flag can be either `on` or `off` (make sure to use proper quoting, see [YAML Idiosyncrasies](#)). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are: `bios_grub`, `legacy_boot`, `boot`, `lba`, `root`, `swap`, `hidden`, `raid`, LVM, PALO, PREP, DIAG

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot "on"
```

`salt.modules.parted.set_id`(device, minor, system_id)

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
```

```
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted.system_types()`

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted.toggle(device, partition, flag)`

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

14.6.236 salt.modules.pcs module

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

depends pcs

New in version 2016.3.0.

`salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)`

Authorize nodes to the cluster

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with PCS (default: hacluster)

pcspasswd password for pcsuser (default: hacluster)

extra_args list of extra option for the `pcs cluster auth` command

CLI Example:

```
salt '*' pcs.auth nodes=[' node1.example.org node2.example.org ] \
    pcsuser='hacluster' \
    pcspasswd='hoonetorg' \
    extra_args=[ '--force' ]
```

`salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)`

Create a CIB-file from the current CIB of the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)

extra_args additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' \
    'scope=False'
```

`salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)`

Push a CIB-file as the new CIB to the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)
extra_args additional options for creating the CIB-file
 CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' \  
    'scope=False'
```

salt.modules.pcs.cluster_node_add(*node*, *extra_args=None*)

Add a node to the pacemaker cluster via pcs command
node node that should be added
extra_args list of extra option for the `pcs cluster node add` command
 CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org'
```

salt.modules.pcs.cluster_setup(*nodes*, *pcsclustername='pcscluster'*, *extra_args=None*)

Setup pacemaker cluster via pcs command
nodes a list of nodes which should be set up
pcsclustername Name of the Pacemaker cluster (default: pcscluster)
extra_args list of extra option for the `pcs cluster setup` command
 CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]' \  
    pcsclustername='pcscluster'
```

salt.modules.pcs.config_show(*cibfile=None*)

Show config of cluster
cibfile name/path of the file containing the CIB
 CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.is_auth(*nodes*)

Check if nodes are already authorized
nodes a list of nodes to be checked for authorization to the cluster
 CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

salt.modules.pcs.item_create(*item*, *item_id*, *item_type*, *create='create'*, *extra_args=None*, *cibfile=None*)

Create an item via pcs command (mainly for use with the pcs state module)
item config, property, resource, constraint etc.
item_id id of the item
item_type item type
create create command (create or set f.e., default: create)
extra_args additional options for the pcs command
cibfile use cibfile instead of the live CIB

salt.modules.pcs.item_show(*item*, *item_id=None*, *item_type=None*, *show='show'*, *extra_args=None*, *cibfile=None*)

Show an item via pcs command (mainly for use with the pcs state module)
item config, property, resource, constraint etc.
item_id id of the item
item_type item type
show show command (probably None, default: show)

extra_args additional options for the pcs command
cibfile use cibfile instead of the live CIB

`salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)`

Set the value of a cluster property

prop name of the property

value value of the property prop

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' \
                    value='ignore' \
                    cibfile='/tmp/2_node_cluster.cib'
```

`salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)`

Show the value of a cluster property

prop name of the property

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' \
                    prop='no-quorum-policy' \
                    cibfile='/tmp/2_node_cluster.cib'
```

`salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)`

Create a resource via pcs command

resource_id name for the resource

resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

resource_options additional options for creating the resource

cibfile use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' \
                    resource_type='ocf:heartbeat:galera' \
                    resource_options="[ \
                        'wsrep_cluster_address=gcomm://node1.example.org,node2.\
->example.org,node3.example.org' \
                        '--master' \
                    ]" \
                    cibfile='/tmp/cib_for_galera.cib'
```

`salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)`

Show a resource via pcs command

resource_id name of the resource

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' \
                    cibfile='/tmp/cib_for_galera.cib'
```

`salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)`

Create a stonith resource via pcs command

stonith_id name for the stonith resource
stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options additional options for creating the stonith resource
cibfile use cibfile instead of the live CIB for manipulation
 CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' \  
                           stonith_device_type='fence_eps' \  
                           stonith_device_options="[ \  
->02', \  
                           'pcmk_host_map=node1.example.org:01;node2.example.org: \  
                           'ipaddr=myepsdevice.example.org', \  
                           'action=reboot', \  
                           'power_wait=5', \  
                           'verbose=1', \  
                           'debug=/var/log/pcsd/eps_fence.log', \  
                           'login=hidden', \  
                           'passwd=hoonetorg' \  
                           ]" \  
                           cibfile='/tmp/cib_for_stonith.cib'
```

salt.modules.pcs.stonith_show(*stonith_id*, *extra_args=None*, *cibfile=None*)

Show the value of a cluster stonith
stonith_id name for the stonith resource
extra_args additional options for the pcs stonith command
cibfile use cibfile instead of the live CIB
 CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' \  
                          cibfile='/tmp/2_node_cluster.cib'
```

14.6.237 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.install(*pecls*, *defaults=False*, *force=False*, *preferred_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

pecls The pecl extensions to install.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

salt.modules.pecl.list(*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

salt.modules.pecl.uninstall(*pecls*)

Uninstall one or several pecl extensions.

pecls The pecl extensions to uninstall.
CLI Example:

```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.update (*pecls*)
Update one or several pecl extensions.
pecls The pecl extensions to update.
CLI Example:

```
salt '*' pecl.update fuse
```

14.6.238 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

14.6.239 salt.modules.pillar

Extract the pillar data for this minion

salt.modules.pillar.ext (*external*, *pillar=None*)
Generate the pillar and apply an explicit external pillar

CLI Example:

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

```
salt '*' pillar.ext '{libvirt: _}'
```

salt.modules.pillar.fetch (*key*, *default=<type `exceptions.KeyError`>*, *merge=False*, *delimiter=':'*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from pillar, if the named value is not available return the passed default. The default return is an empty string except `__opts__['pillar_raise_on_missing']` is set to True, in which case a `KeyError` will be raised.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

merge Specify whether or not the retrieved values should be recursively merged into the passed default.

New in version 2014.7.0.

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

saltenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version Nitrogen.

CLI Example:

```
salt '*' pillar.get pkg:apache
```

salt.modules.pillar.file_exists(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the **saltenv** argument is given, restrict search to that environment only.

Will only work with **pillar_roots**, not external pillars.

Returns True if the file is found, and False otherwise.

path The path to the file in question. Will be treated as a relative path

saltenv Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

salt.modules.pillar.get(*key*, *default=<type `exceptions.KeyError`>*, *merge=False*, *delimiter=':'*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from pillar, if the named value is not available return the passed default. The default return is an empty string except **__opts__['pillar_raise_on_missing']** is set to True, in which case a **KeyError** will be raised.

If the **merge** parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

merge Specify whether or not the retrieved values should be recursively merged into the passed default.

New in version 2014.7.0.

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

saltenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing

this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version Nitrogen.

CLI Example:

```
salt '*' pillar.get pkg:apache
```

`salt.modules.pillar.item(*args, **kwargs)`

New in version 0.16.2.

Return one or more pillar entries

pillar if specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.items(*args, **kwargs)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

pillar if specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

saltenv Pass a specific pillar environment from which to compile pillar data. If unspecified, the minion's `environment` option is used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version Nitrogen.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.keys(key, delimiter=':')`

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.

delimiter Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

`salt.modules.pillar.ls(*args)`

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.obfuscate(*args)`

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'some login', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.raw(key=None)`

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

14.6.240 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, `cwd: `C:\salt\bin\scripts``. Sometimes python thinks the single back slash is an escape character.

`salt.modules.pip.freeze` (*bin_env=None, user=None, cwd=None, use_vt=False*)

Return a list of installed packages either globally or in the specified virtualenv

bin_env path to pip bin or path to virtualenv. If doing an uninstall from the system python and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want. If uninstalling from a virtualenv, just use the path to the virtualenv (/home/code/path/to/virtualenv/)

user The user under which to run pip

cwd Current working directory to run pip from

CLI Example:

```
salt '*' pip.freeze /home/code/path/to/virtualenv/
```

```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False,
                        no_use_wheel=False, log=None, proxy=None, timeout=None,
                        editable=None, find_links=None, index_url=None, extra_index_url=None,
                        no_index=False, mirrors=None, build=None, target=None,
                        download=None, download_cache=None, source=None,
                        upgrade=False, force_reinstall=False, ignore_installed=False,
                        exists_action=None, no_deps=False, no_install=False, no_download=False,
                        global_options=None, install_options=None, user=None,
                        no_chown=False, cwd=None, pre_releases=False, cert=None,
                        allow_all_external=False, allow_external=None, allow_unverified=None,
                        process_dependency_links=False, saltenv='base', env_vars=None,
                        use_vt=False, trusted_host=None, no_cache_dir=False)
```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs Comma separated list of packages to install

requirements Path to requirements

bin_env Path to pip bin or path to virtualenv. If doing a system install, and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want.

Note: If installing into a virtualenv, just use the path to the virtualenv (e.g. /home/code/path/to/virtualenv/)

use_wheel Prefer wheel archives (requires pip>=1.4)

no_use_wheel Force to not use wheel archives (requires pip>=1.4)

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=dja`)

find_links URL to search for packages

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index

mirrors Specific mirror URL(s) to query (automatically adds `--use-mirrors`)

Warning: This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

build Unpack packages into `build` dir

target Install packages into `target` dir

download Download packages into `download` instead of installing them

download_cache Cache downloaded packages in `download_cache` dir

source Check out `editable` packages into `source` dir

upgrade Upgrade all packages to the newest available version

force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.

ignore_installed Ignore the installed packages (reinstalling instead)

exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

no_deps Ignore package dependencies

no_install Download and unpack all packages, but don't actually install them

no_download Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)

install_options Extra arguments to be supplied to the setup.py install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `--install-option` options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.

global_options Extra global options to be supplied to the setup.py call before the install command.

user The user under which to run pip

no_chown When user is given, do not attempt to copy and chown a requirements file

cwd Current working directory to run pip from

pre_releases Include pre-releases in the available versions

cert Provide a path to an alternate CA bundle

allow_all_external Allow the installation of all externally hosted files

allow_external Allow the installation of externally hosted files (comma separated list)

allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links Enable the processing of dependency links

env_vars Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{ 'CUSTOM_PATH': '/opt/django_app' }"
```

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

use_vt Use VT terminal emulation (see output while installing)

no_cache_dir Disable the cache.

CLI Example:

```
salt '*' pip.install <package name>, <package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django          editable=git+https://github.
↪com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.list (*prefix=None, bin_env=None, user=None, cwd=None*)

Filter list of installed apps from freeze and check to see if `prefix` exists in the list of packages installed.

CLI Example:

```
salt '*' pip.list salt
```

salt.modules.pip.list_upgrades (*bin_env=None, user=None, cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt.modules.pip.uninstall (*pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, no_chown=False, cwd=None, saltenv='base', use_vt=False*)

Uninstall packages with pip

Uninstall packages individually or from a pip requirements file. Uninstall packages globally or from a virtualenv.

pkgs comma separated list of packages to install

requirements path to requirements.

bin_env path to pip bin or path to virtualenv. If doing an uninstall from the system python and want to use a specific pip bin (pip-2.7, pip-2.6, etc..) just specify the pip bin you want. If uninstalling from a virtualenv, just use the path to the virtualenv (/home/code/path/to/virtualenv/)

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

user The user under which to run pip

no_chown When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)

cwd Current working directory to run pip from

use_vt Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.upgrade(*bin_env=None, user=None, cwd=None, use_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

salt.modules.pip.upgrade_available(*pkg, bin_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

salt.modules.pip.version(*bin_env=None*)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

CLI Example:

```
salt '*' pip.version
```

14.6.241 salt.modules.pkg_resource

Resources needed by pkg providers

`salt.modules.pkg_resource.add_pkg(pkg, name, pkgver)`

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{} bind 9
```

`salt.modules.pkg_resource.check_extra_requirements(pkgname, pkgver)`

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

`salt.modules.pkg_resource.pack_sources(sources, normalize=True)`

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar": "salt://  
↪bar.rpm"}]'
```

`salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)`

Parses the input to `pkg.install` and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.sort_pkglist(pkgs)`

Accepts a dict obtained from `pkg.list_pkgs()` and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.stringify(pkgs)`

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.version_clean(verstr)`

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

14.6.242 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsd/pkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.pkgin.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.file_dict(*packages)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.file_list(package)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.\ndeb"}]
```

Return a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',\n               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>\nsalt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>\nsalt '*' pkg.purge <package1>, <package2>, <package3>\nsalt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.refresh_db()`

Use pkg update to get latest pkg_summary

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove` (*name=None, pkgs=None, **kwargs*)

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pkgin.search` (*pkg_name*)

Searches for an exact match using `pkgin ^package$`

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.upgrade` ()

Run `pkg upgrade`, if `pkgin` used. Otherwise do nothing

Returns a dictionary containing the changes:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.version` (**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

14.6.243 salt.modules.pkgng

Support for `pkgng`, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ``pkg.install' is not available`), see [here](#).

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the `pkgng` module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as `pkgng`, as it will behave like a normal Salt `pkg` provider. The documentation below should not be considered to apply to this module in versions `<= 0.17.x`. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use `pkgng`, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

`salt.modules.pkgng.audit` (*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)

root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

`salt.modules.pkgng.autoremove` (*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

`salt.modules.pkgng.backup` (*file_name, jail=None, chroot=None, root=None*)

Export installed packages into yml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

jail Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.check` (*jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False*)

Sanity checks installed packages

jail Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

chroot Perform the sanity check in the specified chroot (ignored if `jail` is specified)

root Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

depends Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

recompute Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

checksum Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

`salt.modules.pkgng.clean` (*jail=None, chroot=None, root=None*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
salt '*' pkg.clean jail=<jail name or id>
salt '*' pkg.clean chroot=/path/to/chroot
```

`salt.modules.pkgng.fetch` (*name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot Fetch package in the specified chroot (ignored if jail is specified)

root Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob Treat `pkg_name` as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex Treat `pkg_name` as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre Treat `pkg_name` as an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local Skip updating the repository catalogs with `pkg-update(8)`. Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.install`(*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall_requires=False, regex=False, pcre=False, **kwargs*)

Install package(s) from a repository

name The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if `jail` is specified)

root Install the package into the specified root (ignored if `jail` is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet Force quiet output, except when `dryrun` is used, where `pkg install` will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires When used with `force`, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

fromrepo In multi-repo mode, override the `pkg.conf` ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.install <extended regular expression> pcre=True
```

salt.modules.pkgng.latest_version(**names, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

salt.modules.pkgng.list_pkgs(*versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail List the packages in the specified jail

chroot List the packages in the specified chroot (ignored if `jail` is specified)

root List the packages in the specified root (ignored if `jail` is specified)

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.parse_config(*file_name='/usr/local/etc/pkg.conf'*)

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

salt.modules.pkgng.refresh_db(*jail=None, chroot=None, root=None, force=False*)

Refresh PACKAGESITE contents

Note: This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely

match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail Refresh the pkg database within the specified jail

chroot Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root Refresh the pkg database within the specified root (ignored if `jail` is specified)

force Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

```
salt.modules.pkgng.remove(name=None, pkgs=None, jail=None, chroot=None, root=None,
                          all_installed=False, force=False, glob=False, dryrun=False, recurse=False,
                          regex=False, pcre=False, **kwargs)
```

Remove a package from the database and system

Note: This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

name The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail Delete the package from the specified jail

chroot Delete the package from the specified chroot (ignored if `jail` is specified)

root Delete the package from the specified root (ignored if `jail` is specified)

all_installed Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcr Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.restore(*file_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

jail Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.search(*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

jail Perform the search using the pkg.conf(5) from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

chroot Perform the search using the pkg.conf(5) from the specified chroot (ignored if jail is specified)

root Perform the search using the pkg.conf(5) from the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

glob Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

regex Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

pcre Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

comment Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

desc Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

full Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

depends Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

size Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

quiet Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

origin Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

prefix Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

`salt.modules.pkgng.stats` (*local=False, remote=False, jail=None, chroot=None, root=None*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

local Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

remote Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

jail Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot Retrieve stats from the specified chroot (ignored if `jail` is specified).

root Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

`salt.modules.pkgng.update_package_site` (*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.updating` (*name, jail=None, chroot=None, root=None, filedate=None, filename=None*)

Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

jail Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot Perform the action in the specified chroot (ignored if `jail` is specified)

root Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.update foo chroot=/path/to/chroot
```

filedate Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.update foo filedate=20130101
```

filename Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.update foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.upgrade(*names, **kwargs)`

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)

root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

force Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the `local` option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

`salt.modules.pkgng.version` (*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

jail Get package version information for the specified jail

chroot Get package version information for the specified chroot (ignored if `jail` is specified)

root Get package version information for the specified root (ignored if `jail` is specified)

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.version_cmp` (pkg1, pkg2, ignore_epoch=False)

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.which` (path, jail=None, chroot=None, root=None, origin=False, quiet=False)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

jail Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot Perform the check in the specified chroot (ignored if `jail` is specified)

root Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

14.6.244 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see [here](#).

`salt.modules.pkgutil.install`(*name=None, refresh=False, version=None, pkgs=None, **kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3'}]
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pkgutil.latest_version`(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs`(*versions_as_list=False, **kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades`(*refresh=True, **kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge` (*name=None, pkgs=None, **kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo"', "bar"]'
```

`salt.modules.pkgutil.refresh_db` ()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.remove` (*name=None, pkgs=None, **kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo"', "bar"]'
```

`salt.modules.pkgutil.upgrade` (*refresh=True*)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

`salt.modules.pkgutil.upgrade_available` (*name*)

Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

`salt.modules.pkgutil.version(*names, **kwargs)`
Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

14.6.245 salt.modules.portage_config

Configure portage(5)

`salt.modules.portage_config.append_to_package_conf(conf, atom=' ', flags=None, string=' ', overwrite=False)`

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
↳ libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1
↳ flags="['ldap', '-libvirt']"
```

`salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)`

Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap', '-
↳ libvirt']"
```

`salt.modules.portage_config.enforce_nice_config()`

Enforce a nice tree structure for `/etc/portage/package.*` configuration files.

See also:

[`salt.modules.ebuild.ex_mod_init\(\)`](#) for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)`

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use(cp)`

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags(cp)`

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist in `/etc/portage/package.use/`

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf(conf, atom)`

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use(cp, use='USE')`

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse(cp)`

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags(conf, atom, flags)`

Find out which of the given flags are currently not set. CLI Example:

```
salt '*' portage_config.get_missing_flags use salt ["ldap', '-libvirt', 'openssl
↪']"
```

`salt.modules.portage_config.has_flag(conf, atom, flag)`

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

`salt.modules.portage_config.has_use(atom, use)`

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

`salt.modules.portage_config.is_changed_uses(cp)`

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

`salt.modules.portage_config.is_present`(*conf, atom*)

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

14.6.246 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the `master.cf` file (which is one style) and files in the style of `main.cf` (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

`salt.modules.postfix.delete`(*queue_id*)

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
```

```
salt '*' postfix.delete ALL
```

`salt.modules.postfix.hold`(*queue_id*)

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
```

```
salt '*' postfix.hold ALL
```

`salt.modules.postfix.requeue`(*queue_id*)

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
```

```
salt '*' postfix.requeue ALL
```

`salt.modules.postfix.set_main`(*key, value, path='/etc/postfix/main.cf'*)

Set a single config value in the `main.cf` file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

`salt.modules.postfix.set_master`(*service, conn_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command='', write_conf=True, path='/etc/postfix/master.cf'*)

Set a single config value in the `master.cf` file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, ``-`` cannot be set as a value, as is normal in the `master.cf` file; either ``y``, ``n`` or a number should be used when calling this function from the command line. If the value used matches the

default, it will internally be converted to a ```. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: `service` (required), `conn_type` (required), `private` (y), `unpriv` (y), `chroot` (y), `wakeup` (n), `maxproc` (100), `command` (required).

By default, this function will write out the changes to the `master.cf` file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main` (*path*='/etc/postfix/main.cf')

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the `main.cf` file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the `main.cf` file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master` (*path*='/etc/postfix/master.cf')

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the `main.cf` file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue` ()

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold` (*queue_id*)

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA
```

```
salt '*' postfix.unhold ALL
```

14.6.247 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `'postgres'` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar

note This module uses MD5 hashing which may not be compliant with certain security audits.

note When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

```
salt.modules.postgres.available_extensions(user=None, host=None, port=None,
maintenance_db=None, password=None,
runas=None)
```

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

```
salt.modules.postgres.create_extension(name, if_not_exists=None, schema=None,
ext_version=None, from_version=None, user=None,
host=None, port=None, maintenance_db=None,
password=None, runas=None)
```

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

```
salt.modules.postgres.create_metadata(name, ext_version=None, schema=None, user=None,
host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

```
salt.modules.postgres.datadir_exists(name)
```

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

```
salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, runas=None)
```

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize
auth The default authentication method for local connections
password The password to set for the postgres user
user The database superuser name
encoding The default encoding for new databases
locale The default locale for new databases
runas The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(*name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None*)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

salt.modules.postgres.db_create(*name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None*)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'  
salt '*' postgres.db_create 'dbname' template=template_postgis
```

salt.modules.postgres.db_exists(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

salt.modules.postgres.db_list(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

salt.modules.postgres.db_remove(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

salt.modules.postgres.drop_extension(*name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.get_available_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.get_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.group_create`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.group_remove`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

`salt.modules.postgres.group_update`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.has_privileges`(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

name Name of the role whose privileges should be checked on `object_type`

object_name Name of the object on which the check is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

privileges Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If `grant_option` is set to `True`, the grant option check is performed

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.installed_extensions(user=None, host=None, port=None,
                                             maintenance_db=None, password=None,
                                             runas=None)
```

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

```
salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None,
                                              maintenance_db=None, password=None,
                                              runas=None)
```

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.is_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

`salt.modules.postgres.language_create`(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name Language to install

maintenance_db The database to install the language in

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

`salt.modules.postgres.language_exists`(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name Language to check for

maintenance_db The database to check in

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

`salt.modules.postgres.language_list`(*maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db The database to check

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

`salt.modules.postgres.language_remove`(*name*, *maintenance_db*, *user=None*, *host=None*,
port=None, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

name Language to remove
maintenance_db The database to install the language in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

`salt.modules.postgres.owner_to`(*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*,
runas=None)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

`salt.modules.postgres.privileges_grant`(*name*, *object_name*, *object_type*, *privileges=None*,
grant_option=None, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*,
password=None, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \  
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role to which privileges should be granted
object_name Name of the object on which the grant is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

privileges Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER

- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name Name of the object for which the permissions should be returned

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.psql_query(query, user=None, host=None, port=None, mainte-
                                nance_db=None, password=None, runas=None)
```

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = `rolename' RETURNING
rolconnlimit) SELECT * FROM updated;
```

query The query string.

user Database username, if different from config or default.

host Database host, if different from config or default.

port Database port, if different from the config or default.

maintenance_db The database to run the query against.

password User password, if different from the config or default.

runas User to run the command as.

CLI Example:

```
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

```
salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None,
                                password=None, runas=None, return_password=False)
```

Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

`salt.modules.postgres.schema_create`(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
    user='user' \
    db_user='user' db_password='password'
    db_host='hostname' db_port='port'
```

`salt.modules.postgres.schema_exists`(*dbname*, *name*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname Database name we query on

name Schema name we look for

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.modules.postgres.schema_get`(*dbname*, *name*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname Database name we query on

name Schema name we look for

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.modules.postgres.schema_list`(*dbname*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname Database name we query on

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

```
salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None,
                                       db_password=None, db_host=None, db_port=None)
```

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

dbname Database name we work on

schemaname The schema's name we'll remove

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

```
salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None,
                                         password=None, new_name=None, new_owner=None, set_option=None,
                                         reset_option=None, runas=None)
```

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{ 'seq_page_cost': '1.1' }"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

```
salt.modules.postgres.tablespace_create(name, location, options=None, owner=None,
                                          user=None, host=None, port=None, maintenance_db=None,
                                          password=None, runas=None)
```

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

```
salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None,
                                           password=None, runas=None)
```

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

```
salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None,
                                         password=None, runas=None)
```

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

`salt.modules.postgres.user_create`(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *inherit=None*, *login=None*, *connlimit=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.user_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

`salt.modules.postgres.user_list`(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

`salt.modules.postgres.user_remove`(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

`salt.modules.postgres.user_update`(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *connlimit=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \  
    host='hostname' port='port' password='password' \  
    rolepassword='rolepassword'
```

`salt.modules.postgres.version`(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

14.6.248 salt.modules.poudriere

Support for poudriere

`salt.modules.poudriere.bulk_build`(*jail, pkg_file, keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

`salt.modules.poudriere.create_jail`(*name, arch, version='9.0-RELEASE'*)

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

`salt.modules.poudriere.create_ports_tree`()

Not working need to run portfetch non interactive

`salt.modules.poudriere.delete_jail`(*name*)

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

`salt.modules.poudriere.is_jail`(*name*)

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

`salt.modules.poudriere.list_jails`()

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

`salt.modules.poudriere.list_ports()`
Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

`salt.modules.poudriere.make_pkgng_aware(jname)`
Make jail *jname* pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

`salt.modules.poudriere.parse_config(config_file=None)`
Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

`salt.modules.poudriere.update_jail(name)`
Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

`salt.modules.poudriere.update_ports_tree(ports_tree)`
Updates the ports tree, either the default or the *ports_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

`salt.modules.poudriere.version()`
Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

14.6.249 salt.modules.powerpath

powerpath support.

Assumes RedHat

`salt.modules.powerpath.add_license(key)`
Add a license

`salt.modules.powerpath.list_licenses()`
returns a list of applied powerpath license keys

`salt.modules.powerpath.remove_license(key)`
Remove a license

14.6.250 salt.modules.proxy module

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

salt.modules.proxy.get_ftp_proxy (*network_service='Ethernet'*)

Returns the current ftp proxy settings

network_service The network service to apply the changes to, this only necessary on OSX

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

salt.modules.proxy.get_http_proxy (*network_service='Ethernet'*)

Returns the current http proxy settings

network_service The network service to apply the changes to, this only necessary on OSX

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

salt.modules.proxy.get_https_proxy (*network_service='Ethernet'*)

Returns the current https proxy settings

network_service The network service to apply the changes to, this only necessary on OSX

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

salt.modules.proxy.get_proxy_bypass (*network_service='Ethernet'*)

Returns the current domains that can bypass the proxy

network_service The network service to get the bypass domains from, this is only necessary on OSX

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

salt.modules.proxy.get_proxy_win ()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

salt.modules.proxy.set_ftp_proxy (*server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None*)

Sets the ftp proxy settings

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on OSX

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass ↵
↵network_service=Ethernet
```

`salt.modules.proxy.set_http_proxy`(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on OSX

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_https_proxy`(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on OSX

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_proxy_bypass`(*domains*, *network_service='Ethernet'*)

Sets the domains that can bypass the proxy

domains An array of domains allowed to bypass the proxy

network_service The network service to apply the changes to, this only necessary on OSX

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

`salt.modules.proxy.set_proxy_win`(*server*, *port*, *types=None*, *bypass_hosts=None*)

Sets the http proxy settings, only works with Windows.

server The proxy server to use

password The password to use if required by the server

types The types of proxy connections should be setup with this server. Valid types are http and https.

bypass_hosts The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

14.6.251 salt.modules.ps

A salt interface to psutil, a system and process library. See <http://code.google.com/p/psutil>.

depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

`salt.modules.ps.boot_time` (*time_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

time_format Optionally specify a `strftime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. `Fri May 2 19:08:32 2014`).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

`salt.modules.ps.cpu_percent` (*interval=0.1, per_cpu=False*)

Return the percent of time the CPU is busy.

interval the number of seconds to sample CPU usage over

per_cpu if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.cpu_times` (*per_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

per_cpu if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

`salt.modules.ps.disk_io_counters` (*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
```

```
salt '*' ps.disk_io_counters device=sda1
```

`salt.modules.ps.disk_partition_usage` (*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

`salt.modules.ps.disk_partitions` (*all=False*)

Return a list of disk partitions and their device, mount point, and filesystem type.

all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

`salt.modules.ps.disk_usage` (*path*)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

`salt.modules.ps.get_pid_list()`

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

`salt.modules.ps.get_users()`

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

`salt.modules.ps.kill_pid(pid, signal=15)`

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid PID of process to kill.

signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

`salt.modules.ps.lsof(name)`

Retrieve the lsof informations of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

`salt.modules.ps.netstat(name)`

Retrieve the netstat informations of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

`salt.modules.ps.network_io_counters(interface=None)`

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
```

```
salt '*' ps.network_io_counters interface=eth0
```

`salt.modules.ps.num_cpus()`

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

`salt.modules.ps.pgrep` (*pattern*, *user=None*, *full=False*)

Return the pids for processes matching a pattern.

If `full` is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern Pattern to search for in the process list.

user Limit matches to the given username. Default: All users.

full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Find all httpd processes on all `www` minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user `tom`:

```
salt '*' ps.pgrep bash user=tom
```

`salt.modules.ps.pkill` (*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
    [full=(true|false)]
```

pattern Pattern to search for in the process list.

user Limit matches to the given username. Default: All users.

signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all `www` minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user `tom`:

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.proc_info` (*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs=['pid', 'name']
```

pid PID of process to query.

attrs Optional list of desired process attributes. The list of possible attributes can be found here: <http://pythonhosted.org/psutil/#psutil.Process>

`salt.modules.ps.psaux` (*name*)

Retrieve information corresponding to a ``ps aux`` filtered with the given pattern. It could be just a name or a regular expression (using python search from ``re`` module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.swap_memory()`

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.top(num_processes=5, interval=3)`

Return a list of top CPU consuming processes during the interval. `num_processes` = return the top N CPU consuming processes `interval` = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top
```

```
salt '*' ps.top 5 10
```

`salt.modules.ps.total_physical_memory()`

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.virtual_memory()`

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

14.6.252 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.full_data(tgt, fun, arg=None, expr_form='glob', returner='', timeout=5)`

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```
salt.modules.publish.publish(tgt, fun, arg=None, expr_form='glob', returner='', timeout=5,  
                             via_master=None)
```

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `expr_form` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'  
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam', 'spam=cheese']"
```

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner` (*fun, arg=None, timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

14.6.253 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.disable` (*message=None*)

New in version 2014.7.0.

Disable the puppet agent

message New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.enable` ()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

`salt.modules.puppet.fact` (*name, puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

`salt.modules.puppet.facts` (*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

`salt.modules.puppet.noop` (**args, **kwargs*)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
↳ tags=basefiles::edit,apache::server
```

`salt.modules.puppet.plugin_sync()`

Runs a plugin synch between the puppet master and agent

CLI Example: .. code-block:: bash

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run(*args, **kwargs)`

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
↳ ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules tags=basefiles:
↳ :edit,apache::server
```

`salt.modules.puppet.status()`

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.summary()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

14.6.254 salt.modules.pushbullet module

Module for sending messages to Pushbullet (<https://www.pushbullet.com>)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

`salt.modules.pushbullet.push_note(device=None, title=None, body=None)`

Pushing a text note.

Parameters

- **device** -- Pushbullet target device

- **title** -- Note title
- **body** -- Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example
↳body."
```

14.6.255 salt.modules.pushover_notify

Module for sending messages to Pushover (<https://www.pushover.net>)

New in version 2016.3.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.post_message (*user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None*)

Send a message to a Pushover user or group.

Parameters

- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

14.6.256 salt.modules.pw_group

Manage groups on FreeBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.pw_group.add`(*name*, *gid=None*, ***kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.adduser`(*name*, *username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `'bar'` as a member of an existing group `'foo'`, if not then adds it.

`salt.modules.pw_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.deluser`(*name*, *username*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `'bar'` from a group `'foo'`. If group is not present then returns True.

`salt.modules.pw_group.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.info`(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.members`(*name*, *members_list*)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...`
```

Replaces a membership list for a local group `foo`. foo:x:1234:user1,user2,user3,...

14.6.257 salt.modules.pw_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info` is not available`), see [here](#).

```
salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None,
                        unique=True, fullname='', roomnumber='', workphone='', homephone='',
                        createhome=True, loginclass=None, **kwargs)
```

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```
salt.modules.pw_user.chfullname(name, fullname)
```

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

```
salt.modules.pw_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

```
salt.modules.pw_user.chgroups(name, groups, append=False)
```

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

```
salt.modules.pw_user.chhome(name, home, persist=False)
```

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.chhomephone` (*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.chloginclass` (*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.chroomnumber` (*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.chshell` (*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.chuid` (*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete` (*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.get_loginclass` (*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.rename` (*name, new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

14.6.258 salt.modules.pyenv

Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.

`salt.modules.pyenv.default` (*python=None, runas=None*)

Returns or sets the currently defined default python.

python=None The version to set as the default. Should match one of the versions listed by [pyenv.versions](#). Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

`salt.modules.pyenv.do`(*cmdline=None, runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

`salt.modules.pyenv.do_with_python`(*python, cmdline, runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

`salt.modules.pyenv.install`(*runas=None, path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

`salt.modules.pyenv.install_python`(*python, runas=None*)

Install a python implementation.

python The version of python to install, should match one of the versions listed by `pyenv.list`

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

`salt.modules.pyenv.is_installed`(*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

`salt.modules.pyenv.list`(*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.rehash`(*runas=None*)

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.uninstall_python`(*python, runas=None*)

Uninstall a python implementation.

python The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update`(*runas=None, path=None*)
 Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions`(*runas=None*)
 List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

14.6.259 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

depends qemu-img

`salt.modules.qemu_img.convert`(*orig, dest, fmt*)
 Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image`(*location, size, fmt*)
 Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

14.6.260 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear`(*mnt*)
 Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"mnt/foo": "/dev/nbd0p1"}'
```

`salt.modules.qemu_nbd.connect`(*image*)
 Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

`salt.modules.qemu_nbd.init`(*image*, *root=None*)
Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

`salt.modules.qemu_nbd.mount`(*nbd*, *root=None*)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

14.6.261 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.get_mode`(*device*)
Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.off`(*device*)
Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.on`(*device*)
Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.report`(*mount*)
Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.set`(*device*, ***kwargs*)
Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576  
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.stats`()
Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.warn()`

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

14.6.262 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user` (*name*, *password=None*, *runas=None*)

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost` (*vhost*, *runas=None*)

Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password` (*name*, *password*, *runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password` (*name*, *password*, *runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password` (*name*, *runas=None*)

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status` (*runas=None*)

return rabbitmq cluster_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy` (*vhost*, *name*, *runas=None*)

Delete a policy based on rabbitmqctl clear_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA'
```

`salt.modules.rabbitmq.delete_user` (*name*, *runas=None*)

Deletes a user via rabbitmqctl delete_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost` (*vhost*, *runas=None*)

Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin` (*name*, *runas=None*)

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin` (*name*, *runas=None*)

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset` (*runas=None*)

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster` (*host*, *user='rabbit'*, *ram_node=None*, *runas=None*)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster 'rabbit.example.com' 'rabbit'
```

`salt.modules.rabbitmq.list_permissions` (*vhost*, *runas=None*)

Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions '/myvhost'
```

`salt.modules.rabbitmq.list_policies`(*vhost*='/', *runas*=None)

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.list_policies'
```

`salt.modules.rabbitmq.list_queues`(*runas*=None, **args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_queues_vhost`(*vhost*, *runas*=None, **args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_user_permissions`(*name*, *runas*=None)

List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions 'user'.
```

`salt.modules.rabbitmq.list_users`(*runas*=None)

Return a list of users based off of rabbitmqctl user_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.list_vhosts`(*runas*=None)

Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled`(*name*, *runas*=None)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled foo
```

`salt.modules.rabbitmq.policy_exists`(*vhost*, *name*, *runas*=None)

Return whether the policy exists based on rabbitmqctl list_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset`(*runas=None*)

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions`(*vhost, user, conf='*', write='*', read='*', runas=None*)

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions 'myvhost' 'myuser'
```

`salt.modules.rabbitmq.set_policy`(*vhost, name, pattern, definition, priority=None, runas=None*)

Set a policy based on rabbitmqctl set_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_user_tags`(*name, tags, runas=None*)

Add user tags via rabbitmqctl set_user_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags 'myadmin' 'administrator'
```

`salt.modules.rabbitmq.start_app`(*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.status`(*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.stop_app`(*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.user_exists`(*name, runas=None*)

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.vhost_exists`(*name*, *runas=None*)
Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

14.6.263 salt.modules.raet_publish

Publish a command from a minion to a target

`salt.modules.raet_publish.full_data`(*tgt*, *fun*, *arg=None*, *expr_form='glob'*, *returner=''*, *timeout=5*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.publish`(*tgt*, *fun*, *arg=None*, *expr_form='glob'*, *returner=''*, *timeout=5*)
Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `expr_form` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.runner` (*fun, arg=None, timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

14.6.264 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in `/etc/salt/minion`:

`salt.modules.rallydev.list_items` (*name*)

List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

`salt.modules.rallydev.list_users` ()

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

`salt.modules.rallydev.query_item` (*name, query_string, order='Rank'*)

Query a type of record for one or more items. Requires a valid query string. See <https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp> for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

`salt.modules.rallydev.query_user` (*query_string, order='UserName'*)

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

`salt.modules.rallydev.show_artifact` (*id_*)

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

`salt.modules.rallydev.show_item(name, id_)`

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

`salt.modules.rallydev.show_user(id_)`

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

`salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)`

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

`salt.modules.rallydev.update_user(id_, field, value)`

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

14.6.265 salt.modules.random_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

`salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)`

List all Slack users.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

Returns The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

`salt.modules.random_org.generateDecimalFractions` (*api_key=None*, *api_version=None*, ***kwargs*)

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4 ↗
↪ replacement=True
```

`salt.modules.random_org.generateGaussians` (*api_key=None*, *api_version=None*, ***kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0 ↗
↪ significantDigits=8
```

`salt.modules.random_org.generateIntegers` (*api_key=None*, *api_version=None*, ***kwargs*)

Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

`salt.modules.random_org.generateStrings` (*api_key=None, api_version=None, **kwargs*)

Generate random strings.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↳ 'abcdefghijklmnopqrstuvwxy'
salt '*' random_org.generateStrings number=10 length=16 characters
↳ 'abcdefghijklmnopqrstuvwxy'
```

`salt.modules.random_org.generateUUIDs` (*api_key=None, api_version=None, **kwargs*)

Generate a list of random UUIDs

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

`salt.modules.random_org.getUsage` (*api_key=None, api_version=None*)

Show current usages statistics

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

Returns The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=1
```

14.6.266 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and Mac OS X. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

<http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/>

New in version 0.16.0.

`salt.modules.rbenv.default` (*ruby=None, runas=None*)

Returns or sets the currently defined default ruby

ruby The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

`salt.modules.rbenv.do` (*cmdline, runas=None, env=None*)

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

`salt.modules.rbenv.do_with_ruby` (*ruby, cmdline, runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

`salt.modules.rbenv.install` (*runas=None, path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.install_ruby` (*ruby, runas=None*)

Install a ruby implementation.

ruby The version of Ruby to install, should match one of the versions listed by `rbenv.list`

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

`salt.modules.rbenv.is_installed` (*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

`salt.modules.rbenv.list` (*runas=None*)

List the installable versions of ruby

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

`salt.modules.rbenv.rehash` (*runas=None*)

Run rbenv rehash to update the installed shims

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

`salt.modules.rbenv.uninstall_ruby` (*ruby, runas=None*)

Uninstall a ruby implementation.

ruby The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

`salt.modules.rbenv.update` (*runas=None, path=None*)

Updates the current versions of rbenv and ruby-build

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

`salt.modules.rbenv.versions` (*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

14.6.267 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.disable`()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.disconnect_session` (*session_id*)

Disconnect a session.

New in version 2016.11.0.

Parameters `session_id` -- The numeric Id of the session.

Returns A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
```

```
salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.enable`()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.get_session` (*session_id*)

Get information about a session.

New in version 2016.11.0.

Parameters `session_id` -- The numeric Id of the session.

Returns A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
```

```
salt '*' rdp.get_session 99
```

`salt.modules.rdp.list_sessions` (*logged_in_users_only=False*)

List information about the sessions.

New in version 2016.11.0.

Parameters `logged_in_users_only` -- If True, only return sessions with users logged in.

Returns A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

`salt.modules.rdp.logoff_session`(*session_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters **session_id** -- The numeric Id of the session.

Returns A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

`salt.modules.rdp.status`()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

14.6.268 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

configuration This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'localhost'
redis.port: 6379
redis.db: 0
redis.password: None
```

`salt.modules.redismod.bgrewriteaof`(*host=None, port=None, db=None, password=None*)

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

`salt.modules.redismod.bgsave`(*host=None, port=None, db=None, password=None*)

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

`salt.modules.redismod.config_get`(*pattern='*', host=None, port=None, db=None, password=None*)

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

`salt.modules.redismod.config_set`(*name*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

`salt.modules.redismod.dbsize`(*host=None*, *port=None*, *db=None*, *password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

`salt.modules.redismod.delete`(**keys*, ***connection_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

`salt.modules.redismod.exists`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

`salt.modules.redismod.expire`(*key*, *seconds*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat`(*key*, *timestamp*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall`(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb`(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip`(*host=None*, *port=None*, *password=None*)

Get host information about slave

CLI Example:

```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hget`(*key*, *field*, *host=None*, *port=None*, *db=None*, *password=None*)

Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.info`(*host=None*, *port=None*, *db=None*, *password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

`salt.modules.redismod.key_type`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

`salt.modules.redismod.keys`(*pattern='*'*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

`salt.modules.redismod.lastsave`(*host=None*, *port=None*, *db=None*, *password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

`salt.modules.redismod.llen`(*key, host=None, port=None, db=None, password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

`salt.modules.redismod.lrange`(*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

`salt.modules.redismod.ping`(*host=None, port=None, db=None, password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

`salt.modules.redismod.save`(*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

`salt.modules.redismod.sentinel_get_master_ip`(*master, host=None, port=None, password=None*)

Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

`salt.modules.redismod.set_key`(*key, value, host=None, port=None, db=None, password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

`salt.modules.redismod.shutdown`(*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

`salt.modules.redismod.slaveof`(*master_host=None, master_port=None, host=None, port=None, db=None, password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers` (*key, host=None, port=None, db=None, password=None*)
Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time` (*host=None, port=None, db=None, password=None*)
Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard` (*key, host=None, port=None, db=None, password=None*)
Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange` (*key, start, stop, host=None, port=None, db=None, password=None*)
Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

14.6.269 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY. - HKEY_LOCAL_MACHINE - HKEY_CURRENT_USER - HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

Values or Entries

Values/Entries are name/data pairs. There can be many values in a key. The (Default) value corresponds to the Key, the rest are their own value pairs.

depends

- winreg Python module

class `salt.modules.reg.Registry`

Delay `'_winreg'` usage until this module is used

`salt.modules.reg.broadcast_change()`

Refresh the windows environment.

Returns (bool): True if successful, otherwise False

CLI Example:

```
salt '*' reg.broadcast_change
```

`salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)`

New in version 2015.5.4.

Delete a registry key to include all subkeys.

Parameters

- **hive** -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** -- The key to remove (looks like a path)
- **use_32bit_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type `dict`

The following example will remove `salt` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

CLI Example:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\salt
```

`salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)`

Delete a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use_32bit_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns Returns True if successful, False if not

Return type `bool`

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

`salt.modules.reg.list_keys(hive, key=None, use_32bit_registry=False)`

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns A list of keys/subkeys under the hive or key.

Return type *list*

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.list_values` (*hive*, *key=None*, *use_32bit_registry=False*, *include_default=True*)

Enumerates the values in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
- **include_default** (*bool*) -- Toggle whether to include the '(Default)' value.

Returns A list of values under the hive or key.

Return type *list*

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
```

`salt.modules.reg.read_value` (*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Reads a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns A dictionary containing the passed settings as well as the `value_data` if successful. If unsuccessful, sets `success` to `False`.

Return type `dict`

If `vname` is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.
- Returns False if key not found.

CLI Example:

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

`salt.modules.reg.set_value`(*hive*, *key*, *vname=None*, *vdata=None*, *vtype=u'REG_SZ'*, *use_32bit_registry=False*, *volatile=False*)

Sets a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*object*) -- The value data to be set. What the type of this paramater should be is determined by the value of the `vtype` paramater. The correspondence is as follows:
 - REG_BINARY binary data (i.e. str in python version < 3 and bytes in version >=3)
 - REG_DWORD int
 - REG_EXPAND_SZ str
 - REG_MULTI_SZ list of objects of type str
 - REG_SZ str
- **vtype** (*str*) -- The value type. The possible values of the `vtype` paramater are indicated above in the description of the `vdata` paramater.
- **use_32bit_registry** (*bool*) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) -- When this paramater has a value of `True`, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This paramater only has an effect when a key is being created and at no other time.

Returns Returns `True` if successful, `False` if not

Return type `bool`

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2'
```

This function is strict about the type of `vdata`. For instance the the next example will fail because `vtype` has a value of `REG_SZ` and `vdata` has a type of `int` (as opposed to `str` as expected).

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata=0
```

However, this next example where vdata is properly quoted should succeed.

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata="'0'"
```

An example of using vtype REG_BINARY is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_BINARY vdata='!!binary d2hhdCdzIHRoZSBwb2ludA=='
```

An example of using vtype REG_LIST is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_LIST vdata='[a,b,c]'
```

14.6.270 salt.modules.rest_package

Package support for the REST example

`salt.modules.rest_package.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

14.6.271 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

`salt.modules.rest_service.enabled(name, sig=None)`

Only the `redbull` service is `enabled` in the test

New in version 2015.8.1.

`salt.modules.rest_service.get_all()`

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.rest_service.list()`

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.rest_service.restart`(*name*, *sig=None*)

Restart the specified service with `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.running`(*name*, *sig=None*)

Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.start`(*name*, *sig=None*)

Start the specified service on the `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.status`(*name*, *sig=None*)

Return the status for a service via `rest_sample`, returns a bool whether the service is running.

New in version 2015.8.0.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop`(*name*, *sig=None*)

Stop the specified service on the `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.272 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, <https://packages.debian.org/debian-goodies>) and psdel by Sam Morris.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.restartcheck`(*ignorelist=None*, *blacklist=None*, *excludepid=None*,
verbose=True)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** -- string or list of packages to be ignored
- **blacklist** -- string or list of file paths to be ignored
- **excludepid** -- string or list of process IDs to be ignored
- **verbose** -- boolean, enables extensive output

Returns True if no packages for restart found. False on failure. String with checkrestart output if some package seems to need to be restarted.

New in version 2015.8.3.

CLI Example: .. code-block:: bash
 salt '*' restartcheck.restartcheck

14.6.273 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(*returner, fun*)
 Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

salt.modules.ret.get_jid(*returner, jid*)
 Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

salt.modules.ret.get_jids(*returner*)
 Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

salt.modules.ret.get_minions(*returner*)
 Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

14.6.274 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.apply_network_settings(***settings*)
 Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_bond`(*iface*, ***settings*)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.rh_ip.build_interface`(*iface*, *iface_type*, *enabled*, ***settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings`(***settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes`(*iface*, ***settings*)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down`(*iface*, *iface_type*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.get_bond`(*iface*)

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.rh_ip.get_interface`(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.get_network_settings`()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.get_routes`(*iface*)

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.up`(*iface, iface_type*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

14.6.275 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.rh_service.available`(*name, limit=''*)

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete`(*name, **kwargs*)

Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable`(*name, **kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled`(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable`(*name, **kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit='')`
Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.get_disabled(limit='')`
Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

`salt.modules.rh_service.get_enabled(limit='')`
Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

`salt.modules.rh_service.missing(name, limit='')`
The inverse of `service.available`. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

`salt.modules.rh_service.reload(name)`
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.rh_service.restart(name)`
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rh_service.start(name)`
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rh_service.status`(*name*, *sig=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rh_service.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.276 salt.modules.riak

Riak Salt Module

`salt.modules.riak.cluster_commit`()

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

`salt.modules.riak.cluster_join`(*username*, *hostname*)

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster *hostname* - The riak hostname you are connecting to

`salt.modules.riak.cluster_leave`(*username*, *hostname*)

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster *hostname* - The riak hostname you are connecting to

`salt.modules.riak.cluster_plan`()

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

`salt.modules.riak.member_status()`

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

`salt.modules.riak.services()`

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

`salt.modules.riak.start()`

Start Riak

CLI Example:

```
salt '*' riak.start
```

`salt.modules.riak.status()`

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

`salt.modules.riak.stop()`

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

`salt.modules.riak.test()`

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

14.6.277 salt.modules.rpm

Support for rpm

`salt.modules.rpm.bin_pkg_info(path, saltenv='base')`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm.checksum(*paths)`

Return if the signature of a RPM file is valid.

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm.diff(package, path)`

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

- **package** -- The name of the package
- **path** -- Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:

```
salt '*' lowpkg.diff apache2 /etc/apache2/httpd.conf
```

`salt.modules.rpm.file_dict(*packages)`

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm.info(*packages, **attr)`

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters

- **packages** --
- **attr** -- Comma-separated package attributes. If no `attr` is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

Returns

CLI example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
```

`salt.modules.rpm.list_pkgs(*packages)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm.verify(*packages, **kwargs)`

Runs an `rpm -Va` on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
```

```
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm.version_cmp`(*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if *ver1* < *ver2*, 0 if *ver1* == *ver2*, and 1 if *ver1* > *ver2*. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

14.6.278 salt.modules.rpmbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild.build`(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html https://raw.
↳githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-libnacl.spec
↳https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

`salt.modules.rpmbuild.make_repo`(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1
```

```

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvdyEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

```

gpg_pkg_priv_keyname: gpg_pkg_key.pem

```

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

```

```

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

```

gpg_pkg_pub_keyname: gpg_pkg_key.pub

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making yum repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild.make_src_pkg`(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/ https://raw.githubusercontent.com/
↳saltstack/libnacl/master/pkg/rpm/python-libnacl.spec https://pypi.python.org/
↳packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

14.6.279 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into *opts* will overwrite options passed into *pillar*.

`salt.modules.rsync.config(conf_path='/etc/rsyncd.conf')`

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

conf_path [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.rsync(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False)`

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

CLI Example:

```
salt '*' rsync.rsync {src} {dst} {delete=True} {update=True} {passwordfile=/etc/
↳pass.crt} {exclude=xx}
salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini}
```

`salt.modules.rsync.version()`

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

14.6.280 salt.modules.runit

runit service module (<http://smarden.org/runit>)

This module is compatible with the *service* states, so it can be used to maintain services using the *provider* argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual *service* module on systems using runit as init.

Service management rules (*sv* command):

service *\$n* is ENABLED if file SERVICE_DIR/*\$n*/run exists service *\$n* is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/*\$n*/run exists service *\$n* is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/*\$n* is normally a symlink to a AVAIL_SVR_DIR/*\$n* folder

Service auto-start/stop mechanism:

sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service *sva* is an alias of service *svc* when AVAIL_SVR_DIR/*sva* symlinks to folder AVAIL_SVR_DIR/*svc*. *svc* can't be enabled if it is already enabled through an alias already enabled, since *sv* files are stored in folder SERVICE_DIR/*svc*/.

XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

`salt.modules.runit.add_svc_avail_path(path)`

Add a path that may contain available services. Return True if added (or already present), False on error. **path** directory to add to AVAIL_SVR_DIRS

`salt.modules.runit.available(name)`

Returns True if the specified service is available, otherwise returns False.

name the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`

Don't start service name at boot Returns True if operation is successful

name the service's name

stop if True, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`

Return True if the named service is disabled, False otherwise

name the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`

Start service name at boot. Returns True if operation is successful

name the service's name

start

False [Do not start the service once enabled. Default mode.] (consistent with other service management)

True : also start the service at the same time (default sv mode)

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

salt.modules.runit.enabled(*name*)

Return True if the named service is enabled, False otherwise

name the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.runit.full_restart(*name*)

Calls `runit.restart()`

name the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

salt.modules.runit.get_all()

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

salt.modules.runit.get_disabled()

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.runit.get_enabled()

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.runit.get_svc_alias()

Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.get_svc_avail_path()

Return list of paths that may contain available services

salt.modules.runit.get_svc_broken_path(*name='*'*)

Return list of broken path(s) in SERVICE_DIR that match name

A path is broken if it is a broken symlink or can not be a runit service

name a glob for service name. default is `*`

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

`salt.modules.runit.missing(name)`

The inverse of `runit.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

name the service's name

CLI Example:

```
salt '*' runit.missing <service name>
```

`salt.modules.runit.reload(name)`

Reload service

name the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

`salt.modules.runit.remove(name)`

Remove the service `<name>` from system. Returns `True` if operation is successful. The service will be also stopped.

name the service's name

CLI Example:

```
salt '*' service.remove <name>
```

`salt.modules.runit.restart(name)`

Restart service

name the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

`salt.modules.runit.show(name)`

Show properties of one or more units/jobs or the manager

name the service's name

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.runit.start(name)`

Start service

name the service's name

CLI Example:

```
salt '*' runit.start <service name>
```

`salt.modules.runit.status(name, sig=None)`

Return `True` if service is running

name the service's name

sig signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

`salt.modules.runit.status_autostart(name)`

Return `True` if service `<name>` is autostarted by sv (file `$service_folder/down` does not exist) NB: return `False` if the service is not enabled.

name the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

`salt.modules.runit.stop`(*name*)

Stop service

name the service's name

CLI Example:

```
salt '*' runit.stop <service name>
```

14.6.281 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

`salt.modules.rvm.do`(*ruby, command, runas=None, cwd=None*)

Execute a command in an RVM controlled environment.

ruby Which ruby to use

command The rvm command to execute

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

cwd The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

`salt.modules.rvm.gemset_copy`(*source, destination, runas=None*)

Copy all gems from one gemset to another.

source The name of the gemset to copy, complete with ruby version

destination The destination gemset

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

`salt.modules.rvm.gemset_create`(*ruby, gemset, runas=None*)

Creates a gemset.

ruby The ruby version for which to create the gemset

gemset The name of the gemset to create

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

`salt.modules.rvm.gemset_delete`(*ruby, gemset, runas=None*)

Delete a gemset

ruby The ruby version to which the gemset belongs

gemset The gemset to delete

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty`(*ruby*, *gemset*, *runas=None*)

Remove all gems from a gemset.

ruby The ruby version to which the gemset belongs

gemset The gemset to empty

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list`(*ruby='default'*, *runas=None*)

List all gemsets for the given ruby.

ruby [default] The ruby version for which to list the gemsets

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all`(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

`salt.modules.rvm.get`(*version='stable'*, *runas=None*)

Update RVM

version [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

`salt.modules.rvm.install`(*runas=None*)

Install RVM system-wide

runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

`salt.modules.rvm.install_ruby`(*ruby*, *runas=None*)

Install a ruby implementation.

ruby The version of ruby to install

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

`salt.modules.rvm.is_installed`(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

salt.modules.rvm.list (*runas=None*)

List all rvm-installed rubies

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

salt.modules.rvm.reinstall_ruby (*ruby, runas=None*)

Reinstall a ruby implementation

ruby The version of ruby to reinstall

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

salt.modules.rvm.rubygems (*ruby, version, runas=None*)

Installs a specific rubygems version in the given ruby

ruby The ruby for which to install rubygems

version The version of rubygems to install, or 'remove' to use the version that ships with 1.9

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

salt.modules.rvm.set_default (*ruby, runas=None*)

Set the default ruby

ruby The version of ruby to make the default

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

salt.modules.rvm.wrapper (*ruby_string, wrapper_prefix, runas=None, *binaries*)

Install RVM wrapper scripts

ruby_string Ruby/gemset to install wrappers for

wrapper_prefix What to prepend to the name of the generated wrapper binaries

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

binaries [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

14.6.282 salt.modules.s3

Connection module for Amazon S3

configuration This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
```

A service_url may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various documentation as an ``endpoint''. A comprehensive list for Amazon S3 may be found at:

```
http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region
```

The service_url will form the basis for the final endpoint that is used to query the service.

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends requests

salt.modules.s3.delete (*bucket*, *path=None*, *action=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

salt.modules.s3.get (*bucket=None*, *path=None*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

salt.modules.s3.head(*bucket*, *path=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*)
Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

salt.modules.s3.put(*bucket*, *path=None*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*)
Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

14.6.283 salt.modules.s6 module

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

codeauthor :email: `Marek Skrobacki <skrobul@skrobul.com>`

salt.modules.s6.available(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' s6.available foo
```

salt.modules.s6.full_restart(*name*)

Calls `s6.restart()` function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.get_all()

Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

salt.modules.s6.missing(*name*)

The inverse of `s6.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' s6.missing foo
```

salt.modules.s6.reload(*name*)

Send a HUP to service via `s6`

CLI Example:

```
salt '*' s6.reload <service name>
```

salt.modules.s6.restart(*name*)

Restart service via `s6`. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

salt.modules.s6.start(*name*)

Starts service via `s6`

CLI Example:

```
salt '*' s6.start <service name>
```

`salt.modules.s6.status`(*name*, *sig=None*)

Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

`salt.modules.s6.stop`(*name*)

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

`salt.modules.s6.term`(*name*)

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

14.6.284 salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.configure_proxy`(*proxyname*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.is_running`(*proxyname*)

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxyname** -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

14.6.285 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.create`(*name*, *profile*)

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

14.6.286 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

`salt.modules.saltutil.clear_cache`()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.cmd`(*tgt*, *fun*, *arg=()*, *timeout=None*, *expr_form='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter`(*tgt*, *fun*, *arg=()*, *timeout=None*, *expr_form='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job`(*jid*)

Return the data for a specific cached job id. Note this only works if `cache_jobs` has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job`(*jid*)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
  arg:
    - 30
  fun:
    test.sleep
  jid:
    20160503150049487736
  pid:
    9601
  ret:
  tgt:
    my-minion
  tgt_type:
    glob
  user:
    root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
```

`salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

`salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

`salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

`salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)`

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

`salt.modules.saltutil.refresh_beacons()`

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.refresh_modules(async=True)`

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the ``async`` flag to `False`.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

`salt.modules.saltutil.refresh_pillar()`

Signal the minion to refresh the pillar data.

CLI Example:

```
salt '*' saltutil.refresh_pillar
```

`salt.modules.saltutil.regen_keys()`

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)`

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the ``preserve_minion_cache`` flag is set to `True`, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.runner(name, **kwargs)`

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using `salt-call` on a master.

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that `master_minion` is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
```

`salt.modules.saltutil.running()`

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

`salt.modules.saltutil.signal_job(jid, sig)`

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.sync_all` (*saltenv=None, refresh=True*)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
```

`salt.modules.saltutil.sync_beacons` (*saltenv=None, refresh=True*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.sync_engines` (*saltenv=None, refresh=False*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

`salt.modules.saltutil.sync_grains` (*saltenv=None, refresh=True*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to `False` to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

`salt.modules.saltutil.sync_log_handlers` (*saltenv=None, refresh=True*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

`salt.modules.saltutil.sync_modules` (*saltenv=None, refresh=True*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

`salt.modules.saltutil.sync_output` (*saltenv=None, refresh=True*)

Sync outputters from `salt://_output` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_outputters (*saltenv=None, refresh=True*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_pillar (*saltenv=None, refresh=True*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

refresh [True] Also refresh the execution modules available to the minion, and refresh pillar data.

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.sync_proxymodules (*saltenv=None, refresh=False*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

salt.modules.saltutil.sync_renderers (*saltenv=None, refresh=True*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

salt.modules.saltutil.sync_returners (*saltenv=None, refresh=True*)

New in version 0.10.0.

Sync beacons from `salt://_returners` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.sync_sdb (*saltenv=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [False] This argument has no affect and is included for consistency with the other sync functions.

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.sync_states (*saltenv=None, refresh=True*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

salt.modules.saltutil.sync_utils (*saltenv=None, refresh=True*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

salt.modules.saltutil.term_all_jobs()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

salt.modules.saltutil.term_job(jid)

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

salt.modules.saltutil.update(version=None)

Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here: update_url: <https://repo.saltstack.com/windows/>

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

salt.modules.saltutil.wheel(name, *args, **kwargs)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name The name of the function to run

args Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.

New in version v2015.8.11.

kwargs Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, ``empty`` returns are expected. The remote minion does not have access to wheel functions and their return data.

14.6.287 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

salt.modules.schedule.add(*name*, ***kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']
↳" seconds=60
```

salt.modules.schedule.build_schedule_item(*name*, ***kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

salt.modules.schedule.copy(*name*, *target*, ***kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

salt.modules.schedule.delete(*name*, ***kwargs*)

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

salt.modules.schedule.disable(***kwargs*)

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

salt.modules.schedule.disable_job(*name*, ***kwargs*)

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.enable(***kwargs*)

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

salt.modules.schedule.enable_job(*name*, ***kwargs*)

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name)`

List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
```

`salt.modules.schedule.list(show_all=False, show_disabled=True, where=None, return_yaml=True)`

List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify(name, **kwargs)`

Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.move(name, target, **kwargs)`

Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.purge(**kwargs)`

Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge
```

`salt.modules.schedule.reload()`

Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

`salt.modules.schedule.run_job(name, force=False)`

Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

`salt.modules.schedule.save(**kwargs)`

Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

14.6.288 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.ls(get_size=True)`

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

`get_size` [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the ``-s'` option in `lsscsi`.

New in version 2015.5.10.

`salt.modules.scsi.rescan_all(host)`

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all(0)
```

14.6.289 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.delete(uri)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return False.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get(uri)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.modules.sdb.set(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

14.6.290 salt.modules.seed

Virtual machine image management tools

`salt.modules.seed.apply(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)`

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
    [gen_key=(true|false)] [approve_key=(true|false)] \
    [install=(true|false)]
```

path Full path to the directory, device, or disk image on the target minion's file system.

id Minion id with which to seed the path.

config Minion configuration options. By default, the `'master'` option is set to the target host's `'master'`.

approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `true`.

install Install salt-minion, if absent. Default: `true`.

prep_install Prepare the bootstrap script, but don't run it. Default: `false`

`salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)`

Generate keys and config and put them in a tmp directory.

pub_key absolute path or file content of an optional preseeded salt key

priv_key absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
    [id_=minion_id] [approve_key=(true|false)]
```

`salt.modules.seed.prep_bootstrap(mpt)`

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

14.6.291 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages

are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

`salt.modules.selinux.getenforce()`

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.getsebool(boolean)`

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.getsemod(module)`

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.list_sebool()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.list_semod()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

`salt.modules.selinux.selinux_fs_path(*args)`

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

`salt.modules.selinux.setenforce(mode)`

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

`salt.modules.selinux.setsebool(boolean, value, persist=False)`

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

`salt.modules.selinux.setsebools`(*pairs*, *persist=False*)

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

`salt.modules.selinux.setsemod`(*module*, *state*)

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

14.6.292 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

`salt.modules.sensors.sense`(*chip*, *fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the `sensors` command and see the leading line in the block.

Example:

```
/usr/bin/sensors
```

```
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C
(high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C,
crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
```

Given the above, the chip is `coretemp-isa-0000`.

14.6.293 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

`salt.modules.serverdensity_device.create`(*name*, ***params*)

Function to create device in Server Density. For more info, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.delete`(*device_id*)

Delete a device from Server Density. For more information, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

`salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')`
Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)`
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2b added6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2b added6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls(**params)`

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on [listing](#) and [searching](#).

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.update(device_id, **params)`

Updates device information in Server Density. For more information see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama✘
↳group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama✘
↳group=rock_lamas swapSpace=512
```

14.6.294 salt.modules.service

service is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<code>debian_service</code>	Debian Wheezy and earlier
<code>freebsd_service</code>	FreeBSD-based OSes using <code>service(8)</code>
<code>gentoo_service</code>	Gentoo Linux using <code>sysvinit</code> and <code>rc-update(8)</code>
<code>launchctl</code>	Mac OS hosts using <code>launchctl(1)</code>
<code>netbsd_service</code>	NetBSD-based OSes
<code>openbsd_service</code>	OpenBSD-based OSes
<code>rh_service</code>	RedHat-based distros and derivatives using <code>service(8)</code> and <code>chkconfig(8)</code> . Supports both pure <code>sysvinit</code> and mixed <code>sysvinit/upstart</code> systems.
<code>service</code>	Fallback which simply wraps <code>sysvinit</code> scripts
<code>smf</code>	Solaris-based OSes which use SMF
<code>systemd</code>	Linux distros which use <code>systemd</code>
<code>upstart</code>	Ubuntu-based distros using <code>upstart</code>
<code>win_service</code>	Windows

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps `sysvinit` scripts.

`salt.modules.service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.service.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.service.reload(name)`

Refreshes config files by calling `service reload`. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.service.restart(name)`

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.service.run(name, action)`

Run the specified service with an action.

New in version 2015.8.1.

name Service name.

action Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```

`salt.modules.service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.service.status(name, sig=None)`

Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.295 salt.modules.shadow

shadow is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<code>shadow</code>	Linux
<code>bsd_shadow</code>	FreeBSD, OpenBSD, NetBSD
<code>solaris_shadow</code>	Solaris-based OSes
<code>win_shadow</code>	Windows

Manage the shadow file on Linux systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

`salt.modules.shadow.default_hash()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.shadow.del_password(name)`

New in version 2014.7.0.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

New in version 2014.7.0.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password Plaintext password to be hashed.

crypt_salt Cryptographic salt. If not given, a random 8-character salt will be generated.

algorithm The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↳algorithm=sha256
```

`salt.modules.shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.shadow.lock_password(name)`

New in version 2016.11.0.

Lock the password from name user

CLI Example:

```
salt '*' shadow.lock_password username
```

`salt.modules.shadow.set_date`(*name*, *date*)

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.

CLI Example:

```
salt '*' shadow.set_date username 0
```

`salt.modules.shadow.set_expire`(*name*, *expire*)

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.

CLI Example:

```
salt '*' shadow.set_expire username -1
```

`salt.modules.shadow.set_inactdays`(*name*, *inactdays*)

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.

CLI Example:

```
salt '*' shadow.set_inactdays username 7
```

`salt.modules.shadow.set_maxdays`(*name*, *maxdays*)

Set the maximum number of days during which a password is valid. See man chage.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.shadow.set_mindays`(*name*, *mindays*)

Set the minimum number of days between password changes. See man chage.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.shadow.set_password`(*name*, *password*, *use_usermod=False*)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:

```
python -c "import crypt; print crypt.crypt('password', '\$6\$\$SALTsalt')"
```

SALTsalt is the 8-character cryptographic salt. Valid characters in the salt are ., /, and any alphanumeric character.

Keep in mind that the \$6 represents a sha512 hash, if your OS is using a different hashing algorithm this needs to be changed accordingly

CLI Example:

```
salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'
```

`salt.modules.shadow.set_warndays`(*name*, *warndays*)

Set the number of days of warning before a password change is required. See man chage.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

`salt.modules.shadow.unlock_password(name)`

New in version 2016.11.0.

Unlock the password from name user

CLI Example:

```
salt '*' shadow.unlock_password username
```

14.6.296 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.call_hook(message, attachment=None, color='good', short=False, identifier=None, channel=None, username=None, icon_emoji=None)`

Send message to Slack incoming webhook.

Parameters

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.find_room(name, api_key=None)`

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

Returns The room object.

CLI Example:

```
salt '*' slack.find_room name="random"

salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.find_user` (*name*, *api_key=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
↳key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_rooms` (*api_key=None*)

List all Slack rooms.

Parameters **api_key** -- The Slack admin api key.

Returns The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_users` (*api_key=None*)

List all Slack users.

Parameters **api_key** -- The Slack admin api key.

Returns The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.post_message` (*channel*, *message*, *from_name*, *api_key=None*, *icon=None*)

Send a message to a Slack channel.

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
↳from_name="Build Server"
```

14.6.297 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.renderer` (*path=None, string=None, default_renderer='jinja|yaml', **kwargs*)
Parse a string or file through Salt's renderer system

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's ``renderer pipes'' system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** -- The path to a file on the filesystem.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the `'py'` renderer requires a file, for example.
- **default_renderer** -- The renderer pipe to send the file through; this is overridden by a ``she-bang'' at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's `compile_template()` function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing ``map files'', as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default `'jinja|yaml'` renderer.

For example, the two following map files produce identical results but one is written using the normal `'jinja|yaml'` and the other is using `'py'`:

```
#!/jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!/py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

14.6.298 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

`salt.modules.smartos_imgadm.avail` (*search=None, verbose=False*)

Return a list of available images

search [string] search keyword

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

`salt.modules.smartos_imgadm.delete` (*uuid*)

Remove an installed image

uuid [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.get` (*uuid*)

Return info on an installed image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.import` (*uuid, verbose=False*)

Import an image from the repository

uuid [string] uuid to import

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

`salt.modules.smartos_imgadm.list` (*verbose=False*)

Return a list of installed images

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.list [verbose=True]
```

`salt.modules.smartos_imgadm.show` (*uuid*)

Show manifest of a given image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.update` (*uuid=''*)

Gather info on unknown image(s) (locally installed)

uuid [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

`salt.modules.smartos_imgadm.vacuum(verbose=False)`
 Remove unused images
verbose [boolean (False)] toggle verbose output
 CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

`salt.modules.smartos_imgadm.version()`
 Return imgadm version
 CLI Example:

```
salt '*' imgadm.version
```

14.6.299 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

`salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)`
 Add a new nictag
name [string] name of new nictag
mac [string] mac of parent interface or `etherstub` to create a ether stub
mtu [int] MTU
 CLI Example:

```
salt '*' nictagadm.add storage etherstub
salt '*' nictagadm.add trunk 'DE:AD:00:00:BE:EF' 9000
```

`salt.modules.smartos_nictagadm.delete(name, force=False)`
 Delete nictag
name [string] nictag to delete
force [boolean] force delete even if vms attached
 CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)`
 Check if nictags exists
nictag [string] one or more nictags to check
verbose [boolean] return list of nictags
 CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.list(include_etherstubs=True)`
 List all nictags
include_etherstubs [boolean] toggle include of etherstubs
 CLI Example:

```
salt '*' nictagadm.list
```

`salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)`
 Update a nictag

name [string] name of nictag
mac [string] optional new mac for nictag
mtu [int] optional new MTU for nictag
CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.vms(*nictag*)
List all vms connect to nictag
nictag [string] name of nictag
CLI Example:

```
salt '*' nictagadm.vms admin
```

14.6.300 salt.modules.smartos_virt

virt compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.create(*domain*)
Deprecated since version Nitrogen: Use *start()* instead.
Start a defined domain
CLI Example:

```
salt '*' virt.create <domain>
```

salt.modules.smartos_virt.destroy(*domain*)
Deprecated since version Nitrogen: Use *stop()* instead.
Power off a defined domain
CLI Example:

```
salt '*' virt.destroy <domain>
```

salt.modules.smartos_virt.get_macs(*domain*)
Return a list off MAC addresses from the named VM
CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.init(***kwargs*)
Initialize a new VM
CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

salt.modules.smartos_virt.list_active_vms()
Return a list of uuids for active virtual machine on the minion
CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.smartos_virt.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.smartos_virt.list_inactive_vms()`

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.smartos_virt.list_vms()`

Deprecated since version Nitrogen: Use `list_domains()` instead.

List all virtual machines.

CLI Example:

```
salt '*' virt.list_vms <domain>
```

`salt.modules.smartos_virt.reboot(domain)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.smartos_virt.setmem(domain, memory)`

Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

`salt.modules.smartos_virt.shutdown(domain)`

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.smartos_virt.start(domain)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.smartos_virt.stop(domain)`

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.smartos_virt.vm_info(domain)`
Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

`salt.modules.smartos_virt.vm_virt_type(domain)`
Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

14.6.301 salt.modules.smartos_vm~~adm~~

Module for running vm~~adm~~ command on SmartOS

`salt.modules.smartos_vmadm.create(from_file=None, **kwargs)`

Create a new vm

from_file [string] json file to create the vm from -- if present, all other options will be ignored

kwargs [string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{"nic_tag": "admin",
↪ "ip": "198.51.100.123", ...}, {...}]' [...]
```

`salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')`

Create snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set `[-_.:%]` to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.delete(vm, key='uuid')`

Delete a vm

vm [string] vm to be deleted

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

`salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')`

Delete snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set `[-_.:%]` to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.get(*vm*, *key*='uuid')

Output the JSON object describing a VM

vm [string] vm to be targeted

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.info(*vm*, *info_type*='all', *key*='uuid')

Lookup info on running kvm

vm [string] vm to be targeted

info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.list(*search*=None, *sort*=None, *order*='uuid, type, ram, state, alias', *keyed*=True)

Return a list of VMs

search [string] vmadm filter property

sort [string] vmadm sort (-s) property

order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

keyed [boolean]

specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

salt.modules.smartos_vmadm.lookup(*search*=None, *order*=None, *one*=False)

Return a list of VMs using lookup

search [string] vmadm filter property

order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

one [boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.reboot(*vm*, *force*=False, *key*='uuid')

Reboot a vm

vm [string] vm to be rebooted

force [boolean] force reboot of vm if true

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.receive(*uuid*, *source*)

Receive a vm from a directory

uuid [string] uuid of vm to be received

source [string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.reprovision(*vm*, *image*, *key*='uuid')

Reprovision a vm

vm [string] vm to be reprovisioned

image [string] uuid of new image

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
↪11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

salt.modules.smartos_vmadm.rollback_snapshot(*vm*, *name*, *key*='uuid')

Rollback snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.send(*vm*, *target*, *key*='uuid')

Send a vm to a directory

vm [string] vm to be sent

target [string] target directory

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.start(*vm*, *options*=None, *key*='uuid')

Start a vm

vm [string] vm to be started

options [string] optional additional options

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```

salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=/
↳path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname

```

salt.modules.smartos_vmadm.stop(*vm*, *force=False*, *key='uuid'*)

Stop a vm

vm [string] vm to be stopped

force [boolean] force stop of vm if true

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```

salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname

```

salt.modules.smartos_vmadm.sysrq(*vm*, *action='nmi'*, *key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot

vm [string] vm to be targeted

action [string] nmi or screenshot -- Default: nmi

key [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```

salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias

```

salt.modules.smartos_vmadm.update(*vm*, *from_file=None*, *key='uuid'*, ***kwargs*)

Update a new vm

vm [string] vm to be updated

from_file [string] json file to update the vm with -- if present, all other options will be ignored

key [string [uuid|alias|hostname]] value type of `vm` parameter

kwargs [string|int|...] options to update for the vm

CLI Example:

```

salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_
↳vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_
↳memory=1024

```

14.6.302 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

[Desktop Management Interface \(DMI\)](#)

[System Management BIOS](#)

[DMidecode](#)

`salt.modules.smbios.get`(*string*, *clean=True*)

Get an individual DMI string from SMBIOS info
string

The string to fetch. DMidecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information
 (invalid UUID's, serial 000000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records`(*rec_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System

Continued on next page

Table 14.7 -- continued from previous page

Type	Information
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

clean

Don't return well-known false information
(invalid UUID's, serial 00000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
```

```
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

14.6.303 salt.modules.smf

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.smf.available`(*name*)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the `svcs` command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf.disable`(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf.disabled`(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf.enable`(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf.enabled`(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf.get_all`()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf.get_disabled`()

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf.get_running()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf.get_stopped()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf.missing(name)`

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.304 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends

- smtplib python module

configuration This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass

another-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

`salt.modules.smtp.send_msg`(*recipient*, *message*, *subject*='Message from Salt', *sender*=None, *server*=None, *use_ssl*='True', *username*=None, *password*=None, *profile*=None)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```
smtp.send_msg 'admin@example.com' 'This is a salt module test'           profile=
↳ 'my-smtp-account'
smtp.send_msg 'admin@example.com' 'This is a salt module test'           ✘
↳ username='myuser' password='verybadpass' sender='admin@example.com' ✘
↳ server='smtp.domain.com'
```

14.6.305 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.acquit(*fmri*)

Acquit resource or acquit case

fmri: string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

salt.modules.solaris_fmadm.config()

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

salt.modules.solaris_fmadm.faulty()

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

salt.modules.solaris_fmadm.flush(*fmri*)

Flush cached state for resource

fmri: string fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

salt.modules.solaris_fmadm.healthy()

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

salt.modules.solaris_fmadm.list(*after=None, before=None*)

Display fault management logs

after [string] filter events after time, see man fmdump for format

before [string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load(path)`

Load specified fault manager module

path: `string` path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired(fmri)`

Notify fault manager that resource has been repaired

fmri: `string` fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced(fmri)`

Notify fault manager that resource has been replaced

fmri: `string` fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.reset(module, serd=None)`

Reset module or sub-component

module: `string` module to unload

serd [`string`] serd sub module

CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.show(uuid)`

Display log details

uuid: `string` uuid of fault

CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload(module)`

Unload specified fault manager module

module: `string` module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

14.6.306 salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.solaris_group.add(name, gid=None, **kwargs)`
 Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid(name, gid)`
 Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete(name)`
 Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent(refresh=False)`
 Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info(name)`
 Return information about a group

CLI Example:

```
salt '*' group.info foo
```

14.6.307 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

`salt.modules.solaris_shadow.default_hash()`
 Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.del_password(name)`
 New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

New in version 2015.8.8.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password Plaintext password to be hashed.

crypt_salt Cryptographic salt. If not given, a random 8-character salt will be generated.

algorithm The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'  
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'  
↪algorithm=sha256
```

`salt.modules.solaris_shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.set_warndays(name, warndays)`

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

14.6.308 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.halt()

Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.solaris_system.init(*state*)

Change the system runlevel on sysV compatible systems

CLI Example:

state [string] Init state

```
salt '*' system.init 3
```

salt.modules.solaris_system.poweroff()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.solaris_system.reboot(*delay=0, message=None*)

Reboot the system

delay [int] Optional wait time in seconds before the system will be rebooted.

message [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

salt.modules.solaris_system.shutdown(*delay=0, message=None*)

Shutdown a running system

delay [int] Optional wait time in seconds before the system will be shutdown.

message [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

14.6.309 salt.modules.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info' is not available`), see [here](#).

`salt.modules.solaris_user.add`(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname='`*, *roomnumber='`*, *workphone='`*, *home-phone='`*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.chfullname`(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.chgid`(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.chgroups`(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.chhome`(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.chhomephone`(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.chroomnumber`(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.chshell`(*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.chuid`(*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.chworkphone`(*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.delete`(*name, remove=False, force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.list_users`()

Return a list of all users CLI Example: .. code-block:: bash

```
salt '*' user.list_users
```

`salt.modules.solaris_user.rename`(*name, new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

14.6.310 salt.modules.solarisips

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install' is not available`), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

`salt.modules.solarisips.available_version(name, **kwargs)`

This function is an alias of `latest_version`.

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.get_fmri(name, **kwargs)`

Returns FMRI from partial name. Returns empty string (``) if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisips.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)`

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{ '<package>': { 'old': '<old-version>',
                 'new': '<new-version>' }}
```

Multiple Package Installation Options:

pkgs A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['foo', 'bar']
```

`salt.modules.solarisips.is_installed(name, **kwargs)`

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisips.latest_version(name, **kwargs)`

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.list_pkgs(versions_as_list=False, **kwargs)`

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisips.list_upgrades(refresh=False, **kwargs)`

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh [False] Set to True to force a full pkg DB refresh before listing

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=True
```

`salt.modules.solarisips.normalize_name(name, **kwargs)`

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisips.purge`(*name*, ***kwargs*)
Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisips.refresh_db`(*full=False*)
Updates the remote repos database.

`full` : False

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisips.remove`(*name=None*, *pkgs=None*, ***kwargs*)
Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

`name` The name of the package to be deleted.

Multiple Package Options:

`pkgs` A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo"', "bar"]'
```

`salt.modules.solarisips.search`(*name*, *versions_as_list=False*, ***kwargs*)
Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisips.upgrade`(*refresh=False*, ***kwargs*)
Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constraints linked to the version of `pkg://solaris/entire`.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisips.upgrade_available(name)`

Check if there is an upgrade available for a certain package. Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisips.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using `pkg_resource`, full FMRI is required.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

14.6.311 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)`

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-
↳sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-
↳local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
↳filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/gcc-3.4.
↳6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass `current_zone_only=True` to salt to have the package only installed in the global zone. (Behind the scenes this is passing `-G` to the `pkgadd` command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↳sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source` option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↳instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
→admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)`

Remove packages with `pkgrm`

name The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source` option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.upgrade_available(name)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

14.6.312 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the `solr.type`. If you have questions or want a feature request please ask.

Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve `match_index_versions` since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores A list of core names e.g. `['core1','core2']`. An empty list indicates non-multicore setup.

solr.baseurl The root level URL to access solr via HTTP

solr.request_timeout The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

solr.type Possible values are `'master'` or `'slave'`

solr.backup_path The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

solr.num_backups For versions of solr `>= 3.5`. Indicates the number of backups to keep. This option is ignored if your version is less.

solr.init_script The full path to your init script with start/stop options

solr.dih.options A list of options to pass to the DIH.

Required Options for DIH

clean [False] Clear the index before importing

commit [True] Commit the documents to the index upon completion

optimize [True] Optimize the index after commit is complete

verbose [True] Get verbose output

salt.modules.solr.abort_import (*handler, host=None, core_name=None, verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with `solr.type=master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

`salt.modules.solr.backup` (*host=None, core_name=None, append_core_to_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: `OK` in the response simply means that solr received the request successfully.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

append_core_to_path [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.core_status` (*host=None, core_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

`salt.modules.solr.delta_import` (*handler, host=None, core_name=None, options=None, extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

options [dict (`__opts__`)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use `__opts__` defaults. options will be merged with `__opts__`

extra [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

`salt.modules.solr.full_import` (*handler, host=None, core_name=None, options=None, extra=None*)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
extra [dict ({})] Extra name value pairs to pass to the handler. e.g. [{"name=value"}]
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

salt.modules.solr.import_status(*handler, host=None, core_name=None, verbose=False*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: `master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__[‘host’] is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

salt.modules.solr.is_replication_enabled(*host=None, core_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

host [str (None)] The solr host to query. __opts__[‘host’] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

salt.modules.solr.lucene_version(*core_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

salt.modules.solr.match_index_versions(*host=None, core_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

host [str (None)] The solr host to query. `__opts__['host']` is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

`salt.modules.solr.optimize` (*host=None, core_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

host [str (None)] The solr host to query. `__opts__['host']` is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

`salt.modules.solr.ping` (*host=None, core_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

host [str (None)] The solr host to query. `__opts__['host']` is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.reload_core` (*host=None, core_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the ``new`` core is initializing, the ``old`` one will continue to accept requests. Once it has finished, all new request will go to the ``new`` core, and the ``old`` core will be unloaded.

host [str (None)] The solr host to query. `__opts__['host']` is default.
core_name [str] The name of the core to reload
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

`salt.modules.solr.reload_import_config(handler, host=None, core_name=None, verbose=False)`

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a `master` type

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

`salt.modules.solr.replication_details(host=None, core_name=None)`

Get the full replication details.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

`salt.modules.solr.set_is_polling(polling, host=None, core_name=None)`

SLAVE CALL Prevent the slaves from polling the master for updates.

polling [boolean] True will enable polling. False will disable it.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

`salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)`

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

status [boolean] Sets the replication status to the specified state.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.signal(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

signal [str (None)] The command to pass to the apache solr init valid values are `start`, `stop`, and `restart`

CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.version(*core_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

14.6.313 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

salt.modules.splunk.create_user(*email, profile='splunk', **kwargs*)

create a splunk user by name/email

CLI Example:

```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User"
name=testuser
```

salt.modules.splunk.delete_user(*email, profile='splunk'*)

Delete a splunk user by email

CLI Example:

```
salt myminion splunk_user.delete `user@example.com`
```

`salt.modules.splunk.get_user(email, profile='splunk', **kwargs)`

Get a splunk user by name/email

CLI Example:

```
salt myminion splunk.get_user `user@example.com` user_details=false salt myminion
splunk.get_user `user@example.com` user_details=true
```

`salt.modules.splunk.list_users(profile='splunk')`

List all users in the splunk DB

CLI Example:

```
salt myminion splunk.list_users
```

`salt.modules.splunk.update_user(email, profile='splunk', **kwargs)`

Create a splunk user by email

CLI Example:

```
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"
```

14.6.314 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

`salt.modules.splunk_search.create(name, profile='splunk', **kwargs)`

Create a splunk search

CLI Example:

```
splunk_search.create `my search name` search='error msg'
```

`salt.modules.splunk_search.delete(name, profile='splunk')`

Delete a splunk search

CLI Example:

```
splunk_search.delete `my search name`
```

`salt.modules.splunk_search.get(name, profile='splunk')`

Get a splunk search

CLI Example:

```
splunk_search.get `my search name`
```

`salt.modules.splunk_search.list` (*profile='splunk'*)

List splunk searches (names only)

CLI Example: `splunk_search.list`

`salt.modules.splunk_search.list_all` (*prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk'*)

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where ``description_contains in description" is true if name_not_contains is specified, results will be limited to those where ``name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:

1. **Make a ``backup" of all existing searches** \$ salt-call splunk_search.list_all --out=txt | sed ``s/local: //" > legacy_searches.sls
2. **Get all searches with new prefixed names** \$ salt-call splunk_search.list_all ``prefix=**MANAGED BY SALT** " --out=txt | sed ``s/local: //" > managed_searches.sls
3. **Insert the managed searches into splunk** \$ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. **Delete the original searches** \$ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls \$ salt-call state.sls remove_legacy_searches.sls
6. **Get all searches again, verify no changes** \$ salt-call splunk_search.list_all --out=txt | sed ``s/local: //" > final_searches.sls \$ diff final_searches.sls managed_searches.sls

`salt.modules.splunk_search.update` (*name, profile='splunk', **kwargs*)

Update a splunk search

CLI Example:

```
splunk_search.update `my search name' sharing=app
```

14.6.315 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.fetch` (*db=None, sql=None*)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.indexes` (*db=None*)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.indices` (*db=None*)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.modify` (*db=None, sql=None*)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

`salt.modules.sqlite3.sqlite_version`()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.tables` (*db=None*)

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.version`()

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

14.6.316 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

`salt.modules.ssh.auth_keys` (*user=None, config='.ssh/authorized_keys'*)

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.check_key` (*user, key, enc, comment, options, config='.ssh/authorized_keys', cache_keys=None*)

Check to see if a key needs updating, returns ``update``, ``add`` or ``exists``

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

salt.modules.ssh.check_key_file(*user, source, config='ssh/authorized_keys', saltenv='base'*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.check_known_host(*user=None, hostname=None, key=None, fingerprint=None, config=None, port=None*)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return ``update'', if no value is found for a given host, return ``add'', otherwise return ``exists''.

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

salt.modules.ssh.get_known_host(*user, hostname, config=None, port=None*)

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:

```
salt '*' ssh.get_known_host <user> <hostname>
```

salt.modules.ssh.hash_known_hosts(*user=None, config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user hash known hosts of this user

config path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.host_keys(*keydir=None, private=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
```

salt.modules.ssh.key_is_encrypted(*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.recv_known_host`(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*)

Retrieve information about host public key from remote server

hostname The name of the remote host (e.g. ``github.com``)

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.rm_auth_key`(*user*, *key*, *config='ssh/authorized_keys'*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.rm_auth_key_from_file`(*user*, *source*, *config='ssh/authorized_keys'*, *saltenv='base'*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.rm_known_host`(*user=None*, *hostname=None*, *config=None*, *port=None*)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.set_auth_key`(*user*, *key*, *enc='ssh-rsa'*, *comment=''*, *options=None*, *config='ssh/authorized_keys'*, *cache_keys=None*)

Add a key to the authorized_keys file. The ``key`` parameter must only be the string of text that is the encoded key. If the key begins with ``ssh-rsa`` or ends with `user@host`, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

`salt.modules.ssh.set_auth_key_from_file`(*user*, *source*, *config='ssh/authorized_keys'*, *saltenv='base'*)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.set_known_host`(*user=None*, *hostname=None*, *fingerprint=None*, *key=None*, *port=None*, *enc=None*, *config=None*, *hash_known_hosts=True*, *timeout=5*)

Download SSH public key from remote host ``hostname`, optionally validate its fingerprint against ``fingerprint` variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

user The user who owns the ssh authorized keys file to modify

hostname The name of the remote host (e.g. ``github.com`)

fingerprint The fingerprint of the key which must be presented in the known_hosts file (optional if key specified)

key The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to ``/etc/ssh/ssh_known_hosts`. If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=
↳ '.ssh/known_hosts'
```

`salt.modules.ssh.user_keys` (*user=None, pubfile=None, prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
↳ home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=["'user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

14.6.317 salt.modules.ssh_package module

Service support for the REST example

14.6.318 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

`salt.modules.ssh_service.enabled` (*name, sig=None*)

Only the `redbull` service is `enabled` in the test

`salt.modules.ssh_service.get_all` ()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.ssh_service.list()`

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.restart(name, sig=None)`

Restart the specified service with rest_sample CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.running(name, sig=None)`

Return whether this service is running.

`salt.modules.ssh_service.start(name, sig=None)`

Start the specified service on the rest_sample

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.status(name, sig=None)`

Return the status for a service via rest_sample, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.stop(name, sig=None)`

Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.319 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with `cache=True` it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

`salt.modules.state.apply(mods=None, **kwargs)`

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in `top.sls`:

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://test.sls (or salt://test/init.sls)
salt '*' state.apply test
# Run the states configured in salt://test.sls (or salt://test/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply test,pkgs
```

The following additional arguments are also accepted when applying individual SLS files:

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv [None] Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. By default, all Pillar environments will be merged together and used.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply test localconfig=/path/to/minion.yml
```

`salt.modules.state.check_request` (*name=None*)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.clear_cache` ()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.clear_request` (*name=None*)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.disable` (*states*)

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a `state.sls` call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.enable`(*states*)

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.event`(*tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.high`(*data, test=None, queue=False, **kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}]'
```

`salt.modules.state.highstate`(*test=None, queue=False, **kwargs*)

Retrieve the state data from the salt master for this minion and execute it

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↳exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.list_disabled()`

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

`salt.modules.state.low(data, queue=False, **kwargs)`

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

`salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)`

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- Docs for the ``salt`` state module <salt.states.saltmod>

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

`salt.modules.state.pkg`(*pkg_path*, *pkg_sum*, *hash_type*, *test=None*, ***kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

`salt.modules.state.request`(*mods=None*, ***kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via `salt-call state.run_request` All arguments match state.apply

CLI Example:

```
salt '*' state.request
salt '*' state.request test
salt '*' state.request test,pkgs
```

`salt.modules.state.run_request`(*name='default'*, ***kwargs*)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.running`(*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.show_highstate`(*queue=False*, ***kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.show_low_sls`(*mods*, *saltenv='base'*, *test=None*, *queue=False*, ***kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

CLI Example:

```
salt '*' state.show_low_sls foo
```

`salt.modules.state.show_lowstate`(*queue=False*, ***kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.show_sls` (*mods*, *saltenv*='base', *test*=None, *queue*=False, ***kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is base, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_sls core,edit.vim dev
```

`salt.modules.state.show_top` (*queue*=False, ***kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

`salt.modules.state.single` (*fun*, *name*, *test*=None, *queue*=False, ***kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

`salt.modules.state.sls` (*mods*, *saltenv*=None, *test*=None, *exclude*=None, *queue*=False, *pillarenv*=None, ***kwargs*)

Execute the states in one or more SLS files

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{ "foo": "bar" }'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv [None] Specify a salt filesrv environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

pillarenv

Specify a Pillar environment to be used when applying states. By default, all Pillar environments will be merged together and used.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Example:

```
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'
→ '}'"

salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.sls_id(*id_*, *mods*, *saltenv*='base', *test*=None, *queue*=False, ***kwargs*)

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

New in version 2014.7.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module
```

salt.modules.state.template(*tem*, *queue*=False, ***kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

salt.modules.state.template_str(*tem*, *queue*=False, ***kwargs*)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.top`(*topfn*, *test=None*, *queue=False*, *saltenv=None*, ***kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_
↪exclude'}]"
```

14.6.320 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.all_status`()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.cpuinfo`()

..versionchanged:: 2016.3.2 Return the CPU info for this minion

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.cputats`()

Return the CPU stats for this minion

CLI Example:

```
salt '*' status.cputats
```

`salt.modules.status.custom`()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cputats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cputats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace `all_status()`, which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

`salt.modules.status.diskstats`()

..versionchanged:: 2016.3.2 Return the disk stats for this minion

CLI Example:

```
salt '*' status.diskstats
```

`salt.modules.status.diskusage(*args)`

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage           # usage for all filesystems
salt '*' status.diskusage / /tmp    # usage for / and /tmp
salt '*' status.diskusage ext?     # usage for ext[234] filesystems
salt '*' status.diskusage / ext?   # usage for / and all ext filesystems
```

`salt.modules.status.loadavg()`

Return the load averages for this minion

CLI Example:

```
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

`salt.modules.status.master(master=None, connected=True)`

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.status.meminfo()`

Return the memory info for this minion

CLI Example:

```
salt '*' status.meminfo
```

`salt.modules.status.netdev()`

..versionchanged:: 2016.3.2 Return the network device stats for this minion

CLI Example:

```
salt '*' status.netdev
```

`salt.modules.status.netstats()`

Return the network stats for this minion

CLI Example:

```
salt '*' status.netstats
```

`salt.modules.status.nproc()`

Return the number of processing units available on this system

CLI Example:

```
salt '*' status.nproc
```

`salt.modules.status.pid(sig)`

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

CLI Example:

```
salt '*' status.pid <sig>
```

`salt.modules.status.ping_master(master)`

New in version 2016.3.0.

Sends ping request to the given master. Fires `__master_failback` event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

`salt.modules.status.procs()`

Return the process data

CLI Example:

```
salt '*' status.procs
```

`salt.modules.status.time(format='%A, %d. %B %Y %I:%M%p')`

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

`salt.modules.status.uptime()`

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

CLI Example:

```
salt '*' status.uptime
```

`salt.modules.status.version()`

Return the system version for this minion

CLI Example:

```
salt '*' status.version
```

`salt.modules.status.vstats()`

..versionchanged:: 2016.3.2 Return the virtual memory stats for this minion

CLI Example:

```
salt '*' status.vstats
```

`salt.modules.status.w()`

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

14.6.321 salt.modules.stormpath

Support for Stormpath

New in version 2015.8.0.

`salt.modules.stormpath.create_account(directory_id, email, password, givenName, surname, **kwargs)`

Create an account

CLI Examples:

```
salt myminion stormpath.create_account <directory_id> shemp@example.com letmein Shemp Howard
```

`salt.modules.stormpath.delete_account(account_id)`

Delete an account.

CLI Examples:

```
salt myminion stormpath.delete_account <account_id>
```

`salt.modules.stormpath.list_accounts()`

Show all accounts.

CLI Example:

```
salt myminion stormpath.list_accounts
```

`salt.modules.stormpath.list_directories()`

Show all directories.

CLI Example:

```
salt myminion stormpath.list_directories
```

`salt.modules.stormpath.show_account(account_id=None, email=None, directory_id=None, application_id=None, group_id=None, **kwargs)`

Show a specific account.

CLI Example:

```
salt myminion stormpath.show_account <account_id>
```

`salt.modules.stormpath.show_tenant()`

Get the tenant for the login being used.

`salt.modules.stormpath.update_account(account_id, key=None, value=None, items=None)`

Update one or more items for this account. Specifying an empty value will clear it for that account.

CLI Examples:

```
salt myminion stormpath.update_account <account_id> givenName shemp salt myminion storm-
path.update_account <account_id> middleName `` salt myminion stormpath.update_account
<account_id> items={'`givenName': ``Shemp`} salt myminion stormpath.update_account <ac-
count_id> items={'`middlename': ``}`
```

14.6.322 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.add(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Activates any updates in config for process/group.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

salt.modules.supervisord.custom(*command*, *user=None*, *conf_file=None*, *bin_env=None*)

Run any custom supervisord command

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

salt.modules.supervisord.options(*name*, *conf_file=None*)

New in version 2014.1.0.

Read the config file and return the config options for a given process

name Name of the configured process

conf_file path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

salt.modules.supervisord.remove(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Removes process/group from active config

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

salt.modules.supervisord.reread(*user=None*, *conf_file=None*, *bin_env=None*)

Reload the daemon's configuration files

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

`salt.modules.supervisord.restart` (*name='all', user=None, conf_file=None, bin_env=None*)

Restart the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

`salt.modules.supervisord.start` (*name='all', user=None, conf_file=None, bin_env=None*)

Start the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

`salt.modules.supervisord.status` (*name=None, user=None, conf_file=None, bin_env=None*)

List programs and its state

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

`salt.modules.supervisord.status_raw` (*name=None, user=None, conf_file=None, bin_env=None*)

Display the raw output of status

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

`salt.modules.supervisord.stop` (*name='all', user=None, conf_file=None, bin_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

`salt.modules.supervisord.update` (*user=None, conf_file=None, bin_env=None, name=None*)

Reload config and add/remove/update as necessary

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

name name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisor.update
```

14.6.323 salt.modules.svn

Subversion SCM

salt.modules.svn.add(*cwd*, *targets*, *user=None*, *username=None*, *password=None*, **opts*)

Add files to be tracked by the Subversion working-copy checkout

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

salt.modules.svn.checkout(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

Download a working copy of the remote Subversion repository directory or file

cwd The path to the Subversion repository

remote [None] URL to checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

salt.modules.svn.commit(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Commit the current directory, files, or directories to the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses `.`

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.diff(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses `.`

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.export(*cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts*)

Create an unversioned copy of a tree.

cwd The path to the Subversion repository

remote [None] URL and path to file or directory checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

salt.modules.svn.info(*cwd, targets=None, user=None, username=None, password=None, fmt='str'*)

Display the Subversion information from the checkout.

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments svn uses `.` by default

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

fmt [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

salt.modules.svn.remove(*cwd, targets, msg=None, user=None, username=None, password=None, *opts*)

Remove files and directories from the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

salt.modules.svn.status(*cwd, targets=None, user=None, username=None, password=None, *opts*)

Display the status of the current directory, files, or directories in the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses `.`

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

salt.modules.svn.switch(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

cwd The path to the Subversion repository

remote [None] URL to switch

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.update(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Update the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses `!`

user [None] Run svn as a user other than what the minion runs as

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

username [None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

14.6.324 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```

openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k

```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting `keystone.auth_version = 1` is recommended.

`salt.modules.swift.delete` (*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.get` (*cont=None*, *path=None*, *local_file=None*, *return_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set `return_bin` to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.put` (*cont*, *path=None*, *local_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

14.6.325 salt.modules.sysbench

The `'sysbench'` module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

`salt.modules.sysbench.cpu()`

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

`salt.modules.sysbench.fileio()`

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

`salt.modules.sysbench.memory()`

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

`salt.modules.sysbench.mutex()`

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

`salt.modules.sysbench.threads()`

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

14.6.326 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

<https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt>

New in version 2016.3.0.

`salt.modules.sysfs.attr` (*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, it's destination is returned

Returns value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

`salt.modules.sysfs.interfaces` (*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
    "readahead"
  ],
  "w": [
    "stop",
    "clear_stats",
    "attach",
    "detach"
  ]
}
```

Note:

- `r` interfaces are read-only
- `w` interfaces are write-only (e.g. actions)
- `rw` are interfaces that can both be read or written

`salt.modules.sysfs.read(key, root='')`

Read from SysFS

Parameters **key** -- file or path in SysFS; if key is a list then root will be prefixed on each key

Returns the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=True)`

Return the basename of a SysFS key path

Parameters

- **key** -- the location to resolve within SysFS
- **full** -- full path instead of basename

Returns fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`

Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor
↳ 'performance'
```

14.6.327 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd

platform all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the/sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

class salt.modules.syslog_ng.**Argument**(value='')

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

class salt.modules.syslog_ng.**Buildable**(iterable, join_body_on='', append_extra_newline=True)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with it's children.

build_body()

Builds the body of a syslog-ng configuration object.

build_header()

Builds the header of a syslog-ng configuration object.

build_tail()

Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.**GivenStatement**(value, add_newline=True)

This statement returns a string without modification. It can be used to use existing configuration snippets.

Does not need examples.

class salt.modules.syslog_ng.**NamedStatement**(type, id='', options=None)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.**Option**(type='', params=None)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

class salt.modules.syslog_ng.**Parameter**(iterable=None, join_body_on='')

An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.**ParameterValue**(iterable=None, join_body_on='')

A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameter**(value='')

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

/var/log/messages is a SimpleParameter.

Does not need examples.

`class salt.modules.syslog_ng.SimpleParameterValue(value='')`

A ParameterValue which holds a simple type, like a string or a number.

For example in `ip(127.0.0.1)` `127.0.0.1` is a `SimpleParameterValue`.

Does not need examples.

`class salt.modules.syslog_ng.Statement(type, id='', options=None, has_name=True)`

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

`class salt.modules.syslog_ng.TypedParameter(type='', values=None)`

A Parameter, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a `TypedParameter`.

Does not need examples.

`class salt.modules.syslog_ng.TypedParameterValue(type='', arguments=None)`

We have to go deeper...

A `TypedParameter` can have a `parameter`, which also have a type. For example `key_file` and `cert_file`:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
};
```

Does not need examples.

`class salt.modules.syslog_ng.UnnamedStatement(type, options=None)`

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

`salt.modules.syslog_ng.config(name, config, write=True)`

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

`name` : the id of the Salt document or it is the format of `<statement name>.id` `config` : the parsed YAML code
`write` : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{ 'tcp': [{ 'ip': '127.0.0.1' }, {
↪ 'port': 1233 } ] } ]"
```

`salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)`

Runs syntax check against `cfgfile`. If `syslog_ng_sbin_dir` is specified, it is added to the `PATH` during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
↳syslog-ng.conf
```

`salt.modules.syslog_ng.get_config_file()`

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

`salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)`

Returns the available modules. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.reload(name)`

Reloads `syslog-ng`. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.set_binary_path(name)`

Sets the path, where the `syslog-ng` binary can be found. This function is intended to be used from states.

If `syslog-ng` is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.set_config_file(name)`

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

`salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)`

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
↳config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

`salt.modules.syslog_ng.start`(*name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None*)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog-ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

`salt.modules.syslog_ng.stats`(*syslog_ng_sbin_dir=None*)

Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng-ctl`.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.stop`(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog-ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

`salt.modules.syslog_ng.version`(*syslog_ng_sbin_dir=None*)

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.write_config`(*config, newlines=2*)

Writes the given parameter `config` into the config file. This function is intended to be used from states.

If `syslog-ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.write_version`(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog-ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

14.6.328 salt.modules.sysmod

The sys module provides information about the available functions on the minion

`salt.modules.sysmod.argspec` (*module=''*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

`salt.modules.sysmod.doc` (**args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

`salt.modules.sysmod.list_functions` (**args, **kwargs*)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

`salt.modules.sysmod.list_modules` (**args*)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

`salt.modules.sysmod.list_renderers(*args)`

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

`salt.modules.sysmod.list_returner_functions(*args, **kwargs)`

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

`salt.modules.sysmod.list_returners(*args)`

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

`salt.modules.sysmod.list_runner_functions(*args, **kwargs)`

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*
```

`salt.modules.sysmod.reload_modules()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.renderer_doc(*args)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.returner_argspec(module='')`

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

`salt.modules.sysmod.returner_doc(*args)`

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returner_doc 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec`(*module=''*)

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.runner_doc`(**args*)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

`salt.modules.sysmod.state_argspec`(*module=''*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.state_doc`(**args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.state_schema` (*module*=)

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

14.6.329 salt.modules.sysrc

sysrc module for FreeBSD

`salt.modules.sysrc.get` (***kwargs*)

Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

`salt.modules.sysrc.remove` (*name*, ***kwargs*)

Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

`salt.modules.sysrc.set` (*name*, *value*, ***kwargs*)

Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

14.6.330 salt.modules.system

Support for reboot, shutdown, etc

`salt.modules.system.get_computer_desc` ()

Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

Returns Value of PRETTY_HOSTNAME if this does not exist False.

Return type str

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.get_system_date` (*utc_offset=None*)

Get the system date

Parameters `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system date. :rtype: str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.get_system_date_time` (*utc_offset=None*)

Get the system date/time.

Parameters `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system time in YYYY-MM-DD hh:mm:ss format. :rtype: str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.get_system_time` (*utc_offset=None*)

Get the system time.

Parameters `utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns the system time in HH:MM AM/PM format. :rtype: str

CLI Example:

```
salt '*' system.get_system_time
```

`salt.modules.system.halt` ()

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.system.init` (*runlevel*)

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.system.poweroff` ()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.system.reboot`(*at_time=None*)

Reboot the system

at_time The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

`salt.modules.system.set_computer_desc`(*desc*)

Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters **desc** (*str*) -- The computer description

Returns False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

`salt.modules.system.set_system_date`(*newdate, utc_offset=None*)

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters **newdate** (*str*) -- The date to set. Can be any of the following formats - YYYY-MM-DD - MM-DD-YYYY - MM-DD-YY - MM/DD/YYYY - MM/DD/YY - YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.set_system_date_time`(*years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Parameters

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59
- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'`. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: True if successful. Otherwise False. :rtype: bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.set_system_time`(*newtime, utc_offset=None*)

Set the system time.

Parameters

- **newtime** (*str*) -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'``. Note: if being passed through the command line will need to be quoted twice to allow negative offsets. :return: Returns True if successful. Otherwise False. :rtype: bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

`salt.modules.system.shutdown`(*at_time=None*)

Shutdown a running system

at_time The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

14.6.331 salt.modules.system_profiler

System Profiler Module

Interface with Mac OSX's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications`()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

`salt.modules.system_profiler.receipts`()

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

14.6.332 salt.modules.systemd

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see [here](#).

`salt.modules.systemd.available(name)`

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.systemd.disable(name, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.systemd.disabled(name)`

Return if the named service is disabled from starting on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.systemd.enable(name, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd.enabled(name, **kwargs)`

Return if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd.execs()`

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd.force_reload(name)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with `systemd`

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd.get_disabled()`

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd.get_enabled()`

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd.get_running()`

Return a list of all running services, so far as `systemd` is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd.get_static()`

New in version 2015.8.5.

Return a list of all static services

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd.mask(name, runtime=False)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with `systemd`
runtime [False] Set to True to mask this service only until the next reboot

New in version 2015.8.5.

CLI Example:

```
salt '*' service.mask <service name>
```

`salt.modules.systemd.masked(name)`

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Check whether or not a service is masked

CLI Example:

```
salt '*' service.masked <service name>
```

`salt.modules.systemd.missing(name)`

New in version 2014.1.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd.reload(name)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with `systemd`

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.systemd.restart(name)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with `systemd`

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd.show(name)`

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd.start(*name*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with systemd

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.systemd.status(*name*, *sig=None*)

Return the status for a service via systemd, returns `True` if the service is running and `False` if it is not.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.systemd.stop(*name*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with systemd

CLI Example:

```
salt '*' service.stop <service name>
```

salt.modules.systemd.systemctl_reload()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

salt.modules.systemd.unmask(*name*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with systemd

CLI Example:

```
salt '*' service.unmask <service name>
```

14.6.333 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

configuration This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available at:

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

In the minion's config file:

```
telemetry.telemetry_api_keys:
  - abc123 # Key 1
  - efg321 # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends requests

`salt.modules.telemetry.create_alarm`(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

`salt.modules.telemetry.delete_alarms`(*deployment_id*, *alert_id=None*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alarms`(*deployment_id*, *profile='telemetry'*)

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alert_config`(*deployment_id*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

Get all alert definitions associated with a given deployment or if *metric_name* is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry salt
myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_notification_channel_id`(*notify_channel*, *profile='telemetry'*)

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

notify_channel Email escalation policy
profile A dict of telemetry config information.
CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry
```

salt.modules.telemetry.update_alarm(*deployment_id, metric_name, data, api_key=None, profile='telemetry'*)

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

14.6.334 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

salt.modules.temp.dir(*suffix='', prefix='tmp', parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

salt.modules.temp.file(*suffix='', prefix='tmp', parent=None*)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

14.6.335 salt.modules.test

Module for running arbitrary tests

salt.modules.test.arg(**args, **kwargs*)

Print out the data passed into the function **args* and *`kwargs*, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns `{`args': args, `kwargs': kwargs}`.

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_repr(**args, **kwargs*)

Print out the data passed into the function **args* and *`kwargs*, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns `{`args': repr(args), `kwargs': repr(kwargs)}`.

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_type(*args, **kwargs)`

Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

`salt.modules.test.assertion(assertion)`

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

`salt.modules.test.attr_call()`

Call grains.items via the attribute

CLI Example:

```
salt '*' test.attr_call
```

`salt.modules.test.collatz(start)`

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.conf_test()`

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.cross_test(func, args=None)`

Execute a minion function via the `__salt__` object in the test module, used to verify that the minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.echo(text)`

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.exception(message='Test Exception')`

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.false()`

Always return False

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.fib(num)`

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.get_opts()`

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.kwarg(**kwargs)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.module_report()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.not_loaded()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

`salt.modules.test.opts_pkg()`

Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

`salt.modules.test.outputter(data)`

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

salt.modules.test.ping()

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:

```
salt '*' test.ping
```

salt.modules.test.provider(*module*)

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

salt.modules.test.providers()

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

salt.modules.test.rand_sleep(*max=60*)

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

salt.modules.test.rand_str(*size=999999999, hash_type=None*)

Return a random string

size size of the string to generate

hash_type hash type to use

New in version 2015.5.2.

CLI Example:

```
salt '*' test.rand_str
```

salt.modules.test.retcode(*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

salt.modules.test.sleep(*length*)

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

salt.modules.test.stack()

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

salt.modules.test.true()

Always return True

CLI Example:

```
salt '*' test.true
```

salt.modules.test.try_() (*module*, *return_try_exception=False*, ***kwargs*)

Try to run a module command. On an exception return None. If *return_try_exception* is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```
<pre>
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
  ↳'+i)|yaml(False) }}
{% endfor %}
</pre>
```

salt.modules.test.tty() (**args*, ***kwargs*)

Deprecated! Moved to cmdmod.

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.version()

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

salt.modules.test.versions()

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

salt.modules.test.versions_information()

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

salt.modules.test.versions_report()

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

14.6.336 salt.modules.test_virtual

Module for running arbitrary tests with a `__virtual__` function

14.6.337 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.get_offset()`

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.timezone.get_zone()`

Get current timezone (i.e. America/Denver)

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.timezone.set_zone(timezone)`

Unlinks, then symlinks `/etc/localtime` to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.timezone.zone_compare`(*timezone*)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in `/etc/localtime`. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

14.6.338 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends

- PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration Add the following values in `/etc/salt/minion` for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1 Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \  
days=5 \  
CN='My Little CA' \  
C=US \  
ST=Utah \  
L=Salt Lake City \  
O=Saltstack \  
emailAddress=pleasedontemail@example.com  
  
Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"  
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"  
  
# salt-call tls.create_csr my_little CN=www.example.com  
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"  
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"  
  
# salt-call tls.create_ca_signed_cert my_little CN=www.example.com  
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt  
↪"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client  
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."  
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."  
  
# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1  
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↳MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
↳server.csr."

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
  cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
↳completely_different.crt"
```

`salt.modules.tls.ca_exists`(*ca_name*, *cacert_path*=None, *ca_filename*=None)

Verify whether a Certificate Authority (CA) already exists

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

`salt.modules.tls.cert_base_path`(*cacert_path*=None)

Return the base path for certs from CLI or from options

cacert_path absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

`salt.modules.tls.cert_info(cert_path, digest='sha256')`

Return information for a particular certificate

cert_path path to the cert file

digest what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

`salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress='xyz@pdq.net', fix-mode=False, cacert_path=None, ca_filename=None, digest='sha256', on-lyif=None, unless=None, replace=False)`

Create a Certificate Authority (CA)

ca_name name of the CA

bits number of RSA key bits, default is 2048

days number of days the CA will be valid, default is 365

CN common name in the request, default is ``localhost``

C country, default is ``US``

ST state, default is ``Utah``

L locality, default is ``Centerville``, the city where SaltStack originated

O organization, default is ``SaltStack``

OU organizational unit, default is None

emailAddress email address for the CA owner, default is `xyz@pdq.net`

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, ``md5`` or ``sha1``. Default: ``sha256``

replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

`salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, digest='sha256', cert_type=None, type_ext=False, replace=False)`

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by `create_csr`. If it does not, this method does nothing.

ca_name name of the CA

CN common name matching the certificate signing request

days number of days certificate is valid, default is 365 (1 year)

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

cert_path full path to the certificates directory

cert_filename alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, `md5` or `sha1`. Default: `sha256`

replace Replace this certificate even if it exists

New in version 2015.5.1.

cert_type string. Either `server` or `client` (see `create_csr()` for details).

If `create_csr(type_ext=True)` this function **must** be called with the same `cert_type` so it can find the CSR file.

Note: `create_csr()` defaults to `cert_type='server'`; therefore, if it was also called with `type_ext`, `cert_type` becomes a required argument for `create_ca_signed_cert()`

type_ext bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: `some_subject_CN_server.crt` or `some_subject_CN_client.crt`

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

`salt.modules.tls.create_csr`(*ca_name*, *bits=2048*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress='xyz@pdq.net'*, *subjectAltName=None*, *cacert_path=None*, *ca_filename=None*, *csr_path=None*, *csr_filename=None*, *digest='sha256'*, *type_ext=False*, *cert_type='server'*, *replace=False*)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

ca_name name of the CA

bits number of RSA key bits, default is 2048

CN common name in the request, default is ``localhost``

C country, default is ``US``

ST state, default is ``Utah``

L locality, default is ``Centerville``, the city where SaltStack originated

O organization, default is ``SaltStack`` NOTE: Must the same as CA certificate or an error will be raised

OU organizational unit, default is None

emailAddress email address for the request, default is ``xyz@pdq.net``

subjectAltName valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

```
examples: ['DNS:somednsname.com', `DNS:1.2.3.4`, `IP:1.2.3.4`, `IP:2001:4801:7821:77:be76:4eff:fe11:e51`,
`email:me@i.like.pie.com`]
```

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to <https://1.2.3.4> will fail from python's requests library w/out the second entry in the above list

New in version 2015.8.0.

cert_type Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'serverAuth',
  'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'clientAuth',
  'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved

replace Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

`salt.modules.tls.create_empty_crl`(*ca_name*, *cacert_path*=None, *ca_filename*=None, *crl_file*=None)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

crl_file full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
→                               crl_file='/etc/openssl/team1/crl.pem'
```

`salt.modules.tls.create_pkcs12`(*ca_name*, *CN*, *passphrase*='', *cacert_path*=None, *replace*=False)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name name of the CA

CN common name matching the certificate signing request

passphrase used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path absolute path to ca certificates root directory

replace Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

`salt.modules.tls.create_self_signed_cert`(*tls_dir*='tls', *bits*=2048, *days*=365, *CN*='localhost', *C*='US', *ST*='Utah', *L*='Salt Lake City', *O*='SaltStack', *OU*=None, *emailAddress*='xyz@pdq.net', *cacert_path*=None, *cert_filename*=None, *digest*='sha256', *replace*=False)

Create a Self-Signed Certificate (CERT)

tls_dir location appended to the `ca.cert_base_path`, default is `'tls'`

bits number of RSA key bits, default is 2048

CN common name in the request, default is `'localhost'`

C country, default is `'US'`

ST state, default is `'Utah'`

L locality, default is `'Centerville'`, the city where SaltStack originated

O organization, default is `'SaltStack'` NOTE: Must the same as CA certificate or an error will be raised

OU organizational unit, default is None

emailAddress email address for the request, default is `'xyz@pdq.net'`

cacert_path absolute path to ca certificates root directory
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, `md5` or `sha1`. Default: `sha256`
replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

`salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)`

Get the certificate path or content

ca_name name of the CA

as_text if true, return the certificate content instead of the path

cacert_path absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)`

Get the certificate path or content

ca_name name of the CA

CN common name of the certificate

as_text if true, return the certificate content instead of the path

cacert_path absolute path to certificates root directory

cert_filename alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
↳etc/certs
```

`salt.modules.tls.get_ca_signed_key(ca_name, CN='localhost', as_text=False, cacert_path=None, key_filename=None)`

Get the certificate path or content

ca_name name of the CA

CN common name of the certificate

as_text if true, return the certificate content instead of the path

cacert_path absolute path to certificates root directory

key_filename alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
↳as_text=False cacert_path=/etc/certs
```

salt.modules.tls.get_extensions(*cert_type*)

Fetch X509 and CSR extension definitions from `tls:extensions:` (`common|server|client`) or set them to standard defaults.

New in version 2015.8.0.

cert_type: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

salt.modules.tls.maybe_fix_ssl_version(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

ca_name ca authority name

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

salt.modules.tls.revoke_cert(*ca_name*, *CN*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *crl_file=None*)

Revoke a certificate.

New in version 2015.8.0.

ca_name Name of the CA.

CN Common name matching the certificate signing request.

cacert_path Absolute path to ca certificates root directory.

ca_filename Alternative filename for the CA.

cert_path Path to the cert file.

cert_filename Alternative filename for the certificate, useful when using special characters in the CN.

crl_file Full path to the CRL file.

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
↳ crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.set_ca_path(*cacert_path*)

If wanted, store the aforementioned `cacert_path` in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

14.6.339 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface ``0:0:0:0:0:1``
- If you are using tomcat.tar.gz it has to be installed or symlinked under `/opt`, preferably using name tomcat
- ``tomcat.signal start/stop`` works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:  
  user: <username>  
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>  
tomcat-manager.passwd: <password>
```

Also configure a user in the `conf/tomcat-users.xml` file:

```
<?xml version='1.0' encoding='utf-8'?>  
<tomcat-users>  
  <role rolename="manager-script"/>  
  <user username="tomcat" password="tomcat" roles="manager-script"/>  
</tomcat-users>
```

Note:

- More information about tomcat manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
 - if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
 - Tested on:
 - JVM Vendor: Sun Microsystems Inc.
 - JVM Version: 1.6.0_43-b01
 - OS Architecture: amd64
 - OS Name: Linux
 - OS Version: 2.6.32-358.el6.x86_64
 - Tomcat Version: Apache Tomcat/7.0.37
-

```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager',
                               saltenv='base', timeout=180, temp_war_location=None, version='')
```

Deploy a WAR file

war absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function

context the context path to deploy

force [False] set True to deploy the webapp even one is deployed in the context

url [http://localhost:8080/manager] the URL of the server manager webapp

saltenv [base] the environment for WAR file in used by salt.modules.cp.get_url function

timeout [180] timeout for HTTP request

temp_war_location [None] use another location to temporarily copy to war file by default the system's temp directory is used

version [``] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
↪manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
↪manager
```

salt.modules.tomcat.fullversion()

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)

Find memory leaks in tomcat

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)

list all the deployed webapps

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

`salt.modules.tomcat.passwd`(*passwd*, *user=''*, *alg='sha1'*, *realm=None*)

This function replaces the \$CATALINA_HOME/bin/digest.sh script convert a clear-text password to the \$CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

`salt.modules.tomcat.reload`(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Reload the webapp

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.serverinfo`(*url='http://localhost:8080/manager'*, *timeout=180*)

return details about the server

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

`salt.modules.tomcat.sessions`(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

return the status of the webapp sessions

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.signal`(*signal=None*)

Signals catalina to start, stop, securestart, forcestop.

CLI Example:

```
salt '*' tomcat.signal start
```

`salt.modules.tomcat.start`(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Start the webapp

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.status (*url='http://localhost:8080/manager', timeout=180*)

Used to test if the tomcat manager is up

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

salt.modules.tomcat.status_webapp (*app, url='http://localhost:8080/manager', timeout=180*)

return the status of the webapp (stopped | running | missing)

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.stop (*app, url='http://localhost:8080/manager', timeout=180*)

Stop the webapp

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.undeploy (*app, url='http://localhost:8080/manager', timeout=180*)

Undeploy a webapp

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.version ()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

14.6.340 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

`salt.modules.trafficserver.alarms()`

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

`salt.modules.trafficserver.bounce_cluster()`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

`salt.modules.trafficserver.bounce_local(drain=False)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

drain This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

`salt.modules.trafficserver.clear_alarms(alarm)`

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

`salt.modules.trafficserver.clear_cluster()`

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

`salt.modules.trafficserver.clear_node()`

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

`salt.modules.trafficserver.match_config(regex)`

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

`salt.modules.trafficserver.match_metric(regex)`

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.match_var(regex)`

Display the current values of all performance statistics or configuration variables whose names match the given regular expression.

Deprecated since version Oxygen: Use `match_metric` or `match_config` instead.

```
salt '*' trafficserver.match_var regex
```

`salt.modules.trafficserver.offline`(*path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config`(**args*)

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric`(**args*)

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.read_var`(**args*)

Read variable definitions from the `traffic_line` command.

Deprecated since version Oxygen: Use `read_metric` or `read_config` instead. Note that this function does not work for Traffic Server versions ≥ 7.0 .

```
salt '*' trafficserver.read_var proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh`()

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster`()

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local`(*drain=False*)

Restart the `traffic_manager` and `traffic_server` processes on the local node.

drain This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config`(*variable*, *value*)

Set the value of a Traffic Server configuration variable.

variable Name of a Traffic Server configuration variable.

value The new value to set.
New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

`salt.modules.trafficserver.set_var` (*variable, value*)

Deprecated since version Oxygen: Use `set_config` instead. Note that this function does not work for Traffic Server versions ≥ 7.0 .

```
salt '*' trafficserver.set_var proxy.config.http.server_ports
```

`salt.modules.trafficserver.shutdown` ()
Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

`salt.modules.trafficserver.startup` ()
Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

`salt.modules.trafficserver.status` ()
Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

`salt.modules.trafficserver.zero_cluster` ()
Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

`salt.modules.trafficserver.zero_node` ()
Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

14.6.341 salt.modules.tuned

Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>

maturity new

depends tuned-adm

platform Linux

`salt.modules.tuned.active` ()
Return current active profile

CLI Example:

```
salt '*' tuned.active
```

`salt.modules.tuned.list()`

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

`salt.modules.tuned.off()`

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

`salt.modules.tuned.profile(profile_name)`

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

14.6.342 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

depends

- twilio python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-twilio-account:
  twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
  twilio.auth_token: mytoken
```

`salt.modules.twilio_notify.send_sms(profile, body, to, from_)`

Send an sms

CLI Example:

```
twilio.send_sms twilio-account `Test sms` +18019999999 +18011111111'
```

14.6.343 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

`salt.modules.udev.env(dev)`

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

`salt.modules.udev.exportdb()`

Return all the udev database

CLI Example:

`salt.modules.udev.info(dev)`

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

`salt.modules.udev.links(dev)`

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

`salt.modules.udev.name(dev)`

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

`salt.modules.udev.path(dev)`

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

14.6.344 salt.modules.upstart

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like `update-rc.d`). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of `initctl show-config` to determine if all service dependencies are enabled to start on boot. For example, see the `start on` condition for the `lightdm` service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] <http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting>

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-added
↳card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
↳PREVLEVEL=S)
stop on runlevel [016]
```

Warning: This module should not be used on Red Hat systems. For these, the *rh_service* module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart.disable(name, **kwargs)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart.full_restart(name)`

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart.missing(name)`

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart.reload(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.upstart.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.345 salt.modules.uptime

Wrapper around uptime API

`salt.modules.uptime.check_exists(name)`

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

`salt.modules.uptime.checks_list()`

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

`salt.modules.uptime.create(name, **params)`

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation <https://github.com/fzaninotto/uptime> for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

`salt.modules.uptime.delete(name)`

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

14.6.346 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info' is not available`), see [here](#).

`salt.modules.useradd.add`(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *system=False*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, *loginclass=None*, *root=None*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.chfullname`(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.chgid`(*name*, *gid*, *root=None*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.chgroups`(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs

name User to modify

groups Groups to set for the user

append [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.chhome`(*name*, *home*, *persist=False*, *root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.chhomephone`(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.chloginclass`(*name*, *loginclass*, *root=None*)

Change the default login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.chroomnumber` (*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.useradd.chshell` (*name*, *shell*, *root=None*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.useradd.chuid` (*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.useradd.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

`salt.modules.useradd.delete` (*name*, *remove=False*, *force=False*, *root=None*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.get_loginclass` (*name*)

Get the login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.list_groups(name)`

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.list_users()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.primary_group(name)`

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.rename(name, new_name, root=None)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

14.6.347 salt.modules.uwsgi

uWSGI stats server <https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html>

maintainer Peter Baumgartner <pete@lincolnloop.com>

maturity new

platform all

`salt.modules.uwsgi.stats(socket)`

Return the data from `uwsgi --connect-and-read` as a dictionary.

socket The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatserver.sock
```

```
salt '*' uwsgi.stats 127.0.0.1:5050
```

14.6.348 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

`salt.modules.varnish.ban(ban_expression)`
 Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

`salt.modules.varnish.ban_list()`
 List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

`salt.modules.varnish.param_set(param, value)`
 Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

`salt.modules.varnish.param_show(param=None)`
 Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

`salt.modules.varnish.purge()`
 Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

`salt.modules.varnish.version()`
 Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

14.6.349 salt.modules.vbox_guest

VirtualBox Guest Additions installer

`salt.modules.vbox_guest.additions_install(*args, **kwargs)`
 Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D` (`Host` is usually `Right Ctrl`).

See <https://www.virtualbox.org/manual/ch04.html#idp52733088> for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot** (*bool*) -- reboot computer to complete installation
- **upgrade_os** (*bool*) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error

`salt.modules.vbox_guest.additions_mount()`

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

Returns True or OSError exception

`salt.modules.vbox_guest.additions_remove(**kwargs)`

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters **force** (*bool*) -- force VirtualBox Guest Additions removing

Returns True if VirtualBox Guest Additions were removed successfully else False

`salt.modules.vbox_guest.additions_umount(mount_point)`

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

Parameters **mount_point** -- directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

`salt.modules.vbox_guest.additions_version()`

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

Returns version of VirtualBox Guest Additions or False if they are not installed

`salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters

- **name** (*str*) -- name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) -- list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`

List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

14.6.350 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

The default for this setting is `False`.

depends `virtualbox`

`salt.modules.vboxmanage.clonemedium`(*medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

`salt.modules.vboxmanage.clonevm`(*name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

`salt.modules.vboxmanage.create`(*name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs*)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

`salt.modules.vboxmanage.destroy(name)`

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

`salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')`

Return a list of a specific type of item. The following items are available:

vms runningvms otypes hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers
hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks
groups webcams screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>  
salt 'hypervisor' vboxmanage.items <item> details=True  
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

`salt.modules.vboxmanage.list_nodes()`

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

`salt.modules.vboxmanage.list_nodes_full()`

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.list_nodes_min()`

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.list_ostypes()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.register(filename)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.start(name)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.stop(name)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

`salt.modules.vboxmanage.unregister(name, delete=False)`

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

`salt.modules.vboxmanage.vboxcmd()`

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

14.6.351 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)`

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters **message_type** -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param `timestamp_fmt` The date format for the timestamp parameter.

Parameters

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.

- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

Returns A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone'
↳ '
    entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key=
↳ 'everyone'
↳ 'Acknowledged' ack_author='username'
    entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone'
↳ '
    entity_id='hostname/diskspace'
```

The following parameters are required: message_type

14.6.352 salt.modules.virt

Work with virtual machines managed by libvirt

depends libvirt Python module

salt.modules.virt.cpu_baseline (*full=False, migratable=False, out='libvirt'*)

Return the optimal `custom` CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- `libvirt` (default) for usable libvirt XML definition, `salt` for nice dict

CLI Example:

```
salt '*' virt.cpu_baseline
```

salt.modules.virt.create (*domain*)

Deprecated since version 2016.3.0: Use *start()* instead.

Start a defined domain

CLI Example:

```
salt '*' virt.create <domain>
```

salt.modules.virt.create_xml_path (*path*)

Start a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.create_xml_str(xml)`

Start a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.ctrl_alt_del(vm_)`

Sends CTRL+ALT+DEL to a VM

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

`salt.modules.virt.define_vol_xml_path(path)`

Define a volume based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_vol_xml_str(xml)`

Define a volume based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

`salt.modules.virt.define_xml_path(path)`

Define a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_xml_str(xml)`

Define a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

`salt.modules.virt.delete_snapshots(name, *names, **kwargs)`

Delete one or more snapshots of the given VM.

Options:

- **all**: Remove all snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

`salt.modules.virt.destroy(domain)`

Deprecated since version 2016.3.0: Use `stop()` instead.

Power off a defined domain

CLI Example:

```
salt '*' virt.destroy <domain>
```

salt.modules.virt.freecpu()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.virt.freemem()

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.virt.full_info()

Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.virt.get_disks(vm_)

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.get_graphics(vm_)

Returns the information on vnc for a given vm

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.get_macs(vm_)

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.virt.get_nics(vm_)

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <domain>
```

salt.modules.virt.get_profiles(hypervisor=None)

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic

- disk

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi
```

salt.modules.virt.get_xml(*vm_*)

Returns the XML for a given vm

CLI Example:

```
salt '*' virt.get_xml <domain>
```

salt.modules.virt.init(*name, cpu, mem, image=None, nic='default', hypervisor='kvm', start=True, disk='default', saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', enable_vnc=False, **kwargs*)

Initialize a new vm

CLI Example:

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

salt.modules.virt.is_hyper()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.virt.is_kvm_hyper()

Returns a bool whether or not this node is a KVM hypervisor

CLI Example:

```
salt '*' virt.is_kvm_hyper
```

salt.modules.virt.is_xen_hyper()

Returns a bool whether or not this node is a XEN hypervisor

CLI Example:

```
salt '*' virt.is_xen_hyper
```

salt.modules.virt.list_active_vms()

Return a list of names for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.list_domains()

Return a list of available domains.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.list_inactive_vms()

Return a list of names for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.list_snapshots(*domain=None*)

List available snapshots for certain vm or for all.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

salt.modules.virt.list_vms()

Deprecated since version 2016.3.0: Use *list_domains()* instead.

List all virtual machines.

CLI Example:

```
salt '*' virt.list_vms <domain>
```

salt.modules.virt.migrate(*vm_*, *target*, *ssh=False*)

Shared storage migration

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor>
```

salt.modules.virt.migrate_non_shared(*vm_*, *target*, *ssh=False*)

Attempt to execute non-shared storage ``all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

salt.modules.virt.migrate_non_shared_inc(*vm_*, *target*, *ssh=False*)

Attempt to execute non-shared storage ``all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

salt.modules.virt.node_info()

Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

salt.modules.virt.pause(*vm_*)

Pause the named vm

CLI Example:

```
salt '*' virt.pause <domain>
```

salt.modules.virt.purge(*vm_*, *dirs=False*)

Recursively destroy and delete a virtual machine, pass True for *dirs* to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

CLI Example:

```
salt '*' virt.purge <domain>
```

`salt.modules.virt.reboot`(*name*)

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset`(*vm_*)

Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume`(*vm_*)

Resume the named vm

CLI Example:

```
salt '*' virt.resume <domain>
```

`salt.modules.virt.revert_snapshot`(*name*, *snapshot=None*, *cleanup=False*)

Revert snapshot to the previous from current (if available) or to the specific.

Options:

- cleanup**: Remove all newer than reverted snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

`salt.modules.virt.seed_non_shared_migrate`(*disks*, *force=False*)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

`salt.modules.virt.set_autostart`(*vm_*, *state='on'*)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

`salt.modules.virt.setmem`(*vm_*, *memory*, *config=False*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

memory is to be specified in MB If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

`salt.modules.virt.setvcpus`(*vm_*, *vcpus*, *config=False*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

vcpus is an int representing the number to be assigned. If *config* is True then we ask libvirt to modify the config as well.

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

`salt.modules.virt.shutdown`(*vm_*)

Send a soft shutdown signal to the named vm.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.virt.snapshot`(*domain*, *name=None*, *suffix=None*)

Create a snapshot of a VM.

Options:

- name:** Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- suffix:** Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

`salt.modules.virt.start`(*name*)

Start a defined domain.

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.virt.stop`(*name*)

Hard power down the virtual machine, this is equivalent to pulling the power.

CLI Example:

```
salt '*' virt.stop <domain>
```

`salt.modules.virt.undefine`(*vm_*)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down.

CLI Example:

```
salt '*' virt.undefine <domain>
```

`salt.modules.virt.virt_type`()

Returns the virtual machine type as a string.

CLI Example:

```
salt '*' virt.virt_type
```

`salt.modules.virt.virt_vm_cputime`(*vm_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.virt_vm_cputime
```

`salt.modules.virt.virt_vm_diskstats`(*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rd_req' : 0,
    'rd_bytes' : 0,
    'wr_req' : 0,
    'wr_bytes' : 0,
    'errs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.virt_vm_blockstats
```

`salt.modules.virt.virt_vm_info`(*vm_=None*)

Return detailed information about the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.virt.vm_netstats` (*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rx_bytes' : 0,
    'rx_packets' : 0,
    'rx_errs' : 0,
    'rx_drop' : 0,
    'tx_bytes' : 0,
    'tx_packets' : 0,
    'tx_errs' : 0,
    'tx_drop' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state` (*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

14.6.353 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

`salt.modules.virtualenv_mod.create` (*path*, *venv_bin=None*, *system_site_packages=False*, *distribute=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *pip=False*, *symlinks=None*, *upgrade=None*, *user=None*, *use_vt=False*, *saltenv='base'*)

Create a virtualenv

path The path to the virtualenv to be created

venv_bin The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

system_site_packages [False] Passthrough argument given to virtualenv or pyvenv

distribute [False] Passthrough argument given to virtualenv

pip [False] Install pip after creating a virtual environment. Implies `distribute=True`

clear [False] Passthrough argument given to virtualenv or pyvenv

python [None (default)] Passthrough argument given to virtualenv

extra_search_dir [None (default)] Passthrough argument given to virtualenv

never_download [None (default)] Passthrough argument given to virtualenv if True
prompt [None (default)] Passthrough argument given to virtualenv if not None
symlinks [None] Passthrough argument given to pyvenv if True
upgrade [None] Passthrough argument given to pyvenv if True
user [None] Set ownership for the virtualenv
runas [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: **user** should be used instead
use_vt [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.
saltenv ['base'] Specify a different environment. The default environment is base.

New in version 2014.1.0.

Note: The **runas** argument is deprecated as of 2014.1.0. **user** should be used instead.

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

salt.modules.virtualenv_mod.get_distribution_path(*venv, distribution*)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv Path to the virtualenv.

distribution Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

salt.modules.virtualenv_mod.get_resource_content(*venv, package_or_requirement=None, resource_name=None, package=None, resource=None*)

Return the content of a package resource installed inside a virtualenv

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

package_or_requirement Name of the package in which the resource resides

Deprecated since version Nitrogen: Use **package** instead.

resource Name of the resource of which the content is to be returned

New in version 2016.3.0.

resource_name Name of the resource of which the content is to be returned

Deprecated since version Nitrogen.

New in version 2015.5.0.

venv Path to the virtualenv.

package_or_requirement Name of the package where the resource resides in.

resource_name Name of the resource of which the content is to be returned.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.  
↪xml
```

```
salt.modules.virtualenv_mod.get_resource_path(venv, package_or_requirement=None,
                                             resource_name=None, package=None,
                                             resource=None)
```

Return the path to a package resource installed inside a virtualenv

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

package_or_requirement Name of the package in which the resource resides

Deprecated since version Nitrogen: Use **package** instead.

resource Name of the resource of which the path is to be returned

New in version 2016.3.0.

resource_name Name of the resource of which the path is to be returned

Deprecated since version Nitrogen.

New in version 2015.5.0.

venv Path to the virtualenv.

package_or_requirement Name of the package where the resource resides in.

resource_name Name of the resource of which the path is to be returned.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

```
salt.modules.virtualenv_mod.get_site_packages(venv)
```

Return the path to the site-packages directory of a virtualenv

venv Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

14.6.354 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency

in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name

that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user>
→ <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
-----
  esxi-1.example.com:
  -----
    Coredump Config:
    -----
      enabled:
      False
  esxi-2.example.com:
  -----
    Coredump Config:
    -----
      enabled:
      True
      host_vnic:
      vmk0
      ip:
      coredump-location.example.com
      port:
      6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-
→password>
local:
-----
  10.4.28.150:
  -----
    Coredump Config:
    -----
      enabled:
      True
      host_vnic:
      vmk0
      ip:
      coredump-location.example.com
      port:
      6500
```

`salt.modules.vsphere.add_host_to_dvs`(*host*, *username*, *password*, *vmknic_name*, *vmnic_name*, *dvs_name*, *target_portgroup_name*, *uplink_portgroup_name*, *protocol=None*, *port=None*, *host_names=None*)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

host The location of the vCenter server.

username The username used to login to the vCenter server.

password The password used to login to the vCenter server.

vmknic_name The name of the virtual NIC to migrate.

vmnic_name The name of the physical NIC to migrate.

dvs_name The name of the Distributed Virtual Switch.

target_portgroup_name The name of the distributed portgroup in which to migrate the virtual NIC.

uplink_portgroup_name The name of the uplink portgroup in which to migrate the physical NIC.

protocol Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

host_names: An array of VMware host names to migrate

CLI Example:

```
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
  username='administrator@vsphere.corp.com' password='vsphere_password'
  vmknic_name='vmk0' vnic_name='vnic0' dvs_name='DSwitch'
  target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-DVUplinks-
  ↪181'
  protocol='https' port='443', host_names="['esxi1.corp.com','esxi2.corp.com',
  ↪'esxi3.corp.com']"
```

Return Example:

```
somehost:
  -----
  esxi1.corp.com:
    -----
    dvs:
      DSwitch
    portgroup:
      DPortGroup
    status:
      True
    uplink:
      DSwitch-DVUplinks-181
    vmknic:
      vmk0
    vnic:
      vnic0
  esxi2.corp.com:
    -----
    dvs:
      DSwitch
    portgroup:
      DPortGroup
    status:
      True
    uplink:
      DSwitch-DVUplinks-181
    vmknic:
      vmk0
    vnic:
      vnic0
  esxi3.corp.com:
    -----
    dvs:
      DSwitch
    portgroup:
      DPortGroup
    status:
      True
```

```

uplink:
  DSwitch-DVUplinks-181
vmknic:
  vmk0
vmlnic:
  vmlnic0
message:
success:
  True

```

This was very difficult to figure out. VMware's PyVmomi documentation at

<https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst> (which is a copy of the official documentation here: https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html)

says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful ``busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does what we want. I used Onyx (<https://labs.vmware.com/flings/onyx>) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```

<UpdateNetworkConfig xmlns="urn:vim25"> <_this      type="HostNetworkSystem">networkSystem-
187</_this> <config>
  <vswitch> <changeOperation>edit</changeOperation> <name>vSwitch0</name> <spec>
    <numPorts>7812</numPorts>
  </spec>
</vswitch> <proxySwitch>
  <changeOperation>edit</changeOperation>   <uuid>73   a4   05   50
b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid> <spec> <backing
xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">
  <pnicSpec><pnicDevice>vmlnic0</pnicDevice></pnicSpec>
</backing> </spec>
</proxySwitch> <portgroup>
  <changeOperation>remove</changeOperation> <spec>
    <name>Management      Network</name><vlanId>-
1</vlanId><vswitchName /><policy />
  </spec>
</portgroup> <vnic>
  <changeOperation>edit</changeOperation> <device>vmk0</device> <port-
group /> <spec>
    <distributedVirtualPort> <switchUuid>73   a4   05   50   b0
    d2 7e b9-38 80 5d 24 65 8f da 70</switchUuid>
    <portgroupKey>dvportgroup-191</portgroupKey>
  </distributedVirtualPort>
  </spec>
</vnic>

```

```
</config> <changeMode>modify</changeMode>
</UpdateNetworkConfig>
```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.coredump_network_enable`(*host, username, password, enabled, protocol=None, port=None, esxi_hosts=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `ERROR` key dictionary for the given host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

enabled Python `True` or `False` to enable or disable coredumps.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
↳ True          esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.enable_firewall_ruleset`(*host, username, password, ruleset_enable, ruleset_name, protocol=None, port=None, esxi_hosts=None*)

Enable or disable an ESXi firewall rule set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

ruleset_enable `True` to enable the ruleset, `false` to disable.

ruleset_name Name of ruleset to target.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

Returns A standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True
↳ 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password
↳ True 'syslog'          esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.esxcli_cmd`(*cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None*)

Run an ESXCLI command directly on the host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

cmd_str The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password 'system
↳ coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↳ 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_coredump_network_config(host, username, password,
                                                protocol=None, port=None,
                                                esxi_hosts=None)
```

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

Returns A dictionary with the network configuration, or, if getting the network config failed, a error message retrieved from the standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↳ password esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None,
                                         port=None, esxi_hosts=None)
```

Show status of all firewall rule sets.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

Returns Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
↳ esxi_hosts=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.get_host_datetime`(*host, username, password, protocol=None, port=None, host_names=None*)

Get the date/time information for a given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get date/time information.

If `host_names` is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
↳ host_names=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.get_ntp_config`(*host, username, password, protocol=None, port=None, host_names=None*)

Get the NTP configuration information for a given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get ntp configuration information.

If `host_names` is not provided, the NTP configuration will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password      host_
↳ names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_service_policy`(*host, username, password, service_name, protocol=None, port=None, host_names=None*)

Get the service name's policy for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

service_name

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtid
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get service policy information.

If `host_names` is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd' ✘
↳ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_service_running`(*host, username, password, service_name, protocol=None, port=None, host_names=None*)

Get the service name's running state for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

service_name

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get the service's running state.

If `host_names` is not provided, the service's running state will be retrieved for the `host` location instead.

This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_ssh_key(host, username, password, protocol=None, port=None, certificate_verify=False)`

Retrieve the `authorized_keys` entry for `root`. This function only works for ESXi, not vCenter.

Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to `https`, can be `http` if `ssl` is disabled on ESXi
- **port** -- defaults to 443 for `https`

- **certificate_verify** -- If true require that the SSL connection present a valid certificate

Returns True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

```
salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None,
                                       esxi_hosts=None)
```

Retrieve the syslog configuration.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

Returns Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None,
                                         port=None, host_names=None)
```

Get the VMotion enabled status for a given host or a list of `host_names`. Returns `True` if VMotion is enabled, `False` if it is not enabled.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VMotion is enabled.

If `host_names` is not provided, the VMotion status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password
↳ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None,
                                              port=None, host_names=None)
```

Returns a list of VSAN-eligible disks for a given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If `host_names` is not provided, the VSAN-eligible disks will be retrieved for the `host` location instead.

This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vsan_enabled`(*host, username, password, protocol=None, port=None, host_names=None*)

Get the VSAN enabled status for a given host or a list of `host_names`. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VSAN enabled.

If `host_names` is not provided, the VSAN status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_clusters`(*host, username, password, protocol=None, port=None*)

Returns a list of clusters for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datacenters` (*host, username, password, protocol=None, port=None*)

Returns a list of datacenters for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datastore_clusters` (*host, username, password, protocol=None, port=None*)

Returns a list of datastore clusters for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datastores` (*host, username, password, protocol=None, port=None*)

Returns a list of datastores for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_dvs` (*host, username, password, protocol=None, port=None*)

Returns a list of distributed virtual switches for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_folders` (*host, username, password, protocol=None, port=None*)

Returns a list of folders for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_hosts`(*host, username, password, protocol=None, port=None*)

Returns a list of hosts for the the specified VMware environment.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_networks`(*host, username, password, protocol=None, port=None*)

Returns a list of networks for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_non_ssds`(*host, username, password, protocol=None, port=None, host_names=None*)

Returns a list of Non-SSD disks for the given host or list of `host_names`.

Note: In the `pyVmomi StorageSystem`, `ScsiDisks` may, or may not have an `ssd` attribute. This attribute indicates if the `ScsiDisk` is SSD backed. As this option is optional, if a relevant disk in the `StorageSystem` does not have `ssd = true`, it will end up in the `non_ssds` list here.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If `host_names` is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password      host_
↳names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None,
                                         port=None)
```

Returns a list of resource pools for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None,
                                host_names=None)
```

Returns a list of SSDs for the given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve SSDs.

If `host_names` is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password          host_
      ↪names=['esxi-1.host.com, esxi-2.host.com']
```

```
salt.modules.vsphere.list_vapps(host, username, password, protocol=None, port=None)
```

Returns a list of vApps for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_vms(host, username, password, protocol=None, port=None)
```

Returns a list of VMs for the the specified host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None)
```

Reset the syslog service to its default settings.

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

syslog_config List of parameters to reset, provided as a comma-delimited string, or `'all'` to reset all syslog configuration parameters. Required.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

Returns Dictionary with a top-level key of `'success'` which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

`syslog_config` can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
↳ syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
↳ syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None)
```

Restart the named service for the given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd

- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'
↪ host_names=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.service_start`(*host, username, password, service_name, protocol=None, port=None, host_names=None*)

Start the named service for the given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to start the service.

If `host_names` is not provided, the service will be started for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.service_stop`(*host, username, password, service_name, protocol=None, port=None, host_names=None*)

Stop the named service for the given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to stop the service.

If `host_names` is not provided, the service will be stopped for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'
↳ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip,
                                                protocol=None, port=None,
                                                host_vnic='vmk0', dump_port=6500,
                                                esxi_hosts=None)
```

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see `coredump_network_enable`) before these parameters may be set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

dump_ip IP address of host that will accept the dump.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

host_vnic Host VNIC port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump, defaults to 6500.

Returns A standard `cmd.run_all` dictionary with a `success` key added, per host. `success` will be `True` if the set succeeded, `False` otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_
↳ ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password
↳ 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_ntp_config(host, username, password, ntp_servers, protocol=None,
                                   port=None, host_names=None)
```

Set NTP configuration for a given host of list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

ntp_servers A list of servers that should be added to and configured for the specified host's NTP configuration.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to configure ntp servers.

If `host_names` is not provided, the NTP servers will be configured for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100,
↳ 192.174.1.200]'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.
↪100, 192.174.1.200]'          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_service_policy(host, username, password, service_name,
                                       service_policy, protocol=None, port=None,
                                       host_names=None)
```

Set the service name's policy for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

service_policy The policy to set for the service. For example, `'automatic'`.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to set the service policy.

If `host_names` is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
↪'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd'
↪'automatic'          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, con-
                                     fig_value, protocol=None, port=None, firewall=True,
                                     reset_service=True, esxi_hosts=None)
```

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host ESXi or vCenter host to connect to.

username User to connect as, usually root.

password Password to connect with.

syslog_config Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are logdir, loghost, default-rotate`, ``default-size, de-
fault-timeout, and logdir-unique.

config_value Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

firewall Enable the firewall rule set for syslog. Defaults to True.

reset_service After a successful parameter set, reset the service. Defaults to True.

esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

Returns Dictionary with a top-level key of `success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
↳ loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
↳ loghost ssl://localhost:5432,tcp://10.1.0.1:1514 esxi_hosts=
↳ '[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None,
                                           port=None, esxi_hosts=None)
```

Reload the syslog service so it will pick up any changes.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

Returns A standard cmd.run_all dictionary. This dictionary will at least have a *retcode* key. If *retcode* is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.system_info`(*host, username, password, protocol=None, port=None*)

Return system information about a VMware environment.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

`salt.modules.vsphere.update_host_datetime`(*host, username, password, protocol=None, port=None, host_names=None*)

Update the date/time on the given host or list of `host_names`. This function should be used with caution since network delays and execution delays can result in time skews.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should update their date/time.

If `host_names` is not provided, the date/time will be updated for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
↳ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.update_host_password`(*host, username, password, new_password, protocol=None, port=None*)

Update the password for a given host.

Note: Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

host The location of the ESXi host.

username The username used to login to the ESXi host, such as `root`.

password The password used to login to the ESXi host.

new_password The new password that will be updated for the provided username on the ESXi host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-
↳bad-password
```

`salt.modules.vsphere.upload_ssh_key`(*host*, *username*, *password*, *ssh_key=None*, *ssh_key_file=None*, *protocol=None*, *port=None*, *certificate_verify=False*)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **ssh_key** -- Public SSH key, will be added to `authorized_keys` on ESXi
- **ssh_key_file** -- File containing the SSH key. Use `ssh_key` or `ssh_key_file`, but not both.
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate

Returns Dictionary with a `'status'` key, True if upload is successful. If upload is unsuccessful, `'status'` key will be False and an `'Error'` key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file='/etc/
↳salt/my_keys/my_key.pub'
```

`salt.modules.vsphere.vmotion_disable`(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*)

Disable vMotion for a given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VMotion.

If `host_names` is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password
↳host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vmotion_enable`(*host, username, password, protocol=None, port=None, host_names=None, device='vmk0'*)

Enable vMotion for a given host or list of host_names.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VMotion.

If `host_names` is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

device The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
↳names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_add_disks`(*host, username, password, protocol=None, port=None, host_names=None*)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If `host_names` is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
↳names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_disable`(*host, username, password, protocol=None, port=None, host_names=None*)

Disable VSAN for a given host or list of host_names.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VSAN.

If `host_names` is not provided, VSAN will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password      host_
↳names=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.vsan_enable`(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*)

Enable VSAN for a given host or list of `host_names`.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VSAN.

If `host_names` is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password      host_
↳names=['esxi-1.host.com, esxi-2.host.com']
```

14.6.355 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.list`()

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

14.6.356 salt.modules.win_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

salt.modules.win_certutil.add_store (*source, store, saltenv='base'*)

Add the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to add the certificate to

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.del_store (*source, store, saltenv='base'*)

Delete the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to delete the certificate from

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.get_cert_serial (*cert_file*)

Get the serial number of a certificate file

cert_file The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

salt.modules.win_certutil.get_stored_cert_serials (*store*)

Get all of the certificate serials in the specified store

store The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

14.6.357 salt.modules.win_dacl

Manage DACLs on Windows

depends

- winreg Python module

salt.modules.win_dacl.add_ace (*path, objectType, user, permission, acetype, propagation*)

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) **user**: user to add

permission: permissions for the user **acetype**: either allow/deny for each user/permission (ALLOW, DENY)

propagation: how the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey, propagate to this
↳key and subkeys
    salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\somekey'
↳'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

`salt.modules.win_dacl.check_ace` (*path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False*)

Checks a path to verify the ACE (access control entry) specified exists

Parameters

- **path** -- path to the file/reg key
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- user that the ACL is for
- **permission** -- permission to test for (READ, FULLCONTROL, etc)
- **acetype** -- the type of ACE (ALLOW or DENY)
- **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): `Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

`salt.modules.win_dacl.check_inheritance` (*path, objectType, user=None*)

Check a specified path to verify if inheritance is enabled

Parameters

- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): `Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

class `salt.modules.win_dacl.daclConstants`

DACL constants used throughout the module

getAceTypeBit (*t*)

returns the acetype bit of a text value

getAceTypeText (*t*)

returns the textual representation of a acetype bit

getObjectTypeBit (*t*)

returns the bit value of the string object type

getPermissionBit (*t, m*)

returns a permission bit of the string permission value for the specified object type

getPermissionText(*t, m*)

returns the permission textual representation of a specified permission bit/object type

getPropagationBit(*t, p*)

returns the propagation bit of a text value

getPropagationText(*t, p*)

returns the textual representation of a propagation bit

getSecurityHkey(*s*)

returns the necessary string value for an HKEY for the win32security module

processPath(*path, objectType*)

processes a **path/object type combo** and **returns**: registry types with the correct HKEY text representation files/directories with environment variables expanded

`salt.modules.win_dacl.disable_inheritance`(*path, objectType, copy=True*)

Disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

`salt.modules.win_dacl.enable_inheritance`(*path, objectType, clear=False*)

enable/disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get`(*path, objectType, user=None*)

Get the ACL of an object. Will filter by user if one is provided.

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace`(*path, objectType, user, permission=None, acetype=None, propagation=None*)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated
↳to this key and subkeys
  salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_
↳MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↳'
```

14.6.358 salt.modules.win_disk

Module for gathering disk information on Windows

depends

- win32api Python module

salt.modules.win_disk.usage()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

14.6.359 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.add_capability(*capability*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a capability

Parameters

- **capability** (*str*) -- The capability to install
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.add_feature` (*feature*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

Parameters

- **feature** (*str*) -- The feature to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **enable_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.add_package` (*package*, *ignore_check=False*, *prevent_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

Parameters

- **package** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder
- **ignore_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.available_capabilities` (*image=None*)

List the capabilities available on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use `ServerManager` instead.

Returns A list of available capabilities

Return type *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.available_features` (*image=None*)

List the features available on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of available features

Return type *list*

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.get_capabilities` (*image=None*)

List all capabilities on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use `ServerManager` instead.

Returns A list of capabilities

Return type *list*

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.get_features` (*package=None, image=None*)

List features on the system or in a package

Parameters

- **package** (*Optional[str]*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files

This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of features

Return type *list*

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab
```

```
# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
↳x86~en~1.0.0.0
```

`salt.modules.win_dism.installed_capabilities`(*image=None*)

List the capabilities installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use `ServerManager` instead.

Returns A list of installed capabilities

Return type *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.installed_features`(*image=None*)

List the features installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed features

Return type *list*

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.installed_packages`(*image=None*)

List the packages installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed packages

Return type *list*

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.package_info`(*package, image=None*)

Display information about a package

Parameters

- **package** (*str*) -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A dictionary containing the results of the command

Return type *dict*

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

`salt.modules.win_dism.remove_capability`(*capability, image=None, restart=False*)

Uninstall a capability

Parameters

- **capability** (*str*) -- The capability to be removed
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

```
salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)
```

Disables the feature.

Parameters

- **feature** (*str*) -- The feature to uninstall
- **remove_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

```
salt.modules.win_dism.remove_package(package, image=None, restart=False)
```

Uninstall a package

Parameters

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.
↪0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

14.6.360 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.add_dns` (*ip*, *interface='Local Area Connection'*, *index=1*)
Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.dns_dhcp` (*interface='Local Area Connection'*)
Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.get_dns_config` (*interface='Local Area Connection'*)
Get the type of DNS configuration (dhcp / static)

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

`salt.modules.win_dns_client.get_dns_servers` (*interface='Local Area Connection'*)
Return a list of the configured DNS servers of the specified interface

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

`salt.modules.win_dns_client.rm_dns` (*ip*, *interface='Local Area Connection'*)
Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

14.6.361 salt.modules.win_dsc

Module for working with DSC (Alpha)

depends

- PowerShell 5.0

`salt.modules.win_dsc.apply_config` (*path*, *source=None*, *salt_env=u'base'*)
Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

Parameters `path` (*str*) -- Local path to the directory that contains the .mof configuration file to apply. Required.

Parameters `source` (*str*) -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the `path` directory and then executed. If the `path` and `source` directories differ, the `source` directory will be applied. If `source` is not passed, the config located at `path` will be applied. Optional.

Parameters **salt_env** (*str*) -- The salt environment to use when copying your source.
Default is `'base'`

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

To apply a config that already exists on the the system

```
salt '*' dsc.run_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.run_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/
↳WebSiteConfiguration
```

`salt.modules.win_dsc.compile_config`(*path*, *source=None*, *config=None*, *salt_env=u'base'*)

Compile a config from a powershell script (`.ps1`)

Parameters **path** (*str*) -- Path (local) to the script that will create the `.mof` configuration file. If no source is passed, the file must exist locally. Required.

Parameters **source** (*str*) -- Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.

Parameters **config** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config must be specified. If the config is not specified, the name of the file will be used as the config to run. Optional.

Parameters **salt_env** (*str*) -- The salt environment to use when copying the source.
Default is `'base'`

Returns A dictionary containing the results of the compilation

Return type `dict`

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

`salt.modules.win_dsc.get_config`()

Get the current DSC Configuration

Returns A dictionary representing the DSC Configuration on the machine

Return type `dict`

CLI Example:

```
salt '*' dsc.get_config
```

`salt.modules.win_dsc.get_config_status`()

Get the status of the current DSC Configuration

Returns A dictionary representing the status of the current DSC Configuration on the machine :rtype: dict

CLI Example:

```
salt '*' dsc.get_config_status
```

`salt.modules.win_dsc.get_lcm_config()`

Get the current Local Configuration Manager settings

Returns A dictionary representing the Local Configuration Manager settings on the machine

Return type `dict`

CLI Example:

```
salt '*' dsc.get_lcm_config
```

`salt.modules.win_dsc.run_config(path, source=None, config=None, salt_env='base')`

Compile a DSC Configuration in the form of a powershell script (.ps1) and apply it. The powershell script can be cached from the master using the `source` option. If there is more than one config within the powershell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` and `dsc.apply_config` separately.

Parameters `path (str)` -- The local path to the powershell script that contains the DSC Configuration. Required.

Parameters `source (str)` -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If `source` is not passed, the config script located at `path` will be compiled. Optional.

Parameters `config (str)` -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config must be specified. If the config is not specified, the name of the file will be used as the config to run. Optional.

Parameters `salt_env (str)` -- The salt environment to use when copying the source. Default is `'base'`

Returns True if successfully compiled and applied, False if not

Return type `bool`

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_apply_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_apply_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

`salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)`

For detailed descriptions of the parameters see: <https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig>

Parameters `config_mode (str)` -- How the LCM applies the configuration. Valid values are: - ApplyOnly - ApplyAndMonitor - ApplyAndAutoCorrect

Parameters `config_mode_freq (int)` -- How often, in minutes, the current configuration is checked and applied. Ignored if `config_mode` is set to `ApplyOnly`. Default is 15.

Parameters `refresh_mode (str)` -- How the LCM gets configurations. Valid values are:

- Disabled
- Push
- Pull

Parameters `refresh_freq (int)` -- How often, in minutes, the LCM checks for updated

configurations. (pull mode only) Default is 30.

Note: Either `config_mode_freq` or `refresh_freq` needs to be a multiple

of the other. See documentation on MSDN for more details.

Parameters `reboot_if_needed` (*bool*) -- Reboot the machine if needed after a configuration is applied. Default is False.

Parameters `action_after_reboot` (*str*) -- Action to take after reboot. Valid values are: - ContinueConfiguration - StopConfiguration

Parameters `certificate_id` (*guid*) -- A GUID that specifies a certificate used to access the configuration: (pull mode)

Parameters `configuration_id` (*guid*) -- A GUID that identifies the config file to get from a pull server. (pull mode)

Parameters `allow_module_overwrite` (*bool*) -- New configs are allowed to overwrite old ones on the target node.

Parameters `debug_mode` (*str*) -- Sets the debug level. Valid values are:

- None
- ForceModuleImport
- All

Parameters `status_retention_days` (*int*) -- Number of days to keep status of the current config.

Returns (bool): True if successful, otherwise False

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.test_config()`

Tests the current applied DSC Configuration

Returns True if successfully applied, otherwise False

Return type `bool`

CLI Example:

```
salt '*' dsc.test_config
```

14.6.362 salt.modules.win_file

Manage information about files on the minion, set/read user, group data

depends

- win32api
- win32file
- win32security

`salt.modules.win_file.chgrp` (*path, group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a `primary group`, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the `primary group` of a file, use `file.chpgrp`.

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.chown`(*path*, *user*, *group=None*, *pgroup=None*, *follow_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a `primary group` property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the `primary group` property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

To set the primary group to `None`, it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.chpgrp`(*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

To set the primary group to `None`, it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```

`salt.modules.win_file.get_attributes`(*path*)

Return a dictionary object with the Windows file attributes for a file.

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

`salt.modules.win_file.get_gid`(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgid*.

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

salt.modules.win_file.get_group(*path*, *follow_symlinks=True*)

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgroup*.

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

salt.modules.win_file.get_mode(*path*)

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

salt.modules.win_file.get_pgid(*path*, *follow_symlinks=True*)

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

salt.modules.win_file.get_pgroup(*path*, *follow_symlinks=True*)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be `None`, e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of `None` which means no value was returned. To be certain, use the `get_pgid` function which will return the SID, including for the system `None` group.

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.get_uid(path, follow_symlinks=True)`

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.get_user(path, follow_symlinks=True)`

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.gid_to_group(gid)`

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `uid_to_user`.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.group_to_gid(group)`

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if `None` is given, `''` is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.

CLI Example:

```
salt '*' file.group_to_gid administrators
```

`salt.modules.win_file.is_link(path)`

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.lchown`(*path*, *user*, *group=None*, *pgroup=None*)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.readlink`(*path*)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.win_file.remove`(*path*, *force=False*)

Remove the named file or directory

Parameters

- **path** (*str*) -- The path to the file or directory to remove.
- **force** (*bool*) -- Remove even if marked Read-Only

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.set_attributes`(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.set_mode(path, mode)`

Set the mode of a file

This just calls `get_mode`, which returns `None` because we don't use mode on Windows

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)`

Return a dict containing the stats for a given file

Under Windows, `gid` will equal `uid` and `group` will equal `user`.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the `pgroup` and `pgid` properties.

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink(src, link)`

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the `SeCreateSymbolicLink` privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.uid_to_user(uid)`

Convert a uid to a user name

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.user_to_uid(user)`

Convert user name to a uid

CLI Example:

```
salt '*' file.user_to_uid myusername
```

14.6.363 salt.modules.win_firewall

Module for configuring Windows Firewall

`salt.modules.win_firewall.add_rule`(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new firewall rule

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

`salt.modules.win_firewall.delete_rule`(*name*, *localport*, *protocol='tcp'*, *dir='in'*, *remoteip='any'*)

New in version 2015.8.0.

Delete an existing firewall rule

CLI Example:

```
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'
```

`salt.modules.win_firewall.disable`(*profile='allprofiles'*)

Disable firewall profile :param profile: (default: allprofiles)

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable`(*profile='allprofiles'*)

Enable firewall profile :param profile: (default: allprofiles)

New in version 2015.5.0.

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.get_config`()

Get the status of all the firewall profiles

CLI Example:

```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.get_rule`(*name='all'*)

New in version 2015.5.0.

Get firewall rule(s) info

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

14.6.364 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.win_groupadd.add`(*name*, *gid=None*, *system=False*)

Add the specified group

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.adduser`(*name*, *username*)

add a user to a group

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.win_groupadd.deluser`(*name*, *username*)

remove a user from a group

CLI Example:

```
salt '*' group.deluser foo username
```

`salt.modules.win_groupadd.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.info`(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.win_groupadd.list_groups`(*refresh=False*)

Return a list of groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.members`(*name*, *members_list*)

remove a user from a group

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

14.6.365 salt.modules.win_iis module

Microsoft IIS site management via WebAdministration powershell module

platform Windows

New in version 2016.3.0.

salt.modules.win_iis.create_app(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
↳ apppool='site0'
```

salt.modules.win_iis.create_apppool(*name*)

Create an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.create_binding(*site*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*, *sslflags=0*)

Create an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example' ipaddress='*'
↳ port='80'
```

```
salt.modules.win_iis.create_cert_binding(name, site, hostheader='', ipaddress='*', port=443,
                                       sslflags=0)
```

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name, sourcepath, apppool='', hostheader='', ipaddress='*',
                                port=80, protocol='http')
```

Create a basic website in IIS.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool=
↳ 'TestPool'
```

```
salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')
```

Create an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:
↳\inetpub\vdirs\vd0'
```

`salt.modules.win_iis.get_container_setting(name, container, settings)`

Get the value of the setting for the IIS container.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type `dict`

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools'
settings=["processModel.identityType"]
```

`salt.modules.win_iis.list_appools()`

List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_appools
```

`salt.modules.win_iis.list_apps(site)`

Get all configured IIS applications for the specified site.

Parameters **site** (*str*) -- The IIS site name.

Returns A dictionary of the application names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.list_bindings(site)`

Get all configured IIS bindings for the specified site.

Parameters **site** (*str*) -- The IIS site name.

Returns A dictionary of the binding names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_cert_bindings(site)`

List certificate bindings for an IIS site.

Parameters **site** (*str*) -- The IIS site name.

Returns A dictionary of the binding names and properties.

Return type `dict`

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_sites()`

List all the currently deployed websites.

Returns A dictionary of the IIS sites and their properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.list_vdirs(site, app='')`

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters

- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns A dictionary of the virtual directory names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.remove_app(name, site)`

Remove an IIS application.

Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

`salt.modules.win_iis.remove_apppool(name)`

Remove an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

`salt.modules.win_iis.remove_binding(site, hostheader='', ipaddress='*', port=80)`

Remove an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example' ipaddress='*'
↳port='80'
```

salt.modules.win_iis.remove_cert_binding(*name*, *site*, *hostheader*='', *ipaddress*='', *port*=443)

Remove a certificate from an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=
↳'example' ipaddress='*' port='443'
```

salt.modules.win_iis.remove_site(*name*)

Delete a website from IIS.

Parameters **name** (*str*) -- The IIS site name.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.remove_vdir(*name*, *site*, *app*='')

Remove an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
 - **site** (*str*) -- The IIS site name.
 - **app** (*str*) -- The IIS application.
- Returns** A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.restart_appool(*name*)

Restart an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.restart_appool name='MyTestPool'
```

`salt.modules.win_iis.set_container_setting(name, container, settings)`

Set the value of the setting for an IIS container.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
settings="{ 'managedPipeLineMode': 'Integrated' }"
```

14.6.366 salt.modules.win_ip

The networking module for Windows based systems

`salt.modules.win_ip.disable(iface)`

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

`salt.modules.win_ip.enable(iface)`

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

`salt.modules.win_ip.get_all_interfaces()`

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

`salt.modules.win_ip.get_default_gateway()`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

`salt.modules.win_ip.get_interface(iface)`

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.get_subnet_length(mask)`
Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.is_disabled(iface)`
Returns True if interface is disabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.is_enabled(iface)`
Returns True if interface is enabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.raw_interface_configs()`
Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.set_dhcp_all(iface)`
Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_dns(iface)`
Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_ip(iface)`
Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.set_static_dns(iface, *addrs)`
Set static DNS configuration on a Windows NIC

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1'  
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.  
↪252' '192.168.1.253'
```

`salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)`
Set static IP configuration on a Windows NIC

iface The name of the interface to manage

addr IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

gateway [None] If specified, the default gateway will be set to this value.

append [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
  ↳ gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
  ↳ append=True
```

14.6.367 salt.modules.win_license module

This module allows you to manage windows licensing via `slmgr.vbs`

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.activate()`

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

`salt.modules.win_license.info()`

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

`salt.modules.win_license.install(product_key)`

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.installed(product_key)`

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.licensed()`

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

`salt.modules.win_license.uninstall()`

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

14.6.368 salt.modules.win_network

Module for gathering and managing network information

`salt.modules.win_network.connect`(*host*, *port=None*, ***kwargs*)

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

`salt.modules.win_network.dig`(*host*)

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.win_network.hw_addr`(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.hwaddr`(*iface*)

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.in_subnet`(*cidr*)

Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.win_network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.win_network.interfaces_names()`

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.ip_addrs(interface=None, include_loopback=False)`

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False)`

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.ipaddrs(interface=None, include_loopback=False)`

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False)`

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.netstat()`

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.win_network.nslookup(host)`

Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

`salt.modules.win_network.ping`(*host*, *timeout=False*, *return_boolean=False*)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.win_network.subnets`()

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.win_network.traceroute`(*host*)

Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

14.6.369 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

`salt.modules.win_ntp.get_servers`()

Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

`salt.modules.win_ntp.set_servers`(**servers*)

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

14.6.370 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message <http://support.microsoft.com/kb/104011>

`salt.modules.win_path.add(path, index=0)`

Add the directory to the SYSTEM path in the index location

Returns boolean True if successful, False if unsuccessful

CLI Example:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

`salt.modules.win_path.exists(path)`

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

`salt.modules.win_path.get_path()`

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.rehash()`

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables

CLI Example:

```
... code-block:: bash
salt '*' win_path.rehash
```

`salt.modules.win_path.remove(path)`

Remove the directory from the SYSTEM path

Returns boolean True if successful, False if unsuccessful

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

14.6.371 salt.modules.win_pkg

A module to manage software on Windows

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

The following functions require the existence of a *windows repository* metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`

- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

`salt.modules.win_pkg.compare_versions(ver1=u'', oper=u'==', ver2=u'')`

Compare software package versions

Parameters

- **ver1** (*str*) -- A software version to compare
- **oper** (*str*) -- The operand to use to compare
- **ver2** (*str*) -- A software version to compare

Returns (bool): True if the comparison is valid, otherwise False

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.genrepo(**kwargs)`

Generate package metadata db based on files within the winrepo_source_dir

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

Keyword Arguments (kwargs)

Parameters

- **saltenv** (*str*) -- Salt environment. Default: base
- **verbose** (*bool*) -- Return verbose data structure which includes `'success_list'`, a list of all sls files and the package names contained within. Default `'False'`
- **failhard** (*bool*) -- If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

`salt.modules.win_pkg.get_repo_data(saltenv=u'base')`

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters **saltenv** (*str*) -- Salt environment. Default base

Returns Returns a dict containing contents of metadata db.

Return type dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) on the system using winrepo

Parameters

- **name** (*str*, *list*, or *None*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (*bool*) -- Boolean value representing whether or not to refresh the winrepo db
- **pkgs** (*list* or *None*) -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

Keyword Arguments (kwargs)

Parameters

- **version** (*str*) -- The specific version to install. If omitted, the latest version will be installed. If passed with multiple install, the version will apply to all packages. Recommended for single installation only.
- **cache_file** (*str*) -- A single file to copy down for use with the installer. Copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don't want to cache additional files that may reside in the installer directory. Only applies to files on `salt://`
- **cache_dir** (*bool*) -- True will copy the contents of the installer directory. This is useful for installations that are not a single file. Only applies to directories on `salt://`
- **saltenv** (*str*) -- Salt environment. Default 'base'
- **report_reboot_exit_codes** (*bool*) -- If the installer exits with a recognized exit code indicating that a reboot is required, the module function

`win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns Return a dict containing the new package names and versions:

Return type

dict

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If the package is already installed:

```
{'<package>': {'current': '<current-version>'}}
```

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:
→\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:
→\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

Keyword Arguments (kwargs): `param` str saltenv: Salt environment. Default `base`. `refresh`: Refresh package metadata. Default `True`

`salt.modules.win_pkg.list_available(*names, **kwargs)`

Return a list of available versions of the specified package.

Parameters `name` (*str*) -- One or more package names

Returns For multiple package names listed returns dict of package names and versions For single package name returns a version string

Return type dict or string

Keyword Arguments (kwargs): `param` str saltenv: The salt environment to use. Default `base`. `refresh`: Refresh package metadata. Default `True`. `return_dict_always`: Default `False` dict when a single package name is queried.

CLI Example: .. code-block:: bash

```
salt '*' pkg.list_available <package name> return_dict_always=True salt '*' pkg.list_available
<package name01> <package name02>
```

`salt.modules.win_pkg.list_pkgs` (*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
*Keyword Arguments (kwargs)*
```

Parameters

- **saltenv** (*str*) -- The salt environment to use. Default base.
- **refresh** (*bool*) -- Refresh package metadata. Default ``False``.
{<package_name>: '<version>'}

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.list_upgrades` (*refresh=True*, ***kwargs*)

List all available package upgrades on this system

Parameters **refresh** (*bool*) -- Refresh package metadata. Default True

Keyword Arguments (kwargs): param str saltenv: Salt environment. Default base

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.purge` (*name=None*, *pkgs=None*, *version=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

version The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Keyword Arguments (kwargs): param str saltenv: Salt environment. Default base :param bool refresh: Refresh package metadata. Default False

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.win_pkg.refresh_db` (***kwargs*)

Fetches metadata files and calls `pkg.genrepo` to compile updated repository metadata.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove` (*name=None*, *pkgs=None*, *version=None*, ***kwargs*)

Remove the passed package(s) from the system using winrepo

Parameters

- **name** (*str*, *list*, or *None*) -- The name of the package to be uninstalled.
- **version** (*str*) -- The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

Multiple Package Options:

Parameters **pkgs** (*list* or *None*) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Keyword Arguments (kwargs): param *str* saltenv: Salt environment. Default *base* :param *bool* refresh: Refresh package metadata. Default *False*

Returns Returns a dict containing the changes.

Return type

dict

If the package is removed by `pkg.remove`:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{<package>: {'current': 'not installed'}}
```

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.upgrade(**kwargs)`

Upgrade all software. Currently not implemented

Keyword Arguments (kwargs): param *str* saltenv: The salt environment to use. Default *base*. :param *bool* refresh: Refresh package metadata. Default *True*.

Note: This feature is not yet implemented for Windows.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.win_pkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

Parameters **name** -- The name of a single package

Returns Return *True* if newer version available

Return type *bool*

Keyword Arguments (kwargs): param *str* saltenv: Salt environment :param *bool* refresh: Refresh package metadata. Default *True*

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.win_pkg.version(*names, **kwargs)`

Returns a version if the package is installed, else returns an empty string

Parameters **name** (*str*) -- One or more package names

Returns For multiple package names listed returns dict of package names and current version For single package name returns a current version string

Return type dict or string

Keyword Arguments (kwargs) :param str saltenv: The salt environment to use. Default base. :param bool refresh: Refresh package metadata. Default False.

CLI Example: .. code-block:: bash

```
salt '*' pkg.version <package name> salt '*' pkg.version <package name01> <package name02>
```

14.6.372 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
salt '*' powercfg.set_monitor_timeout 0 power=dc
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.get_disk_timeout()

Get the current disk timeout of the current scheme

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

salt.modules.win_powercfg.get_hibernate_timeout()

Get the current hibernate timeout of the current scheme

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

salt.modules.win_powercfg.get_monitor_timeout()

Get the current monitor timeout of the current scheme

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

salt.modules.win_powercfg.get_standby_timeout()

Get the current standby timeout of the current scheme

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

salt.modules.win_powercfg.set_disk_timeout(timeout, power='ac')

Set the disk timeout in minutes for the current power scheme

CLI Example:

```
salt '*' powercfg.set_disk_timeout 30 power=dc
```

timeout The amount of time in minutes before the disk will timeout

power Should we set the value for AC or DC (battery)? Valid options ac,dc.

`salt.modules.win_powercfg.set_hibernate_timeout` (*timeout*, *power='ac'*)
Set the hibernate timeout in minutes for the current power scheme

CLI Example:

```
salt '*' powercfg.set_hibernate_timeout 30 power=pc
```

timeout The amount of time in minutes before the computer hibernates
power Should we set the value for AC or DC (battery)? Valid options ac,dc.

`salt.modules.win_powercfg.set_monitor_timeout` (*timeout*, *power='ac'*)
Set the monitor timeout in minutes for the current power scheme

CLI Example:

```
salt '*' powercfg.set_monitor_timeout 30 power=ac
```

timeout The amount of time in minutes before the monitor will timeout
power Should we set the value for AC or DC (battery)? Valid options ac,dc.

`salt.modules.win_powercfg.set_standby_timeout` (*timeout*, *power='ac'*)
Set the standby timeout in minutes for the current power scheme

CLI Example:

```
salt '*' powercfg.set_standby_timeout 30 power=dc
```

timeout The amount of time in minutes before the computer sleeps
power Should we set the value for AC or DC (battery)? Valid options ac,dc.

14.6.373 salt.modules.win_repo

Module to manage Windows software repo on a Standalone Minion

file_client: `local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

`salt.modules.win_repo.genrepo` ()
Generate winrepo_cache file based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.win_repo.show_sls` (*name*, *saltenv='base'*)
New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run `pkg.refresh_db` to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

Parameters

- **str** (*saltenv*) -- The name/path of the package you want to view. This can be the

- **path to a file on the minion file system or a file on the local** (*full*) --
- **cache.** (*minion*) --
- **str** -- The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

salt.modules.win_repo.**update_git_repos** (*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

Important: This function requires *Git for Windows* to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

clean [False] Clean repo cachedirs which are not configured under *winrepo_remotes*.

Note: This option only applies if either *pygit2* or *GitPython* is installed into Salt's bundled Python.

Warning: This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

14.6.374 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module

salt.modules.win_servermanager.**install** (*feature, recurse=False, restart=False, source=None, exclude=None*)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature** (*str*) -- The name of the feature to install
- **recurse** (*bool*) -- Install all sub-features. Default is False
- **source** (*str*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*bool*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*str*) -- The name of the feature to exclude when installing the named feature.

Note: As there is no exclude option for the Add-WindowsFeature command, the feature will be installed with other sub-features and will then be removed.

- **restart** -- Restarts the computer when installation is complete, if required by the role feature installed.

Returns A dictionary containing the results of the install

Return type *dict*

CLI Example:

```
salt '*' win_servermanager.install Telnet-Client
salt '*' win_servermanager.install SNMP-Service True
salt '*' win_servermanager.install TFTP-Client source=d:\side-by-side
```

salt.modules.win_servermanager.list_available()

List available features to install

Returns A list of available features

Return type *list*

CLI Example:

```
salt '*' win_servermanager.list_available
```

salt.modules.win_servermanager.list_installed()

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns A list of installed features

Return type *list*

CLI Example:

```
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.remove (*feature*, *remove_payload=False*, *restart=False*)

Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

Parameters

- **feature** (*str*) -- The name of the feature to remove
- **remove_payload** (*bool*) -- True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- **restart** (*bool*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

Returns A dictionary containing the results of the uninstall

Return type `dict`

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

14.6.375 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

`salt.modules.win_service.available`(*name*)

Check if a service is available on the system.

Parameters **name** (*str*) -- The name of the service to check

Returns True if the service is available, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.config`(*name*, *bin_path=None*, *display_name=None*, *svc_type=None*, *start_type=None*, *error=None*, *group=None*, *tag=None*, *depend=None*, *obj=None*, *password=None*, ***kwargs*)

Deprecated since version 2016.11.0: Use `service.modify` instead

Modify the named service. Because this is deprecated it will use the passed parameters to run `service.modify` instead.

Parameters

- **name** (*str*) -- Specifies the service name. This is not the `display_name`
- **bin_path** (*str*) -- Specifies the path to the service binary file.
- **must be escaped, eg** (*Backslashes*) -- C:\path\to\binary.exe
- **display_name** (*str*) -- the name to be displayed in the service manager
- **svc_type** (*str*) -- Specifies the service type. Default is `own`.
- **options are as follows** (*Valid*) --
 - `kernel`: Driver service
 - `filesystem`: File system driver service

- adapter: Adapter driver service (reserved)
- recognizer: Recognizer driver service (reserved)
- own (default): Service runs in its own process
- share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
 - boot: Device driver that is loaded by the boot loader
 - system: Device driver that is started during kernel initialization
 - auto: Service that automatically starts
 - manual (default): Service must be started manually
 - disabled: Service cannot be started
- **error** (*str*) -- The severity of the error, and action taken, if this
- **fails to start. Valid options are as follows** (*service*) --
 - normal (normal): Error is logged and a message box is displayed
 - severe: Error is logged and computer attempts a restart with the last known good configuration
 - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
 - ignore: Error is logged and startup continues, no notification is given to the user
- **group** -- The name of the load order group to which this service belongs
- **depend** (*list*) -- A list of services or load ordering groups that
- **start before this service** (*must*) --
- **obj** (*str*) -- The name of the account under which the service
- **run. For own type services this should be in the** (*should*) --
- **format. The following are examples of valid built-in** (*domain\username*) --
- **accounts** (*service*) --
 - NT Authority\LocalService
 - NT Authority\NetworkService
 - NT Authority\LocalSystem
 - .\LocalSystem
- **password** (*str*) -- The password for the account name specified in
- **For the above built-in accounts, this can be None.** (*account_name.*) --
- **a password must be specified.** (*Otherwise*) --

CLI Example:

```
salt '*' service.config <service name> <path to exe> display_name='<display name>'
```

```
salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)
```

Create the named service.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- Specifies the service name. This is not the `display_name`
- **bin_path** (*str*) -- Specifies the path to the service binary file.
- **must be escaped, eg** (*Backslashes*) -- `C:\path\to\binary.exe`
- **exe_args** (*str*) -- Any additional arguments required by the service binary.
- **display_name** (*str*) -- the name to be displayed in the service manager
- **description** (*str*) -- A description of the service
- **service_type** (*str*) -- Specifies the service type. Default is `own`.
- **options are as follows** (*Valid*) --
 - `kernel`: Driver service
 - `filesystem`: File system driver service
 - `adapter`: Adapter driver service (reserved)
 - `recognizer`: Recognizer driver service (reserved)
 - `own` (default): Service runs in its own process
 - `share`: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as
- **follows** --
 - `boot`: Device driver that is loaded by the boot loader
 - `system`: Device driver that is started during kernel initialization
 - `auto`: Service that automatically starts
 - `manual` (default): Service must be started manually
 - `disabled`: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to `Auto(Delayed Start)`. Only valid
- **the start_type is set to Auto. If service_type is not passed, but** (*if*) --
- **service is already set to Auto, then the flag will be set.** (*the*) --
- **is False** (*Default*) --
- **error_control** (*str*) -- The severity of the error, and action taken, if
- **service fails to start. Valid options are as follows** (*this*) --
 - `normal` (normal): Error is logged and a message box is displayed
 - `severe`: Error is logged and computer attempts a restart with the last known good configuration
 - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure

- ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that
- **start before this service** (*must*) --
- **account_name** (*str*) -- The name of the account under which the service
- **run. For own type services this should be in the** (*should*) --
- **format. The following are examples of valid built-in** (*domain\username*) --
- **accounts** (*service*) --
 - NT Authority\LocalService
 - NT Authority\NetworkService
 - NT Authority\LocalSystem
 - .\LocalSystem
- **account_password** (*str*) -- The password for the account name specified in
- **For the above built-in accounts, this can be None.** (*account_name.*) --
- **a password must be specified.** (*Otherwise*) --
- **run_interactive** (*bool*) -- If this setting is True, the service will be
- **to interact with the user. Not recommended for services that run** (*allowed*) --
- **elevated privileges.** (*with*) --

Returns A dictionary containing information about the new service

Return type `dict`

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

`salt.modules.win_service.create_win_salt_restart_task()`

Create a task in Windows task scheduler to enable restarting the salt-minion

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.delete(name)`

Delete the named service

Parameters `name` (*str*) -- The name of the service to delete

Returns True if successful, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.win_service.disable(name, **kwargs)`

Disable the named service to start at boot

Parameters `name` (*str*) -- The name of the service to disable

Returns True if disabled, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.win_service.disabled(name)`

Check to see if the named service is disabled to start on boot

Parameters `name (str)` -- The name of the service to check

Returns True if the service is disabled

Return type `bool`

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.win_service.enable(name, **kwargs)`

Enable the named service to start at boot

Parameters `name (str)` -- The name of the service to enable.

Returns True if successful, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

Parameters `name (str)` -- The name of the service to check

Returns True if the service is set to start

Return type `bool`

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.execute_salt_restart_task()`

Run the Windows Salt restart task

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.get_all()`

Return all installed services

Returns Returns a list of all services on the system.

Return type `list`

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.win_service.get_disabled()`

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Returns A list of disabled services.

Return type `list`

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.win_service.get_enabled()`

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns A list of enabled services

Return type *list*

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.win_service.get_service_name(*args)`

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

`salt.modules.win_service.getsid(name)`

Return the SID for this windows service

Parameters **name** (*str*) -- The name of the service for which to return the SID

Returns A string representing the SID for the service

Return type *str*

CLI Example:

```
salt '*' service.getsid <service name>
```

`salt.modules.win_service.info(name)`

Get information about a service on the system

Parameters

- **name** (*str*) -- The name of the service. This is not the display name. Use
- **to find the service name.** (*get_service_name*) --

Returns A dictionary containing information about the service.

Return type *dict*

CLI Example:

```
salt '*' service.info spooler
```

`salt.modules.win_service.missing(name)`

The inverse of service.available.

Parameters **name** (*str*) -- The name of the service to check

Returns True if the service is missing, False otherwise

Return type *bool*

CLI Example:

```
salt '*' service.missing <service name>
```

```
salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)
```

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the service. Can be found using the
- **function** (*service.get_service_name*) --
- **bin_path** (*str*) -- The path to the service executable. Backslashes must be
- **eg** (*escaped,*) -- C:\path\to\binary.exe
- **exe_args** (*str*) -- Any arguments required by the service executable
- **display_name** (*str*) -- The name to display in the service manager
- **description** (*str*) -- The description to display for the service
- **service_type** (*str*) -- Specifies the service type. Default is own.
- **options are as follows** (*Valid*) --
 - kernel: Driver service
 - filesystem: File system driver service
 - adapter: Adapter driver service (reserved)
 - recognizer: Recognizer driver service (reserved)
 - own (default): Service runs in its own process
 - share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
 - boot: Device driver that is loaded by the boot loader
 - system: Device driver that is started during kernel initialization
 - auto: Service that automatically starts
 - manual: Service must be started manually
 - disabled: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid
- **the start_type is set to Auto. If service_type is not passed, but (if)** --
- **service is already set to Auto, then the flag will be set. (the)** --
- **error_control** (*str*) -- The severity of the error, and action taken, if
- **service fails to start. Valid options are as follows (this)** --
 - normal: Error is logged and a message box is displayed
 - severe: Error is logged and computer attempts a restart with the last known good configuration
 - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure

- ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that
- **start before this service** (*must*) --
- **account_name** (*str*) -- The name of the account under which the service
- **run. For own type services this should be in the** (*should*) --
- **format. The following are examples of valid built-in** (*domain\username*) --
- **accounts** (*service*) --
 - NT Authority\LocalService
 - NT Authority\NetworkService
 - NT Authority\LocalSystem
 - .LocalSystem
- **account_password** (*str*) -- The password for the account name specified in
- **For the above built-in accounts, this can be None.** (*account_name.*) --
- **a password must be specified.** (*Otherwise*) --
- **run_interactive** (*bool*) -- If this setting is True, the service will be
- **to interact with the user. Not recommended for services that run** (*allowed*) --
- **elevated privileges.** (*with*) --

Returns (dict): A dictionary of changes made

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart`(*name*)

Restart the named service. This issues a stop command followed by a start.

Parameters **name** -- The name of the service to restart.

Note: If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

Returns True if successful, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start`(*name*)

Start the specified service.

Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

Parameters **name** (*str*) -- The name of the service to start
Returns True if successful, False otherwise
Return type bool

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.win_service.status(*name*, *sig=None*)

Return the status for a service

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not supported on Windows

Returns True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.win_service.stop(*name*)

Stop the specified service

Parameters **name** (*str*) -- The name of the service to stop

Returns True if successful, False otherwise

Return type bool

CLI Example:

```
salt '*' service.stop <service name>
```

14.6.376 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

salt.modules.win_shadow.info(*name*)

Return information for the specified user This is just returns dummy data so that salt states can work.

Parameters **name** (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.win_shadow.require_password_change(*name*)

Require the user to change their password the next time they log in.

Parameters **name** -- The name of the user account to require a password change.

Returns True if successful. False if unsuccessful.

Return type bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

`salt.modules.win_shadow.set_expire(name, expire)`

Set the expiration date for a user account.

Parameters

- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

`salt.modules.win_shadow.set_password(name, password)`

Set the password for a named user.

Parameters

- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.unlock_account(name)`

Unlocks a user account.

Parameters **name** -- The name of the user account to unlock.

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

14.6.377 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends

- pythoncom
- wmi

`salt.modules.win_status.cpuload()`

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

`salt.modules.win_status.diskusage` (*human_readable=False, path=None*)

New in version 2015.8.0.

Return the disk usage for this minion

human_readable [False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

`salt.modules.win_status.master` (*master=None, connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.procs` (*count=False*)

Return the process data

count [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

`salt.modules.win_status.saltmem` (*human_readable=False*)

New in version 2015.8.0.

Returns the amount of memory that salt is using

human_readable [False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

`salt.modules.win_status.uptime` (*human_readable=False*)

New in version 2015.8.0.

Return the system uptime for this machine in seconds

human_readable [False] If True, then return uptime in years, days, and seconds.

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

14.6.378 salt.modules.win_system

Module for managing windows systems.

depends

- win32net

Support for reboot, shutdown, etc

`salt.modules.win_system.get_computer_desc()`

Get the Windows computer description :return:

Returns the computer description if found. Otherwise returns False

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

`salt.modules.win_system.get_computer_name()`

Get the Windows computer name

Returns Returns the computer name if found. Otherwise returns False

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

`salt.modules.win_system.get_domain_workgroup()`

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns The name of the domain or workgroup

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

`salt.modules.win_system.get_hostname()`

New in version 2016.3.0.

Get the hostname of the windows minion

Returns Returns the hostname of the windows minion

CLI Example:

```
salt 'minion-id' system.get_hostname
```

`salt.modules.win_system.get_pending_component_servicing()`

Determine whether there are pending Component Based Servicing tasks that require a reboot.

Returns A boolean representing whether there are pending Component Based Servicing tasks.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

`salt.modules.win_system.get_pending_computer_name()`

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

Returns Returns the pending name if pending restart. Returns none if not pending restart.

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

`salt.modules.win_system.get_pending_domain_join()`

Determine whether there is a pending domain join action that requires a reboot.

Returns A boolean representing whether there is a pending domain join action.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_domain_join
```

`salt.modules.win_system.get_pending_file_rename()`

Determine whether there are pending file rename operations that require a reboot.

Returns A boolean representing whether there are pending file rename operations.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_file_rename
```

`salt.modules.win_system.get_pending_reboot()`

Determine whether there is a reboot pending.

Returns A boolean representing whether reboots are pending.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_reboot
```

`salt.modules.win_system.get_pending_servermanager()`

Determine whether there are pending Server Manager tasks that require a reboot.

Returns A boolean representing whether there are pending Server Manager tasks.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_servermanager
```

`salt.modules.win_system.get_pending_update()`

Determine whether there are pending updates that require a reboot.

Returns A boolean representing whether there are pending updates.

Return type `bool`

New in version 2016.11.0.

CLI Example:

```
salt '*' system.get_pending_update
```

`salt.modules.win_system.get_reboot_required_witnessed()`

New in version 2016.11.0.

This tells us if, at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required. (For the time being, this function will return True if an install completed with exit code 3010 during the current boot session and this usage can be extended where appropriate in the future)

Returns a boolean which will be True if the salt-minion reported a required reboot during the current boot session, otherwise False.

Return type `bool`

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.get_system_date()

Get the Windows system date

Returns Returns the system date.

Return type `str`

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.win_system.get_system_info()

Get system information.

Returns Returns a Dictionary containing information about the system to include name, description, version, etc...

Return type `dict`

CLI Example:

```
salt 'minion-id' system.get_info
```

salt.modules.win_system.get_system_time()

Get the system time.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_system_time
```

salt.modules.win_system.halt(*timeout=5, in_seconds=False*)

Halt a running system.

Parameters **timeout** (*int*) -- Number of seconds before halting the system. Default is 5 seconds.

Returns True is successful.

Return type `bool`

timeout The wait time before the system will be shutdown.

in_seconds Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

CLI Example:

```
salt '*' system.halt 5
```

salt.modules.win_system.init(*runlevel*)

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

salt.modules.win_system.join_domain(*domain, username=None, password=None, account_ou=None, account_exists=False, restart=False*)

Join a computer to an Active Directory domain. Requires reboot.

Parameters

- **domain** (*str*) -- The domain to which the computer should be joined, e.g. example.com

- **username** (*str*) -- Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply `user`
- **password** (*str*) -- Password of the specified user
- **account_ou** (*str*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`
- **account_exists** (*bool*) -- If set to `True` the computer will only join the domain if the account already exists. If set to `False` the computer account will be created if it does not exist, otherwise it will use the existing account. Default is `False`
- **restart** (*bool*) -- Restarts the computer after a successful join

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful. `False` if unsuccessful.

Return type `dict`, `bool`

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
    username='joinuser' password='joinpassword' \
    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
    account_exists=False, restart=True
```

`salt.modules.win_system.lock()`

Lock the workstation.

Returns `True` if successful

Return type `bool`

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.poweroff(timeout=5, in_seconds=False)`

Power off a running system.

Parameters **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.

Returns `True` if successful

Return type `bool`

timeout The wait time before the system will be shutdown.

in_seconds Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

CLI Example:

```
salt '*' system.poweroff 5
```

`salt.modules.win_system.reboot(timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False)`

Reboot a running system.

Parameters

- **timeout** (*int*) -- Number of minutes/seconds before rebooting the system. Minutes vs seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

- **wait_for_reboot** (*bool*) -- Sleeps for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate for example where you have many states that could be ran after this one. Which you don't want to start until after the restart i.e You could end up with a half finished state.

New in version 2015.8.0.

- **only_on_pending_reboot** (*bool*) -- If this is set to True, then then the reboot will only proceed if the system reports a pending reboot. Setting this paramater to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*).

Returns True if successful

Return type `bool`

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

As example of invoking this function from within a final housekeeping state is as follows:

Example:

```
final housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

`salt.modules.win_system.set_computer_desc` (*desc=None*)

Set the Windows computer description

Parameters **desc** (*str*) -- The computer description

Returns False if it fails. Description if successful.

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.set_computer_name` (*name*)

Set the Windows computer name

Parameters **name** (*str*) -- The new name to give the computer. Requires a reboot to take effect.

Returns Returns a dictionary containing the old and new names if successful. False if not.

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.set_hostname` (*hostname*)

New in version 2016.3.0.

Set the hostname of the windows minion, requires a restart before this will be updated.

Parameters **hostname** (*str*) -- The hostname to set

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed` ()

New in version 2016.11.0.

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

`SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data`

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name `'Reboot required'` will be assigned the value of `1`.

(For the time being, this this function is being used whenever an install completes with exit code 3010 and this usage can be extended where appropriate in the future.)

Returns A boolean indicating whether or not the salt minion was able to perform the necessary registry operations.

Return type `bool`

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use `<mm-dd-yy>` format for the date.

Parameters `newdate` (`str`) -- The date to set. Can be any of the following formats - YYYY-MM-DD - MM-DD-YYYY - MM-DD-YY - MM/DD/YYYY - MM/DD/YY - YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Parameters

- **years** (`int`) -- Years digit, ie: 2015
- **months** (`int`) -- Months digit: 1 - 12
- **days** (`int`) -- Days digit: 1 - 31
- **hours** (`int`) -- Hours digit: 0 - 23
- **minutes** (`int`) -- Minutes digit: 0 - 59
- **seconds** (`int`) -- Seconds digit: 0 - 59

Returns True if successful. Otherwise False.

Return type `bool`

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

`salt.modules.win_system.set_system_time(newtime)`

Set the system time.

Parameters `newtime` (`str`) -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Returns Returns True if successful. Otherwise False.

Return type `bool`

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.shutdown(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)`

Shutdown a running system.

Parameters

- **message** (*str*) -- A message to display to the user before shutting down.
- **timeout** (*int*) -- The length of time that the shutdown dialog box should be displayed, in seconds. While this dialog box is displayed, the shutdown can be stopped by the `shutdown_abort` function.

If timeout is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, displays the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows in the system. The dialog box can be moved but not closed. A timer counts down the remaining time before a forced shutdown.

If timeout is zero, the computer shuts down without displaying the dialog box, and the shutdown cannot be stopped by `shutdown_abort`.

Default is 5 minutes

- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.
New in version 2015.8.0.
- **force_close** (*bool*) -- True to force close all open applications. False displays a dialog box instructing the user to close the applications.
- **reboot** (*bool*) -- True restarts the computer immediately after shutdown. False caches to disk and safely powers down the system.
- **only_on_pending_reboot** (*bool*) -- If this is set to True, then then shutdown will only proceed if the system reports a pending reboot.

Returns True if successful

Return type `bool`

CLI Example:

```
salt '*' system.shutdown 5
```

`salt.modules.win_system.shutdown_abort()`

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted

Returns True if successful

Return type `bool`

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

`salt.modules.win_system.shutdown_hard()`

Shutdown a running system with no timeout or warning.

Returns True if successful

Return type `bool`

CLI Example:

```
salt '*' system.shutdown_hard
```

`salt.modules.win_system.start_time_service()`

Start the Windows time service

Returns True if successful. Otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.start_time_service
```

`salt.modules.win_system.stop_time_service()`

Stop the Windows time service

Returns True if successful. Otherwise False

Return type bool

CLI Example:

```
salt '*' system.stop_time_service
```

`salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)`

Unjoin a computer from an Active Directory Domain. Requires restart.

Parameters

- **username** -- Username of an account which is authorized to manage computer accounts on the domain. Need to be fully qualified like `user@domain.tld` or `domain.tld\user`. If domain not specified, the passed domain will be used. If computer account doesn't need to be disabled, can be None.
- **password** (*str*) -- Password of the specified user
- **domain** (*str*) -- The domain from which to unjoin the computer. Can be None
- **workgroup** (*str*) -- The workgroup to join the computer to. Default is

WORKGROUP

New in version 2015.8.2/2015.5.7.

Parameters

- **disable** (*bool*) -- Disable the computer account in Active Directory. True to disable. Default is False
- **restart** (*bool*) -- Restart the computer after successful unjoin

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful. False if unsuccessful.

Return type dict, bool

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \\  
password='unjoinpassword' disable=True \\  
restart=True
```

14.6.379 salt.modules.win_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

`salt.modules.win_task.add_action(name=None, location='\\', action_type='Execute', **kwargs)`

Add an action to a task.

Parameters

- **name** (*str*) -- The name of the task to which to add the action.

- **location** (*str*) -- A string value representing the location of the task.

Default is `` which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **action_type** (*str*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are: - Execute - Email - Message

kwargs

Required kwargs for each value:

Execute Execute a command or an executable.

Parameters

- **cmd** (*str*) -- (required) The command / executable to run.
- **arguments** (*str*) -- (optional) Arguments to be passed to the command /

executable. To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass *cscript.exe* in the *cmd* parameter and pass the script in the *arguments* parameter as follows:

```
•cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'
```

Batch files do not need an interpreter and may be passed to the *cmd* parameter directly.

Parameters **start_in** (*str*) -- (optional) The current working directory for the command.

Email Send and email. Requires *server*, *from*, and *to* or *cc*.

Parameters

- **from** (*str*) -- The sender
- **reply_to** (*str*) -- Who to reply to
- **to** (*str*) -- The recipient
- **cc** (*str*) -- The CC recipient
- **bcc** (*str*) -- The BCC recipient
- **subject** (*str*) -- The subject of the email
- **body** (*str*) -- The Message Body of the email
- **server** (*str*) -- The server used to send the email
- **attachments** (*list*) -- A list of attachments. These will be the paths to the files to attach. ie: *attachments*=['C:attachment1.txt', 'C:attachment2.txt']

Message Display a dialog box. The task must be set to ``Run only when user is logged on'' in order for the dialog box to display. Both parameters are required.

Parameters

- **title** (*str*) -- The dialog box title.
- **message** (*str*) -- The dialog box message body

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```
salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, **kwargs)
```

Parameters

- **name** (*str*) -- The name of the task to which to add the trigger.
- **location** (*str*) -- A string value representing the location of the task.

Default is '\\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters trigger_type (*str*) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows: - Event - Once - Daily - Weekly - Monthly - MonthlyDay - OnIdle - OnTaskCreation - OnBoot - OnLogon - OnSessionChange

Parameters trigger_enabled (*bool*) -- Boolean value that indicates whether the trigger is enabled.

Parameters start_date (*str*) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats: - %Y-%m-%d - %m-%d-%y - %m-%d-%Y - %m/%d/%y - %m/%d/%Y - %Y/%m/%d

Parameters start_time (*str*) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats: - %I:%M:%S %p - %I:%M %p - %H:%M:%S - %H:%M

Parameters end_date (*str*) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats: - %Y-%m-%d - %m-%d-%y - %m-%d-%Y - %m/%d/%y - %m/%d/%Y - %Y/%m/%d

Parameters end_time (*str*) -- The time when the trigger is deactivated. If the this is not passed with end_date it will be set to midnight. Can be one of the following formats: - %I:%M:%S %p - %I:%M %p - %H:%M:%S - %H:%M

Parameters random_delay (*str*) -- The delay time that is randomly added to the start time of the trigger. Valid values are: - 30 seconds = 1 minute - 30 minutes = 1 hour - 8 hours - 1 day

Parameters repeat_interval (*str*) -- The amount of time between each restart of the task. Valid values are: - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour

Parameters repeat_duration (*str*) -- How long the pattern is repeated. Valid values are: - Indefinitely - 15 minutes - 30 minutes - 1 hour - 12 hours - 1 day

Parameters repeat_stop_at_duration_end (*bool*) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

Parameters execution_time_limit (*str*) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are: - 30 minutes - 1 hour - 2 hours - 4 hours - 8 hours - 12 hours - 1 day - 3 days (default)

kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event :param str subscription: An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in windows task scheduler and then copy the xml text.

Once No special parameters required.

Daily :param int days_interval: The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly :param int weeks_interval: The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

param list `days_of_week`: Sets the days of the week on which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

Monthly :param list `months_of_year`: Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.

Parameters `days_of_month` (`list`) -- Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

Parameters `last_day_of_month` (`bool`) -- Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

MonthlyDay :param list `months_of_year`: Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.

Parameters `weeks_of_month` (`list`) -- Sets the weeks of the month during which the task runs. Should be a list. ie: ['First','Third']. Valid options are: - First - Second - Third - Fourth

Parameters `last_week_of_month` (`bool`) -- Boolean value that indicates that the task runs on the last week of the month.

Parameters `days_of_week` (`list`) -- Sets the days of the week during which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

OnIdle No special parameters required.

OnTaskCreation No special parameters required.

OnBoot No special parameters required.

OnLogon No special parameters required.

OnSessionChange :param str `session_user_name`: Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

Parameters `state_change` (`str`) -- Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are: - ConsoleConnect: When you connect to a user session (switch users) - ConsoleDisconnect: When you disconnect a user session (switch users) - RemoteConnect: When a user connects via Remote Desktop - RemoteDisconnect: When a user disconnects via Remote Desktop - SessionLock: When the workstation is locked - SessionUnlock: When the workstation is unlocked

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↳enabled=True start_date=2016/12/1 start_time=12:01
```

`salt.modules.win_task.clear_triggers` (`name`, `location='\'`)

Remove all triggers from the task.

Parameters

- **name** (`str`) -- The name of the task from which to clear all triggers.
- **location** (`str`) -- A string value representing the location of the task.

Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

`salt.modules.win_task.create_folder` (*name*, *location*='\')

Create a folder in which to create tasks.

Parameters **name** (*str*) -- The name of the folder. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the folder. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.create_task` (*name*, *location*='\', *user_name*='System', *password*=None, *force*=False, ***kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- py:function::*edit_task*
- py:function::*add_action*
- py:function::*add_trigger*

Parameters **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the task. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

Parameters **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Parameters **force** (*bool*) -- If the task exists, overwrite the existing task.

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
↳type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-1
↳start_time=01:00
```

`salt.modules.win_task.create_task_from_xml` (*name*, *location*='\', *xml_text*=None, *xml_path*=None, *user_name*='System', *password*=None)

Create a task based on XML. Source can be a file or a string of XML.

Parameters **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the task. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **xml_text** (*str*) -- A string of xml representing the task to be created. This will be overridden by *xml_path* if passed.

Parameters **xml_path** (*str*) -- The path to an XML file on the local system containing the xml that defines the task. This will override *xml_text*

Parameters **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

Parameters **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

`salt.modules.win_task.delete_folder` (*name*, *location*='\')

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder.

Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

`salt.modules.win_task.delete_task` (*name*, *location*='\')

Delete a task from the task scheduler.

Parameters

- **name** (*str*) -- The name of the task to delete.
- **location** (*str*) -- A string value representing the location of the task.

Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

`salt.modules.win_task.edit_task` (*name*=None, *location*='\', *user_name*=None, *password*=None, *description*=None, *enabled*=None, *hidden*=None, *run_if_idle*=None, *idle_duration*=None, *idle_wait_timeout*=None, *idle_stop_on_end*=None, *idle_restart*=None, *ac_only*=None, *stop_if_on_batteries*=None, *wake_to_run*=None, *run_if_network*=None, *network_id*=None, *network_name*=None, *allow_demand_start*=None, *start_when_available*=None, *restart_every*=None, *restart_count*=3, *execution_time_limit*=None, *force_stop*=None, *delete_after*=None, *multiple_instances*=None, ***kwargs*)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

Parameters **location** (*str*) -- A string value representing the location in which to create the task. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Parameters **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

Parameters **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of *user_name* and *password* determine how the task

runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass `System` as the username the task will run as the system account (the password parameter is ignored).

Parameters **description** (*str*) -- A string representing the text that will be displayed in the description field in the task scheduler.

Parameters **enabled** (*bool*) -- A boolean value representing whether or not the task is enabled.

Parameters **hidden** (*bool*) -- A boolean value representing whether or not the task is hidden.

Parameters **run_if_idle** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.

Parameters **idle_duration** (*str*) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are: - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour

Parameters **idle_wait_timeout** (*str*) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are: - Do not wait - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour - 2 hours

Parameters **idle_stop_on_end** (*bool*) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

Parameters **idle_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

Parameters **ac_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

Parameters **stop_if_on_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

Parameters **wake_to_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

Parameters **run_if_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

Parameters

- **network_id** (*guid*) -- GUID value that identifies a network profile.
- **network_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.

Parameters **allow_demand_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

Parameters **start_when_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

Parameters **restart_every** -- A value that specifies the interval between task restart attempts. Valid values are: :type: bool str - False (to disable) - 1 minute - 5 minutes - 10 minutes - 15 minutes - 30 minutes - 1 hour - 2 hours

Parameters **restart_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

Parameters **execution_time_limit** -- The amount of time allowed to complete the task. Valid values are: :type: bool str - False (to disable) - 1 hour - 2 hours - 4 hours - 8 hours - 12 hours - 1 day - 3 days

Parameters **force_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using `TerminateProcess`.

Parameters **delete_after** -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are: :type: bool str - False (to disable) - Immediately - 30 days - 90 days - 180 days - 365 days

Parameters **multiple_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are: - Parallel - Queue - No New Instance - Stop Existing

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.info`(*name*, *location*='')

Get the details about a task in the task scheduler.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task.

Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns

Return type `dict`

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.list_actions`(*name*, *location*='')

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list actions.
- **location** (*str*) -- A string value representing the location of the task

from which to list actions. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of actions.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_actions <task_name>
```

`salt.modules.win_task.list_folders`(*location*='')

List all folders located in a specific location in the task scheduler.

Parameters **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of folders.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_folders
```

`salt.modules.win_task.list_tasks`(*location*='')

List all tasks located in a specific location in the task scheduler.

Parameters **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of tasks.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_tasks
```

`salt.modules.win_task.list_triggers`(*name*, *location*='')

List all triggers that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list triggers.
- **location** (*str*) -- A string value representing the location of the task

from which to list triggers. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of triggers.

Return type *list*

CLI Example:

```
salt 'minion-id' task.list_triggers <task_name>
```

`salt.modules.win_task.run`(*name*, *location*='\')

Run a scheduled task manually.

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type *bool*

CLI Example:

```
salt 'minion-id' task.list_run <task_name>
```

`salt.modules.win_task.run_wait`(*name*, *location*='\')

Run a scheduled task and return when the task finishes

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task.

Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type *bool*

CLI Example:

```
salt 'minion-id' task.list_run_wait <task_name>
```

`salt.modules.win_task.status`(*name*, *location*='\')

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task.

Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

Return type *string*

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.stop(name, location='')`

Stop a scheduled task.

Parameters

- **name** (*str*) -- The name of the task to stop.
- **location** (*str*) -- A string value representing the location of the task.

Default is ``` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

14.6.380 salt.modules.win_timezone

Module for managing timezone on Windows systems.

`salt.modules.win_timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.win_timezone.get_offset()`

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.win_timezone.get_zone()`

Get current timezone (i.e. America/Denver)

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.win_timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.win_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.set_zone(timezone)`

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be magically done for you!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.zone_compare`(*timezone*)

Checks the md5sum between the given *timezone*, and the one set in `/etc/localtime`. Returns True if they match, and False if not. Mostly useful for running state checks.

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

14.6.381 salt.modules.win_update

Module for running windows updates.

depends

- win32com
- win32con
- win32api
- pywintypes

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete. Optionally set `categories` to a category of your choice to only install certain updates. Default is to set to install all available but driver updates. The following example will install all Security and Critical Updates, and download but not install standard updates.

```
salt '*' win_update.install_updates categories="['Critical Updates', 'Security Updates
→']"
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring: .. code-block:: text

```
`UI` - User interaction required, skipped by default
`downloaded` - Already downloaded, included by default
`present` - Present on computer, included by default
`installed` - Already installed, skipped by default
`reboot` - Reboot required, included by default
`hidden` - Skip hidden updates, skipped by default
`software` - Software updates, included by default
`driver` - Driver updates, included by default
```

The following example installs all updates that don't require a reboot: .. code-block:: bash

```
salt '*' win_update.install_updates skips="[{'reboot':True}]"
```

Once installed Salt will return a similar output:

```
2 : Windows Server 2012 Update (KB123456)
4 : Internet Explorer Security Update (KB098765)
2 : Malware Definition Update (KB321456)
...
```

The number at the beginning of the line is an `OperationResultCode` from the Windows Update Agent, it's enumeration is described here: [https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095(v=vs.85).aspx). The result code is then followed by the update name and its KB identifier.

`salt.modules.win_update.download_updates` (*skips=None, retries=5, categories=None*)

Downloads all available updates, skipping those that require user interaction.

Various aspects of the updates can be included or excluded. this feature is still in development.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to update. Must be passed as a list.

```
salt '*' win_update.download_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.download_updates

# Download critical updates only
salt '*' win_update.download_updates categories="['Critical Updates']"
```

`salt.modules.win_update.install_updates` (*skips=None, retries=5, categories=None*)

Downloads and installs all available updates, skipping those that require user interaction.

Add `cached` to only install those updates which have already been downloaded.

you can set the maximum number of retries to `n` in the search process by adding: `retries=n`

various aspects of the updates can be included or excluded. This function is still under development.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to install. Must be passed as a list.

```
salt '*' win_update.install_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.install_updates

# Install all critical updates
salt '*' win_update.install_updates categories="['Critical Updates']"
```

`salt.modules.win_update.list_updates` (*verbose=False, fields=None, skips=None, retries=5, categories=None*)

Returns a summary of available updates, grouped into their non-mutually exclusive categories.

verbose Return full set of results, including several fields from the COM.

fields Return a list of specific fields for each update. The optional values here are those at the root level of the verbose list. This is superseded by the verbose option.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to list. Must be passed as a list.

```
salt '*' win_update.list_updates categories="['Updates']"
```

Categories include, but are not limited to, the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.list_updates

# Specific Fields
salt '*' win_update.list_updates fields="['Title', 'Description']"

# List all critical updates list in verbose detail
salt '*' win_update.list_updates categories="['Critical Updates']" verbose=True
```

14.6.382 salt.modules.win_useradd

Module for managing Windows Users

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ``user.info' is not available`), see [here](#).

depends

- pywintypes
- win32api
- win32net
- win32netcon
- win32profile
- win32security
- win32ts

Note: This currently only works with local user accounts, not domain accounts

```
salt.modules.win_useradd.add(name, password=None, fullname=False, description=None,
                               groups=None, home=None, homedrive=None, profile=None, lo-
                               gonscript=None)
```

Add a user to the minion.

Parameters

- **name** (*str*) -- User name
- **password** (*str*) -- User's password in plain text.
- **fullname** (*str*) -- The user's full name.
- **description** (*str*) -- A brief description of the user account.

- **groups** (*list*) -- A list of groups to add the user to.
- **home** (*str*) -- The path to the user's home directory.
- **homedrive** (*str*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str*) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it's default profile directory.
- **logonscript** (*str*) -- Path to a login script to run when the user logs on.

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.addgroup` (*name, group*)

Add user to a group

Parameters

- **name** (*str*) -- user name to add to the group
- **group** (*str*) -- name of the group to which to add the user

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.addgroup jsnuffly 'Power Users'
```

`salt.modules.win_useradd.chfullname` (*name, fullname*)

Change the full name of the user

Parameters

- **name** (*str*) -- user name for which to change the full name
- **fullname** (*str*) -- the new value for the full name

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.chgroups` (*name, groups, append=True*)

Change the groups this user belongs to, add `append=False` to make the user a member of only the specified groups

Parameters

- **name** (*str*) -- user name for which to change groups
- **groups** (*list, str*) -- a single group or a list of groups to assign to the user
- **append** (*bool*) -- True adds the passed groups to the user's current groups False sets the user's groups to the passed groups only

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.chgroups jsnuffly Administrators,Users True
```

`salt.modules.win_useradd.chhome`(*name*, *home*, ***kwargs*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters

- **name** (*str*) -- name of the user whose home directory you wish to change
- **home** (*str*) -- new location of the home directory

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.chhome foo \\fileserv\home\foo True
```

`salt.modules.win_useradd.chprofile`(*name*, *profile*)

Change the profile directory of the user

Parameters

- **name** (*str*) -- name of the user whose profile you wish to change
- **profile** (*str*) -- new location of the profile

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.chprofile foo \\fileserv\profiles\foo
```

`salt.modules.win_useradd.current`(*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters **sam** (*bool*) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie:

domain\username

Returns Returns False if the username cannot be returned. Otherwise returns the username.

Return type `bool str`

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.delete`(*name*, *purge=False*, *force=False*)

Remove a user from the minion

Parameters

- **name** (*str*) -- The name of the user to delete
- **purge** (*bool*) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed.
- **force** (*bool*) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns True if successful

Return type `bool`

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.getUserSid(username)`

Get the Security ID for the user

Parameters **username** (*str*) -- user name for which to look up the SID

Returns Returns the user SID

Return type *str*

CLI Example:

```
salt '*' user.getUserSid jsnuffly
```

`salt.modules.win_useradd.getent(refresh=False)`

Return the list of all info for all users

Parameters **refresh** (*bool*) -- Refresh the cached user information. Default is False. Useful when used from within a state function.

Returns A dictionary containing information about all users on the system

Return type *dict*

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.info(name)`

Return user information

Parameters **name** (*str*) -- Username for which to display information

Returns

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked

- password_never_expires
- disallow_change_password
- gid

Return type `dict`

CLI Example:

```
salt '*' user.info jsnuffy
```

`salt.modules.win_useradd.list_groups(name)`

Return a list of groups the named user belongs to

Parameters `name (str)` -- user name for which to list groups

Returns list of groups to which the user belongs

Return type `list`

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.list_users()`

Return a list of users on Windows

Returns list of users on the system

Return type `list`

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.removegroup(name, group)`

Remove user from a group

Parameters

- **name (str)** -- user name to remove from the group
- **group (str)** -- name of the group from which to remove the user

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.rename(name, new_name)`

Change the username for a named user

Parameters

- **name (str)** -- user name to change
- **new_name (str)** -- the new name for the current user

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

`salt.modules.win_useradd.setpassword(name, password)`

Set the user's password

Parameters

- **name (str)** -- user name for which to set the password

- **password** (*str*) -- the new password

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.update`(*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration_date=None*, *expired=None*, *account_disabled=None*, *unlock_account=None*, *password_never_expires=None*, *disallow_change_password=None*)

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- The user name to update.
- **password** (*str*) -- New user password in plain text.
- **fullname** (*str*) -- The user's full name.
- **description** (*str*) -- A brief description of the user account.
- **home** (*str*) -- The path to the user's home directory.
- **homedrive** (*str*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str*) -- The path to the logon script.
- **profile** (*str*) -- The path to the user's profile directory.
- **expiration_date** (*date*) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** (*bool*) -- Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration_date* as well.
- **account_disabled** (*bool*) -- True disables the account. False enables the account.
- **unlock_account** (*bool*) -- True unlocks a locked user account. False is ignored.
- **password_never_expires** (*bool*) -- True sets the password to never expire. False allows the password to expire.
- **disallow_change_password** (*bool*) -- True blocks the user from changing the password. False allows the user to change the password.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\\server\homeshare\bob homedrive=U:
```

14.6.383 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

New in version 2015.8.0.

depends

- win32com
- pythoncom

`salt.modules.win_wua.download_update(guid=None)`

Downloads a single update

Parameters `guid` -- str A GUID for the update to be downloaded

Returns A dictionary containing the status, a message, and a list of updates that were downloaded.

CLI Examples:

```
salt '*' win_wua.download_update 12345678-abcd-1234-abcd-1234567890ab
```

`salt.modules.win_wua.download_updates(guid=None)`

Downloads updates that match the list of passed GUIDs. It's easier to use this function by using `list_updates` and setting `install=True`.

Parameters `guid` -- A list of GUIDs to be downloaded

Returns A dictionary containing the status, a message, and a list of updates that were downloaded.

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download_updates guid=['12345678-abcd-1234-abcd-
↳1234567890ab', '87654321-dcba-4321-dcba-ba0987654321']
```

`salt.modules.win_wua.get_needs_reboot()`

Determines if the system needs to be rebooted.

Returns bool True if the system requires a reboot, False if not

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

`salt.modules.win_wua.get_wu_settings()`

Get current Windows Update settings.

Returns

Featured Updates: Boolean value that indicates whether to display notifications for featured updates.

Group Policy Required (Read-only): Boolean value that indicates whether Group Policy requires the Automatic Updates service.

Microsoft Update: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.

Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

Notification Level:

Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only): Boolean value that indicates whether the Automatic Update settings are read-only.

Recommended Updates: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

Scheduled Day: Days of the week on which Automatic Updates installs or uninstalls updates.

Scheduled Time: Time at which Automatic Updates installs or uninstalls updates.

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

`salt.modules.win_wua.install_update` (*guid=None*)

Installs a single update

Parameters **guid** -- str A GUID for the update to be installed

Returns dict A dictionary containing the details about the installed update

CLI Examples:

```
salt '*' win_wua.install_update 12345678-abcd-1234-abcd-1234567890ab
```

`salt.modules.win_wua.install_updates` (*guid=None*)

Installs updates that match the passed criteria. It may be easier to use the `list_updates` function and set `install=True`.

Parameters **guid** -- list A list of GUIDs to be installed

Returns dict A dictionary containing the details about the installed updates

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install_updates
guid=['12345678-abcd-1234-abcd-1234567890ab',
      '87654321-dcba-4321-dcba-ba0987654321']
```

`salt.modules.win_wua.list_update` (*name=None, download=False, install=False*)

Returns details for all updates that match the search criteria

Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID (preferred), a KB number, or the full name of the update. Run `list_updates` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update. This will override `download=True`

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given. If download or install is set to true it will return the results of `win_wua.download_updates`:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
↳reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
            }
}
```

Return type dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.list_update 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number (could possibly return multiple results)
# Not all updates have an associated KB
salt '*' win_wua.list_update KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.list_update 'Microsoft Camera Codec Pack'
```

`salt.modules.win_wua.list_updates` (*software=True, drivers=False, summary=False, installed=False, categories=None, severities=None, download=False, install=False*)

Returns a detailed list of available updates or a summary

Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **summary** (*bool*) -- True: Return a summary of updates available for each category. False (default): Return a detailed list of available updates.
- **installed** (*bool*) -- Include installed updates in the results (default if False)

- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first to see what will be installed, then set `download=True` to download the updates.
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first to see what will be installed, then set `install=True` to install the updates. This will override `download=True`
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↪reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
```

```

        'category 2>',
        ...]
    }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}

```

Return type dict

CLI Examples:

```

# Normal Usage (list all software updates)
salt '*' win_wua.list_updates

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list_updates categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list_updates categories=['Security Updates'] severities=[
    ↪'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list_updates severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list_updates summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list_updates categories=['Feature Packs','Windows 8.1'] ↪
    ↪summary=True

```

`salt.modules.win_wua.set_wu_settings`(*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Parameters

- **level** (*int*) --
Number from 1 to 4 indicating the update level:
 1. Never check for updates
 2. Check for updates but let me choose whether to download and install them
 3. Download updates but let me choose whether to install them
 4. Install updates automatically
- **recommended** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) -- Boolean value that indicates whether to display notifications for featured updates.

- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
 - Everyday
 - Monday
 - Tuesday
 - Wednesday
 - Thursday
 - Friday
 - Saturday
- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:## 24hr format, eg. 3:00 PM would be 15:00

Returns Returns a dictionary containing the results.

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

14.6.384 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends M2Crypto

`salt.modules.x509.create_certificate` (*path=None, text=False, overwrite=True, ca_server=None, **kwargs*)

Create an X509 certificate.

path: Path to write the certificate to.

text: If True, return the PEM text without writing to a file. Default False.

overwrite: If True(default), create_certificate will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

kwargs: Any of the properties below can be included as additional keyword arguments.

ca_server: Request a remotely signed certificate from ca_server. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the ca_server. See `signing_policy` for details. Also the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer:
  .*:
    - x509.sign_remote_certificate
```

subject properties: Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

C: 2 letter Country code

CN: Certificate common name, typically the FQDN.

Email: Email address

GN: Given Name

L: Locality

O: Organization

OU: Organization Unit

SN: SurName

ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, csr or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the `subjectKeyIdentifier` equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the `hash` value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

basicConstraints: X509v3 Basic Constraints

keyUsage: X509v3 Key Usage

extendedKeyUsage: X509v3 Extended Key Usage

subjectKeyIdentifier: X509v3 Subject Key Identifier

issuerAltName: X509v3 Issuer Alternative Name

subjectAltName: X509v3 Subject Alternative Name

crlDistributionPoints: X509v3 CRL distribution points

issuingDistributionPoint: X509v3 Issuing Distribution Point

certificatePolicies: X509v3 Certificate Policies

policyConstraints: X509v3 Policy Constraints

inhibitAnyPolicy: X509v3 Inhibit Any Policy

nameConstraints: X509v3 Name Constraints

noCheck: X509v3 OCSP No Check

nsComment: Netscape Comment

nsCertType: Netscape Certificate Type

days_valid: The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.

version: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.

serial_number: The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.

serial_bits: The number of bits to use when randomly generating a serial number. Defaults to 64.

algorithm: The hashing algorithm to be used for signing this certificate. Defaults to sha256.

copypath: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

prepend_cn: If set to True, the CN and a dash will be prepended to the copypath's filename.

Example: `/etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt`

signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the `match_on` key is included in the signing policy, only minions matching that pattern will be permitted to remotely request certificates from that policy.

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt \
signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

```
salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_cert=None,
                             revoked=None, include_expired=False,
                             days_valid=100, digest='')
```

Create a CRL

Depends

- PyOpenSSL Python module

path: Path to write the crl to.

text: If True, return the PEM text without writing to a file. Default False.

signing_private_key: A path or string of the private key in PEM format that will be used to sign this crl. This is required.

signing_cert: A certificate matching the private key that will be used to sign this crl. This is required.

revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path of the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. It should be a string in the format ``%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format ``%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

include_expired: Include expired certificates in the CRL. Default is `False`.

days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key \
  signing_private_key=/etc/pki/ca.key \
  signing_cert=/etc/pki/ca.crt \
  revoked="{ 'compromized-web-key': \
  { 'certificate': '/etc/pki/certs/www1.crt', \
  'revocation_date': '2015-03-01 00:00:00' }}"
```

`salt.modules.x509.create_csr` (*path=None, text=False, **kwargs*)

Create a certificate signing request.

path: Path to write the certificate to.

text: If `True`, return the PEM text without writing to a file. Default `False`.

algorithm: The hashing algorithm to be used for signing this request. Defaults to `sha256`.

kwargs: The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr \
  public_key='/etc/pki/myca.key' CN='My Cert'
```

`salt.modules.x509.create_private_key` (*path=None, text=False, bits=2048, verbose=True*)

Creates a private key in PEM format.

path: The path to write the file to, either `path` or `text` are required.

text: If `True`, return the PEM text without writing to a file. Default `False`.

bits: Length of the private key in bits. Default `2048`

verbose: Provide visual feedback on stdout. Default `True`

New in version 2016.11.0.

CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.expired` (*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

`salt.modules.x509.get_pem_entries` (*glob_path*)

Returns a dict containing PEM entries in files matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_pem_entries "/etc/pki/*.crt"
```

salt.modules.x509.get_pem_entry(*text*, *pem_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

text: Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type: If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----\nMIICyzCC Ar8CAQI...-----END CERTIFICATE REQUEST"
```

salt.modules.x509.get_private_key_size(*private_key*)

Returns the bit length of a private key in PEM format.

private_key: A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

salt.modules.x509.get_public_key(*key*, *asObj=False*)

Returns a string containing the public key in PEM format.

key: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

salt.modules.x509.get_signing_policy(*signing_policy_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

salt.modules.x509.read_certificate(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

salt.modules.x509.read_certificates(*glob_path*)

Returns a dict containing details of a all certificates matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

salt.modules.x509.read_crl(*crl*)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

Depends

- OpenSSL command line tool

csf: A path or PEM encoded string containing the CSL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

salt.modules.x509.read_csr(*csr*)

Returns a dict containing details of a certificate request.

Depends

- OpenSSL command line tool

csr: A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

salt.modules.x509.sign_remote_certificate(*argdic, **kwargs*)

Request a certificate to be remotely signed according to a signing policy.

argdic: A dict containing all the arguments to be passed into the create_certificate function. This will become kwargs when passed to create_certificate.

kwargs: kwargs delivered from publish.publish

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{ 'public_key': \
    '/etc/pki/www.key', 'signing_policy': 'www' }" __pub_id='www1'
```

salt.modules.x509.verify_crl(*crl, cert*)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify

cert: The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

salt.modules.x509.verify_private_key(*private_key, public_key*)

Verify that 'private_key' matches 'public_key'

private_key: The private key to verify, can be a string or path to a private key in PEM format.

public_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
    public_key=/etc/pki/myca.crt
```

salt.modules.x509.verify_signature(*certificate, signing_pub_key=None*)

Verify that certificate has been signed by signing_pub_key

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
    signing_pub_key=/etc/pki/myca.crt
```

`salt.modules.x509.will_expire`(*certificate, days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

`salt.modules.x509.write_pem`(*text, path, overwrite=True, pem_type=None*)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.

path: Path of the file to write the pem out to.

overwrite: If True(default), `write_pem` will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:

```
salt '*' x509.write_pem \  
  "-----BEGIN CERTIFICATE-----MIIGMzCCBbugA..." \  
  path=/etc/pki/mycert.crt
```

14.6.385 salt.modules.xapi

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. <http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf> . http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/ . <https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python> . <http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD>

`salt.modules.xapi.create`(*domain*)

Deprecated since version Nitrogen: Use `start()` instead.

Start a defined domain

CLI Example:

```
salt '*' virt.create <domain>
```

`salt.modules.xapi.destroy`(*domain*)

Deprecated since version Nitrogen: Use `stop()` instead.

Power off a defined domain

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.xapi.freecpu()`

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.xapi.freemem()`

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.xapi.full_info()`

Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.xapi.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

`salt.modules.xapi.get_macs(vm_)`

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi.get_nics(vm_)`

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.xapi.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.xapi.list_vms()`

Deprecated since version Nitrogen: Use `list_domains()` instead.

List all virtual machines.

CLI Example:

```
salt '*' virt.list_vms <domain>
```

`salt.modules.xapi.migrate`(*vm_*, *target*, *live=1*, *port=0*, *node=-1*, *ssl=None*, *change_home_server=0*)
Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]
```

Optional values:

live Use live migration

port Use a specified port

node Use specified NUMA node on target

ssl use ssl connection for migration

change_home_server change home server for managed domains

`salt.modules.xapi.node_info`()
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.xapi.pause`(*vm_*)
Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi.reboot`(*vm_*)
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

`salt.modules.xapi.reset`(*vm_*)
Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

`salt.modules.xapi.resume`(*vm_*)
Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

`salt.modules.xapi.setmem`(*vm_*, *memory*)
Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

`salt.modules.xapi.setvcpus`(*vm_*, *vcpus*)

Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

`salt.modules.xapi.shutdown`(*vm_*)

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

`salt.modules.xapi.start`(*config_*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

`salt.modules.xapi.stop`(*vm_*)

Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

`salt.modules.xapi.vcpu_pin`(*vm_*, *vcpu*, *cpus*)

Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

`salt.modules.xapi.vm_cputime`(*vm_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.xapi.vm_diskstats` (*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs'   : 0,
    'io_write_kbs'  : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

`salt.modules.xapi.vm_info` (*vm_=None*)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.xapi.vm_netstats` (*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs'           : 0,
    'io_total_read_kbs'     : 0,
    'io_total_write_kbs'    : 0,
    'io_write_kbs'          : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.xapi.vm_state` (*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

14.6.386 salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.defragment (*device*)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

salt.modules.xfs.devices ()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

salt.modules.xfs.dump (*device, destination, level=0, label=None, noerase=None*)

Dump filesystem device to the media (file, tape etc).

Required parameters:

- device**: XFS device, content of which to be dumped.
- destination**: Specifies a dump destination.

Valid options are:

- label**: Label of the dump. Otherwise automatically generated label is used.
- level**: Specifies a dump level of 0 to 9.
- noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

salt.modules.xfs.estimate (*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info (*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

salt.modules.xfs.inventory ()

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

`salt.modules.xfs.mkfs` (*device*, *label=None*, *ssize=None*, *noforce=None*, *bso=None*, *gmo=None*, *ino=None*, *lso=None*, *rso=None*, *nmo=None*, *dso=None*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: **Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.**
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

`salt.modules.xfs.modify` (*device*, *label=None*, *lazy_counting=None*, *uuid=None*)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

`salt.modules.xfs.prune_dump` (*sessionid*)

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

14.6.387 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends

- `sleekxmpp` >=1.3.1
- `pyasn1`
- `pyasn1-modules`
- `dnspython`

configuration This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourceName
  xmpp.password: verybadpass
```

The `resourceName` refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

`salt.modules.xmpp.send_msg`(*recipient, message, jid=None, password=None, profile=None*)
Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' ❌
↳profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' ❌
↳jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

`salt.modules.xmpp.send_msg_multi`(*message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None*)
Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳'secret@conference.xmpp.example.com'] 'This is a salt module test' ❌
↳profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳'secret@conference.xmpp.example.com'] 'This is a salt module test' ❌
↳jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

14.6.388 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install is not available`), see [here](#).

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

`salt.modules.yumpkg.clean_metadata(**kwargs)`

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)`

Delete a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.diff(*paths)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters `path` -- Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.download(*packages)`

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

Note: `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.file_dict(*packages)`

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.file_list(*packages)`

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)`

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.group_diff(name)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.group_info(name, expand=False)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

name Name of the group to query

expand [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)`

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip Packages that would normally be installed by the package group (``default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (``optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

Note: Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

`salt.modules.yumpkg.group_list()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.info_installed(*names)`

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

```
salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None,
                             sources=None, reinstall=False, normalize=True, update_holds=False,
                             **kwargs)
```

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to update the yum database before executing.

reinstall Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

skip_verify Skip the GPG verification check (e.g., `--nogpgcheck`)

version Install a specific version of the package, e.g. `1.2.3-4.el5`. Ignored if `pkgs` or `sources` is passed.

update_holds [False] If True, and this function would update the package version, any packages held using the `yum/dnf` `versionlock` plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {"bar": "1.2.3-4.el5"}]
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↳rpm"}]
```

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳normalize=False
```

New in version 2014.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.yumpkg.latest_version (*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.list_holds (pattern='\w+(?:[-][^~]+)*', full=True)

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

pattern [`\w+(?:[-][^~]+)*`] Regular expression used to match the package name

full [True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_pkgs`(*versions_as_list=False, **kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.yumpkg.list_repo_pkgs`(**args, **kwargs*)

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data is a dictionary of repo names, with each repo containing a dictionary in which the keys are package names, and the values are a list of version numbers. Here is an example of the return data:

```
{
  'base': {
    'bash': ['4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.el6']
  },
  'updates': {
    'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
    'kernel': ['2.6.32-431.29.2.el6',
               '2.6.32-431.23.3.el6',
               '2.6.32-431.20.5.el6',
               '2.6.32-431.20.3.el6',
               '2.6.32-431.17.1.el6',
               '2.6.32-431.11.2.el6',
               '2.6.32-431.5.1.el6',
               '2.6.32-431.3.1.el6',
               '2.6.32-431.1.2.0.1.el6']
  }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

CLI Example:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
```

salt.modules.yumpkg.list_repos (*basedir=None*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.list_upgrades (*refresh=True, **kwargs*)

Check whether or not an upgrade is available for all packages

The *fromrepo*, *enablerepo*, and *disablerepo* arguments are supported, as used in pkg states, and the *disableexcludes* option is also supported.

New in version 2014.7.0: Support for the *disableexcludes* option

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.yumpkg.mod_repo (*repo, basedir=None, **kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo name by which the yum refers to the repo

name a human-readable name for the repo

baseurl the URL for yum to reference

mirrorlist the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

salt.modules.yumpkg.modified (**packages, **flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of *_all_* modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size Include only files where size changed.

mode Include only files which file's mode has been changed.

checksum Include only files which MD5 checksum has been changed.

device Include only files which major and minor numbers has been changed.

symlink Include only files which are symbolic link contents.

owner Include only files where owner has been changed.

group Include only files where group has been changed.

time Include only files where modification time of the file has been changed.

capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.yumpkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

name The name of the package to be purged

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.refresh_db(**kwargs)`

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

repo Refresh just the specified repo

disablerepo Do not refresh the specified repo

enablerepo Refresh a disabled repo using this option

branch Add the specified branch when refreshing

disableexcludes Disable the excludes defined in your config files. Takes one of three options: - **all** - disable all excludes - **main** - disable excludes defined in [main] in yum.conf - **repo id** - disable excludes defined for that repo

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.yumpkg.remove (*name=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, [systemd-run\(1\)](#) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the [systemd.kill\(5\)](#) manpage for more information). If desired, usage of [systemd-run\(1\)](#) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

name The name of the package to be removed

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

salt.modules.yumpkg.unhold (*name=None, pkgs=None, sources=None, **kwargs*)

New in version 2014.7.0.

Remove version locks

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

name The name of the package to be unheld

Multiple Package Options:

pkgs A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.upgrade` (*name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, **kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a yum upgrade

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.

name The name of the package to be upgraded. Note that this parameter is ignored if `pkgs` is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget `name=` and run `pkg.upgrade openssl`, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

pkgs A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳normalize=False
```

New in version 2016.3.0.

salt.modules.yumpkg.upgrade_available(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.yumpkg.verify(**names, **kwargs*)

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

salt.modules.yumpkg.version(**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.version_cmp(*pkg1, pkg2, ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

14.6.389 salt.modules.zabbix module

Support for Zabbix

optdepends

- zabbix server

configuration This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
↳password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.zabbix.apiinfo_version(**connection_args)`

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.apiinfo_version
```

`salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)`

Create new host. NOTE: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

- **visible_name** -- string with visible name of the host, use `visible_name` instead of `name` parameter

to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}'
visible_name='Host Visible Name'
```

`salt.modules.zabbix.host_delete` (*hostids*, ***connection_args*)

Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** -- Hosts (hostids) to delete.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_delete 10106
```

`salt.modules.zabbix.host_exists` (*host=None*, *hostid=None*, *name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_exists `Zabbix server`
```

`salt.modules.zabbix.host_get` (*host=None, name=None, hostids=None, **connection_args*)

Retrieve hosts according to the given parameters. NOTE: This function accepts all optional `host.get` parameters: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/get>

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_get 'Zabbix server'
```

`salt.modules.zabbix.host_list` (***connection_args*)

Retrieve all hosts.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_list
```

`salt.modules.zabbix.host_update` (*hostid, **connection_args*)

Update existing hosts. NOTE: This function accepts all standard `host` and `host.update` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/update> <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

Parameters

- **hostid** -- ID of the host to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

- **visible_name** -- string with visible name of the host, use `visible_name` instead of `name` parameter

to not mess with value supplied from Salt sls file.

Returns ID of the updated host.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_update 10084 name='Zabbix server2'
```

`salt.modules.zabbix.hostgroup_create`(*name*, ***connection_args*)

Create a host group. NOTE: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host_group

New in version 2016.3.0.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host group.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_create MyNewGroup
```

`salt.modules.zabbix.hostgroup_delete`(*hostgroupids*, ***connection_args*)

Delete the host group.

New in version 2016.3.0.

Parameters

- **hostgroupids** -- IDs of the host groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_delete 23
```

`salt.modules.zabbix.hostgroup_exists`(*name=None*, *groupid=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

```
salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)
```

Retrieve host groups according to the given parameters. NOTE: This function accepts all standard hostgroup.get properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.2/manual/api/reference/hostgroup/get>

New in version 2016.3.0.

Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_get MyNewGroup
```

```
salt.modules.zabbix.hostgroup_list(**connection_args)
```

Retrieve all host groups.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_list
```

`salt.modules.zabbix.hostgroup_update`(*groupid*, *name=None*, ***connection_args*)

Update existing hosts group. NOTE: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/hostgroup/object#host_group

New in version 2016.3.0.

Parameters

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of updated host groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

`salt.modules.zabbix.hostinterface_create`(*hostid*, *ip*, *dns=''*, *main=1*, *type=1*, *useip=1*, *port=None*, ***connection_args*)

Create new host interface NOTE: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.0/manual/api/reference/hostinterface/object>

New in version 2016.3.0.

Parameters

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using

host IP address for this host interface) :param **_connection_user**: Optional - zabbix user (can also be set in opts or pillar, see module's docstring) :param **_connection_password**: Optional - zabbix password (can also be set in opts or pillar, see module's docstring) :param **_connection_url**: Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

`salt.modules.zabbix.hostinterface_delete`(*interfaceids*, ***connection_args*)

Delete host interface

New in version 2016.3.0.

Parameters

- **interfaceids** -- IDs of the host interfaces to delete

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_delete 50
```

`salt.modules.zabbix.hostinterface_get`(*hostids*, ***connection_args*)

Retrieve host groups according to the given parameters. NOTE: This function accepts all standard `hostinterface.get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/hostinterface/get>

New in version 2016.3.0.

Parameters

- **hostids** -- Return only host interfaces used by the given hosts.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_get 101054
```

`salt.modules.zabbix.hostinterface_update`(*interfaceid*, ***connection_args*)

Update host interface NOTE: This function accepts all standard `hostinterface`: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/hostinterface/object#host_interface

New in version 2016.3.0.

Parameters

- **interfaceid** -- ID of the hostinterface to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_update 6 ip=0.0.0.2
```

`salt.modules.zabbix.user_addmedia`(*userid*, *active*, *mediatypeid*, *period*, *sendto*, *severity*, ***connection_args*)

Add new media to multiple users.

New in version 2016.3.0.

Parameters

- **userids** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created media.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63
```

`salt.modules.zabbix.user_create` (*alias, passwd, usrgroups, **connection_args*)

Create new zabbix user. NOTE: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.0/manual/appendix/api/user/definitions#user>

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgroups** -- user groups to add the user to
- **_connection_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns On success string with id of the created user.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'
```

`salt.modules.zabbix.user_delete` (*users, **connection_args*)

Delete zabbix users.

New in version 2016.3.0.

Parameters

- **users** -- array of users (userids) to delete

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success array with userids of deleted users.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_delete 15

`salt.modules.zabbix.user_deletemedia`(*mediaids*, ***connection_args*)

Delete media by id.

New in version 2016.3.0.

Parameters

- **mediaids** -- IDs of the media to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_deletemedia 27

`salt.modules.zabbix.user_exists`(*alias*, ***connection_args*)

Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if user exists, else False.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_exists james

`salt.modules.zabbix.user_get`(*alias=None*, *userids=None*, ***connection_args*)

Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **userids** -- return only users with the given IDs

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details of convenient users, False on failure or if no user found.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_get james
```

`salt.modules.zabbix.user_getmedia` (*userids=None, **connection_args*)

Retrieve media according to the given parameters NOTE: This function accepts all standard `usermedia.get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/3.2/manual/api/reference/usermedia/get>

New in version 2016.3.0.

Parameters

- **userids** -- return only media that are used by the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns List of retrieved media, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_getmedia
```

`salt.modules.zabbix.user_list` (***connection_args*)

Retrieve all of the configured users.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with user details.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_list
```

`salt.modules.zabbix.user_update` (*userid, **connection_args*)

Update existing users. NOTE: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.0/manual/appendix/api/user/definitions#user>

New in version 2016.3.0.

Parameters

- **userid** -- id of the user to update

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Id of the updated user on success.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

`salt.modules.zabbix.usergroup_create`(*name*, ***connection_args*)

Create new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created user groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_create GroupName
```

`salt.modules.zabbix.usergroup_delete`(*usergroupids*, ***connection_args*)

New in version 2016.3.0.

Parameters

- **usergroupids** -- IDs of the user groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted user groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_delete 28
```

`salt.modules.zabbix.usergroup_exists`(*name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters

- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the nodeids parameter.)

- **nodeids** -- IDs of the nodes the user groups must belong to
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_exists Guests
```

```
salt.modules.zabbix.usergroup_get(name=None, usrgrpids=None, userids=None, **connection_args)
```

Retrieve user groups according to the given parameters. NOTE: This function accepts all `usergroup_get` properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/usergroup/get>

New in version 2016.3.0.

Parameters

- **name** -- names of the user groups
- **usrgrpids** -- return only user groups with the given IDs
- **userids** -- return only user groups that contain the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_get Guests
```

```
salt.modules.zabbix.usergroup_list(**connection_args)
```

Retrieve all enabled user groups.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_list
```

```
salt.modules.zabbix.usergroup_update(usrgrp_id, **connection_args)
```

Update existing user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/usergroup/object#user_group

New in version 2016.3.0.

Parameters

- **usrgrpid** -- ID of the user group to update.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

14.6.390 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by [minitage's buildout maker](#)

Note: The zc.buildout integration is still in beta; the API is subject to change

General notes

You have those following methods:

- upgrade_bootstrap
- bootstrap
- run_buildout
- buildout

`salt.modules.zcbuildout.bootstrap(*a, **kw)`

Run the buildout bootstrap dance (python bootstrap.py).

directory directory to execute in

config alternative buildout configuration file to use

runas User used to run buildout as

env environment variables to set when running

buildout_ver force a specific buildout version (1 | 2)

test_release buildout accept test release

offline are we executing buildout in offline mode

distribute Forcing use of distribute

new_st Forcing use of setuptools >= 0.7

python path to a python executable to use in place of default (salt one)

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

`salt.modules.zcbuildout.buildout(*a, **kw)`

Run buildout in a directory.

directory directory to execute in

config buildout config to use

parts specific buildout parts to run

runas user used to run buildout as

env environment variables to set when running

buildout_ver force a specific buildout version (1 | 2)

test_release buildout accept test release

new_st Forcing use of setuptools >= 0.7

distribute use distribute over setuptools if possible

offline does buildout run offline

python python to use

debug run buildout with -D debug flag

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

newest run buildout in newest mode

verbose run buildout in verbose mode (-vvvvv)

use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout(*a, **kw)`

Run a buildout in a directory.

directory directory to execute in

config alternative buildout configuration file to use

offline are we executing buildout in offline mode

runas user used to run buildout as

env environment variables to set when running

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

newest run buildout in newest mode

force run buildout unconditionally

verbose run buildout in verbose mode (-vvvvv)

use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

directory directory to execute in

offline are we executing buildout in offline mode

buildout_ver forcing to use a specific buildout version (1 | 2)

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

14.6.391 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

depends requests

configuration This module requires a 'zenoss' entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

`salt.modules.zenoss.add_device` (*device=None, device_class=None, collector='localhost', prod_state=1000*)

A function to connect to a zenoss server and add a new device entry.

Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example: salt '*' zenoss.add_device

`salt.modules.zenoss.device_exists` (*device=None*)

Check to see if a device already exists in Zenoss.

Parameters **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.device_exists

`salt.modules.zenoss.find_device` (*device=None*)

Find a device in Zenoss. If device not found, returns None.

Parameters **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.find_device

`salt.modules.zenoss.set_prod_state` (*prod_state, device=None*)

A function to set the prod_state in zenoss.

Parameters

- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default.

CLI Example: salt zenoss.set_prod_state 1000 hostname

14.6.392 salt.modules.zfs

Salt interface to ZFS commands

codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.modules.zfs.bookmark(*snapshot*, *bookmark*)

New in version 2016.3.0.

Creates a bookmark of the given snapshot

Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a `zfs send` command.

This feature must be enabled to be used. See `zpool-features(5)` for details on ZFS feature flags and the bookmarks feature.

snapshot [string] name of snapshot to bookmark

bookmark [string] name of bookmark

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.clone(*name_a*, *name_b*, ***kwargs*)

New in version 2016.3.0.

Creates a clone of the given snapshot.

name_a [string] name of snapshot

name_b [string] name of filesystem or volume

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

properties [dict] additional zfs properties (`-o`)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called `properties` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.create(*name*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Create a ZFS File System.

name [string] name of dataset or volume

volume_size [string] if specified, a zvol will be created instead of a dataset

sparse [boolean] create sparse volume

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

properties [dict] additional zfs properties (`-o`)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{ 'mountpoint': '/export/zfs',
↳ 'sharenfs': 'on' }"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{ 'volblocksize':
↳ '512' }" [sparse=True|False]
```

`salt.modules.zfs.destroy(name, **kwargs)`

New in version 2015.5.0.

Destroy a ZFS File System.

name [string] name of dataset, volume, or snapshot

force [boolean] force an unmount of any file systems using the unmount -f command.

recursive [boolean] recursively destroy all children. (-r)

recursive_all [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

Warning: watch out when using recursive and recursive_all

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

`salt.modules.zfs.diff(name_a, name_b, **kwargs)`

New in version 2016.3.0.

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

name_a [string] name of snapshot

name_b [string] name of snapshot or filesystem

show_changetime [boolean] display the path's inode change time as the first column of output. (default = False)

show_indication [boolean] display an indication of the type of file. (default = True)

CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

`salt.modules.zfs.exists(name, **kwargs)`

New in version 2015.5.0.

Check if a ZFS filesystem or volume or snapshot exists.

name [string] name of dataset

type [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

`salt.modules.zfs.get(*dataset, **kwargs)`

New in version 2016.3.0.

Displays properties for the given datasets.

***dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

properties [string] comma-separated list of properties to list, defaults to all

recursive [boolean] recursively list children

depth [int] recursively list children to depth

fields [string] comma-separated list of fields to include, the name and property field will always be added

type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

source [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharefs,mountpoint"
↳ [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
↳ fields=value depth=1
```

`salt.modules.zfs.hold(tag, *snapshot, **kwargs)`

New in version 2016.3.0.

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the `zfs destroy` command return EBUSY.

tag [string] name of tag

***snapshot** [string] name of snapshot(s)

recursive [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

Note: A comma-separated list can be provided for the tag parameter to hold multiple tags.

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag,myothertag myzpool/mydataset@mysnapshot
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↳ mydataset@myothersnapshot
```

`salt.modules.zfs.holds(snapshot, **kwargs)`

New in version 2016.3.0.

Lists all existing user references for the given snapshot or snapshots.

snapshot [string] name of snapshot

recursive [boolean] lists the holds that are set on the named descendent snapshots also.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

salt.modules.zfs.inherit(*prop, name, **kwargs*)

New in version 2016.3.0.

Clears the specified property

prop [string] name of property

name [string] name of the filesystem, volume, or snapshot

recursive [boolean] recursively inherit the given property for all children.

revert [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

salt.modules.zfs.list(*name=None, **kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

name [string] name of dataset, volume, or snapshot

recursive [boolean] recursively list children

depth [int] limit recursion to depth

properties [string] comma-separated list of properties to list, the name property will always be added

type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

sort [string] property to sort on (default = name)

order [string [ascending|descending]] sort order (default = ascending)

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharefs,mountpoint"
```

salt.modules.zfs.mount(*name='-a', **kwargs*)

New in version 2016.3.0.

Mounts ZFS file systems

name [string] name of the filesystem, you can use '-a' to mount all unmounted filesystems. (this is the default)

overlay [boolean] perform an overlay mount.

options [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

salt.modules.zfs.promote(*name*)

New in version 2016.3.0.

Promotes a clone file system to no longer be dependent on its ``origin" snapshot.

Note: This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

name [string] name of clone-filessystem

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

`salt.modules.zfs.release`(*tag*, **snapshot*, ***kwargs*)

New in version 2016.3.0.

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

tag [string] name of tag

***snapshot** [string] name of snapshot(s)

recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

Note: A comma-separated list can be provided for the tag parameter to release multiple tags.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
↳mydataset@myothersnapshot
```

`salt.modules.zfs.rename`(*name*, *new_name*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Rename or Relocate a ZFS File System.

name [string] name of dataset, volume, or snapshot

new_name [string] new name of dataset, volume, or snapshot

force [boolean] force unmount any filesystems that need to be unmounted in the process.

create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.

recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

`salt.modules.zfs.rollback(name, **kwargs)`

New in version 2016.3.0.

Roll back the given dataset to a previous snapshot.

Warning: When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the `-r` option.

name [string] name of snapshot

recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.

recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

force [boolean] used with the `-R` option to force an unmount of any clone file systems that are to be destroyed.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

`salt.modules.zfs.set(*dataset, **kwargs)`

New in version 2016.3.0.

Sets the property or list of properties to the given value(s) for each dataset.

***dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

***properties** [string] additional zfs properties pairs

Note: properties are passed as key-value pairs. e.g.
compression=off

Note: Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E, Z (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, exabytes, or zettabytes, respectively).

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
↳ canmount=off
```

`salt.modules.zfs.snapshot(*snapshot, **kwargs)`

New in version 2016.3.0.

Creates snapshots with the given names.

***snapshot** [string] name of snapshot(s)

recursive [boolean] recursively create snapshots of all descendent datasets.

properties [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
↳myotherdataset@yesterday [recursive=True]
```

`salt.modules.zfs.unmount`(*name*, ***kwargs*)

New in version 2016.3.0.

Unmounts ZFS file systems

name [string] name of the filesystem, you can use ``-a`` to unmount all mounted filesystems.

force [boolean] forcefully unmount the file system, even if it is currently in use.

Warning: Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

14.6.393 salt.modules.zk_concurrency

Concurrency controls in zookeeper

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.lock`(*path*, *zk_hosts*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*, *force=False*)

Get lock (with optional timeout)

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string

identifier Name to identify this minion, if unspecified defaults to the hostname

max_concurrency Maximum number of lock holders

timeout timeout to wait for the lock. A None timeout will block forever

ephemeral_lease Whether the locks in zookeeper should be ephemeral

force Forcibly acquire the lock regardless of available slots

Example:

```
... code-block: bash
```

```
  salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

`salt.modules.zk_concurrency.lock_holders`(*path*, *zk_hosts*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*)

Return an un-ordered list of lock holders

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeeper should be ephemeral
 Example:

```
... code-block: bash
    salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.party_members(*path, zk_hosts, min_nodes=1, blocking=False*)
 Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (*min_nodes*) to appear

path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
min_nodes The minimum number of nodes expected to be present in the party
blocking The boolean indicating if we need to block until *min_nodes* are available
 Example:

```
... code-block: bash
    salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 salt minion
    zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

salt.modules.zk_concurrency.unlock(*path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False*)

Remove lease from semaphore
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeeper should be ephemeral
 Example:

```
... code-block: bash
    salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

14.6.394 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

salt.modules.znc.buildmod(**modules*)
 Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

salt.modules.znc.dumpconf()
 Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

`salt.modules.znc.rehashconf()`
Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

`salt.modules.znc.version()`
Return server version from `znc --version`

CLI Example:

```
salt '*' znc.version
```

14.6.395 salt.modules.zpool

Module for running ZFS zpool command

codeauthor Nitin Madhok <nmadhok@clemson.edu>

`salt.modules.zpool.add(zpool, *vdevs, **kwargs)`
Changed in version 2016.3.0.

Add the specified vdev's to the given storage pool

zpool [string] name of storage pool

***vdevs** [string] one or more devices

force [boolean] forces use of device

CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.attach(zpool, device, new_device, force=False)`
Changed in version 2016.3.0.

Attach specified device to zpool

zpool [string] name of storage pool

device [string] device to attach too

new_device [string] device to attach

force [boolean] forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.create(zpool, *vdevs, **kwargs)`
New in version 2015.5.0.

Changed in version 2016.3.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

zpool [string] name of storage pool

***vdevs** [string] one or more devices

force [boolean] forces use of vdevs, even if they appear in use or specify a conflicting replication level.

mountpoint [string] sets the mount point for the root dataset

altroot [string] equivalent to ``-o cachefile=none,altroot=root``

properties [dict] additional pool properties

filesystem_properties [dict] additional filesystem properties

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ``properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called ``filesystem_properties`` and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

salt.modules.zpool.create_file_vdev(*size*, **vdevs*)

Changed in version 2016.3.0.

Creates file based virtual devices for a zpool

**vdevs* is a list of full paths for mkfile to create

CLI Example:

```
salt '*' zpool.create_file_vdev 7g /path/to/vdev1 [/path/to/vdev2] [...]
```

Note: Depending on file size, the above command may take a while to return.

salt.modules.zpool.destroy(*zpool*, *force=False*)

Changed in version 2016.3.0.

Destroys a storage pool

zpool [string] name of storage pool

force [boolean] force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool
```

salt.modules.zpool.detach(*zpool*, *device*)

Changed in version 2016.3.0.

Detach specified device to zpool
zpool [string] name of storage pool
device [string] device to detach
CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

salt.modules.zpool.exists(zpool)
Check if a ZFS storage pool is active
zpool [string] name of storage pool
CLI Example:

```
salt '*' zpool.exists myzpool
```

salt.modules.zpool.export(*pools, **kwargs)
New in version 2015.5.0.
Changed in version 2016.3.0.

Export storage pools
***pools** [string] one or more storage pools to export
force [boolean] force export of storage pools
CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]  
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

salt.modules.zpool.get(zpool, prop=None, show_source=False)
New in version 2016.3.0.

Retrieves the given list of properties
zpool [string] name of storage pool
prop [string] optional name of property to retrieve
show_source [boolean] show source of property
CLI Example:

```
salt '*' zpool.get myzpool
```

salt.modules.zpool.healthy()
New in version 2016.3.0.

Check if all zpools are healthy
CLI Example:

```
salt '*' zpool.healthy
```

salt.modules.zpool.history(zpool=None, internal=False, verbose=False)
New in version 2016.3.0.

Displays the command history of the specified pools or all pools if no pool is specified
zpool [string] optional storage pool
internal [boolean] toggle display of internally logged ZFS events
verbose [boolean] toggle display of the user name, the hostname, and the zone in which the operation was performed
CLI Example:

```
salt '*' zpool.upgrade myzpool
```

`salt.modules.zpool.import` (*zpool=None, new_name=None, **kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Import storage pools or list pools available for import

zpool [string] optional name of storage pool

new_name [string] optional new name for the storage pool

mntopts [string] comma-separated list of mount options to use when mounting datasets within the pool.

force [boolean] forces import, even if the pool appears to be potentially active.

altroot [string] equivalent to ```-o cachefile=None,altroot=root```

dir [string] searches for devices or files in dir, multiple dirs can be specified as follows:: `dir="dir1,dir2"`

no_mount [boolean] import the pool without mounting any file systems.

only_destroyed [boolean] imports destroyed pools only. this also sets `force=True`.

properties [dict] additional pool properties

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ```properties``` and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

`salt.modules.zpool.iostat` (*zpool=None, sample_time=0*)

Changed in version 2016.3.0.

Display I/O statistics for the given pools

zpool [string] optional name of storage pool

sample_time [int] seconds to capture data before output

CLI Example:

```
salt '*' zpool.iostat myzpool
```

`salt.modules.zpool.list` (*properties='size, alloc, free, cap, frag, health', zpool=None*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Return information about (all) storage pools

zpool [string] optional name of storage pool

properties [string] comma-separated list of properties to list

Note: the ```name``` property will always be included, the ```frag``` property will get removed if not available

zpool [string] optional zpool

Note: multiple storage pool can be provided as a space separated list

CLI Example:

```
salt '*' zpool.list
```

`salt.modules.zpool.offline`(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

zpool [string] name of storage pool

***vdevs** [string] one or more devices

temporary [boolean] enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

`salt.modules.zpool.online`(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are online

zpool [string] name of storage pool

***vdevs** [string] one or more devices

expand [boolean] Expand the device to use all available space.

Note: If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

`salt.modules.zpool.reguid`(*zpool*)

New in version 2016.3.0.

Generates a new unique identifier for the pool

Warning: You must ensure that all devices in this pool are online and healthy before performing this action.

zpool [string] name of storage pool

CLI Example:

```
salt '*' zpool.reguid myzpool
```

`salt.modules.zpool.reopen`(*zpool*)

New in version 2016.3.0.

Reopen all the vdevs associated with the pool

zpool [string] name of storage pool

CLI Example:

```
salt '*' zpool.reopen myzpool
```

`salt.modules.zpool.replace`(*zpool*, *old_device*, *new_device=None*, *force=False*)

Changed in version 2016.3.0.

Replaces *old_device* with *new_device*.

Note: This is equivalent to attaching *new_device*, waiting for it to resilver, and then detaching *old_device*.

The size of *new_device* must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

zpool [string] name of storage pool
old_device [string] old device to replace
new_device [string] optional new device
force [boolean] Forces use of *new_device*, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

`salt.modules.zpool.scrub`(*zpool*, *stop=False*)

Changed in version 2016.3.0.

Scrub a storage pool

zpool [string] name of storage pool
stop [boolean] if true, cancel ongoing scrub

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set`(*zpool*, *prop*, *value*)

New in version 2016.3.0.

Sets the given property on the specified pool

zpool [string] name of storage pool
prop [string] name of property
value [string] value to set property to

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

`salt.modules.zpool.status`(*zpool=None*)

Changed in version 2016.3.0.

Return the status of the named zpool

zpool [string] optional name of storage pool

CLI Example:

```
salt '*' zpool.status myzpool
```

`salt.modules.zpool.upgrade`(*zpool=None*, *version=None*)

New in version 2016.3.0.

Enables all supported features on the given pool

Warning: Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See `zpool-features(5)` for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

zpool [string] optional storage pool, applies to all otherwise
version [int] version to upgrade to, if unspecified upgrade to the highest possible

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

14.6.396 salt.modules.zypper

Package support for openSUSE via the zypper package manager

depends

- rpm Python module. Install with `zypper install rpm-python`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.zypper.add_lock`(*packages*, ***kwargs*)

Add a package lock. Specify packages to lock by exact name.

CLI Example:

```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>, <package2>, <package3>
salt '*' pkg.add_lock pkgs='["foo", "bar"]'
```

`salt.modules.zypper.clean_locks`()

Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

`salt.modules.zypper.del_repo`(*repo*)

Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

`salt.modules.zypper.diff`(**paths*)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters **path** -- Full path to the installed file

Returns Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.zypper.download(*packages, **kwargs)`

Download packages to the local disk.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.zypper.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.get_repo(repo, **kwargs)`

Display a repo.

CLI Example:

```
salt '*' pkg.get_repo alias
```

`salt.modules.zypper.info(*names, **kwargs)`

Deprecated since version Nitrogen: Use `info_available()` instead.

Return the information of the named package available for the system.

CLI example:

```
salt '*' pkg.info <package1>
salt '*' pkg.info <package1> <package2> <package3> ...
```

`salt.modules.zypper.info_available(*names, **kwargs)`

Return the information of the named package available for the system.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

`salt.modules.zypper.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

Parameters

- **names** -- Names of the packages to get information about.

- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **errors** -- Handle RPM field errors (true|false). By default, various mistakes in the textual fields are simply ignored and omitted from the data. Otherwise a field with a mistake is not returned, instead a 'N/A (bad UTF-8)' (not available, broken) text is returned.

Valid attributes are: ignore, report

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... ❌
↳attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... ❌
↳attr=version,vendor errors=true
```

`salt.modules.zypper.install` (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a 'zypper refresh' before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh force a refresh if set to `True`. If set to `False` (default) it depends on zypper if a refresh is executed.

fromrepo Specify a package repository to install from.

downloadonly Only download the packages, do not install.

skip_verify Skip the GPG verification check (e.g., `--no-gpg-checks`)

version Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. '>1.2.3-4'). This parameter is ignored if `pkgs` or `sources` is passed.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↳rpm"}]'
```

ignore_repo_failure Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.zypper.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.zypper.list_installed_patterns()`

List installed patterns on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

`salt.modules.zypper.list_locks()`

List current package locks.

Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>'
               'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

`salt.modules.zypper.list_patterns(refresh=False)`

List all known patterns from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patterns
```

`salt.modules.zypper.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict with versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

versions_as_list: If set to true, the versions are provided as a list

```
{<package_name>: [<version>, <version>]}
```

removed: not supported

purge_desired: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.zypper.list_products(*all=False, refresh=False*)

List all available or installed SUSE products.

all List all products available or only installed. Default is False.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

salt.modules.zypper.list_repos()

Lists all repos.

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.zypper.list_upgrades(*refresh=True, **kwargs*)

List all available package upgrades on this system

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.zypper.mod_repo(*repo, **kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo or **alias** alias by which the zypper refers to the repo

url, **mirrorlist** or **baseurl** the URL for zypper to reference

enabled enable or disable (True or False) repository, but do not remove if disabled.

refresh enable or disable (True or False) auto-refresh of the repository.

cache Enable or disable (True or False) RPM files caching.

gpgcheck Enable or disable (True or False) GPG check for this repository.

gpgautoimport Automatically trust and import new repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a url can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

salt.modules.zypper.modified(**packages, **flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size Include only files where size changed.

mode Include only files which file's mode has been changed.

checksum Include only files which MD5 checksum has been changed.

device Include only files which major and minor numbers has been changed.

symlink Include only files which are symbolic link contents.

owner Include only files where owner has been changed.

group Include only files where group has been changed.

time Include only files where modification time of the file has been changed.

capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.zypper.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.zypper.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.zypper.refresh_db()`

Force a repository refresh by calling `zypper refresh --force`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.zypper.remove` (*name=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.zypper.remove_lock` (*packages, **kwargs*)

Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs='["foo", "bar"]'
```

`salt.modules.zypper.search` (*criteria, refresh=False*)

List known packages, available to the system.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.search <criteria>
```

`salt.modules.zypper.upgrade` (*refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

dryrun If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

dist_upgrade Perform a system dist-upgrade. Default: False
fromrepo Specify a list of package repositories to upgrade from. Default: None
novendorchange If set to True, no allow vendor changes. Default: False
skip_verify Skip the GPG verification check (e.g., --no-gpg-checks)
 Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist-upgrade=True fromrepo='["MyRepoName"]'
↳ novendorchange=True
salt '*' pkg.upgrade dist-upgrade=True dryrun=True
```

salt.modules.zypper.upgrade_available(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.zypper.verify(**names*, ***kwargs*)

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the **ignore_types** keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

salt.modules.zypper.version(**names*, ***kwargs*)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.zypper.version_cmp(*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if *ver1* < *ver2*, 0 if *ver1* == *ver2*, and 1 if *ver1* > *ver2*. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

14.7 netapi modules

14.7.1 rest_cherry.py

A REST API for Salt

New in version 2014.7.0.

depends

- CherryPy Python module. Version 3.2.3 is currently recommended when SSL is enabled, since this version worked the best with SSL in internal testing. Versions 3.2.3 - 4.x can be used if SSL is not enabled. Be aware that there is a known [SSL error](#) introduced in version 3.2.5. The issue was reportedly resolved with CherryPy milestone 3.3, but the patch was committed for version 3.6.1.

optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: <https://github.com/SUSE/salt-netapi-client>
- Python: <https://github.com/saltstack/pepper>

setup All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include `salt-api` in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

- (a) Install the PyOpenSSL package.
- (b) Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

```
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the [full external auth instructions](#).
5. Edit the master config with the following production-ready example to enable the `rest_cherry.py` module. (Adjust cert paths as needed, or disable SSL (not recommended!))

```
rest_cherry.py:  
  port: 8000  
  ssl_cert: /etc/pki/tls/certs/localhost.crt  
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

configuration All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port **Required**

The port for the webserver to listen on.

host [0.0.0.0] The socket interface for the HTTP server to listen on.

debug [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file Path to a file to write HTTP access logs.

log_error_file Path to a file to write HTTP error logs.

ssl_cert The path to a SSL certificate. (See below)

ssl_key The path to the private key for your SSL certificate. (See below)

ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

disable_ssl A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth [False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url [/hook] Configure the URL endpoint for the *Webhook* entry point.

thread_pool [100] The number of worker threads to start up in the pool.

socket_queue_size [30] Specify the maximum number of HTTP connections to queue.

expire_responses [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

max_request_body_size [1048576] Maximum size for the HTTP request body.

collect_stats [False] Collect and report statistics about the CherryPy server

Reports are available via the *Stats* URL.

static A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path [/static] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.

app A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

app_path [/app] The URL prefix to use for serving the HTML file specified in the `app` setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

root_prefix [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

For example, using curl:

```
curl -sSk https://localhost:8000/login \  
-H 'Accept: application/x-yaml' \  
-d username=saltdev \  
-d password=saltdev \  
-d eauth=auto
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \  
-H 'Accept: application/x-yaml' \  
-H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \  
-d client=local \  
-d tgt='*' \  
-d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:  
curl -sSk https://localhost:8000/login \  
-c ~/cookies.txt \  
-H 'Accept: application/x-yaml' \  
-d username=saltdev \  
-d password=saltdev \  
-d eauth=auto  
  
# Read the cookie file:  
curl -sSk https://localhost:8000 \  
-b ~/cookies.txt \  
-H 'Accept: application/x-yaml' \  
-d client=local \  
-d tgt='*' \  
-d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests  
>>> session = requests.Session()  
>>> session.post('http://localhost:8000/login', json={  
    'username': 'saltdev',  
    'password': 'saltdev',  
    'eauth': 'auto',  
})  
<Response [200]>  
>>> resp = session.post('http://localhost:8000', json=[{
```

```

    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
  })
  >>> resp.json()
  {'return': [{
    ...snip...
  ]}]

```

See also:

You can bypass the session handling via the [Run](#) URL.

Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```

% curl -sSi https://localhost:8000 -H 'Content-type: application/json' -
  →d '[{
    "client": "local",
    "tgt": "*",
    "fun": "test.ping"
  }]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]

{"return": [{"jerry": true}]}

```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full client interfaces documentation, but in short:

- `local` uses *LocalClient* which sends commands to Minions. Equivalent to the `salt` CLI command.
- `runner` uses *RunnerClient* which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- `wheel` uses *WheelClient* which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the *key wheel module* exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the *test.arg execution function* using `LocalClient` and the *test.arg runner function* using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json'
→ ' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.arg",
    "arg": ["positional arg one", "positional arg two"],
    "kwarg": {
      "keyword arg one": "Hello from a minion",
      "keyword arg two": "Hello again from a minion"
    }
  },
  {
    "client": "runner",
    "fun": "test.arg",
    "keyword arg one": "Hello from a master",
    "keyword arg two": "Runners do not support positional args"
  }
]
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kwargs": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}
```

```
}

```

One more example, this time with more commonly used functions:

```
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json'
→ ' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "state.sls",
    "kwarg": {
      "mods": "apache",
      "pillar": {
        "lookup": {
          "wwwdir": "/srv/httpd/htdocs"
        }
      }
    }
  },
  {
    "client": "runner",
    "fun": "cloud.create",
    "provider": "my-ec2-provider",
    "instances": "my-centos-6",
    "image": "ami-1624987f",
    "delvol_on_destroy": true
  }
]
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {
          [...snip full state return here...]
        }
      }
    }
    [...snip other minion returns here...]
  ],
  {
    [...snip full salt-cloud output here...]
  }
]
}
```

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \
  -b ~/cookies.txt \
  -d client=runner \
  -d fun='jobs.lookup_jid' \
  -d jid='20150129182456704682'
```

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
-H "Accept: application/json" \
-d username='myapiuser' \
--data-urlencode password='1234+' \
-d eauth='pam'
```

Deployment

The `rest_cherry` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

salt-api using the CherryPy server

The default configuration is to run this module using **salt-api** to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready.

Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with `mod_wsgi` or Nginx with `FastCGI`, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherry` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
  ServerName example.com
  ServerAlias *.example.com

  ServerAdmin webmaster@example.com

  LogLevel warn
  ErrorLog /var/www/example.com/logs/error.log
  CustomLog /var/www/example.com/logs/access.log combined

  DocumentRoot /var/www/example.com/htdocs

  WSGIScriptAlias / /path/to/salt/netapi/rest_cherry.py
</VirtualHost>
```

REST URI Reference

- /
- /login
- /logout
- /minions
- /jobs
- /run
- /events
- /hook
- /keys
- /ws
- /stats

/

class salt.netapi.rest_cherry.py.app.**LowDataAdapter**

The primary entry point to Salt's REST API

GET()

An explanation of the API with links of where to go next

GET /

Request Headers

- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required

- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

/login

class salt.netapi.rest_cherrypy.app.**Login**(*args, **kwargs)

Log in to receive a session token

Authentication information.

GET ()

Present the login interface

GET /login

An explanation of how to log in.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: text/html
```

POST (**kwargs)

Authenticate against Salt's eauth system

POST /login

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Form Parameters

- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -si localhost:8000/login \
  -c ~/cookies.txt \
  -H "Accept: application/json" \
  -H "Content-type: application/json" \
  -d '{
    "username": "saltuser",
    "password": "saltuser",
    "eauth": "auto"
  }'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT; Path=/

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": [
    "grains.*",
    "status.*",
    "sys.*",
    "test.*"
  ]
}}
```

/logout

class salt.netapi.rest_cherry.py.app.**Logout**

Class to remove or invalidate sessions

POST()

Destroy the currently active session and expire the session cookie

/minions

class salt.netapi.rest_cherry.py.app.**Minions**

Convenience URLs for working with minions

GET (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

GET /minions/ (*mid*)

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...
```

POST (***kwargs*)

Start an execution command and immediately return the job id

POST /minions

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

- **Content-Type** -- the format of the request body.

Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '["tgt": "*", "fun": "status.diskusage"]'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
_links:
  jobs:
    - href: /jobs/20130603122505459265
```

/jobs

```
class salt.netapi.rest_cherrypy.app.Jobs
```

GET (*jid=None, timeout=''*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET `/jobs/` (*jid*)

List jobs or show a single job from the job cache.

Request Headers

- **X-Auth-Token** -- a session token from *Login*.

- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml
```

```
return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: jerry
  Target-type: glob
```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml
```

```
info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
```

```
- jerry:
  - - 0
    - 1
    - 1
    - 2
    - 6.9141387939453125e-06
```

/run

class salt.netapi.rest_cherrypy.app.Run

Class to run commands without normal session handling

POST (***kwargs*)

Run commands bypassing the *normal session handling*

POST /run

This entry point is primarily for ``one-off`` commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the root URL (/).

lowstate data describing Salt commands must be sent in the request body.

Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '{
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "username": "saltdev",
  "password": "saltdev",
  "eauth": "auto"
}'
```

POST /run HTTP/1.1

Host: localhost:8000

Accept: application/x-yaml

Content-Length: 75

Content-Type: application/json

```
{
  "client": "local", "tgt": "*", "fun": "test.ping", "username": "saltdev",
  "password": "saltdev", "eauth": "auto"
}
```

Example response:

HTTP/1.1 200 OK

Content-Length: 73

Content-Type: application/x-yaml

```
return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The `/run` endpoint can also be used to issue commands using the `salt-ssh` subsystem.

When using `salt-ssh`, `eauth` credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the `salt-ssh` client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

Example SSH client request:

```
curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -d client='ssh' \
  -d tgt='*' \
  -d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=ssh&tgt=*&fun=test.ping
```

Example SSH response:

```
return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20141203103525666185'
  retcode: 0
  return: true
  success: true
```

`/events`

class `salt.netapi.rest_cherrypy.app.Events`

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

[Events & Reactor](#)

GET (*token=None, salt_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Query Parameters

- **token** -- optional parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt_token** -- optional parameter containing a raw Salt *eaauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4
↳', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid':
↳ '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd
↳ ': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
```

```
var saltEvent = JSON.parse(message.data);
console.info(saltEvent.tag)
console.debug(saltEvent.data)
};
```

Or using CORS:

```
var source = new EventSource('/events?
↳token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
  while IFS= read -r line ; do
    echo $line
  done
```

Here is an example of using `awk` to filter events based on tag:

```
curl -NsS localhost:8000/events | \
  awk '
    BEGIN { RS=""; FS="\n" }
    $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
  '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
↳", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:
↳01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions":
↳["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
↳"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
↳": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
↳"id": "jerry"}}
```

/hook

class salt.netapi.rest_cherry.py.app.Webhook

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"
```

See also:

Events & Reactor, reactor

POST (**args*, ***kwargs*)

Fire an event in Salt with a custom event tag and data

POST /hook

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available
- **413** -- request body is too large

Example request:

```
curl -s localhost:8000/hook \
  -H 'Content-type: application/json' \
  -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*****
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
 'headers': {
   'X-My-Secret-Key': 'F0fAgoQjIT@W',
   'Content-Length': '37',
   'Content-Type': 'application/json',
   'Host': 'localhost:8000',
   'Remote-Addr': '127.0.0.1'},
 'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
  - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}
```

/keys

class salt.netapi.rest_cherry.py.app.Keys

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

GET (*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

GET /keys/ (*mid*)

List all keys or show a specific key

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry
  minions_pre: []
  minions_rejected: []
```

Example request:

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b
```

POST (***kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the *key.gen_accept*.

Example partial kickstart script to bootstrap a new minion:

```
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
    -d mid=jerry \
    -d username=kickstart \
```

```
-d password=kickstart \  
-d eauth=pam \  
| tar -C /etc/salt/pki/minion -xf -  
  
mkdir -p /etc/salt/minion.d  
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf  
%end
```

POST /keys

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -sSk https://localhost:8000/keys \  
-d mid=jerry \  
-d username=kickstart \  
-d password=kickstart \  
-d eauth=pam \  
-o jerry-salt-keys.tar
```

```
POST /keys HTTP/1.1  
Host: localhost:8000
```

Example response:

```
HTTP/1.1 200 OK  
Content-Length: 10240  
Content-Disposition: attachment; filename="saltkeys-jerry.tar"  
Content-Type: application/x-tar  
  
jerry.pub00000644000000000000000000000000000000000000703000000000000010730 0ustar   
↵00000000000000
```

/ws

class salt.netapi.rest_cherrypy.app.WebsocketEndpoint

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

Events & Reactor

GET (*token=None, **kwargs*)

Return a websocket connection of Salt's event stream

GET /ws/ (*token*)

Query format_events The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

Reqheader X-Auth-Token an authentication token from *Login*.

Status 101 switching to the websockets protocol

Status 401 authentication required

Status 406 requested Content-Type not available

Example request:

```
curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: "$$(echo -n $RANDOM | base64)" \
localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

Example response:

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

`/stats`

`class salt.netapi.rest_cherrypy.app.Stats`

Expose statistics on the running CherryPy server

GET()

Return a dump of statistics collected from the CherryPy server

GET /stats

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

14.7.2 `rest_tornado`

A Websockets add-on to `saltnado`

`depends`

- `tornado` Python module

In order to enable `saltnado_websockets` you must add `websockets: True` to your `saltnado` config block.

```
rest_tornado:
  # can be any port
  port: 8000
  ssl_cert: /etc/pki/api/certs/server.crt
  # no need to specify ssl_key if cert and key
  # are in one single file
  ssl_key: /etc/pki/api/certs/server.key
  debug: False
  disable_ssl: False
  websockets: True
```

All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='salt' \
  -d password='salt' \
  -d eauth='pam'
```

Which results in the response

```
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
```

```
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()          # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
↳self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Formatted Events

Exposes formatted ``real-time" events from Salt's event bus on a websocket connection. It should be noted that ``Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw ``real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small

value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='salt' \
  -d password='salt' \
  -d eauth='pam'
```

Which results in the response

```
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
  ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
  ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')
```

```
# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()          # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
→self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Example responses

`Minion information` is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
 - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minion removal

```
# Not all grains are shown
data: {
  "minions": {
    "minion1": {
      "id": "minion1",
      "grains": {
        "kernel": "Darwin",
        "domain": "local",
        "zmqversion": "4.0.3",
        "kernelrelease": "13.2.0"
      }
    }
  }
}
```

`Job information` is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
  "jobs": {
    "20140609153646699137": {
      "tgt_type": "glob",
      "jid": "20140609153646699137",
      "tgt": "*",
      "start_time": "2014-06-09T15:36:46.700315",
      "state": "complete",
    }
  }
}
```

```

    "fun": "test.ping",
    "minions": {
      "minion1": {
        "return": true,
        "retcode": 0,
        "success": true
      }
    }
  }
}

```

14.7.3 rest_wsgi

A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

[*rest_cherry.py*](#)

The [*rest_cherry.py*](#) module is more full-featured, production-ready, and has builtin security features.

Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with `mod_wsgi` or Nginx with `FastCGI`.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

salt-api using a development-only server

If run directly via the salt-api daemon it uses the `wsgiref.simple_server()` that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption;** please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

Usage examples

POST /

Example request for a basic `test.ping`:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"local","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": ↪
  ↪true}]}
```

Example request for an asynchronous `test.ping`:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2
  ↪", "ms--1", "ms--0"]}]}
```

Example request for looking up a job ID:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]' localhost:8001
```

Example response:

```

HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
↵true}]}

```

form lowstate A list of lowstate data appropriate for the *client* interface you are calling.

status 200 success

14.8 output modules

Follow one of the below links for further information and examples

<i>highstate</i>	Outputter for displaying results of state runs
<i>json_out</i>	Display return data in JSON format
<i>key</i>	Display salt-key output
<i>nested</i>	Recursively display nested data
<i>newline_values_only</i>	Display values only, separated by newlines
<i>no_out</i>	Display no output
<i>no_return</i>	Display output for minions that did not return
<i>overstatestage</i>	Display clean output of an overstate stage
<i>pprint_out</i>	Python pretty-print (pprint)
<i>progress</i>	Display return data as a progress bar
<i>raw</i>	Display raw output data structure
<i>txt</i>	Simple text outputter
<i>virt_query</i>	virt.query outputter
<i>yaml_out</i>	Display return data in YAML format

14.8.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

state_verbose: By default *state_verbose* is set to *True*, setting this to *False* will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed

state_output: The highstate outputter has six output modes, `full`, `terse`, `mixed`, `mixed_id`, `changes` and `filter`.

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.

- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `mixed_id` is used, then the mixed form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`. * for `exclude`, `state.highstate` expects a list of states to be excluded

(or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance:
`exclude=True,`

– for `terse`, `state.highstate` expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

state_tabular: If `state_output` uses the terse output, set this to `True` for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If `state_output: filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:
Summary for twd
-----
Succeeded: 1 (changed=1)
Failed:    0
-----
Total states run:    1
```

Example output with no special settings in configuration files:

```
myminion:
-----
      ID: test.ping
Function: module.run
  Result: True
Comment: Module function test.ping executed
Changes:
-----
      ret:
        True

Summary for myminion
```

```
-----  
Succeeded: 1  
Failed:    0  
-----  
Total:     0
```

`salt.output.highstate.output`(*data*, ***kwargs*)

The HighState Outputter is only meant to be used with the `state.highstate` function, or a function that returns highstate return data.

14.8.2 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}  
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}  
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}  
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}  
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}  
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

`salt.output.json_out.output`(*data*, ***kwargs*)

Print the output data in JSON

14.8.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

`salt.output.key.output`(*data*, ***kwargs*)

Read in the dict structure generated by the salt key API methods and print the structure.

14.8.4 salt.output.nested

Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```

myminion:
  -----
  foo:
    -----
    bar:
      baz
    dictionary:
      -----
      abc:
        123
      def:
        456
    list:
      - Hello
      - World

```

class salt.output.nested.NestDisplay

Manage the nested display contents

display(*ret*, *indent*, *prefix*, *out*)

Recursively iterate down through data structures to determine output

salt.output.nested.output(*ret*, ***kwargs*)

Display ret data

14.8.5 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

Warning: As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`, or `yaml`) may be more suitable.

Example 1

Input

```
{
  'myminion': ['127.0.0.1', '10.0.0.1'],
  'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

Example 2

Input

```
{
  'myminion': 8,
  'second-minion': 10
}
```

Output

```
8
10
```

`salt.output.newline_values_only.output(data, **kwargs)`
Display modified ret data

14.8.6 salt.output.no_out

Display no output

No output is produced when this outputter is selected

`salt.output.no_out.output(ret, **kwargs)`
Don't display data. Used when you only are interested in the return.

14.8.7 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
  Minion did not return
```

class salt.output.no_return.NestDisplay

Create generator for nested output

display(*ret*, *indent*, *prefix*, *out*)

Recursively iterate down through data structures to determine output

salt.output.no_return.**output**(*ret*, ***kwargs*)

Display ret data

14.8.8 salt.output.overstatestage

Display clean output of an overstate stage

This outputter is used to display OverState stages, and should not be called directly.

salt.output.overstatestage.**output**(*data*, ***kwargs*)

Format the data for printing stage information from the overstate system

14.8.9 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                    'dictionary': {'abc': 123, 'def': 456},
                    'list': ['Hello', 'World']}}}
```

salt.output.pprint_out.**output**(*data*, ***kwargs*)

Print out via pretty print

14.8.10 salt.output.progress

Display return data as a progress bar

salt.output.progress.**output**(*ret*, *bar*, ***kwargs*)

Update the progress bar

salt.output.progress.**progress_iter**(*progress*)

Initialize and return a progress bar iter

14.8.11 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `print` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

Example output:

```
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 123, 'def': 456}}}}
```

```
salt.output.raw.output(data, **kwargs)
    Rather basic...
```

14.8.12 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

```
salt.output.txt.output(data, **kwargs)
    Output the data in lines, very nice for running commands
```

14.8.13 salt.output.virt_query

virt.query outputter

Used to display the output from the `virt.query` runner.

```
salt.output.virt_query.output(data, **kwargs)
    Display output for the salt-run virt.query function
```

14.8.14 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

Example output:

```
saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
      - Hello
      - World
```

`salt.output.yaml_out.output(data, **kwargs)`
 Print out YAML using the block mode

14.9 pillar modules

<i>cmd_json</i>	Execute a command and read the output as JSON.
<i>cmd_yaml</i>	Execute a command and read the output as YAML.
<i>cmd_yamllex</i>	Execute a command and read the output as YAMLEX.
<i>cobbler</i>	A module to pull data from Cobbler via its API into the Pillar dictionary
<i>confidant</i>	An external pillar module for getting credentials from confidant.
<i>consul_pillar</i>	Use Consul K/V as a Pillar source with values parsed as YAML
<i>django_orm</i>	Generate Pillar data from Django models through the Django ORM
<i>ec2_pillar</i>	Retrieve EC2 instance data for minions.
<i>etcd_pillar</i>	Use etcd data as a Pillar source
<i>file_tree</i>	Recursively iterate over directories and add all files as Pillar data
<i>foreman</i>	A module to pull data from Foreman via its API into the Pillar dictionary
<i>git_pillar</i>	Use a git repository as a Pillar source
<i>hg_pillar</i>	Use remote Mercurial repository as a Pillar source.
<i>hieradata</i>	Use hieradata as a Pillar source
<i>http_yaml</i>	A module that adds data to the Pillar structure retrieved by an http request
<i>libvirt</i>	Load up the libvirt keys into Pillar for a given minion if said keys have been
<i>mongo</i>	Read Pillar data from a mongodb collection
<i>mysql</i>	Retrieve Pillar data by doing a MySQL query
<i>neutron</i>	Use Openstack Neutron data as a Pillar source.
<i>nodegroups</i>	
<i>pepa</i>	Pepa
<i>pillar_ldap</i>	Use LDAP data as a Pillar source
<i>puppet</i>	Execute an unmodified puppet_node_classifier and read the output as YAML.
<i>reclass_adapter</i>	Use the ``reclass`` database as a Pillar source
<i>redismod</i>	Read pillar data from a Redis backend
<i>s3</i>	Copy pillar data from a bucket in Amazon S3
<i>sql_base</i>	Retrieve Pillar data by doing a SQL query
<i>sqlcipher</i>	Retrieve Pillar data by running a SQLCipher query
<i>sqlite3</i>	Retrieve Pillar data by doing a SQLite3 query
<i>stack</i>	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
<i>svn_pillar</i>	Clone a remote SVN repository and use the filesystem as a Pillar source
<i>varstack_pillar</i>	Use Varstack data as a Pillar source
<i>vault</i>	Vault Pillar Module
Continued on next page	

Table 14.9 -- continued from previous page

<code>virtkey</code>	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
----------------------	--

14.9.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

```
salt.pillar.cmd_json.ext_pillar(minion_id, pillar, command)
    Execute a command and read the output as JSON
```

14.9.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

```
salt.pillar.cmd_yaml.ext_pillar(minion_id, pillar, command)
    Execute a command and read the output as YAML
```

14.9.3 salt.pillar.cmd_yamllex

Execute a command and read the output as YAMLEX. The YAMLEX data is then directly overlaid onto the minion's Pillar data

```
salt.pillar.cmd_yamllex.ext_pillar(minion_id, pillar, command)
    Execute a command and read the output as YAMLEX
```

14.9.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
ext_pillar:
- cobbler:
    key: cobbler # Nest results within this key. By default, values are not nested.
    only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

```
salt.pillar.cobbler.ext_pillar(minion_id, pillar, key=None, only=())
    Read pillar data from Cobbler via its API.
```

14.9.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via `ext_pillar` in the minion config:

`ext_pillar:`

- `confidant:`

```

profile: # The URL of the confidant web service url: `https://confidant-production.example.com`
            # The context to use for KMS authentication auth_context: from: example-production-
            iad to: confidant-production-iad user_type: service # The KMS master key to use for au-
            thentication auth_key: ``alias/authnz" # Cache file for KMS auth token token_cache_file:
            /run/confidant/confidant_token # The duration of the validity of a token, in minutes to-
            ken_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally
            best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk
            key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1
  
```

`depends` confidant-common, confidant-client

Module Documentation

`salt.pillar.confidant.ext_pillar` (*minion_id*, *pillar*, *profile=None*)

Read pillar data from Confidant via its API.

14.9.6 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

`depends`

- `python-consul`

In order to use an consul server, a profile must be created in the master configuration file:

```

my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
  
```

All parameters are optional.

The `consul.token` requires `python-consul >= 0.4.7`.

If you have a multi-datacenter Consul cluster you can map your `pillarenv``s` to your data centers by providing a dictionary of mappings in ```consul.dc` field:

```
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^(?P<env>.*): '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config

ext_pillar:
  - consul: my_consul_config root=/salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
  - consul: my_consul_config root=/salt/{minion_id}s
  - consul: my_consul_config root=/salt/{role}s
  - consul: my_consul_config root=/salt/{environment}s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - consul: my_consul_config root=/salt-shared
  - consul: my_other_consul_config root=/salt-private/{minion_id}s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

`salt.pillar.consul_pillar.consul_fetch(client, path)`
Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`
Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path)`
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`
Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value)`
Perform data formatting to be used as pillar data and merge it with the current pillar data

14.9.7 salt.pillar.django_orm

Generate Pillar data from Django models through the Django ORM

maintainer Micah Hausler <micah.hausler@gmail.com>
maturity new

Configuring the django_orm ext_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```
ext_pillar:
  - django_orm:
      pillar_name: my_application
      project_path: /path/to/project/
      settings_module: my_application.settings
      env_file: /path/to/env/file.sh
      # Optional: If your project is not using the system python,
      # add your virtualenv path below.
      env: /path/to/virtualenv/

      django_app:

          # Required: the app that is included in INSTALLED_APPS
          my_application.clients:

              # Required: the model name
              Client:
```

```

# Required: model field to use as the key in the rendered
# Pillar. Must be unique; must also be included in the
# ``fields`` list below.
name: shortname

# Optional:
# See Django's QuerySet documentation for how to use .filter()
filter: {'kw': 'args'}

# Required: a list of field names
# List items will be used as arguments to the .values() method.
# See Django's QuerySet documentation for how to use .values()
fields:
  - field_1
  - field_2

```

This would return pillar data that would look like

```

my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2

```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```

ext_pillar:
  - django_orm:
      pillar_name: djangotutorial
      project_path: /path/to/mysite
      settings_module: mysite.settings

      django_app:
        mysite.polls:
          Choices:
            name: poll__question
            fields:
              - poll__question
              - poll__id
              - choice_text
              - votes

```

Module Documentation

`salt.pillar.django_orm.ext_pillar`(*minion_id*, *pillar*, *pillar_name*, *project_path*, *settings_module*, *django_app*, *env=None*, *env_file=None*, **args*, ***kwargs*)

Connect to a Django database through the ORM and retrieve model fields

Parameters

- **pillar_name** (*str*) -- The name of the pillar to be returned

- **project_path** (*str*) -- The full path to your Django project (the directory `manage.py` is in)
- **settings_module** (*str*) -- The settings module for your project. This can be found in your `manage.py` file
- **django_app** (*str*) -- A dictionary containing your apps, models, and fields
- **env** (*str*) -- The full path to the `virtualenv` for your Django project
- **env_file** (*str*) -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

14.9.8 salt.pillar.ec2_pillar

Retrieve EC2 instance data for minions.

The minion id must be the instance-id retrieved from AWS. As an option, `use_grain` can be set to `True`. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

```
ext_pillar:
  - ec2_pillar:
      use_grain: True
      minion_ids:
        - trusted-minion-1
        - trusted-minion-2
        - trusted-minion-3
```

This is a very simple pillar that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

`salt.pillar.ec2_pillar.ext_pillar` (*minion_id*, *pillar*, *use_grain=False*, *minion_ids=None*)
Execute a command and read the output as YAML

14.9.9 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

depends

- `python-etcd`

In order to use an etcd server, a profile must be created in the master configuration file:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
- etcd: my_etcd_config
- etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```
ext_pillar:
- etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
- etcd: my_etcd_config root=/salt-shared
- etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

`salt.pillar.etcd_pillar.ext_pillar` (*minion_id*, *pillar*, *conf*)
Check etcd for all data

14.9.10 salt.pillar.file_tree

Recursively iterate over directories and add all files as Pillar data

New in version 2015.5.0.

Example Configuration

```
ext_pillar:
- file_tree:
    root_dir: /path/to/root/directory
    follow_dir_links: False
    keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

Warning: Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

If `keep_newline` is set to True, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *file.managed* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over

which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:
  - file_tree:
      root_dir: /path/to/root/directory
      keep_newline:
        - files/testdir/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:
  -----
  files:
    -----
    another-testdir:
      -----
      symlink-to-file1.txt:
        Contents of file #1.

    testdir:
      -----
      file1.txt:
        Contents of file #1.

      file2.txt:
        Contents of file #2.
```

Note: Subdirectories underneath `root_dir/hosts/id` become nested dictionaries, as shown above.

Assigning Pillar Data to Entire Nodegroups

To assign Pillar data to all minions in a given nodegroup, this external pillar recursively iterates over `root_dir/nodegroups/nodegroup` (where `nodegroup` is the name of a nodegroup), and like for individual hosts, compiles pillar data with each subdirectory as a dictionary key and each file as a value.

Important: If the same Pillar key is set for a minion both by nodegroup and by individual host, then the value set for the individual host will take precedence.

For example, the following `root_dir` tree:

```
./nodegroups/  
./nodegroups/test-group/  
./nodegroups/test-group/files/  
./nodegroups/test-group/files/testdir/  
./nodegroups/test-group/files/testdir/file1.txt  
./nodegroups/test-group/files/testdir/file2.txt  
./nodegroups/test-group/files/another-testdir/  
./nodegroups/test-group/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar data for minions in the node group `test-group`:

```
test-host:  
-----  
files:  
-----  
  another-testdir:  
  -----  
    symlink-to-file1.txt:  
      Contents of file #1.  
  
  testdir:  
  -----  
    file1.txt:  
      Contents of file #1.  
  
    file2.txt:  
      Contents of file #2.
```

`salt.pillar.file_tree.ext_pillar` (*minion_id*, *pillar*, *root_dir=None*, *follow_dir_links=False*, *debug=False*, *raw_data=None*, *keep_newline=False*)
Compile pillar data for the specified minion ID

14.9.11 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

Configuring the Foreman `ext_pillar`

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:  
- foreman:  
  key: foreman # Nest results within this key
```

```

    only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme

```

The following options are optional:

```

foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cacertfile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True

```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

Module Documentation

`salt.pillar.foreman.ext_pillar` (*minion_id*, *pillar*, *key=None*, *only=()*)
 Read pillar data from Foreman via its API.

14.9.12 salt.pillar.git_pillar

Use a git repository as a Pillar source

Note: This external pillar has been rewritten for the *2015.8.0* release. The old method of configuring this external pillar will be maintained for a couple releases, allowing time for configurations to be updated to reflect the new usage.

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```

base:
  '*!':
    - foo

```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

Important: Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#), or [here](#) for Salt releases before 2015.8.0), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

Configuring `git_pillar` for Salt releases before 2015.8.0

For Salt releases earlier than *2015.8.0*, GitPython is the only supported provider for `git_pillar`. Individual repositories can be configured under the `ext_pillar` configuration parameter like so:

```
ext_pillar:
  - git: master https://gitserver/git-pillar.git root=subdirectory
```

The repository is specified in the format `<branch> <repo_url>`, with an optional `root` parameter (added in the *2014.7.0* release) which allows the pillar SLS files to be served up from a subdirectory (similar to `gitfs_root` in `gitfs`).

To use more than one branch from the same repo, multiple lines must be specified under `ext_pillar`:

```
ext_pillar:
  - git: master https://gitserver/git-pillar.git
  - git: dev https://gitserver/git-pillar.git
```

To remap a specific branch to a specific Pillar environment, use the format `<branch>:<env>`:

```
ext_pillar:
  - git: develop:dev https://gitserver/git-pillar.git
  - git: master:prod https://gitserver/git-pillar.git
```

In this case, the `develop` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

The `master` branch would need its own `top.sls` with a `prod` section in it:

```
prod:
  '*':
    - bar
```

If `__env__` is specified as the branch name, then `git_pillar` will first look at the minion's `environment` option. If unset, it will fall back to using branch specified by the master's `gitfs_base`:

```
ext_pillar:
  - git: __env__ https://gitserver/git-pillar.git root=pillar
```

The corresponding Pillar top file would look like this:

```

{{env}}:
  '*':
    - bar

```

Note: This feature was unintentionally omitted when `git_pillar` was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config described above. For 2016.3.4 and later, refer to explanation of the `__env__` parameter in the below section.

Versions 2016.3.0 through 2016.3.4 incorrectly check the *master's* `environment` config option (instead of the minion's) before falling back to `gitfs_base`. This has been fixed in the 2016.3.5 and 2016.11.1 releases (2016.11.0 contains the incorrect behavior).

Configuring `git_pillar` for Salt releases 2015.8.0 and later

Note: In version 2015.8.0, the method of configuring git external pillars has changed, and now more closely resembles that of the *Git Fileserver Backend*. If Salt detects the old configuration schema, it will use the pre-2015.8.0 code to compile the external pillar. A warning will also be logged.

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython` (`Dulwich` will not be supported for the foreseeable future). The requirements for `GitPython` and `pygit2` are the same as for `gitfs`, as described *here*.

Important: `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```

ext_pillar:
  - git:
    # Use 'prod' instead of the branch name 'production' as the environment
    - production https://gitserver/git-pillar.git:
      - env: prod
    # Use 'dev' instead of the branch name 'develop' as the environment
    - develop https://gitserver/git-pillar.git:
      - env: dev
    # No per-remote config parameters (and no trailing colon), 'qa' will
    # be used as the environment
    - qa https://gitserver/git-pillar.git
    # SSH key authentication
    - master git@other-git-server:pillardata-ssh.git:
      # Pillar SLS files will be read from the 'pillar' subdirectory in
      # this repository
      - root: pillar
      - privkey: /path/to/key
      - pubkey: /path/to/key.pub

```

```
- passphrase: CorrectHorseBatteryStaple
# HTTPS authentication
- master https://other-git-server/pillardata-https.git:
  - user: git
  - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the `git_pillar` configuration parameters can also be set. To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
  - git:
    - production https://gitserver/git-pillar.git:
      - env: prod
```

If `__env__` is specified as the branch name, then `git_pillar` will use the branch specified by `git_pillar_base`:

```
ext_pillar:
  - git:
    - __env__ https://gitserver/git-pillar.git:
      - root: pillar
```

The corresponding Pillar top file would look like this:

```
{{env}}:
  '*':
    - bar
```

Note: This feature was unintentionally omitted when `git_pillar` was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. The fallback value replaced by `{{env}}` is `:conf_master`: is `git_pillar_base`, while the legacy config's version of this feature replaces `{{env}}` with `gitfs_base`.

On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config in the previous section of this page.

The same issue which affected the behavior of the minion's `environment` config value using the legacy configuration syntax (see the documentation in the pre-2015.8.0 section above for the legacy support of this feature) also affects the new-style `git_pillar` syntax in version 2016.3.4. This has been corrected in version 2016.3.5 and 2016.11.1 (2016.11.0 contains the incorrect behavior).

2016.3.4 incorrectly checks the *master's* `environment` config option (instead of the minion's) before falling back to the master's `git_pillar_base`.

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

Note: The `name` parameter can be used to further differentiate between two remotes with the same URL and branch.

When using two remotes with the same URL, the name option is required.

`salt.pillar.git_pillar.ext_pillar` (*minion_id*, *repo*, *pillar_dirs*)

Checkout the `ext_pillar` sources and compile the resulting pillar SLS

14.9.13 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs_` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

`class salt.pillar.hg_pillar.Repo` (*repo_uri*)

Deal with remote hg (mercurial) repository for Pillar

`close` ()

Cleanup mercurial command server

`update` (*branch='default'*)

Ensure we are using the latest revision in the hg repository

`salt.pillar.hg_pillar.ext_pillar` (*minion_id*, *pillar*, *repo*, *branch='default'*, *root=None*)

Extract pillar from an hg repository

`salt.pillar.hg_pillar.update` (*repo_uri*)

Execute an hg pull on all the repos

14.9.14 salt.pillar.hiera

Use hiera data as a Pillar source

`salt.pillar.hiera.ext_pillar` (*minion_id*, *pillar*, *conf*)

Execute hiera and return the data

14.9.15 salt.pillar.http_yaml module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_YAML ext_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

Module Documentation

`salt.pillar.http_yaml.ext_pillar` (*minion_id, pillar, url*)

Read pillar data from HTTP response.

:param url String to make request :returns dict with pillar data to add :returns empty if error

14.9.16 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

depends certtool

`salt.pillar.libvirt.ext_pillar` (*minion_id, pillar, command*)

Read in the generated libvirt keys

`salt.pillar.libvirt.gen_hyper_keys` (*minion_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted'*)

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

14.9.17 salt.pillar.mongo

Read Pillar data from a mongodb collection

depends pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

Configuring the Mongo ext_pillar

The Mongo `ext_pillar` takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```

ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
    →[customer_id, software, apache_vhosts]}

```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

Module Documentation

`salt.pillar.mongo.ext_pillar` (*minion_id*, *pillar*, *collection='pillar'*, *id_field='_id'*, *re_pattern=None*, *re_replace=''*, *fields=None*)

Connect to a mongo database and read per-node pillar information.

Parameters

- **collection** (*) -- The mongodb collection to read data from. Defaults to 'pillar'.
- **id_field** (*) -- The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re_replace** (*) -- Use as the replacement value in node ids matched with *re_pattern*. Defaults to `''`. Feel free to use backreferences here.
- **fields** (*) -- The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

14.9.18 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` `ext_pillar` for MySQL.

maturity new

depends python-mysqldb

platform all

Configuring the mysql ext_pillar

Use the `'mysql'` key under `ext_pillar` for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

Complete example

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

extract_queries(args, kwargs)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against MySQL, merge and return as a dict

14.9.19 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my_openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```

ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config

```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```

ext_pillar:
  • neutron: my_openstack_config neutron_networks

```

`salt.pillar.neutron.ext_pillar` (*minion_id, pillar, conf*)
Check neutron for all data

14.9.20 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of `nodegroups` which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

Configuring Nodegroups Pillar

```

extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'

```

`salt.pillar.nodegroups.ext_pillar` (*minion_id, pillar, pillar_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

Parameters

- **minion_id** -- provided by salt, but not used by nodegroups `ext_pillar`
- **pillar** -- provided by salt, but not used by nodegroups `ext_pillar`
- **pillar_name** -- optional name to use for the pillar, defaults to `'nodegroups'`

Returns a dictionary which is included by the salt master in the pillars returned to the minion

14.9.21 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```

extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host           # Name of resource directory and sub-key in pillars
      sequence:                # Sequence used for hierarchical substitution
      - hostname:              # Name of key
          name: input          # Alias used for template directory
          base_only: True      # Only use templates from Base environment, i.e. no
→staging
      - default:
      - environment:
      - location..region:
          name: region
      - location..country:
          name: country
      - location..datacenter:
          name: datacenter
      - roles:
      - osfinger:
          name: os
      - hostname:
          name: override
          base_only: True
      subkey: True            # Create a sub-key in pillars, named after the
→resource in this case [host]
      subkey_only: True      # Only create a sub-key, and leave the top level
→untouched

pepa_roots:                  # Base directory for each environment
  base: /srv/pepa/base      # Path for base environment
  dev: /srv/pepa/base       # Associate dev with base
  qa: /srv/pepa/qa
  prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys
→may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
#  environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
#  saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
#  salt: warning
#  salt.loaded.ext.pillar.pepa: debug

```

Pepa can also be used in Master-less SaltStack setup.

Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
             hostname

positional arguments:
  hostname              Hostname

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG, --config CONFIG
                        Configuration file
  -d, --debug           Print debug info
  -g GRAINS, --grains GRAINS
                        Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                        Input Pillar as YAML
  -n, --no-color        No color output
  -v, --validate        Validate output
```

Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test_example_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
time..ntp..servers:
  - ntp1.amer.example.com
  - ntp2.amer.example.com
  - ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

Example:

```
osfinger: Fedora-19
```

Would become:

```
fedora_19.yaml
```

Nested dictionaries

In order to create nested dictionaries as output you can use double dot "." as a delimiter. You can change this using ``pepa_delimiter`` we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

Example:

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1
network..dns..search:
  - example.com
```

Would become:

```
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

Example:

```
network..dns..search..merge():
  - foobar.com
  - dummy.nl
```

```
owner..immutable(): Operations
host..printers..unset():
```

Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
  type: string
  regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$
```

```
network.interfaces..{{ interface }}..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}
```

14.9.22 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

Configuring the LDAP ext_pillar

The basic configuration is part of the master configuration.

```
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

Note: When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the `salt-master` process will attempt to parse its content.

Warning: Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using *Salt's Renderers* <renderers> which makes it possible to reference grains within the configuration.

Warning: When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the ``id`` grain which is verified through the minion's key/cert.

Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- **filtering for:**
 - members of the group `it-admins`
 - objects with `objectclass=user`
- returning the data of users (`mode: map`), where each user is a dictionary containing the configured string or list attributes.

Configuration:

```
salt-users:
  server: ldap.company.tld
  port: 389
  tls: true
  dn: 'dc=company,dc=tld'
  binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw: bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode: map
  dn: 'ou=users,dc=company,dc=tld'
  filter: '(&(memberof=cn=it-
→admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
  attrs:
    - cn
    - displayName
    - givenName
    - sn
  lists:
    - memberOf

**Result:**
```

```
salt-users:
  - cn: cn=johndoe,ou=users,dc=company,dc=tld
    displayName: John Doe
    givenName: John
    sn: Doe
    memberOf:
      - cn=it-admins,ou=groups,dc=company,dc=tld
      - cn=team01,ou=groups,dc=company
  - cn: cn=janedoe,ou=users,dc=company,dc=tld
```

```
displayName: Jane Doe
givenName: Jane
sn: Doe
memberOf:
  - cn=it-admins,ou=groups,dc=company,dc=tld
  - cn=team02,ou=groups,dc=company
```

List Mode

TODO: see also `_result_to_dict()` documentation

`salt.pillar.pillar_ldap.ext_pillar` (*minion_id, pillar, config_file*)
Execute LDAP searches and return the aggregated data

14.9.23 salt.pillar.puppet

Execute an unmodified `puppet_node_classifier` and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.puppet.ext_pillar` (*minion_id, pillar, command*)
Execute an unmodified `puppet_node_classifier` and read the output as YAML

14.9.24 salt.pillar.reclass_adapter

Use the `reclass` database as a Pillar source

This `ext_pillar` plugin provides access to the `reclass` database, such that Pillar data for a specific minion are fetched using `reclass`.

You can find more information about `reclass` at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHON-PATH environment variable, or by setting the configuration option, like in the example above.

```
salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)
```

Obtain the Pillar data from reclass for the given minion_id.

14.9.25 salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends

- redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

Configuring the Redis ext_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

```
salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)
```

Grabs external pillar data based on configured function

```
salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)
```

Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.

pillar_key Pillar key to return data into

```
salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')
```

Looks for key in redis matching minion_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

pillar_key Pillar key to return data into

14.9.26 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
- s3:
  bucket: my.fancy.pillar.bucket
  keyid: KASKFJWAKJASJKDAJKSD
  key: ksladfDLKDALSFKSD93q032sdDasdfasdfsadkf
  multiple_env: False
  environment: base
  prefix: somewhere/overthere
  verify_ssl: True
  service_url: s3.amazonaws.com
  kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
  s3_cache_expire: 30
  s3_sync_on_update: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a `'subdirectory'` of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in `ext_pillar` for each environment rather than specifying `multiple_env`. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
                        location=None, multiple_env=False, environment='base', pre-
                        fix='', service_url=None, kms_keyid=None, s3_cache_expire=30,
                        s3_sync_on_update=True)
```

Execute a command and read the output as YAML

14.9.27 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

maturity new

platform all

Theory of sql_base ext_pillar

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys ``query" and ``depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake `sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
  - sql_base:
    - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
  - sql_base:
    main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```

ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    2

```

Or as a mapping

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    depth: 2

```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {'b': b, 'c': c, 'd': d}}
- With depth 2: {a: {b: {'c': c, 'd': d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
    ↪minion_id != %s"
    depth: 2
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    depth: 2
  ignore_null: True

```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string `'1,3'` will result in:

```

a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
  ^      ^

```

These columns define list grouping

```

{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4 }
  ]}
]}

```

```

    ]
  }
}]

```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

More complete example for MySQL (to also show configuration)

```

mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

class `salt.pillar.sql_base.SqlBaseExtPillar`

This class receives and processes the database rows in a database agnostic way.

enter_root(*root*)

Set `self.focus` for kwarg queries

extract_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

fetch(*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries, merge and return as a dict.

process_fields(*field_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

process_results(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

14.9.28 `salt.pillar.sqlcipher` module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the `pysqlcipher` Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the `sql_base` `ext_pillar` for SQLCipher.

```
maturity new
depends pysqlcipher (for py2) or pysqlcipher3 (for py3)
platform all
```

Configuring the `sqlcipher` `ext_pillar`

Use the `'sqlcipher'` key under `ext_pillar` for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0
```

Complete example

```
sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

`class salt.pillar.sqlcipher.SQLCipherExtPillar`

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

14.9.29 `salt.pillar.sqlite3` module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

sqlite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql_base ext_pillar for SQLite3.

platform all

Configuring the sqlite3 ext_pillar

Use the `sqlite3` key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

Legacy Compatibility

SQLite3 database connection configuration previously had keys under pillar.

```
pillar.sqlite3.database: /var/lib/salt/pillar.db
pillar.sqlite3.timeout: 5.0
```

This has been deprecated in 2016.3.0 and will be removed in Salt Nitrogen.

Complete Example

```
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against SQLite3, merge and return as a dict

14.9.30 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

`PillarStack` is a custom saltstack `ext_pillar` which was inspired by `varstack` but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbnet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- all these rendered files are then parsed as `yaml`
- then all `yaml` dicts are merged in order with support for the following merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`
- `stack` config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

Installation

`PillarStack` is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override `PillarStack` with a more recent one, follow the installation procedure below.

Installing the `PillarStack ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure `PillarStack` in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single `PillarStack` config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
  - stack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- stack:
  pillar:environment:
    dev: /path/to/dev/stack.cfg
    prod: /path/to/prod/stack.cfg
  grains:custom:grain:
    value:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
  opts:custom:opt:
    value: /path/to/stack0.cfg
```

PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
|-- config.cfg
|-- core.yml
|-- osarchs/
```

```

|   |-- amd64.yml
|   |-- armhf.yml
|-- oscodenames/
|   |-- wheezy.yml
|   |-- jessie.yml
|-- roles/
|   |-- web.yml
|   |-- db.yml
|-- minions/
|   |-- test-1-dev.yml
|   |-- test-2-dev.yml

```

Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse` salt `pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__ : <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

`merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

`merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

`remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

`overwrite` strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: merge-last tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: merge-first tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 500 roles: - developer - sysadmin mat: uid: 1001 root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: remove tom: mat:</pre>	<pre>users: root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: overwrite tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - developer mat: uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

14.9.31 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
  - svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
  - svn: trunk svn://svnserver/repo
  - svn: dev  svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

```
class salt.pillar.svn_pillar.SvnPillar(branch, repo_location, root, opts)
    Deal with the remote SVN repository for Pillar
```

```
pillar_dir()
    Returns the directory of the pillars (repo cache + branch + root)
```

```
salt.pillar.svn_pillar.ext_pillar(minion_id, pillar, repo_string)
    Execute a command and read the output as YAML
```

14.9.32 salt.pillar.varstack_pillar

Use `Varstack` data as a Pillar source

Configuring Varstack

Using `varstack` in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
  - varstack: /etc/varstack.yaml
```

`Varstack` will then use `/etc/varstack.yaml` to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of `varstack` on how this file is evaluated.

```
salt.pillar.varstack_pillar.ext_pillar(minion_id, pillar, conf)
    Parse varstack data and return the result
```

14.9.33 salt.pillar.vault module

Vault Pillar Module

```
maintainer SaltStack
maturity New
platform all
```

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

The vault module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myvault:
  vault.host: 127.0.0.1
  vault.port: 8200
  vault.scheme: http # Optional; default is https
  vault.token: 012356789abcdef # Required, unless set in environment
```

`vault.host` refers to the host that is hosting vault and `vault.port` refers to the port on that host. A vault token is also required. It may be set statically, as above, or as an environment variable:

```
$ export VAULT_TOKEN=0123456789abcdef
```

After the profile is created, configure the external pillar system to use it. A path must also be specified so that vault knows where to look.

```
ext_pillar:
  - vault: my_vault_config path=secret/salt
```

Using these configuration profiles, multiple vault sources may also be used:

```
ext_pillar:
  - vault: my_vault_config
  - vault: my_other_vault_config
```

`salt.pillar.vault.ext_pillar` (*minion_id*, *pillar*, *conf*)
Check vault for all data

14.9.34 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar` (*hyper_id*, *pillar*, *name*, *key*)
Accept the key for the VM on the hyper, if authorized.

14.10 proxy modules

<i>chronos</i>	Chronos
<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>nxos</i>	Proxy Minion for Cisco NX OS Switches
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.

14.10.1 salt.proxy.chronos module

Chronos

Proxy minion for managing a Chronos cluster.

Dependencies

- *chronos execution module* (*salt.modules.chronos*)

Pillar

The chronos proxy configuration requires a `base_url` property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init(opts)`
Perform any needed setup.

`salt.proxy.chronos.ping()`
Is the chronos api responding?

`salt.proxy.chronos.shutdown(opts)`
For this proxy shutdown is a no-op

14.10.2 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

Special Note: SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's 'Proxy Minion' functionality enables you to designate another machine to host a minion process that 'proxies' communication from the Salt Master. The master does not know nor care that the target is not a 'real' Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
  passwords:
    - first_password
    - second_password
    - third_password
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

host

The location, or ip/dns, of the ESXi host. Required.

username

The username used to login to the ESXi host, such as `root`. Required.

passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

Note: When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

port

If the ESXi host is not using the default port, set this value to an alternate port. Default is `443`.

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. [Salt.modules.vsphere](#) is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in [salt.modules.vsphere](#) instead of [salt.modules.esxi](#).

States

Associated states are thoroughly documented in [salt.states.esxi](#). Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the [salt.modules.esxi.cmd](#) shim. It then calls whatever is passed in `cmd` inside the [salt.modules.vsphere](#) module. Passes the return through from the `vsphere` module.

cmd The command to call inside `salt.modules.vsphere`

args Arguments that need to be passed to that command.

kwargs Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

salt.proxy.esxi.init(*opts*)

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

salt.proxy.esxi.ping()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt esxi-host test.ping
```

salt.proxy.esxi.shutdown()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

14.10.3 salt.proxy.fx2

Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

Dependencies

- *iDRAC Remote execution module* (*salt.modules.dracr*)
- *Chassis command shim* (*salt.modules.chassis*)
- *Dell Chassis States* (*salt.states.dellchassis*)
- Dell's `racadm` command line interface to CMC and iDRAC devices.

Special Note: SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply ``chassis``, ``CMC``, or ``FX2``) chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's ``Proxy Minion`` functionality enables you to designate another machine to host a minion process that ``proxies`` communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar toplevel that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
```

```
passwords:
- first_password
- second_password
- third_password
proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is!!!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *salt.modules.dracr* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs *racadm* against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of *racadm* is installed, and that host would reach out over the network and communicate with the chassis.

Chassis.cmd acts as a ``shim" between the execution module and the proxy. It's first parameter is always the function from *salt.modules.dracr* to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in *salt.modules.dracr* instead of *salt.modules.chassis*.

States

Associated states are thoroughly documented in *salt.states.dellchassis*. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

salt.proxy.fx2.admin_password()

Return the `admin_password` in the `DETAILS` dictionary, or `'calvin'` (the Dell default) if there is none present

salt.proxy.fx2.admin_username()

Return the `admin_username` in the `DETAILS` dictionary, or `root` if there is none present

salt.proxy.fx2.chconfig(*cmd*, **args*, *kwargs*)**

This function is called by the *salt.modules.chassis.cmd* shim. It then calls whatever is passed in `cmd` inside the *salt.modules.dracr* module.

Parameters

- **cmd** -- The command to call inside *salt.modules.dracr*
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

Returns Passthrough the return from the *dracr* module.

salt.proxy.fx2.find_credentials()

Cycle through all the possible credentials and return the first one that works

salt.proxy.fx2.grains()

Get the grains from the proxied device

salt.proxy.fx2.grains_refresh()

Refresh the grains from the proxied device

salt.proxy.fx2.init(*opts*)

This function gets called when the proxy starts up. We check `opts` to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

Returns Returns False if the chassis didn't respond, True otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

14.10.4 salt.proxy.junos

Interface with a Junos device via proxy-minion.

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

14.10.5 salt.proxy.marathon module

Marathon

Proxy minion for managing a Marathon cluster.

Dependencies

- *marathon execution module (salt.modules.marathon)*

Pillar

The marathon proxy configuration requires a `'base_url'` property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`

Perform any needed setup.

`salt.proxy.marathon.ping()`

Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`

For this proxy shutdown is a no-op

14.10.6 salt.proxy.napalm

NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

Proxy minion for managing network devices via NAPALM library.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

The `napalm` proxy module requires NAPALM library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

Pillar

The `napalm` proxy configuration requires four mandatory parameters in order to connect to the network device:

- **driver**: specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).
- **host**: hostname
- **username**: username to be used when connecting to the device
- **passwd**: the password needed to establish the connection
- **optional_args**: dictionary with the optional arguments. Check the complete list of supported [optional arguments](#)

Example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
    config_format: set
```

See also:

- NAPALM grains: select network devices based on their characteristics
- *NET module: network basic features*
- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- Routes details
- SNMP configuration module

- Users configuration management

New in version 2016.11.0.

`salt.proxy.napalm.call`(*method*, ***params*)

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

Parameters

- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

Returns

A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback

on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'  
    **{  
        'commands': [  
            'show version',  
            'show chassis fan'  
        ]  
    })
```

`salt.proxy.napalm.fns`()

Method called by NAPALM grains module.

`salt.proxy.napalm.grains`()

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh`()

Refresh the grains.

`salt.proxy.napalm.init`(*opts*)

Opens the connection with the network device.

`salt.proxy.napalm.initialized`()

Connection finished initializing?

`salt.proxy.napalm.ping`()

Connection open successfully?

`salt.proxy.napalm.shutdown`(*opts*)

Closes connection with the device.

14.10.7 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

proxytype (REQUIRED) Use this proxy minion *nxos*

host (REQUIRED) ip address or hostname to connect to

username (REQUIRED) username to login with

password (REQUIRED) password to use to login with

prompt_name (REQUIRED) The name in the prompt on the switch. By default, use your devices hostname.

ssh_args Any extra args to use to connect to the switch.

key_accept Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the *salt.modules.nxos* execution module.

Note: The option *proxy_merge_grains_in_module: True* is required to have the NXOS grains be available from the proxy minion, for the 2016.11.0 release. For Nitrogen, the setting will be True by default.

salt.proxy.nxos.add_config(*lines*)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↳operator'
```

Note: For more than one config added per command, lines should be a list.

salt.proxy.nxos.check_password(*username, password, encrypted=False*)

Check if passed password is the one assigned to user

salt.proxy.nxos.check_role(*username, role*)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

salt.proxy.nxos.delete_config(*lines*)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↳network-operator'
```

Note: For more than one config deleted per command, lines should be a list.

`salt.proxy.nxos.find(pattern)`

Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

Note: This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole `show_run` output.

`salt.proxy.nxos.get_roles(username)`

Get roles that the username is assigned from switch

`salt.proxy.nxos.get_user(username)`

Get username line from switch

`salt.proxy.nxos.grains()`

Get grains for proxy minion

`salt.proxy.nxos.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.nxos.init(opts=None)`

Required. Can be used to initialize the server connection.

`salt.proxy.nxos.ping()`

Ping the device on the other end of the connection

`salt.proxy.nxos.remove_user(username)`

Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

`salt.proxy.nxos.replace(old_value, new_value, full_match=False)`

Replace string or full line matches in switch's running config

If `full_match` is set to `True`, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

`salt.proxy.nxos.sendline(command)`

Run command through switch's cli

`salt.proxy.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256')`

Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
    password='$5$2fWw02vK$7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYYdGT3E.A' \
    encrypted=True
```

`salt.proxy.nxos.set_role(username, role)`

Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

`salt.proxy.nxos.show_run()`

Shortcut to run *show run* on switch

```
salt '*' nxos.cmd show_run
```

`salt.proxy.nxos.show_ver()`
Shortcut to run `show ver` on switch

```
salt '*' nxos.cmd show_ver
```

`salt.proxy.nxos.shutdown(opts)`
Disconnect

`salt.proxy.nxos.system_info()`
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

`salt.proxy.nxos.unset_role(username, role)`
Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

14.10.8 salt.proxy.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

`class salt.proxy.philips_hue.Const`
Constants for the lamp operations.

`salt.proxy.philips_hue.call_alert(*args, **kwargs)`
Lamp alert

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

`salt.proxy.philips_hue.call_blink(*args, **kwargs)`
Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

`salt.proxy.philips_hue.call_brightness(*args, **kwargs)`
Set an effect to the lamp.

Arguments:

- value**: 0~255 brightness of the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- transition**: Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

`salt.proxy.philips_hue.call_color(*args, **kwargs)`

Set a color to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- transition**: Transition 0~200.

Advanced:

- gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

`salt.proxy.philips_hue.call_effect(*args, **kwargs)`

Set an effect to the lamp.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- type**: Type of the effect. Possible values are ``none" or ``colorloop". Default ``none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

`salt.proxy.philips_hue.call_lights(*args, **kwargs)`

Get info about all available lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- id**: Specifies a device ID. Only one device at a time.
- title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- value**: 150-500.

Options:

- id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

`salt.proxy.philips_hue.init(cnf)`

Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`

Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`

Shuts down the service.

14.10.9 salt.proxy.rest_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example

salt.proxy.rest_sample.grains()

Get the grains from the proxied device

salt.proxy.rest_sample.grains_refresh()

Refresh the grains from the proxied device

salt.proxy.rest_sample.id(*opts*)

Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

salt.proxy.rest_sample.initialized()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.rest_sample.package_install(*name*, *kwargs*)**

Install a ``package" on the REST server

salt.proxy.rest_sample.package_list()

List ``packages" installed on the REST server

salt.proxy.rest_sample.package_remove(*name*)

Remove a ``package" on the REST server

salt.proxy.rest_sample.package_status(*name*)

Check the installation status of a package on the REST server

salt.proxy.rest_sample.ping()

Is the REST server up?

salt.proxy.rest_sample.service_list()

List ``services" on the REST server

salt.proxy.rest_sample.service_restart(*name*)

Restart a ``service" on the REST server

salt.proxy.rest_sample.service_start(*name*)

Start a ``service" on the REST server

salt.proxy.rest_sample.service_status(*name*)

Check if a service is running on the REST server

salt.proxy.rest_sample.service_stop(*name*)

Stop a ``service" on the REST server

salt.proxy.rest_sample.shutdown(*opts*)

For this proxy shutdown is a no-op

salt.proxy.rest_sample.uptodate(*name*)

Call the REST endpoint to see if the packages on the ``server" are up to date.

14.10.10 salt.proxy.ssh_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

`salt.proxy.ssh_sample.grains()`
Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`
Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`
Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`
Install a ``package" on the ssh server

`salt.proxy.ssh_sample.package_list()`
List ``packages" by executing a command via ssh This function is called in response to the salt command
..code-block::bash salt target_minion pkg.list_pkgs

`salt.proxy.ssh_sample.package_remove(name)`
Remove a ``package" on the ssh server

`salt.proxy.ssh_sample.parse(out)`
Extract json from out.
Parameter out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`
Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`
Start a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`
Restart a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`
Start a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`
Stop a ``service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`
Disconnect

14.11 queue modules

<code>pgjsonb_queue</code>	New in version 2016.3.0.
<code>sqlite_queue</code>	New in version 2014.7.0.

14.11.1 salt.queues.pgjsonb_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

depends python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.pass: 'salt'
queue.pgjsonb.db: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
  id SERIAL PRIMARY KEY,
  data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'!
↳ backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

salt.queues.pgjsonb_queue.delete(*queue*, *items*)
Delete an item or items from a queue

salt.queues.pgjsonb_queue.insert(*queue*, *items*)
Add an item or items to a queue

salt.queues.pgjsonb_queue.list_items(*queue*)
List contents of a queue

salt.queues.pgjsonb_queue.list_length(*queue*)
Provide the number of items in a queue

salt.queues.pgjsonb_queue.list_queues()
Return a list of Salt Queues on the Salt Master

salt.queues.pgjsonb_queue.pop(*queue*, *quantity=1*)
Pop one or more or all items from the queue return them.

14.11.2 salt.queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the *sqlite_queue_dir* which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

```

salt.queues.sqlite_queue.delete(queue, items)
    Delete an item or items from a queue
salt.queues.sqlite_queue.insert(queue, items)
    Add an item or items to a queue
salt.queues.sqlite_queue.list_items(queue)
    List contents of a queue
salt.queues.sqlite_queue.list_length(queue)
    Provide the number of items in a queue
salt.queues.sqlite_queue.list_queues()
    Return a list of Salt Queues on the Salt Master
salt.queues.sqlite_queue.pop(queue, quantity=1)
    Pop one or more or all items from the queue return them.

```

14.12 roster modules

<i>ansible</i>	Read in an Ansible inventory file or script
<i>cache</i>	Use the minion cache on the master to derive IP addresses based on minion ID.
<i>cloud</i>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<i>clustershell</i>	This roster resolves hostname in a pdsh/clustershell style.
<i>flat</i>	Read in the roster from a flat file using the renderer system
<i>range</i>	This roster resolves targets from a range server.
<i>scan</i>	Scan a netmask or ipaddr for open ssh ports

14.12.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```

[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
↳port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
↳ansible_ssh_pass='password'

[computers:children]
desktop
servers

```

```
[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh all test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh desktop test.ping
home:
  True
[~]# salt-ssh computers test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": {
    "hosts": [
      "salt.gtmanfred.com"
    ]
  },
  "desktop": {
    "hosts": [
      "home"
    ]
  },
  "computers": {
    "hosts": {},
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 22
      },
      "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 23
      }
    }
  }
}
```

```
}
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

Any of the [groups] or direct hostnames will return. The `all` is special, and returns everything.

```
class salt.roster.ansible.Inventory(tgt, tgt_type='glob', inventory_file='/etc/salt/roster')
    Matcher for static inventory files
```

```
class salt.roster.ansible.Script(tgt, tgt_type='glob', inventory_file='/etc/salt/roster')
    Matcher for Inventory scripts
```

```
salt.roster.ansible.targets(tgt, tgt_type='glob', **kwargs)
    Return the targets from the ansible inventory_file Default: /etc/salt/roster
```

14.12.2 salt.roster.cache

Use the minion cache on the master to derive IP addresses based on minion ID.

Currently only contains logic to return an IPv4 address; does not handle IPv6, or authentication (passwords, keys, etc).

It is possible to configure this roster to prefer a particular type of IP over another. To configure the order, set the `roster_order` in the master config file. The default for this is:

```
roster_order:
- public
- private
- local
```

```
salt.roster.cache.extract_ipv4(roster_order, ipv4)
    Extract the preferred IP address from the ipv4 grain
```

```
salt.roster.cache.targets(tgt, tgt_type='glob', **kwargs)
    Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster
```

14.12.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.extract_ipv4(roster_order, ipv4)`

Extract the preferred IP address from the ipv4 grain

`salt.roster.cloud.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

14.12.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

depends clustershell, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets

14.12.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

`class salt.roster.flat.RosterMatcher(raw, tgt, tgt_type, ipv='ipv4')`

Matcher for the roster data structure

get_data(minion)

Return the configured ip

ret_glob_minions()

Return minions that match via glob

ret_list_minions()

Return minions that match via list

ret_nodegroup_minions()

Return minions which match the special list-only groups defined by ssh_list_nodegroups

ret_pcre_minions()

Return minions that match via pcre

ret_range_minions()

Return minions that are returned by a range query

targets()

Execute the correct tgt_type routine and return

`salt.roster.flat.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

14.12.6 salt.roster.range module

This roster resolves targets from a range server.

depends seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

`salt.roster.range.targets`(*tgt*, *tgt_type*='range', ***kwargs*)

Return the targets from a range query

14.12.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

`class salt.roster.scan.RosterMatcher`(*tgt*, *tgt_type*)

Matcher for the roster data structure

targets()

Return ip addrs based on netmask, sitting in the ``glob" spot because it is the default

`salt.roster.scan.targets`(*tgt*, *tgt_type*='glob', ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

14.13 runner modules

<i>asam</i>	Novell ASAM Runner
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>ddns</i>	Dynamic DNS Runner
<i>doc</i>	A runner module to collect and display the inline documentation from the
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>fileservers</i>	Directly manage the Salt fileserver plugins
<i>git_pillar</i>	Runner module to directly manage the git external pillar
<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This runner helps create encrypted passwords that can be included in pillars.
<i>network</i>	Network tools to run from the Master
<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty
<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors

Continued on next page

Table 14.13 -- continued from previous page

<i>salt</i>	New in version 2016.11.0.
<i>saltutil</i>	Sync custom types to the Master
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>search</i>	Runner frontend to search system
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and servers no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>virt</i>	Control virtual machines via Salt
<i>winrepo</i>	Runner to manage Windows software repo

14.13.1 salt.runners.asam

Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

codeauthor Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

Note: Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.add_platform`(*name*, *platform_set*, *server_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.list_platform_sets`(*server_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.list_platforms`(*server_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.remove_platform`(*name, server_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

14.13.2 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all`(*tgt=None, expr_form='glob'*)

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock`(*role, remote=None, **kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (`gitfs`, `git_pillar`, `winrepo`) which use `gitfs` backend code from `salt.utils.gitfs`.

Note: Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a role of `gitfs` is equivalent to running `salt-run file-server.clear_lock backend=git`.

role Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

type [`update,checkout`] The types of lock to clear. Can be `update`, `checkout`, or both of

et (either comma-separated or as a Python list).

New in version 2015.8.8.

CLI Example:

```
salt-run cache.clear_git_lock git_pillar
```

`salt.runners.cache.clear_grains`(*tgt=None, expr_form='glob'*)

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine` (*tgt=None, expr_form='glob'*)

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func` (*tgt=None, expr_form='glob', clear_mine_func_flag=None*)

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, expr_form='glob'*)

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.grains` (*tgt=None, expr_form='glob', **kwargs*)

Return cached grains of the targeted minions

CLI Example:

```
salt-run cache.grains
```

`salt.runners.cache.mine` (*tgt=None, expr_form='glob', **kwargs*)

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar` (*tgt=None, expr_form='glob', **kwargs*)

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

14.13.3 salt.runners.cloud

The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.action` (*func=None, cloudmap=None, instances=None, provider=None, instance=None, **kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

salt.runners.cloud.create(*provider, instances, opts=None, **kwargs*)
Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance           image=ami-1624987f size=
↳ 't1.micro' ssh_username=ec2-user                     securitygroup=default delvol_on_
↳ destroy=True
```

salt.runners.cloud.destroy(*instances*)
Destroy the named vm(s)

salt.runners.cloud.full_query(*query_type='list_nodes_full'*)
List all available cloud provider data

salt.runners.cloud.list_images(*provider='all'*)
List cloud provider images for the given providers

salt.runners.cloud.list_locations(*provider='all'*)
List cloud provider sizes for the given providers

salt.runners.cloud.list_sizes(*provider='all'*)
List cloud provider sizes for the given providers

salt.runners.cloud.map_run(*path, **kwargs*)
Execute a salt cloud map file

salt.runners.cloud.profile(*prof=None, instances=None, opts=None, **kwargs*)
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

salt.runners.cloud.query(*query_type='list_nodes'*)
List cloud provider data for all providers

salt.runners.cloud.select_query(*query_type='list_nodes_select'*)
List selected nodes

14.13.4 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.runners.ddns.add_host(*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)
Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳ salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.create`(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.delete`(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳0.0.1 5 A
```

`salt.runners.ddns.delete_host`(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳keyring 10.0.0.1 5
```

`salt.runners.ddns.update`(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

Note: If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

14.13.5 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.execution`()

Collect all the `sys.doc` output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.runner`()

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.wheel()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

14.13.6 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

`salt.runners.drac.poweroff` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

`salt.runners.drac.poweron` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

`salt.runners.drac.pxe` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.reboot` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.version` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

14.13.7 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.error` (*name=None*, *message=''*)

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

14.13.8 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

salt.runners.f5.add_pool_member (*lb, name, port, pool_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

salt.runners.f5.check_member_pool (*lb, member, pool_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

salt.runners.f5.check_pool (*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

salt.runners.f5.check_virtualserver (*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

salt.runners.f5.create_pool (*lb, name, method='ROUND_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

`salt.runners.f5.create_vs` (*lb, name, ip, port, protocol, profile, pool_name*)
Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

14.13.9 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.clear_cache` (*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git, hg, svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

backend Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.clear_file_list_cache` (*saltenv=None, backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

saltenv By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'filesserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run filesserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run filesserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run filesserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run filesserver.clear_file_list_cache backend=roots
```

`salt.runners.filesserver.clear_lock`(*backend=None, remote=None*)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git, hg, svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend Only clear the update lock for the specified backend(s).

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a **remote** value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.dir_list(saltenv='base', backend=None)`

Return a list of directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list(saltenv='base', backend=None)`

New in version 2015.5.0.

Return a list of empty directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as `git` and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.envs(backend=None, sources=False)`

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["'roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.file_list` (*saltenv='base', backend=None*)

Return a list of files from the salt fileserver

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.lock` (*backend=None, remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git, hg, svn*).

Note: This will only operate on enabled backends (those configured in *fileserver_backend*).

backend Only set the update lock for the specified backend(s).

remote If not None, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list` (*saltenv='base', backend=None*)

Return a list of symlinked files and dirs

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update` (*backend=None*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=['roots','git']`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

14.13.10 salt.runners.git_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update` (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *new git_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git_pillar remotes. The return data has also changed. For releases 2015.8.3 and earlier, there is no value returned. Starting with 2015.8.4, the return data is a dictionary. If using the *old git_pillar configuration schema*, then the dictionary values will be True if the update completed without error, and False if an error occurred. If using the *new git_pillar configuration schema*, the values will be True only if new commits were fetched, and False if there were errors or no new commits were fetched.

Update one or all configured git_pillar remotes.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos (2015.8.4 and later)
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

14.13.11 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query` (*url, output=True, **kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```

salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST          params='key1=val1&
↳key2=val2'
salt-run http.query http://somelink.com/ method=POST          data='<xml>
↳somecontent</xml>'

```

salt.runners.http.update_ca_bundle (*target=None, source=None, merge_files=None*)
Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```

salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem

```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```

salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem

```

14.13.12 salt.runners.jobs

A convenience system to manage jobs, both active and already run

salt.runners.jobs.active (*display_progress=False*)
Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```

salt-run jobs.active

```

salt.runners.jobs.exit_success (*jid, ext_source=None*)
Check if a job has been executed and exit successfully

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

CLI Example: .. code-block:: bash

```

salt-run jobs.exit_success 20160520145827701627

```

salt.runners.jobs.last_run (*ext_source=None, outputter=None, metadata=None, function=None, target=None, display_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

`salt.runners.jobs.list_job(jid, ext_source=None, display_progress=False)`

List a specific job given by its `jid`

`ext_source` If provided, specifies which external job cache to use.

`display_progress` [False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

`salt.runners.jobs.list_jobs(ext_source=None, outputter=None, search_metadata=None, search_function=None, search_target=None, start_time=None, end_time=None, display_progress=False)`

List all detectable jobs and associated functions

`ext_source` If provided, specifies which external job cache to use.

FILTER OPTIONS

Note: If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

`search_metadata` Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{ "foo": "bar", "baz": "qux" }'
```

`search_function` Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=['test.*', 'pkg.install']
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

`search_target` Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target=['db*', 'myminion']
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

`start_time` Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

`end_time` Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↳ metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:
↳ 00'
```

`salt.runners.jobs.list_jobs_filter`(*count*, *filter_find_job=True*, *ext_source=None*, *output-ter=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

`salt.runners.jobs.lookup_jid`(*jid*, *ext_source=None*, *returned=True*, *missing=False*, *display_progress=False*)

Return the printout from a previously executed job

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

returned [True] If True, include the minions that did return from the command.

New in version 2015.8.0.

missing [False] If True, include the minions that did *not* return from the command.

display_progress [False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

`salt.runners.jobs.print_job`(*jid*, *ext_source=None*)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

14.13.13 salt.runners.launchd

Manage launchd plist files

`salt.runners.launchd.write_launchd_plist`(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

14.13.14 salt.runners.lxc

Control Linux Containers via Salt

depends lxc execution module

`salt.runners.lxc.cloud_init`(*names, host=None, quiet=False, **kwargs*)

Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion to start the container on. Required.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead

`salt.runners.lxc.find_guest`(*name, quiet=False, path=None*)

Returns the host for a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

`salt.runners.lxc.find_guests`(*names, path=None*)

Return a dict of hosts and named guests

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

`salt.runners.lxc.freeze`(*name, quiet=False, path=None*)

Freeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

`salt.runners.lxc.info`(*name, quiet=False, path=None*)

Returns information about a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

`salt.runners.lxc.init`(*names, host=None, saltcloud_mode=False, quiet=False, **kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
  [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
  [template=lxc_template_name] [clone=original name] \
  [profile=lxc_profile] [network_profile=network_profile] \
  [nic=network_profile] [nic_opts=nic_opts] \
  [start=(true|false)] [seed=(true|false)] \
  [install=(true|false)] [config=minion_config] \
  [snapshot=(true|false)]
```

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion on which to initialize the container (**required**)

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation

cpuset cgroups cpuset.
cpushare cgroups cpu shares.
memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

template Name of LXC template on which to base this container
clone Clone this container from an existing container
profile A LXC profile (defined in config or pillar).
network_profile Network profile to use for the container

New in version 2015.5.2.

nic Deprecated since version 2015.5.0: Use `network_profile` instead

nic_opts Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

start Start the newly created container.

seed Seed the container with the minion config and autosign its key. Default: true

install If salt-minion is not already installed, install it. Default: true

config Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.list` (*host=None, quiet=False, path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.purge` (*name, delete_key=True, quiet=False, path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.start` (*name, quiet=False, path=None*)

Start the named container.

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.stop` (*name, quiet=False, path=None*)

Stop the named container.

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.unfreeze` (*name, quiet=False, path=None*)

Unfreeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

14.13.15 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

salt.runners.manage.alived (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

salt.runners.manage.allowed (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

salt.runners.manage.bootstrap (*version='develop', script=None, hosts='', root_user=False, script_args='', roster='flat', ssh_user=None, ssh_password=None, ssh_priv_key=None, tmp_dir='/tmp/.bootstrap', http_backend='tornado'*)

Bootstrap minions with salt-bootstrap

version [develop] Git tag of version to install

script [<https://bootstrap.saltstack.com>] URL containing the script to execute

hosts Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

root_user [False] Prepend root@ to each host. Default changed in Salt 2016.11.0 from True to False.

Changed in version 2016.11.0.

Deprecated since version 2016.11.0.

script_args Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

roster [flat] The roster to use for Salt SSH. More information about roster files can be found in [Salt's Roster Documentation](#).

A full list of roster types, see the [builtin roster modules](#) documentation.

New in version 2016.11.0.

ssh_user If user isn't found in the roster, a default SSH user can be set here. Keep in mind that ssh_user will not override the roster user value if it is already defined.

New in version 2016.11.0.

ssh_password If `passwd` isn't found in the roster, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

ssh_privkey If `priv` isn't found in the roster, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

tmp_dir [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

http_backend [tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script=
↳ 'https://bootstrap.saltstack.com/develop'
salt-run manage.bootstrap hosts='ec2-user@host1,ec2-user@host2' root_
↳ user=False
```

`salt.runners.manage.bootstrap_psexec` (`hosts=''`, `master=None`, `version=None`, `arch='win32'`, `installer_url=None`, `username=None`, `password=None`)

Bootstrap Windows minions via PsExec.

hosts Comma separated list of hosts to deploy the Windows Salt minion.

master Address of the Salt master passed as an argument to the installer.

version Point release of installer to download. Defaults to the most recent.

arch Architecture of installer to download. Defaults to win32.

installer_url URL of minion installer executable. Defaults to the latest version from <https://repo.saltstack.com/windows/>

username Optional user name for login on remote computer.

password Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↳ 'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↳ exampledomain/salt-installer.exe'
```

`salt.runners.manage.down` (`removekeys=False`, `tgt='*'`, `expr_form='glob'`)

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" expr_form="nodegroup"
```

`salt.runners.manage.get_stats` (`estate=None`, `stack='road'`)

Print the stack stats

estate [None] The name of the target estate. Master stats would be requested by default

stack ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.

CLI Example:

```
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

`salt.runners.manage.joined` (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.key_regen`()

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.lane_stats` (*estate=None*)

Print the estate manor lane stack stats

estate [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.lane_stats [estate=alpha_minion]
```

`salt.runners.manage.list_not_state` (*subset=None, show_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.list_state` (*subset=None, show_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
state [`'available'`] Show minions being in specific state that is one of `'available'`, `'joined'`, `'allowed'`, `'alived'` or `'reaped'`.

CLI Example:

```
salt-run manage.list_state
```

`salt.runners.manage.not_alived`(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_alived
```

`salt.runners.manage.not_allowed`(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_allowed
```

`salt.runners.manage.not_joined`(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_joined
```

`salt.runners.manage.not_present`(*subset=None, show_ipv4=False*)

New in version 2015.5.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_present
```

`salt.runners.manage.not_reaped`(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.present` (*subset=None, show_ipv4=False*)

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.reaped` (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.road_stats` (*estate=None*)

Print the estate road stack stats

estate [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.road_stats [estate=alpha_minion]
```

`salt.runners.manage.safe_accept` (*target, expr_form='glob'*)

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 expr_form=list
```

`salt.runners.manage.status` (*output=True, tgt='*', expr_form='glob'*)

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" expr_form="nodegroup"
```

`salt.runners.manage.up` (*tgt='*', expr_form='glob'*)

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" expr_form="nodegroup"
```

`salt.runners.manage.versions` ()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

14.13.16 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get`(*tgt, fun, tgt_type='glob'*)

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

14.13.17 salt.runners.nacl

This runner helps create encrypted passwords that can be included in pillars.

depends libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

The following configurations can be defined in the master config so your users can create encrypted passwords using the runner `nacl`:

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
  key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
  keyfile: /root/.nacl
```

Now with the config in the master you can use the runner `nacl` like:

```
salt-run nacl.enc 'data'
```

`salt.runners.nacl.dec`(*data, **kwargs*)

Takes a key generated from `nacl.keygen` and decrypt some data.

CLI Examples:

```
salt-run nacl.dec pEXHQM6cuaF7A=
salt-run nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-run nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
↳nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

`salt.runners.nacl.enc`(*data, **kwargs*)

Takes a key generated from `nacl.keygen` and encrypt some data.

CLI Examples:

```
salt-run nacl.enc datatoenc
salt-run nacl.enc datatoenc keyfile=/root/.nacl
salt-run nacl.enc datatoenc key='cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

`salt.runners.nacl.keygen`(*keyfile=None*)

Use `libnacl` to generate a private key

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen keyfile=/root/.nacl
salt-run --out=newline_values_only nacl.keygen > /root/.nacl
```

14.13.18 salt.runners.network

Network tools to run from the Master

`salt.runners.network.wol` (*mac*, *bcast*=`255.255.255.255`, *destport*=9)
Send a ``Magic Packet`` to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

`salt.runners.network.wolllist` (*maclist*, *bcast*=`255.255.255.255`, *destport*=9)
Send a ``Magic Packet`` to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wolllist '/path/to/maclist'
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
```

14.13.19 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master config.

For example:

```
my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rffWf2214
  pagerduty.subdomain: mysubdomain
```

`salt.runners.pagerduty.create_event` (*service_key*=None, *description*=None, *details*=None, *incident_key*=None, *profile*=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>
  ↪profile=my-pagerduty-account
```

The following parameters are required:

service_key This key can be found by using `pagerduty.list_services`.

description This is a short description of the event.

details This can be a more detailed description of the event.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.list_escalation_policies` (*profile*=None, *api_key*=None)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

salt.runners.pagerduty.list_incidents (*profile=None, api_key=None*)

List incidents belonging to this account

CLI Example:

```
salt-run pagerduty.list_incidents my-pagerduty-account
```

salt.runners.pagerduty.list_maintenance_windows (*profile=None, api_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

salt.runners.pagerduty.list_policies (*profile=None, api_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies
my-pagerduty-account
```

salt.runners.pagerduty.list_schedules (*profile=None, api_key=None*)

List schedules belonging to this account

CLI Example:

```
salt-run pagerduty.list_schedules my-pagerduty-account
```

salt.runners.pagerduty.list_services (*profile=None, api_key=None*)

List services belonging to this account

CLI Example:

```
salt-run pagerduty.list_services my-pagerduty-account
```

salt.runners.pagerduty.list_users (*profile=None, api_key=None*)

List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

salt.runners.pagerduty.list_windows (*profile=None, api_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

14.13.20 salt.runners.pillar

Functions to interact with the pillar compiler on the master

salt.runners.pillar.show_pillar (*minion='*', **kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `*`.

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for `dev` pillar environment:

```
salt-run pillar.show_pillar 'saltenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.show_top(minion=None, saltenv='base')`

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

14.13.21 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.list_upgrades(jid, style='group', outputter='nested', ext_source=None)`

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

14.13.22 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the `process_queue` runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

`salt.runners.queue.delete` (*queue*, *items*, *backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["'item1', 'item2', 'item3']"
```

`salt.runners.queue.insert` (*queue*, *items*, *backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["'item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["'item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.list_items` (*queue*, *backend='sqlite'*)

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.list_length` (*queue*, *backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.list_queues` (*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.pop` (*queue*, *quantity=1*, *backend='sqlite'*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.process_queue` (*queue*, *quantity=1*, *backend='sqlite'*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

14.13.23 salt.runners.reactor

A convenience system to manage reactors

`salt.runners.reactor.add` (*event*, *reactors*, *saltenv='base'*, *test=None*)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↪'
```

`salt.runners.reactor.delete` (*event*, *saltenv='base'*, *test=None*)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.list` (*saltenv='base'*, *test=None*)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

14.13.24 salt.runners.salt

New in version 2016.11.0.

This runner makes Salt's execution modules available on the salt master. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd` (*fun*, **args*, ***kwargs*)

Execute *fun* with the given *args* and *kwargs*. Parameter *fun* should be the string *name* of the execution module to call.

Note that execution modules will be *loaded every time* this function is called.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

14.13.25 salt.runners.saltutil

Sync custom types to the Master

New in version 2016.3.0.

salt.runners.saltutil.sync_all(*saltenv='base'*)

Sync all custom types

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_all
```

salt.runners.saltutil.sync_engines(*saltenv='base'*)

Sync engines from `salt://_engines` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_engines
```

salt.runners.saltutil.sync_grains(*saltenv='base'*)

Sync grains modules from `salt://_grains` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_grains
```

salt.runners.saltutil.sync_modules(*saltenv='base'*)

Sync execution modules from `salt://_modules` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_modules
```

salt.runners.saltutil.sync_output(*saltenv='base'*)

Sync output modules from `salt://_output` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_output
```

salt.runners.saltutil.sync_pillar(*saltenv='base'*)

Sync pillar modules from `salt://_pillar` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_pillar
```

salt.runners.saltutil.sync_proxymodules (*saltenv='base'*)

Sync proxy modules from `salt://_proxy` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_proxy
```

salt.runners.saltutil.sync_queues (*saltenv='base'*)

Sync queue modules from `salt://_queues` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_queues
```

salt.runners.saltutil.sync_renderers (*saltenv='base'*)

Sync renderer modules from `salt://_renderers` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_renderers
```

salt.runners.saltutil.sync_returners (*saltenv='base'*)

Sync returner modules from `salt://_returners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_returners
```

salt.runners.saltutil.sync_runners (*saltenv='base'*)

Sync runners from `salt://_runners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_runners
```

salt.runners.saltutil.sync_states (*saltenv='base'*)

Sync state modules from `salt://_states` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_states
```

salt.runners.saltutil.sync_utils (*saltenv='base'*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv='base'*)

Sync wheel modules from `salt://_wheel` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_wheel
```

14.13.26 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.set` (*uri, value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

14.13.27 salt.runners.search

Runner frontend to search system

`salt.runners.search.query` (*term*)

Query the search system

CLI Example:

```
salt-run search.query foo
```

14.13.28 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

codeauthor Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com
    username: "testuser"
    password: "verybadpass"
  spacewalk02.domain.com
    username: "testuser"
    password: "verybadpass"
```

Note: Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

`salt.runners.spacewalk.unregister` (*name*, *server_url*)

To unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

14.13.29 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd` (*tgt*, *fun*, *arg=()*, *timeout=None*, *expr_form='glob'*, *kwarg=None*)

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

A wrapper around the `SSHClient.cmd` method.

14.13.30 salt.runners.state

Execute orchestration functions

`salt.runners.state.event` (*tagmatch='**, *count=-1*, *quiet=False*, *sock_dir=None*, *pretty=False*, *node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\  
  salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \\  
  salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\  
  salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\  
  salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
  echo $tag
  echo $data | jq -colour-output .
done
```

See also:

See <https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh> for an example of usage within a shell script.

`salt.runners.state.orchestrate` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *orchestration_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

`salt.runners.state.orchestrate_high` (*data*, *test*=None, *queue*=False, *pillar*=None, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
  stage_one:
    {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
  stage_two:
    {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
      require: [{salt: stage_one}],
    }]},
}'
```

`salt.runners.state.orchestrate_single`(*fun*, *name*, *test=None*, *queue=False*, *pillar=None*, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

14.13.31 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *``some of these things are not like the others...''* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff`(**args*, ***kwargs*)

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the *``diffs''* as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
                  <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the *``differences of files''*)

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash`(**args*, ***kwargs*)

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
    <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an ``outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

14.13.32 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for `private` keynames.

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

`salt.runners.test.sleep(s_time=10)`

Sleep t seconds, then return True

`salt.runners.test.stdout_print()`

Print `foo` and return `bar`

`salt.runners.test.stream()`

Return True

14.13.33 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.generate_min(extra_mods='', overwrite=False, so_mods='', python2_bin='python2', python3_bin='python3')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

14.13.34 salt.runners.virt

Control virtual machines via Salt

salt.runners.virt.force_off(*name*)

Force power down the named virtual machine

salt.runners.virt.host_info(*host=None*)

Return information about the host connected to this master

salt.runners.virt.init(*name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable_vnc=False*)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

name The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

cpu The number of cpus to allocate to this new virtual machine.

mem The amount of memory to allocate tot his virtual machine. The number is interpreted in megabytes.

image The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

hypervisor The hypervisor to use for the new virtual machine. Default is `kvm`.

host The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

seed Set to False to prevent Salt from seeding the new virtual machine.

nic The nic profile to use, defaults to the ``default`` nic profile which assumes a single network interface per VM associated with the ``br0`` bridge on the master.

install Set to False to prevent Salt from installing a minion on the new VM before it spins up.

disk The disk profile to use

saltenv The Salt environment to use

salt.runners.virt.list(*host=None, quiet=False, hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

salt.runners.virt.migrate(*name, target=''*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

salt.runners.virt.next_host()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most ``available`` next host.

salt.runners.virt.pause(*name*)

Pause the named VM

salt.runners.virt.purge(*name, delete_key=True*)

Destroy the named VM

salt.runners.virt.query(*host=None, quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

`salt.runners.virt.reset(name)`
Force power down and restart an existing VM

`salt.runners.virt.resume(name)`
Resume a paused VM

`salt.runners.virt.start(name)`
Start a named virtual machine

`salt.runners.virt.vm_info(name, quiet=False)`
Return the information on the named VM

14.13.35 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.genrepo(opts=None, fire_event=True)`
Generate winrepo_cache file based on sls files in the winrepo_dir
opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.
fire_event [True] Fire an event on failure. Only supported on the master.
CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.update_git_repos(opts=None, clean=False, masterless=False)`
Checkout git repos containing Windows Software Package Definitions
opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.
clean [False] Clean repo cachedirs which are not configured under `winrepo_remoses`.

Warning: This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

14.14 sdb modules

<code>confidant</code>	An SDB module for getting credentials from confidant.
<code>consul</code>	Consul sdb Module
<code>couchdb</code>	CouchDB sdb Module
<code>etcd_db</code>	etcd Database Module
<code>keyring_db</code>	Keyring Database Module
<code>memcached</code>	Memcached sdb Module
<code>rest</code>	Generic REST API SDB Module
<code>sqlite3</code>	SQLite sdb Module

Table 14.14 -- continued from previous page

vault

Vault SDB Module

14.14.1 salt.sdb.confidant

An SDB module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via sdb in the minion config:

```

confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1

```

`depends` confidant-common, confidant-client

Module Documentation

`salt.sdb.confidant.get`(*key*, *profile=None*)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get `sdb://confidant/credentials`
```

Valid keys are: `credentials`, `credentials_metadata`, `result`. `credentials` returns a dict of joined `credential_pairs`, `credentials_metadata` returns a dict of metadata relevant to the credentials mapped to the confidant service, and `result` returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If `result` is false, the data in `credentials` or `credentials_metadata` can't be trusted.

14.14.2 salt.sdb.consul module

Consul sdb Module

`maintainer` SaltStack

`maturity` New

platform all

This module allows access to Consul using an `sdb://` URI

Like all `sdb` modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

The `driver` refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

```
salt.sdb.consul.get_conn(profile)
    Return a client object for accessing consul
```

14.14.3 salt.sdb.couchdb

CouchDB `sdb` Module

maintainer SaltStack
maturity New
depends python2-couchdb
platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's `sdb` system to allow for inserts and retrievals using the `sdb://` prefix in salt configuration files.

To use the couchbase `sdb` module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an `sdb://` URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

```
salt.sdb.couchdb.get(key, profile=None)
    Get a value from couchdb by id
```

```
salt.sdb.couchdb.set(key, value, profile=None)
    Set a key/value pair in couchdb
```

14.14.4 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack
maturity New
depends python-etcd

platform all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.delete`(*key*, *service=None*, *profile=None*)

Get a value from the etcd service

`salt.sdb.etcd_db.get`(*key*, *service=None*, *profile=None*)

Get a value from the etcd service

`salt.sdb.etcd_db.set`(*key*, *value*, *service=None*, *profile=None*)

Set a key/value pair in the etcd service

14.14.5 salt.sdb.keyring_db

Keyring Database Module

maintainer SaltStack

maturity New

depends keyring

platform all

This module allows access to the keyring package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the ``Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The `keyczar` backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see [keyring](https://pypi.python.org/pypi/keyring):

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

`salt.sdb.keyring_db.get(key, service=None, profile=None)`

Get a value from a keyring service

`salt.sdb.keyring_db.set(key, value, service=None, profile=None)`

Set a key/value pair in a keyring service

14.14.6 salt.sdb.memcached

Memcached sdb Module

maintainer SaltStack

maturity New

depends python-memcached

platform all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

`salt.sdb.memcached.get(key, profile=None)`

Get a value from memcached

`salt.sdb.memcached.set(key, value, profile=None)`

Set a key/value pair in memcached

14.14.7 salt.sdb.rest module

Generic REST API SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
  backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
  params:
    user: myuser
```

`salt.sdb.rest.get(key, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.query(key, value=None, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.set(key, value, service=None, profile=None)`

Set a key/value pair in the REST interface

14.14.8 salt.sdb.sqlite3

SQLite sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to sqlite3 using an `sdb://URI`

Like all sdb modules, the `sqlite3` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the `sqlite3` module, `database` refers to the `sqlite3` database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

`salt.sdb.sqlite3.get(key, profile=None)`

Get a value from `sqlite3`

`salt.sdb.sqlite3.set(key, value, profile=None)`

Set a key/value pair in `sqlite3`

14.14.9 salt.sdb.vault module

Vault SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://URI`.

Like all sdb modules, the `vault` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myvault:
  driver: vault
  vault.host: 127.0.0.1
  vault.port: 8200
  vault.scheme: http # Optional; default is https
  vault.token: 012356789abcdef # Required, unless set in environment
```

The `driver` refers to the `vault` module, `vault.host` refers to the host that is hosting vault and `vault.port` refers to the port on that host. A vault token is also required. It may be set statically, as above, or as an environment variable:

```
$ export VAULT_TOKEN=0123456789abcdef
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords?mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

```
salt.sdb.vault.get(key, profile=None)
```

Get a value from the vault service

```
salt.sdb.vault.set(key, value, profile=None)
```

Set a key/value pair in the vault service

14.15 serializer modules

<code>configparser</code>	<code>salt.serializers.configparser</code>
<code>json</code>	<code>salt.serializers.json</code>
<code>msgpack</code>	<code>salt.serializers.msgpack</code>
<code>python</code>	<code>salt.serializers.python</code>
<code>yaml</code>	<code>salt.serializers.yaml</code>
<code>yamlex</code>	<code>salt.serializers.yamlex</code>

14.15.1 salt.serializers.configparser module

`salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

```
salt.serializers.configparser.deserialize(stream_or_string, **options)
```

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

```
salt.serializers.configparser.serialize(obj, **options)
```

Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

14.15.2 salt.serializers.json

`salt.serializers.json`

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.deserialize(stream_or_string, **options)`
Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`
Serialize Python data to JSON.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

14.15.3 salt.serializers.msgpack

`salt.serializers.msgpack`

Implements MsgPack serializer.

`salt.serializers.msgpack.deserialize(stream_or_string, **options)`
Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

`salt.serializers.msgpack.serialize(obj, **options)`
Serialize Python data to MsgPack.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

14.15.4 salt.serializers.python module

`salt.serializers.python`

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.serialize(obj, **options)`
Serialize Python data to a Python string representation (via pprint.format)

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to pprint.format

14.15.5 salt.serializers.yaml

salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

`salt.serializers.yaml.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yaml.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

14.15.6 salt.serializers.yamlex

salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file `states.sls` has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an `OrderedDict`

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

`yamlex.__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

14.16 state modules

acme

ACME / Let's Encrypt certificate management state

Continued on next page

Table 14.16 -- continued from previous page

<i>alias</i>	Configuration of email aliases
<i>alternatives</i>	Configuration of the alternatives system
<i>apache</i>	Apache state
<i>apache_conf</i>	Manage Apache Confs
<i>apache_module</i>	Manage Apache Modules
<i>apache_site</i>	Manage Apache Sites
<i>aptpkg</i>	Package management operations specific to APT- and DEB-based systems
<i>archive</i>	Extract an archive
<i>artifactory</i>	This state downloads artifacts from artifactory.
<i>at</i>	Configuration disposable regularly scheduled tasks for at.
<i>augeas</i>	Configuration management using Augeas
<i>aws_sqs</i>	Manage SQS Queues
<i>beacon</i>	Management of the Salt beacons
<i>bigip</i>	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
<i>blockdev</i>	Management of Block Devices
<i>boto_apigateway</i>	Manage Apigateway Rest APIs
<i>boto_asg</i>	Manage Autoscale Groups
<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudtrail</i>	Manage CloudTrail Objects
<i>boto_cloudwatch_alarm</i>	Manage Cloudwatch alarms
<i>boto_cognitoidentity</i>	Manage CognitoIdentity Functions
<i>boto_datapipeline</i>	Manage Data Pipelines
<i>boto_dynamodb</i>	Manage DynamoDB Tables
<i>boto_ec2</i>	Manage EC2
<i>boto_elasticache</i>	Manage Elasticache
<i>boto_elasticsearch_domain</i>	Manage Elasticsearch Domains
<i>boto_elb</i>	Manage ELBs
<i>boto_iam</i>	Manage IAM objects
<i>boto_iam_role</i>	Manage IAM roles
<i>boto_iot</i>	Manage IoT Objects
<i>boto_kms</i>	Manage KMS keys, key policies and grants.
<i>boto_lambda</i>	Manage Lambda Functions
<i>boto_lc</i>	Manage Launch Configurations
<i>boto_rds</i>	Manage RDSs
<i>boto_route53</i>	Manage Route53 records
<i>boto_s3_bucket</i>	Manage S3 Buckets
<i>boto_secgroup</i>	Manage Security Groups
<i>boto_sns</i>	Manage SNS Topics
<i>boto_sqs</i>	Manage SQS Queues
<i>boto_vpc</i>	Manage VPCs
<i>bower</i>	Installation of Bower Packages
<i>cabal</i>	Installation of Cabal Packages
<i>chef</i>	Execute Chef client runs
<i>chocolatey</i>	Manage Chocolatey package installs ..
<i>chronos_job</i>	Configure Chronos jobs via a salt proxy.
<i>cloud</i>	Using states instead of maps to deploy clouds
<i>cmd</i>	Execution of arbitrary commands
<i>composer</i>	Installation of Composer Packages

Table 14.16 -- continued from previous page

<i>cron</i>	Management of cron, the Unix command scheduler
<i>cyg</i>	Installation of Cygwin packages.
<i>ddns</i>	Dynamic DNS updates
<i>debconfmod</i>	Management of debconf selections
<i>dellchassis</i>	Manage chassis via Salt Proxies.
<i>disk</i>	Disk monitoring state
<i>dockerio</i>	Manage Docker containers
<i>dockerng</i>	Management of Docker containers
<i>drac</i>	Management of Dell DRAC
<i>elasticsearch_index</i>	State module to manage Elasticsearch indices
<i>elasticsearch_index_template</i>	State module to manage Elasticsearch index templates
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Management of Gentoo configuration using eselect
<i>etcd_mod</i>	Manage etcd Keys
<i>esxi</i>	Manage VMware ESXi Hosts.
<i>event</i>	Send events through Salt's event system during state runs
<i>file</i>	Operations on regular files, special files, directories, and symlinks
<i>firewall</i>	State to check firewall configurations ..
<i>firewalld</i>	Management of firewalld
<i>gem</i>	Installation of Ruby modules packaged as gems
<i>git</i>	States to manage git repositories and git configuration
<i>github</i>	Github User State Module
<i>glance</i>	Managing Images in OpenStack Glance
<i>glusterfs</i>	Manage GlusterFS pool.
<i>gnomedesktop</i>	Configuration of the GNOME desktop
<i>gpg</i>	Management of the GPG keychains
<i>grafana</i>	Manage Grafana Dashboards
<i>grafana_dashboard</i>	Manage Grafana v2.0 Dashboards
<i>grafana_datasource</i>	Manage Grafana v2.0 data sources
<i>grains</i>	Manage grains on the minion
<i>group</i>	Management of user groups
<i>hg</i>	Interaction with Mercurial repositories
<i>hipchat</i>	Send a message to Hipchat
<i>host</i>	Management of addresses and names in hosts file
<i>htpasswd</i>	Support for htpasswd module.
<i>http</i>	HTTP monitoring states
<i>ifttt</i>	Trigger an event in IFTTT
<i>incron</i>	Management of incron, the inotify cron
<i>influxdb_database</i>	Management of Influxdb databases
<i>influxdb_user</i>	Management of InfluxDB users
<i>infoblox</i>	states for infoblox stuff
<i>ini_manage</i>	Manage ini files
<i>ipmi</i>	Manage IPMI devices over LAN
<i>ipset</i>	Management of ipsets
<i>iptables</i>	Management of iptables
<i>jboss7</i>	Manage JBoss 7 Application Server via CLI interface
<i>jenkins</i>	Management of Jenkins
<i>junos</i>	State modules to interact with Junos devices.

14.16.1 salt.states.acme module

ACME / Let's Encrypt certificate management state

See also the module documentation

```

reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab

```

`salt.states.acme.cert` (*name*, *aliases=None*, *email=None*, *webroot=None*, *test_cert=False*, *renew=None*, *keysize=None*, *server=None*, *owner='root'*, *group='root'*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or full path to webroot used for authentication
- **test_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with `server`)
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of private key
- **group** -- group of private key

14.16.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

salt.states.alias.absent(*name*)

Ensure that the named alias is absent
name The alias to remove

salt.states.alias.present(*name, target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

name The local user/address to assign an alias to
target The forwarding address

14.16.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

salt.states.alternatives.auto(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

name is the master name for this link group (e.g. pager)

`salt.states.alternatives.install(name, link, path, priority)`

Install new alternative for defined <name>

name is the master name for this link group (e.g. pager)

link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

priority is an integer; options with higher numbers have higher priority in automatic mode.

`salt.states.alternatives.remove(name, path)`

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

name is the master name for this link group (e.g. pager)

path is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.set(name, path)`

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

name is the master name for this link group (e.g. pager)

path is the location of one of the alternative target files. (e.g. /usr/bin/less)

14.16.4 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
          AllowOverride: All
```

14.16.5 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.disable(*name*)
Ensure an Apache conf is disabled.

Warning: This function is deprecated and will be removed in Salt Nitrogen.

name Name of the Apache conf

salt.states.apache_conf.disabled(*name*)
Ensure an Apache conf is disabled.
name Name of the Apache conf

salt.states.apache_conf.enable(*name*)
Ensure an Apache conf is enabled.

Warning: This function is deprecated and will be removed in Salt Nitrogen.

name Name of the Apache conf

salt.states.apache_conf.enabled(*name*)
Ensure an Apache conf is enabled.
name Name of the Apache conf

14.16.6 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

salt.states.apache_module.disable(*name*)
Ensure an Apache module is disabled.

Deprecated since version 2016.3.0.

name Name of the Apache module

`salt.states.apache_module.disabled(name)`

Ensure an Apache module is disabled.

New in version 2016.3.0.

name Name of the Apache module

`salt.states.apache_module.enable(name)`

Ensure an Apache module is enabled. This function is deprecated and will be removed in Salt Nitrogen. Please use the `enabled` state function instead.

Deprecated since version 2016.3.0.

name Name of the Apache module

`salt.states.apache_module.enabled(name)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

name Name of the Apache module

14.16.7 salt.states.apache_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default
```

```
Disable default site:
  apache_site.disabled:
    - name: default
```

`salt.states.apache_site.disable(name)`

Ensure an Apache site is disabled.

Warning: This function is deprecated and will be removed in Salt Nitrogen.

name Name of the Apache site

`salt.states.apache_site.disabled(name)`

Ensure an Apache site is disabled.

name Name of the Apache site

`salt.states.apache_site.enable(name)`

Ensure an Apache site is enabled.

Warning: This function is deprecated and will be removed in Salt Nitrogen.

name Name of the Apache site

`salt.states.apache_site.enabled(name)`
 Ensure an Apache site is enabled.
name Name of the Apache site

14.16.8 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.held(name)`
 Set package in 'hold' state, meaning it will not be upgraded.
name The name of the package, e.g., 'tmux'

14.16.9 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, keep=False, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

Important: ZIP Archive Handling

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Password-protected ZIP Archives* (only supported by `archive.unzip`) - `archive.cmd_unzip` is not permitted to extract password-protected ZIP archives, as attempting to do so will cause the `unzip` command to block on user input. The `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed. If `use_cmd_unzip` is specified and set to `True`, then the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```

/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False

```

name Directory into which the archive should be extracted

source Archive to be extracted

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

source_hash Hash of source file, or file with list of hash-to-file mappings

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```

foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5

```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

source_hash_update Set this to `True` if archive should be extracted if `source_hash` has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

skip_verify [`False`] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

password For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

options For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the `tar/zip` command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion's OS.

New in version 2016.11.0: The `tar_options` and `zip_options` parameters have been deprecated in favor of a single argument name.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

tar_options Deprecated since version 2016.11.0: Use `options` instead.

zip_options New in version 2016.3.1.

Deprecated since version 2016.11.0: Use `options` instead.

list_options For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` ``just works''. Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

force [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option *very* carefully.

New in version 2016.11.0.

overwrite [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

New in version 2016.11.1.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and

conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

- keep** [False] For source archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. After extraction, these source archives will be removed unless this argument is set to `True`.
- trim_output** [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

- use_cmd_unzip** [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

- extract_perms** [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

- enforce_toplevel** [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

- enforce_ownership_on** When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the `name` argument.

New in version 2016.11.0.

- archive_format** One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument.

Examples

1.tar with `lmza` (i.e. `xz`) compression:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      ↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2.tar archive with flag for verbose output, and enforcement of `user/group` ownership:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      ↪server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

```

- tar_options: v
- user: foo
- group: foo

```

3.tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
      ↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True

```

14.16.10 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded` (*name, artifact, target_dir='/tmp', target_file=None*)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:

- `artifactory_url`: URL of the artifactory instance
- `repository`: Repository in artifactory
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier .. `versionadded:: 2015.8.0`
- **version: Version** One of the following: - Version to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: Artifactory username .. `versionadded:: 2015.8.0`
- `password`: Artifactory password .. `versionadded:: 2015.8.0`

target_dir Directory where the artifact should be downloaded. By default it is downloaded to `/tmp` directory.

target_file Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:

```

```

artifactory_url: http://artifactory.intranet.example.com/artifactory
repository: 'libs-release-local'
artifact_id: 'module'
group_id: 'com.company.module'
packaging: 'jar'
classifier: 'sources'
version: '1.0'
- target_dir: /opt/jboss7/modules/com/company/lib

```

14.16.11 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name, jobid=None, **kwargs*)

Remove a job from queue The `kwargs` can include hour. minute. day. month. year

limit Target range

tag Job's tag

runas Runs user-specified jobs

```

example1:
  at.absent:
    - limit: all

```

```

example2:
  at.absent:
    - limit: all
    - year: 13

```

```

example3:
  at.absent:
    - limit: all
    - tag: rose
    - runas: jim

```

```

example4:
  at.absent:
    - limit: all
    - tag: rose
    - day: 13
    - hour: 16

```

`salt.states.at.present` (*name, timespec, tag=None, user=None, job=None*)

Add a job to queue.

job Command to run.

timespec The `timespec` follows the format documented in the at(1) manpage.

tag Make a tag for the job.

user The user to run the at job

New in version 2014.1.4.

```

rose:
  at.present:
    - job: 'echo "I love saltstack" > love'

```

```
- timespec: '9:09 11/09/13'
- tag: love
- user: jam
```

14.16.12 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with `python-augeas`, causing the `augeas` module to fail to import. If the minion has the `augeas` module installed, and the state fails with a comment saying that the state is unavailable, first restart the `salt-minion` service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change`(*name*, *context=None*, *changes=None*, *lens=None*, *load_path=None*, ***kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name

context A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary `augeas` path). This is used to avoid duplicating the file name for each item in the `changes` list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

lens The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard `load_path` and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

Note: Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
  augeas.change:
    - lens: redis
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

Note: Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
  augeas.change:
    - lens: services
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] zabbix-agent
      - set service-name[. = 'zabbix-agent']/#comment "Zabbix Agent service"
      - set service-name[. = 'zabbix-agent']/port 10050
      - set service-name[. = 'zabbix-agent']/protocol tcp
      - rm service-name[. = 'im-obsolete']
    - unless: grep "zabbix-agent" /etc/services
```

Warning: Don't forget the `unless` here, otherwise a new entry will be added every time this state is run.

14.16.13 `salt.states.aws_sqs`

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```
myqueue:
  aws_sqs.exists:
    - region: eu-west-1
```

`salt.states.aws_sqs.absent` (*name, region, user=None, opts=False*)

Remove the named SQS queue if it exists.

name Name of the SQS queue.

region Region to remove the queue from

user Name of the user performing the SQS operations

opts Include additional arguments and options to the aws command line

`salt.states.aws_sqs.exists` (*name, region, user=None, opts=False*)

Ensure the SQS queue exists.

name Name of the SQS queue.

region Region to create the queue

user Name of the user performing the SQS operations

opts Include additional arguments and options to the aws command line

14.16.14 `salt.states.beacon`

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - enable: False
    - salt-master: running
    - apache2: stopped

sh:
  beacon.present:

load:
  beacon.present:
    - 1m:
      - 0.0
      - 2.0
    - 5m:
      - 0.0
      - 1.5
    - 15m:
```

```
- 0.1
- 1.0
```

`salt.states.beacon.absent`(*name*, ***kwargs*)

Ensure beacon is absent.

name The name of the beacon ensured absent.

`salt.states.beacon.disabled`(*name*, ***kwargs*)

Disable a beacon.

name The name of the beacon to enable.

`salt.states.beacon.enabled`(*name*, ***kwargs*)

Enable a beacon.

name The name of the beacon to enable.

`salt.states.beacon.present`(*name*, ***kwargs*)

Ensure beacon is configured with the included beacon data.

name The name of the beacon ensure is configured.

14.16.15 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5_bigip_11.6

`salt.states.bigip.add_pool_member`(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The member to add to the pool

`salt.states.bigip.create_monitor`(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node`(*hostname*, *username*, *password*, *name*, *address*)

Create a new node if it does not already exist.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to create

address The address of the node

```

salt.states.bigip.create_pool(hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

```

Create a new node if it does not already exist.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to create

members List of members to be added to the pool

salt.states.bigip.delete_monitor (*hostname, username, password, monitor_type, name*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.delete_node (*hostname, username, password, name*)

Delete an existing node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node which will be deleted.

salt.states.bigip.delete_pool (*hostname, username, password, name*)

Delete an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool which will be deleted

salt.states.bigip.delete_pool_member (*hostname, username, password, name, member*)

Delete an existing pool member.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to be modified

member The name of the member to delete from the pool

salt.states.bigip.delete_profile (*hostname, username, password, profile_type, name*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to create

name The name of the profile to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.delete_virtual (*hostname, username, password, name*)

Delete an existing virtual.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual which will be deleted

`salt.states.bigip.list_monitor` (*hostname, username, password, monitor_type, name*)

A function to list an existing monitor.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to list
name The name of the monitor to list

`salt.states.bigip.list_node` (*hostname, username, password, name*)

A function to connect to a bigip device and list a specific node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list.

`salt.states.bigip.list_pool` (*hostname, username, password, name*)

A function to connect to a bigip device and list a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list.

`salt.states.bigip.list_profile` (*hostname, username, password, profile_type, name*)

A function to list an existing profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to list
name The name of the profile to list

`salt.states.bigip.list_virtual` (*hostname, username, password, name*)

A function to list a specific virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to list

`salt.states.bigip.manage_monitor` (*hostname, username, password, monitor_type, name, **kwargs*)

Create a new monitor if a monitor of this type and name does not already exist. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.manage_node`(*hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None*)

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

salt.states.bigip.manage_pool_members (*hostname, username, password, name, members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members list of pool members to manage.

salt.states.bigip.manage_profile (*hostname, username, password, profile_type, name, **kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.manage_virtual (*hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None*)

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create

`salt.states.bigip.modify_monitor` (*hostname*, *username*, *password*, *monitor_type*, *name*,
***kwargs*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None,
                             description=None, dynamic_ratio=None, logging=None, mon-
                             itor=None, rate_limit=None, ratio=None, session=None,
                             node_state=None)
```

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to modify

connection_limit [integer]

description [string]

dynamic_ratio [integer]

logging [enabled | disabled]

monitor [[name] | none | default]

rate_limit [integer]

ratio [integer]

session [user-enabled | user-disabled]

node_state (state) [user-down | user-up]

```
salt.states.bigip.modify_pool(hostname, username, password, name, al-
                              low_nat=None, allow_snat=None, description=None, gate-
                              way_failsafe_device=None, ignore_persisted_weight=None,
                              ip_tos_to_client=None, ip_tos_to_server=None,

14.16.16 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.formatted`(*name*, *fs_type*='ext4', *force*=False, ***kwargs*)

Manage filesystems of partitions.

name The name of the block device

fs_type The filesystem it should be formatted as

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned`(*name*, ***kwargs*)

Manage options of block device

name The name of the block device

opts:

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

14.16.17 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure Apigateway API exists:
  boto_apigateway.present:
    - name: myfunction
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_apigateway.absent`(*name*, *api_name*, *stage_name*, *nuke_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the stage_name associated with the given api_name deployed by boto_apigateway's present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

name Name of the swagger file in YAML format

api_name Name of the rest api on AWS ApiGateway to ensure is absent.

stage_name Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.

nuke_api If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_apigateway.present`(*name*, *api_name*, *swagger_file*, *stage_name*, *api_key_required*, *lambda_integration_role*, *lambda_region=None*, *stage_variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *lambda_funcname_format='{stage}_{api}_{resource}_{method}'*, *authorization_type='NONE'*)

Ensure the specified api_name with the corresponding swaggerfile is deployed to the given stage_name in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{ `api_name`: api_name, `swagger_file`: basename_of_swagger_file `swagger_file_md5sum`:  
  md5sum_of_swagger_file, `swagger_info_object`: info_object_content_in_swagger_file  
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided `lambda_funcname_format` parameters:

the default `lambda_funcname_format` is a string with the following substitutable keys: ``{stage}_{api}_{resource}_{method}``. The user can choose to reorder the known keys.

the stage key corresponds to the `stage_name` passed in. the api key corresponds to the `api_name` passed in. the resource corresponds to the resource path defined in the passed swagger file. the method corresponds to the method for a resource path defined in the passed swagger file.

for the default `lambda_funcname_format`, given the following input:

```
api_name = ` Test Service' stage_name = `alpha' basePath = `/api' path = `/a/{b}/c'  
method = `POST'
```

we will end up with the following Lambda Function Name that will be looked up:

```
`test_service_alpha_a_b_c_post'
```

The canonicalization of these input parameters is done in the following order:

1. `lambda_funcname_format` is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path paramter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with ``_``
5. consecutive ``_`` are replaced with ``_``

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in `errorMessage` field to aid the response mapping from Lambda to the proper error return status codes.

name The name of the state definition

api_name The name of the rest api that we want to ensure exists in AWS API Gateway

swagger_file Name of the location of the swagger rest api definition file in YAML format.

stage_name Name of the stage we want to be associated with the given `api_name` and `swagger_file` definition

api_key_required True or False - whether the API Key is required to call API methods

lambda_integration_role The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

lambda_region The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. `lambda_region` as passed in (is not None)
- 2) if `lambda_region` is None, use the region as if a `boto_lambda` function were executed without explicitly specifying lambda region. 3) if region determined in (2) is different than the region used by `boto_apigateway` functions, a final lookup will be attempted using the `boto_apigateway` region.

stage_variables A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. `{`string`: `string`}`

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

lambda_funcname_format Please review the earlier example for the usage. The only substituable keys in the funcname format are `{stage}`, `{api}`, `{resource}`, `{method}`. Any other keys or positional substitution

parameters will be flagged as an invalid input.
authorization_type This field can be either `NONE`, or `AWS_IAM`. This will be applied to all methods in the given swagger spec file. Default is set to `NONE`

14.16.18 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkgsh
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkgsh
  region: us-east-1
```

```
Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- suspended_processes:
  - AddToLoadBalancer
  - AlarmNotification
- scaling_policies
  - adjustment_type: ChangeInCapacity
  - as_name: api-production-iad
  - cooldown: 1800
  - min_adjustment_step: None
  - name: ScaleDown
  - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
```

```

- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

# Using a profile from pillars.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
      region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

```

```

- alarms:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_asg_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm
    # override CPU:attributes:threshold
    - alarms:

```

```
CPU:
  attributes:
    threshold: 50.0
```

`salt.states.boto_asg.absent` (*name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False*)

Ensure the named autoscale group is deleted.

name Name of the autoscale group.

force Force deletion of autoscale group.

remove_lc Delete the launch config as well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.present` (*name, launch_config_name, availability_zones, min_size, max_size, launch_config=None, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, subnet_names=None, tags=None, termination_policies=None, termination_policies_from_pillar='boto_asg_termination_policies', suspended_processes=None, scaling_policies=None, scaling_policies_from_pillar='boto_asg_scaling_policies', scheduled_actions=None, scheduled_actions_from_pillar='boto_asg_scheduled_actions', alarms=None, alarms_from_pillar='boto_asg_alarms', region=None, key=None, keyid=None, profile=None, notification_arn=None, notification_arn_from_pillar='boto_asg_notification_arn', notification_types=None, notification_types_from_pillar='boto_asg_notification_types'*)

Ensure the autoscale group exists.

name Name of the autoscale group.

launch_config_name Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

launch_config A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```
my_asg:
  boto_asg.present:
    - launch_config:
      - ebs_optimized: false
      - instance_profile_name: my_iam_profile
      - kernel_id: ''
      - ramdisk_id: ''
      - key_name: my_ssh_key
      - image_name: aws2015091-hvm
      - instance_type: c3.xlarge
      - instance_monitoring: false
      - security_groups:
        - my_sec_group_01
        - my_sec_group_02
```

availability_zones List of availability zones for the group.

min_size Minimum size of the group.

max_size Maximum size of the group.

desired_capacity The desired capacity of the group.

load_balancers List of load balancers for the group. Once set this can not be updated (Amazon restriction).

default_cooldown Number of seconds after a Scaling Activity completes before any further scaling activities can start.

health_check_type The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

health_check_period Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

placement_group Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

vpc_zone_identifier A list of the subnet identifiers of the Virtual Private Cloud.

subnet_names For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

tags A list of tags. Example:

```
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

termination_policies A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

termination_policies_from_pillar: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

suspended_processes List of processes to be suspended. see http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html

scaling_policies List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "0 19 * * 1-5"
```

scheduled_actions_from_pillar: name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `":self:"` this will be replaced with the asg name. For example, `alarm_actions` reading ```['scaling_policy:self:ScaleUp']``` will map to the arn for this asg's scaling policy named ```ScaleUp```. In addition, any alarms that have only `scaling_policy` as actions will be ignored if `min_size` is equal to `max_size` for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

notification_arn The AWS arn that notifications will be sent to

notification_arn_from_pillar name of the pillar dict that contains `notification_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

notification_types_from_pillar name of the pillar dict that contains `notification_types` settings. `notification_types` defined for this specific state will override those from the pillar.

14.16.19 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADfalkfjasdf'
```

```
stack-absent:
  boto_cfn.absent:
    - name: mystack
```

`salt.states.boto_cfn.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cfn.present(name, template_body=None, template_url=None,
                             parameters=None, notification_arns=None, disable_rollback=None,
                             timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None,
                             stack_policy_body=None, stack_policy_url=None, use_previous_template=None,
                             stack_policy_during_update_body=None, stack_policy_during_update_url=None,
                             region=None, key=None, keyid=None, profile=None)
```

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the [SNS_console](#) or your Command Line Interface (CLI).

disable_rollback (bool) – Indicates whether or not to rollback on failure.

timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack_policy_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack_policy_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use_previous_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack_policy_during_update_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

14.16.20 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_cloudtrail.absent`(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

name The name of the state definition.

Name Name of the trail.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.present` (*name*, *Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=True*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=False*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *LoggingEnabled=True*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the trail.

S3BucketName Specifies the name of the Amazon S3 bucket designated for publishing log files.

S3KeyPrefix Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

SnsTopicName Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

IncludeGlobalServiceEvents Specifies whether the trail is publishing events from global services such as IAM to the log files.

EnableLogFileValidation Specifies whether log file integrity validation is enabled. The default is false.

CloudWatchLogsLogGroupArn Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

CloudWatchLogsRoleArn Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

KmsKeyId Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be an alias name prefixed by ``alias/``, a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

LoggingEnabled Whether logging should be enabled for the trail

Tags A dictionary of tags that should be set on the trail

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.21 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
        metric: ApproximateNumberOfMessagesVisible
        namespace: AWS/SQS
        statistic: Average
        comparison: ">="
        threshold: 20000.0
        period: 60
        evaluation_periods: 1
        description: test alarm via salt
        dimensions:
          QueueName:
            - the-sqs-queue-name
        alarm_actions:
          - arn:aws:sns:us-east-1:1111111:myalerting-action
```

salt.states.boto_cloudwatch_alarm.absent (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named cloudwatch alarm is deleted.

name Name of the alarm.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_alarm.present (*name, attributes, region=None, key=None, keyid=None, profile=None*)

Ensure the cloudwatch alarm exists.

name Name of the alarm

attributes A dict of key/value cloudwatch alarm attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

14.16.22 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure function exists:
  boto_cognitoidentity.pool_present:
    - PoolName: my_identity_pool
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.pool_absent` (*name*, *IdentityPoolName*, *RemoveAllMatched=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.

name The name of the state definition.

IdentityPoolName Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

RemoveAllMatched If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cognitoidentity.pool_present` (*name*, *IdentityPoolName*, *AuthenticatedRole*, *AllowUnauthenticatedIdentities=False*, *UnauthenticatedRole=None*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure Cognito Identity Pool exists.

name The name of the state definition

IdentityPoolName Name of the Cognito Identity Pool

AuthenticatedRole An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

AllowUnauthenticatedIdentities Whether to allow anonymous user identities

UnauthenticatedRole An IAM role name or ARN that will be associated with anonymous user identities

SupportedLoginProviders A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.
