Alias to `{box_type}_encrypt`

`box_type`: secretbox, sealedbox(default)

`salt.modules.nacl.enc_file`(*name*, *out=None*, *\*\*kwargs*)

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

*name* can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/
↳etc/salt/pki/master/nacl.pub
```

`salt.modules.nacl.keygen`(*sk\_file=None*, *pk\_file=None*, *\*\*kwargs*)

Use libnacl to generate a keypair.

If no *sk\_file* is defined return a keypair.

If only the *sk\_file* is defined *pk\_file* will use the same name with a postfix `.pub`.

When the *sk\_file* is already existing, but *pk\_file* is not. The *pk\_file* will be generated using the *sk\_file*.

CLI Examples:

```
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
↳master/nacl.pub
salt-call --local nacl.keygen
```

`salt.modules.nacl.sealedbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```
salt-call nacl.sealedbox_decrypt pEXHQm6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk_file=/etc/salt/
↳pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.modules.nacl.sealedbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a public key generated from `nacl.keygen`. The encrypted data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/master/
↳nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
↳'vrwQF7cNiNAVQVAiS3bvcbJUUnF0cN6fU9YTZD9mBfzQ='
```

`salt.modules.nacl.secretbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```

salt-call nacl.secretbox_decrypt pEXHQ6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQ6cuaF7A=' sk_file=/etc/salt/
↳pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQ6cuaF7A=' sk='YmFkcGFzcwo='

```

`salt.modules.nacl.secretbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```

salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/
↳nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='

```

### 21.9.256 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

`salt.modules.nagios.list_plugins`()

List all the nagios plugins

CLI Example:

```

salt '*' nagios.list_plugins

```

`salt.modules.nagios.retcode`(*plugin*, *args=""*, *key\_name=None*)

Run one nagios plugin and return retcode of the execution

`salt.modules.nagios.retcode_pillar`(*pillar\_name*)

Run one or more nagios plugins from pillar data and get the result of `cmd.retcode` The pillar have to be in this format:

```

webserver:
 Ping_google:
 - check_icmp: 8.8.8.8
 - check_icmp: google.com
 Load:
 - check_load: -w 0.8 -c 1
 APT:
 - check_apt

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```

salt '*' nagios.retcode webserver

```

`salt.modules.nagios.run`(*plugin*, *args=""*)

Run nagios plugin and return all the data execution with `cmd.run`

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

`salt.modules.nagios.run_all`(*plugin*, *args=""*)

Run nagios plugin and return all the data execution with `cmd.run_all`

`salt.modules.nagios.run_all_pillar`(*pillar\_name*)

Run one or more nagios plugins from pillar data and get the result of `cmd.run_all` The pillar have to be in this format:

```

webserver:
 Ping_google:
 - check_icmp: 8.8.8.8
 - check_icmp: google.com
 Load:
 - check_load: -w 0.8 -c 1
 APT:
 - check_apt

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar`(*pillar\_name*)

Run one or more nagios plugins from pillar data and get the result of `cmd.run` The pillar have to be in this format:

```

webserver:
 Ping_google:
 - check_icmp: 8.8.8.8
 - check_icmp: google.com
 Load:
 - check_load: -w 0.8 -c 1
 APT:
 - check_apt

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

### 21.9.257 salt.modules.nagios\_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

`salt.modules.nagios_rpc.host_status` (*hostname=None, \*\*kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:

**hostname** The hostname to check the status of the service in Nagios.

**numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns** status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

`salt.modules.nagios_rpc.service_status` (*hostname=None, service=None, \*\*kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:

**hostname** The hostname to check the status of the service in Nagios.

**service** The service to check the status of in Nagios.

**numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns** status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
↳numeric=False
```

## 21.9.258 salt.modules.namecheap\_domains\_dns

Namecheap DNS Management

New in version 2017.7.0.

### Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains_dns.get_hosts(sld, tld)`

Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain

**sld** SLD of the domain name

**tld** TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

`salt.modules.namecheap_domains_dns.get_list(sld, tld)`

Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain

**sld** SLD of the domain name

**tld** TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

`salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)`

Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully

**sld** SLD of the domain name

**tld** TLD of the domain name

**nameservers** array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

`salt.modules.namecheap_domains_dns.set_default(sld, tld)`

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.

**sld** SLD of the domain name

**tld** TLD of the domain name

Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

`salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)`

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully

**sld** SLD of the domain name

**tld** TLD of the domain name

**hosts** Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- **hostname**
- **recordtype** - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
- **address** - URL or IP address
- **ttl** - An integer between 60 and 60000 (default: 1800)

Additionally, the `mxpref` key can be present, but must be accompanied by an `emailtype` key.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

## 21.9.259 salt.modules.namecheap\_domains module

Namecheap Domain Management

New in version 2017.7.0.

### Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains.check(*domains_to_check)`

Checks the availability of domains

**domains\_to\_check** array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

`salt.modules.namecheap_domains.create(domain_name, years, **kwargs)`

Try to register the specified domain name

**domain\_name** The domain name to be registered

**years** Number of years to register

Returns the following information:

- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

`salt.modules.namecheap_domains.get_info(domain_name)`

Returns information about the requested domain

returns a dictionary of information about the `domain_name`

**domain\_name** string Domain name to get information about

CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

`salt.modules.namecheap_domains.get_list`(*list\_type=None, search\_term=None, page=None, page\_size=None, sort\_by=None*)

Returns a list of domains for the particular user as a list of objects offset by page length of `page_size`

**list\_type** [ALL] One of ALL, EXPIRING, EXPIRED

**search\_term** Keyword to look for on the domain list

**page** [1] Number of result page to return

**page\_size** [20] Number of domains to be listed per page (minimum: 10, maximum: 100)

**sort\_by** One of NAME, NAME\_DESC, EXPIREDATE, EXPIREDATE\_DESC, CREATEDATE, or CREATEDATE\_DESC

CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

`salt.modules.namecheap_domains.get_tld_list`()

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

`salt.modules.namecheap_domains.reactivate`(*domain\_name*)

Try to reactivate the expired domain name

Returns the following information:

- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

`salt.modules.namecheap_domains.renew`(*domain\_name, years, promotion\_code=None*)

Try to renew the specified expiring domain name for a specified number of years

**domain\_name** The domain name to be renewed

**years** Number of years to renew

Returns the following information:

- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

### 21.9.260 salt.modules.namecheap\_domains\_ns

Namecheap Nameserver Management

New in version 2017.7.0.

## Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

## Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```

namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response

```

`salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)`  
 Creates a new nameserver. Returns True if the nameserver was created successfully.  
**sld** SLD of the domain name  
**tld** TLD of the domain name  
**nameserver** Nameserver to create  
**ip** Nameserver IP address  
 CLI Example:

```

salt '*' namecheap_domains_ns.create sld tld nameserver ip

```

`salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)`  
 Deletes a nameserver. Returns True if the nameserver was deleted successfully  
**sld** SLD of the domain name  
**tld** TLD of the domain name  
**nameserver** Nameserver to delete  
 CLI Example:

```

salt '*' namecheap_domains_ns.delete sld tld nameserver

```

`salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)`  
 Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

**sld** SLD of the domain name  
**tld** TLD of the domain name  
**nameserver** Nameserver to retrieve  
 CLI Example:

```

salt '*' namecheap_domains_ns.get_info sld tld nameserver

```

`salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)`  
 Deletes a nameserver. Returns True if the nameserver was updated successfully.  
**sld** SLD of the domain name  
**tld** TLD of the domain name  
**nameserver** Nameserver to create  
**old\_ip** Current ip address  
**new\_ip** New ip address

CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

## 21.9.261 salt.modules.namecheap\_ssl module

Namecheap SSL Certificate Management

New in version 2017.7.0.

### Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```
salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, ap-
 prover_email=None, http_dc_validation=False,
 **kwargs)
```

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

**csr\_file** Path to Certificate Signing Request file

**certificate\_id** Unique ID of the SSL certificate you wish to activate

**web\_server\_type** The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hisphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch

- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

**approver\_email** The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

---

**http\_dc\_validation** [False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see [here](#).

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.create`(*years*, *certificate\_type*, *promotion\_code=None*,  
*sans\_to\_add=None*)

Creates a new SSL certificate. Returns the following information:

- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

**years** [1] Number of years to register

**certificate\_type** Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server

- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotional\_code** An optional promo code to use when creating the certificate

**sans\_to\_add** [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANS has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

Provider	Product name	Default number of domains (domain from CSR is counted here)	Maximum number of total domains	Maximum number of domains that can be passed in sans_to_add parameter
Co-modo	PositiveSSL Multi-Domain	3	100	97
Co-modo	Multi-Domain SSL	3	100	97
Co-modo	EV Multi-Domain SSL	3	100	97
Co-modo	Unified Communications	3	100	97
GeoTrust	QuickSSL Premium	1	1 domain + 4 subdomains	The only supported value is 4
GeoTrust	True BusinessID with EV Multi-Domain	5	25	20
GeoTrust	True Business ID Multi-Domain	5	25	20
Thawte	SSL Web Server	1	25	24
Thawte	SSL Web Server with EV	1	25	24
Thawte	SGC Supercerts	1	25	24
Symantec	Secure Site Pro with EV	1	25	24
Symantec	Secure Site with EV	1	25	24
Symantec	Secure Site	1	25	24
Symantec	Secure Site Pro	1	25	24

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

`salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)`

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:

- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

**certificate\_id** Unique ID of the SSL certificate

**returncertificate** [False] Set to True to ask for the certificate in response

**returntype** Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

---

**Note:** Required if `returncertificate` is True

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

`salt.modules.namecheap_ssl.get_list(**kwargs)`

Returns a list of SSL certificates for a particular user

**ListType** [All] Possible values:

- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

**SearchTerm** Keyword to look for on the SSL list

**Page** [1] Page number to return

**PageSize** [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

**SortBy** One of PURCHASEDATE, PURCHASEDATE\_DESC, SSLTYPE, SSLTYPE\_DESC, EXPIREDATETIME, EXPIREDATETIME\_DESC, Host\_Name, or Host\_Name\_DESC

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_list Processing
```

`salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)`

Parses the CSR. Returns a dictionary of result values.

**csr\_file** Path to Certificate Signing Request file

**certificate\_type** Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard

- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**http\_dc\_validation** [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

`salt.modules.namecheap_ssl.reissue`(*csr\_file*, *certificate\_id*, *web\_server\_type*, *ap-  
prover\_email=None, http\_dc\_validation=False, \*\*kwargs*)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

**csr\_file** Path to Certificate Signing Request file

**certificate\_id** Unique ID of the SSL certificate you wish to activate

**web\_server\_type** The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk

- tomcat
- weblogic
- website
- webstar
- zeusv3

**approver\_email** The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

---

**http\_dc\_validation** [False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see [here](#).

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.renew` (*years, certificate\_id, certificate\_type, promotion\_code=None*)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years** [1] Number of years to register

**certificate\_id** Unique ID of the SSL certificate you wish to renew

**certificate\_type** Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard

- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotional\_code** An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```

## 21.9.262 salt.modules.namecheap\_users module

Namecheap User Management

New in version 2017.7.0.

### Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3

```

`salt.modules.namecheap_users.check_balances` (*minimum=100*)

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns `False` if the user's account balance is less than the provided minimum or `True` if greater than the minimum.

**minimum** [100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

`salt.modules.namecheap_users.get_balances` ()

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

---

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the `FundsRequiredForAutoRenew` attribute shows the amount needed in your Namecheap account to complete auto renewal.

---

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

## 21.9.263 salt.modules.napalm\_mod module

### NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

`salt.modules.napalm_mod.alive(**kwargs)`

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
 is_alive: False
comment: ''
```

`salt.modules.napalm_mod.call(method, *args, **kwargs)`

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

---

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

---

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

`salt.modules.napalm_mod.compliance_report(filepath=None, string=None, renderer='jinja/yaml', **kwargs)`

Return the compliance report.

**filepath** The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- salt://
- http:// and https://
- ftp://
- s3://
- swift:/

Or on the local file system (on the Minion).

---

**Note:** The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

---

**string** New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system.

Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

**renderer:** **jinjalyaml** New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

**kwargs** Changed in version 2019.2.0.

Keyword args to pass to Salt's `compile_template()` function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
 os_version: 4.17

- get_interfaces_ip:
 Management1:
 ipv4:
 10.0.2.14:
 prefix_length: 24
 _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
 os_version: {{ grains.version }}
- get_interfaces_ip:
 Loopback0:
 ipv4:
 {{ grains.lo0.ipv4 }}:
 prefix_length: 24
 _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}
```

Output Example:

```
device1:

 comment:
 out:

 complies:
 False
 get_facts:

 complies:
 False
 extra:
 missing:
 present:

 os_version:

 actual_value:
```

(continues on next page)

(continued from previous page)

```

 15.1F6-S1.4
 complies:
 False
 nested:
 False
 get_interfaces_ip:

 complies:
 False
 extra:
 missing:
 - Management1
 present:

 skipped:
result:
 True

```

`salt.modules.napalm_mod.config_diff_text`(*source1='candidate', candidate\_path=None, source2='running', running\_path=None*)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1: candidate** The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

**candidate\_path** Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**source2: running** The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

**running\_path** Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```

salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
Would compare the running config with the configuration available at
https://bit.ly/2mAdq7z

```

`salt.modules.napalm_mod.config_diff_tree`(*source1='candidate', candidate\_path=None, source2='running', running\_path=None*)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1: candidate** The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

**candidate\_path** Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**source2: running** The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

**running\_path** Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or

running\_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
Would compare the running config with the configuration available at
https://bit.ly/2mAdq7z
```

CLI Example:

```
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

`salt.modules.napalm_mod.config_filter_lines`(*parent\_regex*, *child\_regex*, *source='running'*)

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether `child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

---

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See [ciscoconfparse module](#) for more details.

---

**parent\_regex** The regular expression to match the parent configuration lines against.

**child\_regex** The regular expression to match the child configuration lines against.

**source: `running`** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown' source=candidate
```

`salt.modules.napalm_mod.config_find_lines`(*regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `regex` argument. The configuration is read from the network device interrogated.

**regex** The regular expression to match the configuration lines against.

**source: `running`** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

`salt.modules.napalm_mod.config_lines_w_child`(*parent\_regex*, *child\_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having child lines matching `child_regex`. The configuration is read from the network device interrogated.

---

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See

*ciscoconfparse* module for more details.

**parent\_regex** The regular expression to match the parent configuration lines against.

**child\_regex** The regular expression to match the child configuration lines against.

**source: running** The configuration type to retrieve from the network device. Default: running. Available options: running, startup, candidate.

CLI Example:

```
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown' source=candidate
```

```
salt.modules.napalm_mod.config_lines_wo_child(parent_regex, child_regex,
 source='running')
```

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the **parent\_regex** argument, having the child lines *not* matching **child\_regex**. The configuration is read from the network device interrogated.

**Note:** This function is only available only when the underlying library *ciscoconfparse* is installed. See *ciscoconfparse* module for more details.

**parent\_regex** The regular expression to match the parent configuration lines against.

**child\_regex** The regular expression to match the child configuration lines against.

**source: running** The configuration type to retrieve from the network device. Default: running. Available options: running, startup, candidate.

CLI Example:

```
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown' source=candidate
```

```
salt.modules.napalm_mod.config_merge_diff(source='running', merge_config=None,
 merge_path=None, saltenv='base')
```

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

**source: running** The configuration type to retrieve from the network device. Default: running. Available options: running, startup, candidate.

**merge\_config** The config to be merged into the initial config, sent as text. This argument is ignored when **merge\_path** is set.

**merge\_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *cp.get\_url*, e.g., salt://, https://, s3://, ftp://, etc.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if **merge\_path** is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

```
salt.modules.napalm_mod.config_merge_text(source='running', merge_config=None,
 merge_path=None, saltenv='base')
```

New in version 2019.2.0.

Return the merge result of the configuration from **source** with the merge configuration, as plain text (without loading the config on the device).

**source: running** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**merge\_config** The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.config_merge_tree` (*source='running'*, *merge\_config=None*, *merge\_path=None*, *saltenv='base'*)

New in version 2019.2.0.

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

**source: running** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**merge\_config** The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path** Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.config_tree` (*source='running'*, *with\_tags=False*)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

**source: running** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**with\_tags: False** Whether this function should return a detailed view, with tags.

CLI Example:

```
salt '*' napalm.config_tree
```

`salt.modules.napalm_mod.junos_call` (*fun*, *\*args*, *\*\*kwargs*)

New in version 2019.2.0.

Execute an arbitrary function from the `junos` execution module. To check what `args` and `kwargs` you must send to the function, please consult the appropriate documentation.

**fun** The name of the function. E.g., `set_hostname`.

**args** List of arguments to send to the `junos` function invoked.

**kwargs** Dictionary of key-value arguments to send to the `juno` function invoked.

CLI Example:

```
salt '*' napalm.junos_fun cli 'show system commit'
```

`salt.modules.napalm_mod.junos_cli` (*command*, *format=None*, *dev\_timeout=None*, *dest=None*, *\*\*kwargs*)

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

**command** The command to execute on the Junos CLI.

**format: text** Format in which to get the CLI output (either text or xml).

**dev\_timeout: 30** The NETCONF RPC timeout (in seconds).

**dest** Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use `cp.push`.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

`salt.modules.napalm_mod.junos_commit(**kwargs)`

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

**dev\_timeout: 30** The NETCONF RPC timeout (in seconds).

**comment** Provide a comment for the commit.

**confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**sync: False** When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

**force\_sync: False** When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

**full** When True, requires all the daemons to check and evaluate the new configuration.

**detail** When True, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

`salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)`

New in version 2019.2.0.

Copies the file on the remote Junos device.

**src** The source file path. This argument accepts the usual Salt URIs (e.g., salt://, http://, https://, s3://, ftp://, etc.).

**dst** The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/myjunos.cfg
```

`salt.modules.napalm_mod.junos_facts(**kwargs)`

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

`salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)`

New in version 2019.2.0.

Installs the given image on the device.

**path** The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- salt:// to fetch from the Salt fileserver.
- http:// and https://

- ftp://
- swift:/
- s3://

**dev\_timeout:** **30** The NETCONF RPC timeout (in seconds)

**reboot:** **False** Whether to reboot the device after the installation is complete.

**no\_copy:** **False** If True the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

`salt.modules.napalm_mod.junos_rpc` (*cmd=None, dest=None, format=None, \*\*kwargs*)

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

**cmd** The RPC request to be executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

**dest** Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push` Execution function.

**format:** **xml** The format in which the RPC reply is received from the device.

**dev\_timeout:** **30** The NETCONF RPC timeout.

**filter** Used with the `get-config` RPC request to filter out the config tree.

**terse:** **False** Whether to return terse output.

---

**Note:** Some RPC requests may not support this argument.

---

**interface\_name** Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system></
↳configuration>
```

`salt.modules.napalm_mod.netmiko_args` (*\*\*kwargs*)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., `panos`, `f5`, `mos` - either from <https://github.com/napalm-automation-community> or defined in user's own environment, one can specify the Netmiko device type (the `device_type` argument) via the `netmiko_device_type_map` configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
 f5: f5_ltm
 dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM `os` Grain and the Netmiko `device_type`, e.g., when the NAPALM Grain is `f5`, it would use the `f5_ltm` SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

`salt.modules.napalm_mod.netmiko_call` (*method, \*args, \*\*kwargs*)

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

**method** The name of the Netmiko method to execute.

**args** List of arguments to send to the Netmiko method specified in **method**.

**kwargs** Key-value arguments to send to the execution function specified in **method**.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

`salt.modules.napalm_mod.netmiko_commands` (*\*commands*, *\*\*kwargs*)

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

**commands** A list of commands to be executed.

**expect\_string** Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay\_factor: 1** Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500** Controls wait time in conjunction with **delay\_factor**. Will default to be based upon `self.timeout`.

**auto\_find\_prompt: True** Whether it should try to auto-detect the prompt (default: `True`).

**strip\_prompt: True** Remove the trailing router prompt from the output (default: `True`).

**strip\_command: True** Remove the echo of the command from the output (default: `True`).

**normalize: True** Ensure the proper enter is sent at end of command (default: `True`).

**use\_textfsm: False** Process command output through TextFSM template (default: `False`).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

`salt.modules.napalm_mod.netmiko_config` (*\*config\_commands*, *\*\*kwargs*)

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that `netmiko` does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the `commit` argument to `True` to transfer the changes from the candidate into the running config before exiting.

**config\_commands** A list of configuration commands to be loaded on the remote device.

**config\_file** Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see `template_engine`).

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**exit\_config\_mode: True** Determines whether or not to exit config mode after complete.

**delay\_factor: 1** Factor to adjust delays.

**max\_loops: 150** Controls wait time in conjunction with **delay\_factor** (default: 150).

**strip\_prompt: False** Determines whether or not to strip the prompt (default: `False`).

**strip\_command**: **False** Determines whether or not to strip the command (default: `False`).  
**config\_mode\_command** The command to enter into config mode.  
**commit**: **False** Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
salt '*' napalm.netmiko_config https://bit.ly/2sgljCB
```

`salt.modules.napalm_mod.netmiko_conn(**kwargs)`

New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules.

USAGE Example:

```
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

`salt.modules.napalm_mod.netmiko_fun(fun, *args, **kwargs)`

New in version 2019.2.0.

Call an arbitrary function from the *Netmiko* module, passing the authentication details from the existing NAPALM connection.

**fun** The name of the function from the *Netmiko* to invoke.

**args** List of arguments to send to the execution function specified in `fun`.

**kwargs** Key-value arguments to send to the execution function specified in `fun`.

CLI Example:

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

`salt.modules.napalm_mod.netmiko_multi_call(*methods, **kwargs)`

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

**methods** List of dictionaries with the following keys:

- **name**: the name of the Netmiko function to invoke.
- **args**: list of arguments to send to the name method.
- **kwargs**: key-value arguments to send to the name method.

CLI Example:

```
salt '*' napalm.netmiko_multi_call [{"name": 'send_command', 'args': ['show ↵
↵version']}] [{"name": 'send_command', 'args': ['show interfaces']}]
```

`salt.modules.napalm_mod.nxos_api_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)`

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

**commands** The list of configuration commands to load on the Nexus switch.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**config\_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp://`
- `s3://`
- `swift://`

**template\_engine: jinja** The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context: None** Variables to add to the template context.

**defaults: None** Default values of the `context` dict.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy context="{
↳ 'servers': ['1.2.3.4']}"
```

`salt.modules.napalm_mod.nxos_api_rpc(commands, method='cli', **kwargs)`

New in version 2019.2.0.

Execute an arbitrary RPC request via the Nexus API.

**commands** The RPC commands to be executed.

**method: cli** The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

CLI Example:

```
salt '*' napalm.nxos_api_rpc 'show version'
```

`salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)`

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

**commands** The commands to be executed.

**raw\_text: True** Whether to return raw text or structured data.

CLI Example:

```
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

`salt.modules.napalm_mod.pyeapi_call(method, *args, **kwargs)`

New in version 2019.2.0.

Invoke an arbitrary method from the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**method** The name of the `pyeapi` method to invoke.

**kwargs** Key-value arguments to send to the `pyeapi` method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

```
salt.modules.napalm_mod.pyeapi_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**commands** The list of configuration commands to load on the Arista switch.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**config\_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp:/
- s3:/
- swift://

**template\_engine:** **jinja** The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context:** **None** Variables to add to the template context.

**defaults:** **None** Default values of the `context` dict.

**saltenv:** **base** Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

```
salt.modules.napalm_mod.pyeapi_conn(**kwargs)
```

New in version 2019.2.0.

Return the connection object with the Arista switch, over `pyeapi`, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

Usage example:

```
conn = __salt__['napalm.pyeapi_conn']()
res1 = conn.run_commands('show version')
res2 = conn.get_config(as_string=True)
```

```
salt.modules.napalm_mod.pyeapi_nxos_api_args(**prev_kwargs)
```

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the `pyeapi` execution module.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

`salt.modules.napalm_mod.pyeapi_run_commands(*commands, **kwargs)`

Execute a list of commands on the Arista switch, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**commands** A list of commands to execute.

**encoding: json** The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

`salt.modules.napalm_mod.reconnect(force=False, **kwargs)`

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

---

**Note:** This function can be used only when running proxy minions.

---

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

`salt.modules.napalm_mod.rpc(command, **kwargs)`

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- `napalm.junos_rpc` for `junos`
- `napalm.pyeapi_run_commands` for `eos`
- `napalm.nxos_api_rpc` for `nxos`
- `napalm.netmiko_commands` for `ios`, `iosxr`, and `nxos_ssh`

**command** The RPC command to execute. This depends on the nature of the operating system.

**kwargs** Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```
napalm_rpc_map:
 f5: napalm.netmiko_commands
 panos: panos.call
```

The mapping above reads: when the NAPALM os Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

`salt.modules.napalm_mod.scp_get` (*remote\_path*, *local\_path*=", *recursive*=False, *pre-serve\_times*=False, *\*\*kwargs*)

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

---

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

---

**remote\_path** Path to retrieve from remote host. Since this is evaluated by `scp` on the remote host, shell wildcards and environment variables may be used.

**recursive: False** Transfer files and directories recursively.

**preserve\_times: False** Preserve `mtime` and `atime` of transferred files and directories.

**passphrase** Used for decrypting private keys.

**pkey** An optional private key to use for authentication.

**key\_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.

**socket\_timeout: 10** The channel socket timeout in seconds.

**buff\_size: 16384** The size of the SCP send buffer.

**allow\_agent: True** Set to `False` to disable connecting to the SSH agent.

**look\_for\_keys: True** Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`

**banner\_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth\_timeout** An optional timeout (in seconds) to wait for an authentication response.

**auto\_add\_policy: False** Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```

`salt.modules.napalm_mod.scp_put` (*files*, *remote\_path*=None, *recursive*=False, *preserve\_times*=False, *saltenv*='base', *\*\*kwargs*)

New in version 2019.2.0.

Transfer files and directories to remote network device.

---

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

---

**files** A single path or a list of paths to be transferred.

**remote\_path** The path on the remote device where to store the files.

**recursive: True** Transfer files and directories recursively.

**preserve\_times: False** Preserve `mtime` and `atime` of transferred files and directories.

**saltenv: base** The name of the Salt environment. Ignored when `files` is not a `salt://` URL.

**hostname** The hostname of the remote device.

**port: 22** The port of the remote device.

**username** The username required for SSH authentication on the device.

**password** Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

**passphrase** Used for decrypting private keys.

**pkey** An optional private key to use for authentication.

**key\_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.

**socket\_timeout:** **10** The channel socket timeout in seconds.  
**buff\_size:** **16384** The size of the SCP send buffer.  
**allow\_agent:** **True** Set to `False` to disable connecting to the SSH agent.  
**look\_for\_keys:** **True** Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`  
**banner\_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.  
**auth\_timeout** An optional timeout (in seconds) to wait for an authentication response.  
**auto\_add\_policy:** **False** Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

## 21.9.264 salt.modules.napalm\_netacl

### NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**depends** capirca, napalm

**platform** unix

### Dependencies

The firewall configuration is generated by [Capirca](#).

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

**salt.modules.napalm\_netacl.get\_filter\_pillar** (*filter\_name*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter\_name** The name of the filter.

**pillar\_key** The root key of the whole policy config.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**salt.modules.napalm\_netacl.get\_term\_pillar** (*filter\_name*, *term\_name*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter\_name** The name of the filter.

**term\_name** The name of the term.

**pillar\_key:** **acl** The root key of the whole policy config. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```

salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None,
 terms=None, prepend=True, pil-
 lar_key='acl', pillarenv=None,
 saltenv=None, merge_pillar=True,
 only_lower_merge=False, revision_id=None, revision_no=None,
 revision_date=True, revision_date_format='%Y/%m/%d', test=False,
 commit=True, debug=False, **kwargs)

```

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

**filter\_name** The name of the policy filter.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the filter config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```

salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
→debug=True

```

Output Example:

```

edge01.bjm01:

already_configured:
 False
comment:
diff:
 [edit firewall]
 + family inet {
 + /*
 + ** $Date: 2017/03/22 $

 then accept;
 }
 }
 }
 }

```

(continues on next page)

(continued from previous page)

```

 }
 }
 result:
 True

```

The filter configuration has been loaded from the pillar, having the following structure:

```

netacl:
- my-filter:
 terms:
 - my-term:
 source_port:
 - 1234
 - 1235
 action: reject
 - my-other-term:
 source_port:
 - - 5678
 - 5680
 protocol: tcp
 action: accept

```

```

salt.modules.napalm_netacl.load_policy_config(filters=None, prepend=True, pil-
lar_key='acl', pillarenv=None,
saltenv=None, merge_pillar=True,
only_lower_merge=False, revision_id=None, revision_no=None,
revision_date=True, revision_date_format='%Y/%m/%d', test=False,
commit=True, debug=False, **kwargs)

```

Generate and load the configuration of the whole policy.

---

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

**filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the policy config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the policy configuration was generated. Default: True.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the performce data. Default: %Y/%m/%d (<year>/<month>/<day>).

**test: False** Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit: True** Commit? Default: True.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:

already_configured:
 False

```

```

salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, pillar_key='acl',
pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True,
revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)

```

Generate and load the configuration of a policy term.

**filter\_name** The name of the policy filter.

**term\_name** The name of the term.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```

firewall:
- my-filter:
 terms:
 - my-term:
 source_port: 1234
 source_address:
 - 1.2.3.4/32
 - 5.6.7.8/32

```

The `pillar_key` field would be specified as `firewall`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True** Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

**revision\_id** Add a comment in the term config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and `protocol`.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the [file state](#).

**destination\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and `protocol`. Allows the same options as `source_service`.

**term\_fields** Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have a few other [optional](#) keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- `action`
- `address`
- `address_exclude`
- `comment`
- `counter`
- `expiration`
- `destination_address`
- `destination_address_exclude`
- `destination_port`
- `destination_prefix`
- `forwarding_class`
- `forwarding_class_except`
- `logging`
- `log_name`
- `loss_priority`
- `option`
- `policer`
- `port`
- `precedence`
- `principals`
- `protocol`
- `protocol_except`
- `qos`

- pan\_application
  - routing\_instance
  - source\_address
  - source\_address\_exclude
  - source\_port
  - source\_prefix
  - verbatim
  - packet\_length
  - fragment\_offset
  - hop\_limit
  - icmp\_type
  - ether\_type
  - traffic\_class\_count
  - traffic\_type
  - translated
  - dscp\_set
  - dscp\_match
  - dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
  - priority
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application

- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

---

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- - 1000
- 2000
- - 3000
- 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

---

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

Output Example:

```
edge01.bjm01:

already_configured:
 False
comment:
 Configuration discarded.
diff:

 }
 }
 }
 }
 }
result:
 True
```

### 21.9.265 salt.modules.napalm\_bgp module

## NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_bgp.config` (*group=None, neighbor=None, \*\*kwargs*)

Provides the BGP configuration on the device.

### Parameters

- **group** – Name of the group selected to display the configuration.
- **neighbor** – IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

**Returns** A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply\_groups (string list)
- multihop\_ttl (int)
- multipath (True/False)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- import\_policy (string)
- export\_policy (string)
- remove\_private\_as (True/False)
- prefix\_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import\_policy (string)
- export\_policy (string)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- authentication\_key (string)
- prefix\_limit (dictionary)
- route\_reflector\_client (True/False)
- nhs (True/False)

CLI Example:

```

salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-
↳GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about
↳BGP neighbor 172.17.17.1,
configured in the group PEERS-GROUP-NAME

```

Output Example:

```

{
 'PEERS-GROUP-NAME': {
 'type' : 'external',
 'description' : 'Here we should have a nice description',
 'apply_groups' : ['BGP-PREFIX-LIMIT'],
 'import_policy' : 'PUBLIC-PEER-IN',
 'export_policy' : 'PUBLIC-PEER-OUT',
 'remove_private' : True,
 'multipath' : True,
 'multihop_ttl' : 30,
 'neighbors' : {
 '192.168.0.1': {
 'description' : 'Facebook [CDN]',
 'prefix_limit' : {
 'inet': {
 'unicast': {
 'limit': 100,
 'teardown': {
 'threshold' : 95,
 'timeout' : 5
 }
 }
 }
 }
 }
 },
 'peer-as' : 32934,
 'route_reflector': False,
 'nhs' : True
 },
 '172.17.17.1': {
 'description' : 'Twitter [CDN]',
 'prefix_limit' : {
 'inet': {
 'unicast': {
 'limit': 500,
 'no-validate': 'IMPORT-FLOW-ROUTES'
 }
 }
 },
 'peer_as' : 13414,
 'route_reflector': False,
 'nhs' : False
 }
}

```

`salt.modules.napalm_bgp.neighbors` (*neighbor=None, \*\*kwargs*)

Provides details regarding the BGP sessions configured on the network device.

Parameters **neighbor** – IP Address of a specific neighbor.

## Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local\_as (int)
- remote\_as (int)
- local\_address (string)
- routing\_table (string)
- local\_address\_configured (True/False)
- local\_port (int)
- remote\_address (string)
- remote\_port (int)
- multihop (True/False)
- multipath (True/False)
- remove\_private\_as (True/False)
- import\_policy (string)
- export\_policy (string)
- input\_messages (int)
- output\_messages (int)
- input\_updates (int)
- output\_updates (int)
- messages\_queued\_out (int)
- connection\_state (string)
- previous\_connection\_state (string)
- last\_event (string)
- suppress\_4byte\_as (True/False)
- local\_as\_prepend (True/False)
- holdtime (int)
- configured\_holdtime (int)
- keepalive (int)
- configured\_keepalive (int)
- active\_prefix\_count (int)
- received\_prefix\_count (int)
- accepted\_prefix\_count (int)
- suppressed\_prefix\_count (int)
- advertised\_prefix\_count (int)

- flap\_count (int)

CLI Example:

```
salt '*' bgp.neighbors # all neighbors
salt '*' bgp.neighbors 172.17.17.1 # only session with BGP neighbor(s) 172.17.17.
↔1
```

Output Example:

```
{
 'default': {
 8121: [
 {
 'up' : True,
 'local_as' : 13335,
 'remote_as' : 8121,
 'local_address' : '172.101.76.1',
 'local_address_configured' : True,
 'local_port' : 179,
 'remote_address' : '192.247.78.0',
 'router_id' : '192.168.0.1',
 'remote_port' : 58380,
 'multihop' : False,
 'import_policy' : '4-NTT-TRANSIT-IN',
 'export_policy' : '4-NTT-TRANSIT-OUT',
 'input_messages' : 123,
 'output_messages' : 13,
 'input_updates' : 123,
 'output_updates' : 5,
 'messages_queued_out' : 23,
 'connection_state' : 'Established',
 'previous_connection_state' : 'EstabSync',
 'last_event' : 'RecvKeepAlive',
 'suppress_4byte_as' : False,
 'local_as_prepend' : False,
 'holdtime' : 90,
 'configured_holdtime' : 90,
 'keepalive' : 30,
 'configured_keepalive' : 30,
 'active_prefix_count' : 132808,
 'received_prefix_count' : 566739,
 'accepted_prefix_count' : 566479,
 'suppressed_prefix_count' : 0,
 'advertise_prefix_count' : 0,
 'flap_count' : 27
 }
]
 }
}
```

## 21.9.266 salt.modules.napalm\_formula module

### NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula,

napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

`salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=':')`

Return the list of all the possible paths in a container, down to the `config` container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

**model** The OpenConfig-structured object to inspect.

**delim:** **:** The key delimiter. In particular cases, it is indicated to use `//` as `:` might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path '{"interfaces': {'interface': {'Ethernet1': {'config': {'name': 'Ethernet1'}}}}}'
```

The example above would return a list with the following element: `interfaces:interface:Ethernet1:config` which is the only possible path in that hierarchy.

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

`salt.modules.napalm_formula.defaults(model, defaults_, delim='//', flipped_merge=False)`

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

**model** The OpenConfig model to apply the defaults to.

**defaults** The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.

**delim:** `//` The key delimiter to use. Generally, `//` should cover all the possible cases, and you don't need to override this value.

**flipped\_merge:** **False** Whether should merge the model into the defaults, or the defaults into the model.

Default: `False` (merge the model into the defaults, i.e., any defaults would be overridden by the values from the `model`).

CLI Example:

```
salt '*' napalm_formula.defaults '{"interfaces': {'interface': {'Ethernet1': {'config': {'name': 'Ethernet1'}}}}}' '{"interfaces': {'interface': {'*': {'config': {'enabled': True}}}}}'
```

As one can notice in the example above, the `*` corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

`salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)`

Recursive version of the default `dict.update`

Merges `upd` recursively into `dest`

If `recursive_update=False`, will use the classic `dict.update`, or fall back on a manual merge (helpful for non-dict types like `FunctionWrapper`).

If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

`salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)`

Render a field found under the `field` level of the hierarchy in the dictionary object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

**dictionary** The dictionary to traverse.

**field** The key name or part to traverse in the dictionary.

**prepend: None** The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.

**append: None** Text to append at the end.

**quotes: False** Whether should wrap the text around quotes.

CLI Example:

```
salt '*' napalm_formula.render_field "{{'enabled': True}}" enabled
This would return the value of the ``enabled`` leaf key
salt '*' napalm_formula.render_field "{{'enabled': True}}" description
This would not error
```

Jinja usage example:

```
{%- set config = {'enabled': True, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won't be accepted by Junos):

```
description "Interface description";
```

`salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)`

This function works similarly to `render_field` but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

**dictionary** The dictionary to traverse.

**fields** A list of field names or paths in the dictionary.

**indent: 0** The indentation to use, prepended to the rendered field.

**separator: \n** The separator to use between fields.

CLI Example:

```
salt '*' napalm_formula.render_fields "{{'mtu': 68, 'description': 'Interface
↵description'}}" mtu description
```

Jinja usage example:

```
{%- set config={'mtu': 68, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
```

The Jinja example above would generate the following configuration:

```
mtu "68"
description "Interface description"
```

`salt.modules.napalm_formula.setval(key, val, dict_=None, delim=':')`

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}}.

**Note:** Currently this doesn't work with integers, i.e. cannot build lists dynamically.

CLI Example:

```
salt '*' formula.setval foo:baz:bar True
```

`salt.modules.napalm_formula.traverse`(*data*, *key*, *default=None*, *delimiter=':'*)

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the `delimiter` param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return `data['foo']['bar'][0]` if data like `{'foo': {'bar': ['baz']}}`, if data like `{'foo': {'bar': {'0': 'baz'}}}` then return `data['foo']['bar']['0']`

CLI Example:

```
salt '*' napalm_formula.traverse "{ 'foo': { 'bar': { 'baz': True } } }" foo:baz:bar
```

## 21.9.267 salt.modules.napalm\_network module

### NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

`salt.modules.napalm_network.arp`(*interface=*, *ipaddr=*, *macaddr=*, *\*\*kwargs*)

NAPALM returns a list of dictionaries with details of the ARP entries.

#### Parameters

- **interface** – interface name to filter on
- **ipaddr** – IP address to filter on
- **macaddr** – MAC address to filter on

**Returns** List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
 {
 'interface' : 'MgmtEth0/RSP0/CPU0/0',
 'mac' : '5c:5e:ab:da:3c:f0',
 'ip' : '172.17.17.1',
 'age' : 1454496274.84
 },
 {
 'interface': 'MgmtEth0/RSP0/CPU0/0',
 'mac' : '66:0e:94:96:e0:ff',
 'ip' : '172.17.17.2',
 'age' : 1435641582.49
 }
]
```

```
salt.modules.napalm_network.blockreplace(marker_start, marker_end, con-
 tent=", append_if_not_found=False,
 prepend_if_not_found=False, show_changes=True,
 append_newline=False, source='running',
 path=None, test=False, commit=True, debug=False,
 replace=True)
```

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

**marker\_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

**content** The content to be used between the two lines identified by `marker_start` and `marker_stop`.

**append\_if\_not\_found: False** If markers are not found and set to `True` then, the markers and content will be appended to the file.

**prepend\_if\_not\_found: False** If markers are not found and set to `True` then, the markers and content will be prepended to the file.

**append\_newline: False** Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will not be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

**show\_changes: True** Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise `False`).

**source: running** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path: None** Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit the configuration changes? Default: `True`.

**debug: False** Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True** Load and replace the configuration. Default: True.

CLI Example:

```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

`salt.modules.napalm_network.cancel_commit(jid)`

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:

```
salt '*' net.cancel_commit 20180726083540640360
```

`salt.modules.napalm_network.cli(*commands, **kwargs)`

Returns a dictionary with the raw output of all commands passed as arguments.

**commands** List of commands to be executed on the device.

**textfsm\_parse: False** Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_parse`.

---

**textfsm\_path** The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. `textfsm_path` can be either absolute path on the server, either specified using the following URL mschemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

New in version 2018.3.0.

---

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

**textfsm\_template** The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

New in version 2018.3.0.

**textfsm\_template\_dict** A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

---

**platform\_grain\_name:** **os** The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

---

**platform\_column\_name:** **Platform** The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

New in version 2018.3.0.

---

**Note:** This field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

**index\_file:** **index** The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

**saltenv:** **base** Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

New in version 2018.3.0.

**include\_empty:** **False** Include empty files under the `textfsm_path`.

New in version 2018.3.0.

**include\_pat** Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**exclude\_pat** Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

---

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

---

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
 'show version and haiku': 'Hostname: re0.edge01.arn01
 Model: mx480
 Junos: 13.3R6.5
 Help me, Obi-Wan
 I just saw Episode Two
 You're my only hope

 'show chassis fan' : 'Item Status RPM Measurement
↳at intermediate-speed Top Rear Fan OK 3840 Spinningⓧ
↳at intermediate-speed Bottom Rear Fan OK 3840 Spinningⓧ
↳at intermediate-speed Top Middle Fan OK 3900 Spinningⓧ
↳at intermediate-speed Bottom Middle Fan OK 3840 Spinningⓧ
↳at intermediate-speed Top Front Fan OK 3810 Spinningⓧ
↳at intermediate-speed Bottom Front Fan OK 3840 Spinningⓧ
}
```

Example output with TextFSM parsing:

```
{
 "comment": "",
 "result": true,
 "out": {
 "sh ver": [
 {
 "kernel": "9.1S3.5",
 "documentation": "9.1S3.5",
 "boot": "9.1S3.5",
 "crypto": "9.1S3.5",
 "chassis": "",
 "routing": "9.1S3.5",
 "base": "9.1S3.5",
 "model": "mx960"
 }
]
 }
}
```

`salt.modules.napalm_network.commit`(*inherit\_napalm\_device=None*, *\*\*kwargs*)  
Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

`salt.modules.napalm_network.compare_config`(*inherit\_napalm\_device=None*, *\*\*kwargs*)  
Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

`salt.modules.napalm_network.config`(*source=None, \*\*kwargs*)

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `SOURCE` argument.

**source** Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

**Returns**

The object returned is a dictionary with the following keys:

- **running (string):** Representation of the native running configuration.
- **candidate (string):** Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.
- **startup (string):** Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

```
salt '*' net.config
salt '*' net.config source=candidate
```

`salt.modules.napalm_network.config_changed`(*inherit\_napalm\_device=None, \*\*kwargs*)

Will prompt if the configuration has been changed.

**Returns** A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

`salt.modules.napalm_network.config_control`(*inherit\_napalm\_device=None, \*\*kwargs*)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

**Returns** A tuple with a boolean that specifies if the config was changed/committed/rolledback on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

`salt.modules.napalm_network.confirm_commit`(*jid*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:

```
salt '*' net.confirm_commit 20180726083540640360
```

`salt.modules.napalm_network.connected(**kwargs)`  
Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

`salt.modules.napalm_network.discard_config(inherit_napalm_device=None, **kwargs)`  
Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

`salt.modules.napalm_network.environment(**kwargs)`  
Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```
{
 'fans': {
 'Bottom Rear Fan': {
 'status': True
 },
 'Bottom Middle Fan': {
 'status': True
 },
 'Top Middle Fan': {
 'status': True
 },
 'Bottom Front Fan': {
 'status': True
 },
 'Top Front Fan': {
 'status': True
 },
 'Top Rear Fan': {
 'status': True
 }
 },
 'memory': {
 'available_ram': 16349,
 'used_ram': 4934
 },
 'temperature': {
 'FPC 0 Exhaust A': {
 'is_alert': False,
```

(continues on next page)

(continued from previous page)

```

 'temperature': 35.0,
 'is_critical': False
 },
 'cpu': {
 '1': {
 '%usage': 19.0
 },
 '0': {
 '%usage': 35.0
 }
 }
}

```

`salt.modules.napalm_network.facts(**kwargs)`

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os\_version - String with the OS version running on the device.
- serial\_number - Serial number of the device
- interface\_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```

{
 'os_version': '13.3R6.5',
 'uptime': 10117140,
 'interface_list': [
 'lc-0/0/0',
 'pfe-0/0/0',
 'pfe-0/0/0',
 'xe-0/0/0',
 'xe-0/0/1',
 'xe-0/0/2',
 'xe-0/0/3',
 'gr-0/0/10',
 'ip-0/0/10'
],
 'vendor': 'Juniper',
 'serial_number': 'JN131356FBFA',
 'model': 'MX480',
 'hostname': 're0.edge05.syd01',
 'fqdn': 're0.edge05.syd01'
}

```

`salt.modules.napalm_network.interfaces(**kwargs)`

Returns details of the interfaces on the device.

**Returns** Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
 'Management1': {
 'is_up': False,
 'is_enabled': False,
 'description': '',
 'last_flapped': -1,
 'speed': 1000,
 'mac_address': 'dead:beef:dead',
 },
 'Ethernet1': {
 'is_up': True,
 'is_enabled': True,
 'description': 'foo',
 'last_flapped': 1429978575.1554043,
 'speed': 1000,
 'mac_address': 'beef:dead:beef',
 }
}
```

`salt.modules.napalm_network.ipaddrs` (\*\*kwargs)

Returns IP addresses configured on the device.

**Returns** A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
 'FastEthernet8': {
 'ipv4': {
 '10.66.43.169': {
 'prefix_length': 22
 }
 }
 },
 'Loopback555': {
 'ipv4': {
 '192.168.1.1': {
 'prefix_length': 24
 }
 },
 'ipv6': {
 '1::1': {
 'prefix_length': 64
 },
 '2001:DB8:1::1': {
 'prefix_length': 64
 }
 }
 }
}
```

(continues on next page)

(continued from previous page)

```

 'FE80::3': {
 'prefix_length': 'N/A'
 }
 }
}

```

`salt.modules.napalm_network.lldp(interface="", **kwargs)`

Returns a detailed view of the LLDP neighbors.

**Parameters** **interface** – interface name to filter on

**Returns** A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```

salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'

```

Example output:

```

{
 'TenGigE0/0/0/8': [
 {
 'parent_interface': 'Bundle-Ether8',
 'interface_description': 'TenGigE0/0/0/8',
 'remote_chassis_id': '8c60.4f69.e96c',
 'remote_system_name': 'switch',
 'remote_port': 'Eth2/2/1',
 'remote_port_description': 'Ethernet2/2/1',
 'remote_system_description': 'Cisco Nexus Operating System (NX-OS)
↳Software 7.1(0)N1(1a)
 TAC support: http://www.cisco.com/tac
 Copyright (c) 2002-2015, Cisco Systems, Inc. All rights
↳reserved.',
 'remote_system_capab': 'B, R',
 'remote_system_enable_capab': 'B'
 }
]
}

```

`salt.modules.napalm_network.load_config(filename=None, text=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, commit_jid=None, inherit_napalm_device=None, saltenv='base', **kwargs)`

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename** Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2018.3.0.

**text** String containing the desired configuration. This argument is ignored when `filename` is specified.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

**replace: False** Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

**commit\_in: None** Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour), `5h30m` (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at: None** Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None** Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None** Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**saltenv: base** Specifies the Salt environment name.

New in version 2018.3.0.

**Returns** a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user

- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False
```

Example output:

```
{
 'comment': 'Configuration discarded.',
 'already_configured': False,
 'result': True,
 'diff': '[edit interfaces xe-0/0/5]+ description "Adding a description";'
}
```

`salt.modules.napalm_network.load_template` (*template\_name=None, template\_source=None, context=None, defaults=None, template\_engine='jinja', saltenv='base', template\_hash=None, template\_hash\_name=None, skip\_verify=False, test=False, commit=True, debug=False, replace=False, commit\_in=None, commit\_at=None, revert\_in=None, revert\_at=None, inherit\_napalm\_device=None, \*\*template\_vars*)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards the config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

**template\_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
 base:
 - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template\_source:** **None** Inline config template to be rendered and loaded on the device.

**template\_hash:** **None** Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

**context:** **None** Overrides default context variables passed to the template.

New in version 2019.2.0.

**template\_hash\_name:** **None** When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**saltenv:** **base** Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template\_engine:** **jinja** The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

New in version 2016.11.2.

**skip\_verify:** **True** If **True**, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

**test:** **False** Dry run? If set to **True**, will apply the config, discard and return the changes. Default: **False** and will commit the changes on the device.

**commit:** **True** Commit? (default: **True**)

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace:** **False** Load and replace the configuration.

New in version 2016.11.2.

**commit\_in:** **None** Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or

command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at: None** Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None** Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour), `5h30m` (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None** Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**defaults:** `None` Default variables/context passed to the template.

New in version 2016.11.2.

**template\_vars** Dictionary with the arguments/context to be used when the template is rendered.

---

**Note:** Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

---

---

**Note:** It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.

---

**Returns** a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
 host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```

salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses NAPALM
↳default templates

inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {{host_
↳name}}}; }' host_name='MX480.lab'

inline template using grains info:
salt -G 'os:junos' net.load_template template_source='system { host-name {
↳{grains.model}}.lab; }'
if the device is a MX480, the command above will set the hostname as: MX480.lab

inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {{pillar.
↳proxy.host}}}; }'

salt '*' net.load_template https://bit.ly/20hSgqP hostname=example # will commit
salt '*' net.load_template https://bit.ly/20hSgqP hostname=example test=True #
↳dry run

salt '*' net.load_template salt://templates/example.jinja debug=True # Using the
↳salt:// URI

render a mako template:
salt '*' net.load_template salt://templates/example.mako template_engine=mako
↳debug=True

render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True
↳peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gK0j20 test=True debug=True
↳peers=['192.168.0.1']

render multiple templates at once
salt '*' net.load_template "['https://bit.ly/20hSgqP', 'salt://templates/example.
↳jinja']" context="{ 'hostname': 'example' }"

```

Example output:

```

{
 'comment': '',
 'already_configured': False,
 'result': True,
 'diff': '[edit system]+ host-name edge01.bjm01',
 'loaded_config': 'system { host-name edge01.bjm01; }'
}

```

`salt.modules.napalm_network.mac(address="", interface="", vlan=0, **kwargs)`

Returns the MAC Address Table on the device.

#### Parameters

- **address** – MAC address to filter on
- **interface** – Interface name to filter on
- **vlan** – VLAN identifier

**Returns** A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
 {
 'mac' : '00:1c:58:29:4a:71',
 'interface' : 'xe-3/0/2',
 'static' : False,
 'active' : True,
 'moves' : 1,
 'vlan' : 10,
 'last_move' : 1454417742.58
 },
 {
 'mac' : '8c:60:4f:58:e1:c1',
 'interface' : 'xe-1/0/1',
 'static' : False,
 'active' : True,
 'moves' : 2,
 'vlan' : 42,
 'last_move' : 1453191948.11
 }
]
```

`salt.modules.napalm_network.optics(**kwargs)`

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model `openconfig-platform-transceiver.yang`.

#### Returns

Returns a dictionary where the keys are as listed below:

- `intf_name` (unicode)
  - `physical_channels`
    - \* `channels` (list of dicts)
      - `index` (int)
      - `state`
        - `input_power`
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - `output_power`
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)

**laser\_bias\_current**

instant (float)  
 avg (float)  
 min (float)  
 max (float)

CLI Example:

```
salt '*' net.optics
```

`salt.modules.napalm_network.patch`(*patchfile*, *options*=", *saltenv*='base', *source\_hash*=None, *show\_changes*=True, *source*='running', *path*=None, *test*=False, *commit*=True, *debug*=False, *replace*=True)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

**patchfile** A patch file to apply to the configuration source.

**options** Options to pass to patch.

**source\_hash** If the patch file (specified via the `patchfile` argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

**show\_changes: True** Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise `False`).

**source: running** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path: None** Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit the configuration changes? Default: `True`.

**debug: False** Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True** Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

`salt.modules.napalm_network.ping`(*destination*, *source*=None, *ttl*=None, *timeout*=None, *size*=None, *count*=None, *vrf*=None, *\*\*kwargs*)

Executes a ping on the network device and returns a dictionary as a result.

**destination** Hostname or IP address of remote host

**source** Source address of echo request

**ttl** IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

**timeout** Maximum wait time after sending final packet (seconds)

**size** Size of request packets (0..65468 bytes)

**count** Number of ping requests to send (1..2000000000 packets)

**vrf** VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

```
salt.modules.napalm_network.replace_pattern(pattern, repl, count=0, flags=8, bufsize=1,
 append_if_not_found=False,
 prepend_if_not_found=False,
 not_found_content=None, search_only=False,
 show_changes=True, backslash_literal=False,
 source=None, path=None, test=False, replace=True,
 debug=False, commit=True)
```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

**pattern** A regular expression, to be matched using Python's `search()`.

**repl** The replacement text.

**count: 0** Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int): 8** A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to `8` (which supports 'MULTILINE').

**bufsize (int or str): 1** How much of the configuration to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found: False** If set to `True`, and pattern is not found, then the content will be appended to the file.

**prepend\_if\_not\_found: False** If set to `True` and pattern is not found, then the content will be prepended to the file.

**not\_found\_content** Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

**search\_only: False** If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show\_changes: True** If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

**backslash\_literal: False** Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

**source: running** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path** Save the temporary configuration to a specific path, then read from there.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit the configuration changes? Default: `True`.

**debug: False** Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True** Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=" "bind-address:"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

`salt.modules.napalm_network.rollback`(*inherit\_napalm\_device=None, \*\*kwargs*)  
Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

`salt.modules.napalm_network.save_config`(*source=None, path=None*)  
New in version 2019.2.0.

Save the configuration to a file on the local file system.

**source: running** The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

**path** Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

`salt.modules.napalm_network.traceroute`(*destination, source=None, ttl=None, timeout=None, vrf=None, \*\*kwargs*)

Calls the method `traceroute` from the NAPALM driver object and returns a dictionary with the result of the `traceroute` command executed on the device.

**destination** Hostname or address of remote host

**source** Source address to use in outgoing traceroute packets

**ttl** IP maximum time-to-live value (or IPv6 maximum hop-limit value)

**timeout** Number of seconds to wait for response (seconds)

**vrf** VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

## 21.9.268 salt.modules.napalm\_ntp module

### NAPALM NTP

Manages NTP on network devices.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

[NTP peers management state](#)

New in version 2016.11.0.

`salt.modules.napalm_ntp.delete_peers(*peers, **options)`

Removes NTP peers configured on the device.

**Parameters**

- **peers** – list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool) (commit)** – discard loaded config. By default `test` is False (will not discard the changes)
- **(bool)** – commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For a dry run, use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but
↳does not commit
```

`salt.modules.napalm_ntp.delete_servers(*servers, **options)`

Removes NTP servers configured on the device.

**Parameters**

- **servers** – list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool) (commit)** – discard loaded config. By default `test` is False (will not discard the changes)
- **(bool)** – commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False # preserves the changes,
↳but does not commit
```

`salt.modules.napalm_ntp.peers(**kwargs)`

Returns a list the NTP peers configured on the network device.

**Returns** configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
 '192.168.0.1',
 '172.17.17.1',
 '172.17.17.2',
```

(continues on next page)

(continued from previous page)

```

 '2400:cb00:6:1024::c71b:840a'
]

```

`salt.modules.napalm_ntp.servers(**kwargs)`

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```

[
 '192.168.0.1',
 '172.17.17.1',
 '172.17.17.2',
 '2400:cb00:6:1024::c71b:840a'
]

```

`salt.modules.napalm_ntp.set_peers(*peers, **options)`

Configures a list of NTP peers on the device.

**Parameters**

- **peers** – list of IP Addresses/Domain Names
- **(bool) (test)** – discard loaded config. By default `test` is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```

salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False # preserves the changes, but
↳does not commit

```

`salt.modules.napalm_ntp.set_servers(*servers, **options)`

Configures a list of NTP servers on the device.

**Parameters**

- **servers** – list of IP Addresses/Domain Names
- **(bool) (test)** – discard loaded config. By default `test` is False (will not discard the changes)

**Commit commit (bool)** commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```

salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the changes, but
↳does not commit

```

`salt.modules.napalm_ntp.stats` (*peer=None, \*\*kwargs*)

Returns a dictionary containing synchronization details of the NTP peers.

**Parameters** `peer` – Returns only the details of a specific NTP peer.

**Returns**

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
 {
 'remote' : '188.114.101.4',
 'referenceid' : '188.114.100.1',
 'synchronized' : True,
 'stratum' : 4,
 'type' : '-',
 'when' : '107',
 'hostpoll' : 256,
 'reachability' : 377,
 'delay' : 164.228,
 'offset' : -13.866,
 'jitter' : 2.695
 }
]
```

## 21.9.269 salt.modules.napalm\_probes module

### NAPALM Probes

Manages RPM/SLA probes on the network device.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *napalm proxy minion*

- *NET basic features*

See also:

*Probes configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_probes.config(**kwargs)`

Returns the configuration of the RPM probes.

**Returns** A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
 'probe1': {
 'test1': {
 'probe_type' : 'icmp-ping',
 'target' : '192.168.0.1',
 'source' : '192.168.0.2',
 'probe_count' : 13,
 'test_interval': 3
 },
 'test2': {
 'probe_type' : 'http-ping',
 'target' : '172.17.17.1',
 'source' : '192.17.17.2',
 'probe_count' : 5,
 'test_interval': 60
 }
 }
}
```

`salt.modules.napalm_probes.delete_probes(probes, test=False, commit=True, **kwargs)`

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete\_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

**Parameters**

- **probes** – Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises** `MergeConfigException` – If there is an error on the configuration sent.

**Returns** A dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied

- `diff (str)`: returns the config changes applied

Input example:

```
probes = {
 'existing_probe':{
 'existing_test1': {},
 'existing_test2': {}
 }
}
```

`salt.modules.napalm_probes.results(**kwargs)`

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```
{
 'probe1': {
 'test1': {
 'last_test_min_delay' : 63.120,
 'global_test_min_delay' : 62.912,
 'current_test_avg_delay' : 63.190,
 'global_test_max_delay' : 177.349,
 'current_test_max_delay' : 63.302,
 'global_test_avg_delay' : 63.802,
 'last_test_avg_delay' : 63.438,
 'last_test_max_delay' : 65.356,
 'probe_type' : 'icmp-ping',
 'rtt' : 63.138,
 'last_test_loss' : 0,
 'round_trip_jitter' : -59.0,
 'target' : '192.168.0.1',
 'source' : '192.168.0.2',
 'probe_count' : 15,
 'current_test_min_delay' : 63.138
 },
 'test2': {
 'last_test_min_delay' : 176.384,
 'global_test_min_delay' : 169.226,
 'current_test_avg_delay' : 177.098,
 'global_test_max_delay' : 292.628,
 'current_test_max_delay' : 180.055,
 'global_test_avg_delay' : 177.959,
 'last_test_avg_delay' : 177.178,
 'last_test_max_delay' : 184.671,
 'probe_type' : 'icmp-ping',
 'rtt' : 176.449,
 'last_test_loss' : 0,
 'round_trip_jitter' : -34.0,
 'target' : '172.17.17.1',
 'source' : '172.17.17.2',
 'probe_count' : 15,
 'current_test_min_delay' : 176.402
 }
 }
}
```

(continues on next page)

(continued from previous page)

```

 }
 }
}

```

`salt.modules.napalm_probes.schedule_probes` (*probes*, *test=False*, *commit=True*, *\*\*kwargs*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

#### Parameters

- **probes** – Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** – If there is an error on the configuration sent.

Returns a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

Input example:

```

probes = {
 'new_probe': {
 'new_test1': {},
 'new_test2': {}
 }
}

```

`salt.modules.napalm_probes.set_probes` (*probes*, *test=False*, *commit=True*, *\*\*kwargs*)

Configures RPM/SLA probes on the device. Calls the configuration template 'set\_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

#### Parameters

- **probes** – Dictionary formatted as the output of the function `config()`
- **test** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** – If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure.

In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below)

- comment (str): a message for the user
- already\_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```

probes = {
 'new_probe':{
 'new_test1': {
 'probe_type' : 'icmp-ping',
 'target' : '192.168.0.1',
 'source' : '192.168.0.2',
 'probe_count' : 13,
 'test_interval': 3
 },
 'new_test2': {
 'probe_type' : 'http-ping',
 'target' : '172.17.17.1',
 'source' : '192.17.17.2',
 'probe_count' : 5,
 'test_interval': 60
 }
 }
}
set_probes(probes)

```

CLI Example - to push cahnges on the fly (not recommended):

```

salt 'junos_minion' probes.set_probes '{"new_probe':{'new_test1':{'probe_type':
↪'icmp-ping', 'target':'192.168.0.1','source':'192.168.0.2','probe_
↪count':13,'test_interval':3}}}" test=True

```

Output example - for the CLI example above:

```

junos_minion:

already_configured:
 False
comment:
 Configuration discarded.
diff:
 [edit services rpm]
 probe transit { ... }
+ probe new_probe {
+ test new_test1 {
+ probe-type icmp-ping;
+ target address 192.168.0.1;
+ probe-count 13;
+ test-interval 3;
+ source-address 192.168.0.2;
+ }
+ }
result:
 True

```

## 21.9.270 salt.modules.napalm\_route module

### NAPALM Route

Retrieves route details from network devices.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>  
**maturity** new  
**depends** napalm  
**platform** unix

### Dependencies

- *NAPALM proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_route.show(destination, protocol=None, **kwargs)`

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

---

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

---

**destination** destination prefix.

**protocol (optional)** protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
 '172.16.0.0/25': [
 {
 'protocol': 'BGP',
 'last_active': True,
 'current_active': True,
 'age': 1178693,
 'routing_table': 'inet.0',
 'next_hop': '192.168.0.11',
 'outgoing_interface': 'xe-1/1/1.100',
 'preference': 170,
 'selected_next_hop': False,
 'protocol_attributes': {
 'remote_as': 65001,
 'metric': 5,
 'local_as': 13335,
 'as_path': '',

```

(continues on next page)

(continued from previous page)

```

 'remote_address': '192.168.0.11',
 'metric2': 0,
 'local_preference': 0,
 'communities': [
 '0:2',
 'no-export'
],
 'preference2': -1
 },
 'inactive_reason': ''
},
{
 'protocol': 'BGP',
 'last_active': False,
 'current_active': False,
 'age': 2359429,
 'routing_table': 'inet.0',
 'next_hop': '192.168.0.17',
 'outgoing_interface': 'xe-1/1/1.100',
 'preference': 170,
 'selected_next_hop': True,
 'protocol_attributes': {
 'remote_as': 65001,

 'local_preference': 0,
 'communities': [
 '0:3',
 'no-export'
],
 'preference2': -1
 },
 'inactive_reason': 'Not Best in its group - Router ID'
}
]
}

```

### 21.9.271 salt.modules.napalm\_snmp module

#### NAPALM SNMP

Manages SNMP on network devices.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

*SNMP configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_snmp.config(**kwargs)`

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

`salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)`

Removes a configuration element from the SNMP configuration.

### Parameters

- **chassis\_id** – (optional) Chassis ID
- **community** – (optional) A dictionary having the following optional keys:
  - **acl** (if any policy / ACL need to be set)
  - **mode**: rw or ro. Default: ro

### Parameters

- **contact** – Contact details
- **location** – Location
- **test** – Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** – Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises MergeConfigException** – If there is an error on the configuration sent.

**Returns** A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

`salt.modules.napalm_snmp.update_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)`

Updates the SNMP configuration.

### Parameters

- **chassis\_id** – (optional) Chassis ID
- **community** – (optional) A dictionary having the following optional keys:

- `acl` (if any policy / ACL need to be set)
- `mode`: `rw` or `ro`. Default: `ro`

#### Parameters

- **`contact`** – Contact details
- **`location`** – Location
- **`test`** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **`commit`** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (`add` / `remove` / `update`) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **`MergeConfigException`** – If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:

already_configured:
 False
comment:
 Configuration discarded.
diff:
 [edit snmp]
 - location "London, UK";
 + location "Greenwich, UK";
result:
 True
```

## 21.9.272 salt.modules.napalm\_users module

### NAPALM Users

Manages the configuration of the users on network devices.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- *NAPALM proxy minion*

See also:

*Users management state*

New in version 2016.11.0.

`salt.modules.napalm_users.config(**kwargs)`

Returns the configuration of the users on the device

CLI Example:

```
salt '*' users.config
```

Output example:

```
{
 'mircea': {
 'level': 15,
 'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',
 'sshkeys': [
 'ssh-rsa

↪YW+7oH17Fk2HH+tw0L5PcWLHkwA4t60iXn16qDbIk/ze6jv2hDGdCdz7oYQeCE55C
↪ CHOHMJWYfn3jcL4s0qv8/u6Ka1FVkv7iMmro7ChThoV/5snI4Lj f2wKqgHH7TfNaCfpU0WvHA
↪ nTs8zh0rGScSrtb mircea@master-roshi'
]
 }
}
```

`salt.modules.napalm_users.delete_users(users, test=False, commit=True, **kwargs)`

Removes users from the configuration of network devices.

### Parameters

- **users** – Dictionary formatted as the output of the function `config()`
- **test** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** – If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the *already\_configured* flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users '{"mircea': {}}"
```

`salt.modules.napalm_users.set_users` (*users*, *test=False*, *commit=True*, *\*\*kwargs*)

Configures users on network devices.

#### Parameters

- **users** – Dictionary formatted as the output of the function `config()`
- **test** – Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** – Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

Raises **MergeConfigException** – If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users '{"mircea': {}}"
```

## 21.9.273 salt.modules.napalm\_yang\_mod module

### NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

`salt.modules.napalm_yang_mod.compliance_report` (*data*, *\*models*, *\*\*kwargs*)

Return the compliance report using YANG objects.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**filepath** The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/
↪validate.yml
```

Output Example:

```
{
 "skipped": [],
 "complies": true,
 "get_interfaces_ip": {
 "missing": [],
 "complies": true,
 "present": {
 "ge-0/0/0.0": {
```

(continues on next page)

(continued from previous page)

```

 "complies": true,
 "nested": true
 }
},
"extra": []
}
}

```

`salt.modules.napalm_yang_mod.diff(candidate, running, *models)`

Returns the difference between two configuration entities structured according to the YANG model.

---

**Note:** This function is recommended to be used mostly as a state helper.

---

**candidate** First model to compare.

**running** Second model to compare.

**models** A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```

{
 "interfaces": {
 "interface": {
 "both": {
 "Port-Channel1": {
 "config": {
 "mtu": {
 "first": "0",
 "second": "9000"
 }
 }
 }
 },
 "first_only": [
 "Loopback0"
],
 "second_only": [
 "Loopback1"
]
 }
 }
}

```

`salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)`

Return the native config.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
 ip address 192.168.1.1/24
 description Uplink1
 mtu 9000
interface et2
 ip address 192.168.2.1/24
 description Uplink2
 mtu 9000
```

`salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)`

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

**data** Dictionary structured with respect to the models referenced.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**test: False** Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit: True** Commit? Default: True.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False** Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True
↪debug=True
```

Output Example:

```
device1:

already_configured:
 False
comment:
diff:
 [edit interfaces ge-0/0/0]
 - mtu 1400;
 [edit interfaces ge-0/0/0 unit 0 family inet]
 - dhcp;
 [edit interfaces lo0]
 - unit 0 {
 - description lo0.0;
 - }
 + unit 1 {
 + description "new loopback";
 + }
loaded_config:

result:
 True

```

`salt.modules.napalm_yang_mod.parse(*models, **kwargs)`

Parse configuration from the device.

**models** A list of models to be used when parsing.

**config: False** Parse config.

**state: False** Parse state.

**profiles: None** Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```

{
 "interfaces": {
 "interface": {
 ".local.": {
 "name": ".local.",

```

### 21.9.274 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

**depends** netaddr

**salt.modules.netaddress.cidr\_broadcast**(*cidr*)

Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.cidr_netmask(cidr)`  
Get the netmask address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.list_cidr_ips(cidr)`  
Get a list of IP addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

`salt.modules.netaddress.list_cidr_ips_ipv6(cidr)`  
Get a list of IPv6 addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

## 21.9.275 salt.modules.netbox module

### NetBox

Module to query NetBox

**codeauthor** Zach Moody <zmoody@do.co>

**maturity** new

**depends** pynetbox

The following config should be in the minion config file. In order to work with `secrets` you should provide a token and path to your private key file:

```
netbox:
 url: <NETBOX_URL>
 token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
 keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

`salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)`

New in version 2019.2.0.

Create a new Netbox circuit  
**name** Name of the circuit  
**provider\_id** The netbox id of the circuit provider  
**circuit\_type** The name of the circuit type  
**asn** The ASN of the circuit provider  
**description** The description of the circuit

CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299 "New Telia
↪circuit"
```

`salt.modules.netbox.create_circuit_provider`(*name*, *asn=None*)

New in version 2019.2.0.

Create a new Netbox circuit provider

**name** The name of the circuit provider

**asn** The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```

`salt.modules.netbox.create_circuit_termination`(*circuit*, *interface*, *device*, *speed*, *xconnect\_id=None*, *term\_side='A'*)

New in version 2019.2.0.

Terminate a circuit on an interface

**circuit** The name of the circuit

**interface** The name of the interface to terminate on

**device** The name of the device the interface belongs to

**speed** The speed of the circuit, in Kbps

**xconnect\_id** The cross-connect identifier

**term\_side** The side of the circuit termination

CLI Example:

```
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1 myminion
↪10000 xconnect_id=XCON01
```

`salt.modules.netbox.create_circuit_type`(*name*)

New in version 2019.2.0.

Create a new Netbox circuit type.

**name** The name of the circuit type

CLI Example:

```
salt myminion netbox.create_circuit_type Transit
```

`salt.modules.netbox.create_device`(*name*, *role*, *model*, *manufacturer*, *site*)

New in version 2019.2.0.

Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.

**name** The name of the device, e.g., `edge_router`

**role** String of device role, e.g., `router`

**model** String of device model, e.g., `MX480`

**manufacturer** String of device manufacturer, e.g., `Juniper`

**site** String of device site, e.g., `BRU`

CLI Example:

```
salt myminion netbox.create_device edge_router router MX480 Juniper BRU
```

`salt.modules.netbox.create_device_role`(*role*, *color*)

New in version 2019.2.0.

Create a device role

**role** String of device role, e.g., `router`

CLI Example:

```
salt myminion netbox.create_device_role router
```

`salt.modules.netbox.create_device_type(model, manufacturer)`

New in version 2019.2.0.

Create a device type. If the manufacturer doesn't exist, create a new manufacturer.

**model** String of device model, e.g., MX480

**manufacturer** String of device manufacturer, e.g., Juniper

CLI Example:

```
salt myminion netbox.create_device_type MX480 Juniper
```

`salt.modules.netbox.create_interface(device_name, interface_name, mac_address=None, description=None, enabled=None, lag=None, lag_parent=None, form_factor=None)`

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

**device\_name** The name of the device, e.g., edge\_router

**interface\_name** The name of the interface, e.g., TenGigE0/0/0/0

**mac\_address** String of mac address, e.g., 50:87:89:73:92:C8

**description** String of interface description, e.g., NTT

**enabled** String of boolean interface status, e.g., True

**lag**: Boolean of interface lag status, e.g., True

**lag\_parent** String of interface lag parent name, e.g., ae13

**form\_factor** Integer of form factor id, obtained through `_choices` API endpoint, e.g., 200

CLI Example:

```
salt myminion netbox.create_interface edge_router ae13 description="Core uplink"
```

`salt.modules.netbox.create_interface_connection(interface_a, interface_b)`

New in version 2019.2.0.

Create an interface connection between 2 interfaces

**interface\_a** Interface id for Side A

**interface\_b** Interface id for Side B

CLI Example:

```
salt myminion netbox.create_interface_connection 123 456
```

`salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial="", part_id="", description="")`

New in version 2019.2.0.

Add an inventory item to an existing device.

**device\_name** The name of the device, e.g., edge\_router.

**item\_name** String of inventory item name, e.g., Transceiver.

**manufacturer\_name** String of inventory item manufacturer, e.g., Fiberstore.

**serial** String of inventory item serial, e.g., FS1238931.

**part\_id** String of inventory item part id, e.g., 740-01234.

**description** String of inventory item description, e.g., SFP+-10G-LR.

CLI Example:

```
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=740-↵01234
```

`salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)`

New in version 2019.2.0.

Add an IP address, and optionally attach it to an interface.

**ip\_address** The IP address and CIDR, e.g., 192.168.1.1/24

**family** Integer of IP family, e.g., 4

**device** The name of the device to attach IP to, e.g., edge\_router

**interface** The name of the interface to attach IP to, e.g., ae13

CLI Example:

```
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router
↳ interface=ae13
```

**salt.modules.netbox.create\_manufacturer**(*name*)

New in version 2019.2.0.

Create a device manufacturer.

**name** The name of the manufacturer, e.g., Juniper

CLI Example:

```
salt myminion netbox.create_manufacturer Juniper
```

**salt.modules.netbox.create\_platform**(*platform*)

New in version 2019.2.0.

Create a new device platform

**platform** String of device platform, e.g., junos

CLI Example:

```
salt myminion netbox.create_platform junos
```

**salt.modules.netbox.create\_site**(*site*)

New in version 2019.2.0.

Create a new device site

**site** String of device site, e.g., BRU

CLI Example:

```
salt myminion netbox.create_site BRU
```

**salt.modules.netbox.delete\_interface**(*device\_name*, *interface\_name*)

New in version 2019.2.0.

Delete an interface from a device.

**device\_name** The name of the device, e.g., edge\_router.

**interface\_name** The name of the interface, e.g., ae13

CLI Example:

```
salt myminion netbox.delete_interface edge_router ae13
```

**salt.modules.netbox.delete\_inventory\_item**(*item\_id*)

New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id

**item\_id** Integer of item to be deleted

CLI Example:

```
salt myminion netbox.delete_inventory_item 1354
```

**salt.modules.netbox.delete\_ipaddress**(*ipaddr\_id*)

New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.

**id** The Netbox id for the IP address.

CLI Example:

```
salt myminion netbox.delete_ipaddress 9002
```

`salt.modules.netbox.filter_`(*app*, *endpoint*, *\*\*kwargs*)

Get a list of items from NetBox.

**app** String of netbox app, e.g., `dcim`, `circuits`, `ipam`

**endpoint** String of app endpoint, e.g., `sites`, `regions`, `devices`

**kwargs** Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., `role=router`

Returns a list of dictionaries

```
salt myminion netbox.filter dcim devices status=1 role=router
```

`salt.modules.netbox.get_`(*app*, *endpoint*, *id=None*, *\*\*kwargs*)

Get a single item from NetBox.

**app** String of netbox app, e.g., `dcim`, `circuits`, `ipam`

**endpoint** String of app endpoint, e.g., `sites`, `regions`, `devices`

Returns a single dictionary

To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

`salt.modules.netbox.get_circuit_provider`(*name*, *asn=None*)

New in version 2019.2.0.

Get a circuit provider with a given name and optional ASN.

**name** The name of the circuit provider

**asn** The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

`salt.modules.netbox.get_interfaces`(*device\_name=None*, *\*\*kwargs*)

New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters

**device\_name** The name of the device, e.g., `edge_router`

**kwargs** Optional arguments to be used for filtering

CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

`salt.modules.netbox.get_ipaddresses`(*device\_name=None*, *\*\*kwargs*)

New in version 2019.2.0.

Filters for an IP address using specified filters

**device\_name** The name of the device to check for the IP address

**kwargs** Optional arguments that can be used to filter, e.g., `family=4`

CLI Example:

```
salt myminion netbox.get_ipaddresses device_name family=4
```

`salt.modules.netbox.make_interface_child(device_name, interface_name, parent_name)`

New in version 2019.2.0.

Set an interface as part of a LAG.

**device\_name** The name of the device, e.g., `edge_router`.

**interface\_name** The name of the interface to be attached to LAG, e.g., `xe-1/0/2`.

**parent\_name** The name of the LAG interface, e.g., `ae13`.

CLI Example:

```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

`salt.modules.netbox.make_interface_lag(device_name, interface_name)`

New in version 2019.2.0.

Update an interface to be a LAG.

**device\_name** The name of the device, e.g., `edge_router`.

**interface\_name** The name of the interface, e.g., `ae13`.

CLI Example:

```
salt myminion netbox.make_interface_lag edge_router ae13
```

`salt.modules.netbox.openconfig_interfaces(device_name=None)`

New in version 2019.2.0.

Return a dictionary structured as standardised in the `openconfig-interfaces` YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

**device\_name: None** The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

`salt.modules.netbox.openconfig_lacp(device_name=None)`

New in version 2019.2.0.

Return a dictionary structured as standardised in the `openconfig-lacp` YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

---

**Note:** The `interval` and `lacp_mode` keys have the values set as `SLOW` and `ACTIVE` respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See `interval` and `lacp-mode` for further details.

---

**device\_name: None** The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon
```

`salt.modules.netbox.slugify(value)`

' Slugify given value. Credit to Djangooproject [https://docs.djangoproject.com/en/2.0/\\_modules/django/utils/text/#slugify](https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify)

`salt.modules.netbox.update_device(name, **kwargs)`

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

**name** The name of the device, e.g., `edge_router`

**kwargs** Arguments to change in device, e.g., `serial=JN2932930`

CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

`salt.modules.netbox.update_interface(device_name, interface_name, **kwargs)`

New in version 2019.2.0.

Update an existing interface with new attributes.

**device\_name** The name of the device, e.g., `edge_router`

**interface\_name** The name of the interface, e.g., `ae13`

**kwargs** Arguments to change in interface, e.g., `mac_address=50:87:69:53:32:D0`

CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_
↪address=50:87:69:53:32:D0
```

### 21.9.276 salt.modules.netbsd\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.netbsd_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.get(name)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

### 21.9.277 salt.modules.netbsdservice

The service module for NetBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.netbsdservice.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.netbsdservice.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.netbsdservice.disabled(name)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.netbsdservice.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.netbsdservice.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.netbsdservice.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.netbsdservice.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.netbsdservice.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.netbsdservice.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.netbsdservice.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.netbsdservice.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.netbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.netbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.netbsdservice.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.netbsdservice.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 21.9.278 salt.modules.netmiko\_mod

### Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `ip`, `username`, `password` etc.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

**maturity** new

**depends** netmiko

**platform** unix

### Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

### Usage

This module can equally be used via the `netmiko` Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the `netmiko` library installed.

When running outside of the `netmiko Proxy` (i.e., from another Proxy Minion type, or regular Minion), the `netmiko` connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `netmiko` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `netmiko` Proxy Module:

- `device_type` - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron

- brocade\_nos: Brocade NOS
- brocade\_vdx: Brocade NOS
- brocade\_vyos: VyOS
- checkpoint\_gaia: Check Point GAiA
- calix\_b6: Calix B6
- ciena\_saos: Ciena SAOS
- cisco\_asa: Cisco SA
- cisco\_ios: Cisco IOS
- cisco\_nxos: Cisco NX-os
- cisco\_s300: Cisco S300
- cisco\_tp: Cisco TpTcCe
- cisco\_wlc: Cisco WLC
- cisco\_xe: Cisco IOS
- cisco\_xr: Cisco XR
- coriant: Coriant
- dell\_force10: Dell Force10
- dell\_os10: Dell OS10
- dell\_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme\_wing: Extreme Wing
- f5\_ltm: F5 LTM
- fortinet: Fortinet
- generic\_termserver: TerminalServer
- hp\_comware: HP Comware
- hp\_procurve: HP Procurve
- huawei: Huawei
- huawei\_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper\_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv\_optiswitch: MrvOptiswitch
- netapp\_cdot: NetAppcDot
- netscaler: Netscaler

- ovs\_linux: OvsLinux
  - paloalto\_panos: PaloAlto Panos
  - pluribus: Pluribus
  - quanta\_mesh: Quanta Mesh
  - ruckus\_fastiron: Ruckus Fastiron
  - ubiquiti\_edge: Ubiquiti Edge
  - ubiquiti\_edgeswitch: Ubiquiti Edge
  - vyatta\_vyos: VyOS
  - vyos: VyOS
  - brocade\_fastiron\_telnet: Brocade Fastiron over Telnet
  - brocade\_netiron\_telnet: Brocade Netiron over Telnet
  - cisco\_ios\_telnet: Cisco IOS over Telnet
  - apresia\_aeos\_telnet: Apresia AEOS over Telnet
  - arista\_eos\_telnet: Arista EOS over Telnet
  - hp\_procurve\_telnet: HP Procurve over Telnet
  - hp\_comware\_telnet: HP Comware over Telnet
  - juniper\_junos\_telnet: Juniper Junos over Telnet
  - calix\_b6\_telnet: Calix B6 over Telnet
  - dell\_powerconnect\_telnet: Dell PowerConnect over Telnet
  - generic\_termserver\_telnet: TerminalServer over Telnet
  - extreme\_telnet: Extreme Networks over Telnet
  - ruckus\_fastiron\_telnet: Ruckus Fastiron over Telnet
  - cisco\_ios\_serial: Cisco IOS over serial port
- ip - IP address of target device (not required if host is provided)
  - host - Hostname of target device (not required if ip is provided)
  - username - Username to authenticate against target device, if required
  - password - Password to authenticate against target device, if required
  - secret - The enable password if target device requires one
  - port - The destination port used to connect to the target device
  - global\_delay\_factor - Multiplication factor affecting Netmiko delays (default: 1)
  - use\_keys - Connect to target device using SSH keys (default: False)
  - key\_file - Filename path of the SSH key file to use
  - allow\_agent - Enable use of SSH key-agent
  - ssh\_strict - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
  - system\_host\_keys - Load host keys from the user's "known\_hosts" file (default: False)

- `alt_host_keys` - If True, host keys will be loaded from the file specified in `alt_key_file` (default: False)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: 90)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)

Example (when not running in a netmiko Proxy Minion):

```
netmiko:
 username: test
 password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a netmiko Proxy, e.g.:

```
salt '*' netmiko.send_command 'show version' host=router1.example.com device_
↳type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com device_
↳type=cisco_ios
```

---

**Note:** Remember that the above applies only when not running in a netmiko Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

---

`salt.modules.netmiko_mod.call`(*method*, \*args, \*\*kwargs)

Invoke an arbitrary Netmiko method.

**method** The name of the Netmiko method to invoke.

**args** A list of arguments to send to the method invoked.

**kwargs** Key-value dictionary to send to the method invoked.

`salt.modules.netmiko_mod.commit`(\*\*kwargs)

Commit the configuration changes.

**Warning:** This function is supported only on the platforms that support the commit operation.

CLI Example:

```
salt '*' netmiko.commit
```

`salt.modules.netmiko_mod.enter_config_mode`(\*\*kwargs)

Enter into config mode.

**config\_command** Configuration command to send to the device.

**pattern** Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.168.0.1'
↪username='example'
```

`salt.modules.netmiko_mod.exit_config_mode(**kwargs)`

Exit from configuration mode.

**exit\_config** Command to exit configuration mode.

**pattern** Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.exit_config_mode
salt '*' netmiko.exit_config_mode device_type='juniper' ip='192.168.0.1' username=
↪'example'
```

`salt.modules.netmiko_mod.get_connection(**kwargs)`

Return the Netmiko connection object.

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs** Key-value dictionary with the authentication details.

USAGE Example:

```
conn = __salt__['netmiko.get_connection'](host='router1.example.com',
 username='example',
 password='example')
show_if = conn.send_command('show interfaces')
conn.disconnect()
```

`salt.modules.netmiko_mod.multi_call(*methods, **kwargs)`

Invoke multiple Netmiko methods at once, and return their output, as list.

**methods** A list of dictionaries with the following keys:

- **name:** the name of the Netmiko method to be executed.
- **args:** list of arguments to be sent to the Netmiko method.
- **kwargs:** dictionary of arguments to be sent to the Netmiko method.

**kwargs** Key-value dictionary with the connection details (when not running under a Proxy Minion).

`salt.modules.netmiko_mod.send_command(command_string, **kwargs)`

Execute `command_string` on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

**command\_string** The command to be executed on the remote device.

**expect\_string** Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay\_factor: 1** Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500** Controls wait time in conjunction with `delay_factor`. Will default to be based upon `self.timeout`.

**auto\_find\_prompt: True** Whether it should try to auto-detect the prompt (default: True).

**strip\_prompt: True** Remove the trailing router prompt from the output (default: True).

**strip\_command: True** Remove the echo of the command from the output (default: True).

**normalize: True** Ensure the proper enter is sent at end of command (default: True).

**use\_textfsm: False** Process command output through TextFSM template (default: False).

CLI Example:

```

salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com' username=
↳'example' device_type='cisco_ios'

```

`salt.modules.netmiko_mod.send_command_timing`(*command\_string*, *\*\*kwargs*)

Executes *command\_string* on the SSH channel using a delay-based mechanism. Generally used for show commands.

**command\_string** The command to be executed on the remote device.

**delay\_factor: 1** Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500** Controls wait time in conjunction with *delay\_factor*. Will default to be based upon *self.timeout*.

**strip\_prompt: True** Remove the trailing router prompt from the output (default: True).

**strip\_command: True** Remove the echo of the command from the output (default: True).

**normalize: True** Ensure the proper enter is sent at end of command (default: True).

**use\_textfsm: False** Process command output through TextFSM template (default: False).

CLI Example:

```

salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.com'
↳username='example' device_type='arista_eos'

```

`salt.modules.netmiko_mod.send_config`(*config\_file=None*, *config\_commands=None*, *template\_engine='jinja'*, *commit=False*, *context=None*, *defaults=None*, *saltenv='base'*, *\*\*kwargs*)

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

**config\_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**config\_commands** Multiple configuration commands to be sent to the device.

---

**Note:** This argument is ignored when *config\_file* is specified.

---

**template\_engine: jinja** The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**commit: False** Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

**context** Variables to add to the template context.

**defaults** Default values of the *context\_dict*.

**exit\_config\_mode: True** Determines whether or not to exit config mode after complete.

**delay\_factor: 1** Factor to adjust delays.

**max\_loops: 150** Controls wait time in conjunction with *delay\_factor* (default: 150).

**strip\_prompt: False** Determines whether or not to strip the prompt (default: False).

**strip\_command: False** Determines whether or not to strip the command (default: False).

**config\_mode\_command** The command to enter into config mode.

CLI Example:

```

salt '*' netmiko.send_config config_commands="['interface GigabitEthernet3', 'no
↳ ip address']"
salt '*' netmiko.send_config config_commands="['snmp-server location {{ grains.
↳ location }}']"
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_type=
↳ 'cisco_ios' ip='1.2.3.4' username='example'

```

### 21.9.279 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

#### depends

- nsnitro Python module

**Note:** You can install nsnitro using:

```
pip install nsnitro
```

**configuration** This module accepts connection configuration details either as parameters, or as configuration settings in `/etc/salt/minion` on the relevant minions

```

netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password

```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

**CLI Examples** Calls relying on configuration passed using `/etc/salt/minion`, grains, or pillars: .. code-block:: bash

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as `opts` .. code-block:: bash

```

salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4
netscaler_user=username netscaler_pass=password salt-call netscaler.server_exists
server_name netscaler_host=1.2.3.5 netscaler_user=username2
netscaler_pass=password2 salt-call netscaler.server_enable server_name2
netscaler_host=1.2.3.5 salt-call netscaler.server_up server_name3
netscaler_host=1.2.3.6 netscaler_useSSL=False

```

**salt.modules.netscaler.server\_add**(*s\_name*, *s\_ip*, *s\_state=None*, *\*\*connection\_args*)

Add a server Note: The default server state is ENABLED

CLI Example:

```

salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'

```

**salt.modules.netscaler.server\_delete**(*s\_name*, *\*\*connection\_args*)

Delete a server

CLI Example:

```
salt '*' netcaler.server_delete 'serverName'
```

`salt.modules.netcaler.server_disable(s_name, **connection_args)`  
Disable a server globally

CLI Example:

```
salt '*' netcaler.server_disable 'serverName'
```

`salt.modules.netcaler.server_enable(s_name, **connection_args)`  
Enables a server globally

CLI Example:

```
salt '*' netcaler.server_enable 'serverName'
```

`salt.modules.netcaler.server_enabled(s_name, **connection_args)`  
Check if a server is enabled globally

CLI Example:

```
salt '*' netcaler.server_enabled 'serverName'
```

`salt.modules.netcaler.server_exists(s_name, ip=None, s_state=None, **connection_args)`  
Checks if a server exists

CLI Example:

```
salt '*' netcaler.server_exists 'serverName'
```

`salt.modules.netcaler.server_update(s_name, s_ip, **connection_args)`  
Update a server's attributes

CLI Example:

```
salt '*' netcaler.server_update 'serverName' 'serverIP'
```

`salt.modules.netcaler.service_disable(s_name, s_delay=None, **connection_args)`  
Disable a service

CLI Example:

```
salt '*' netcaler.service_disable 'serviceName'
salt '*' netcaler.service_disable 'serviceName' 'delayInSeconds'
```

`salt.modules.netcaler.service_enable(s_name, **connection_args)`  
Enable a service

CLI Example:

```
salt '*' netcaler.service_enable 'serviceName'
```

`salt.modules.netcaler.service_exists(s_name, **connection_args)`  
Checks if a service exists

CLI Example:

```
salt '*' netcaler.service_exists 'serviceName'
```

`salt.modules.netcaler.service_up`(*s\_name*, *\*\*connection\_args*)

Checks if a service is UP

CLI Example:

```
salt '*' netcaler.service_up 'serviceName'
```

`salt.modules.netcaler.servicegroup_add`(*sg\_name*, *sg\_type='HTTP'*, *\*\*connection\_args*)

Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL\_BRIDGE

CLI Example:

```
salt '*' netcaler.servicegroup_add 'serviceGroupName'
salt '*' netcaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

`salt.modules.netcaler.servicegroup_delete`(*sg\_name*, *\*\*connection\_args*)

Delete a new service group

CLI Example:

```
salt '*' netcaler.servicegroup_delete 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_exists`(*sg\_name*, *sg\_type=None*, *\*\*connection\_args*)

Checks if a service group exists

CLI Example:

```
salt '*' netcaler.servicegroup_exists 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_server_add`(*sg\_name*, *s\_name*, *s\_port*, *\*\*connection\_args*)

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_add 'serviceGroupName' 'serverName'
↪ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_delete`(*sg\_name*, *s\_name*, *s\_port*, *\*\*connection\_args*)

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
↪ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_disable`(*sg\_name*, *s\_name*, *s\_port*, *\*\*connection\_args*)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
↪ 'serverPort'
```

`salt.modules.netscaler.servicegroup_server_enable`(*sg\_name*, *s\_name*, *s\_port*, **\*\*connection\_args**)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netscaler.servicegroup_server_exists`(*sg\_name*, *s\_name*, *s\_port=None*, **\*\*connection\_args**)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netscaler.servicegroup_server_up`(*sg\_name*, *s\_name*, *s\_port*, **\*\*connection\_args**)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netscaler.vserver_add`(*v\_name*, *v\_ip*, *v\_port*, *v\_type*, **\*\*connection\_args**)

Add a new lb vserver

CLI Example:

```
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
↳ 'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

`salt.modules.netscaler.vserver_delete`(*v\_name*, **\*\*connection\_args**)

Delete a lb vserver

CLI Example:

```
salt '*' netscaler.vserver_delete 'vserverName'
```

`salt.modules.netscaler.vserver_exists`(*v\_name*, *v\_ip=None*, *v\_port=None*, *v\_type=None*, **\*\*connection\_args**)

Checks if a vserver exists

CLI Example:

```
salt '*' netscaler.vserver_exists 'vserverName'
```

`salt.modules.netscaler.vserver_servicegroup_add`(*v\_name*, *sg\_name*, **\*\*connection\_args**)

Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

`salt.modules.netscaler.vserver_servicegroup_delete`(*v\_name*, *sg\_name*, **\*\*connection\_args**)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_servicegroup_exists`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

`salt.modules.netcaler.vserver_sslcert_add`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_delete`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_exists`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

## 21.9.280 salt.modules.network

Module for gathering and managing network information

`salt.modules.network.active_tcp`()

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

`salt.modules.network.arp`()

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

`salt.modules.network.calc_net`(*ip\_addr*, *netmask=None*)

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

`salt.modules.network.connect`(*host*, *port=None*, *\*\*kwargs*)  
Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↳ timeout=3
```

`salt.modules.network.convert_cidr`(*cidr*)  
returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

`salt.modules.network.default_route`(*family=None*)  
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

`salt.modules.network.dig`(*host*)  
Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.network.get_bufsize`(*iface*)  
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

`salt.modules.network.get_fqdn`()  
Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

`salt.modules.network.get_hostname()`

Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.network.get_route(ip)`

Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.ifacestartswith(cidr)`

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

`salt.modules.network.in_subnet(cidr)`

Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.network.interface(iface)`

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

`salt.modules.network.interface_ip`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

`salt.modules.network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.network.ip_addrs`(*interface=None, include\_loopback=False, cidr=None, type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ip_addrs6`(*interface=None, include\_loopback=False, cidr=None*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.ip_in_subnet`(*ip\_addr, cidr*)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

`salt.modules.network.ipaddrs`(*interface=None, include\_loopback=False, cidr=None, type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ipaddrs6`(*interface=None, include\_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. `::1` is ignored, unless `'include_loopback=True'` is indicated. If `'interface'` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `'cidr="2000::/3"'` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.iphexval(ip)`

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

`salt.modules.network.is_loopback(ip_addr)`

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

`salt.modules.network.is_private(ip_addr)`

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.network.mod_bufsize(iface, *args, **kwargs)`

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

`salt.modules.network.mod_hostname(hostname)`

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

`salt.modules.network.netstat()`

Return information on open ports and states

---

**Note:** On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

---

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.ping`(*host*, *timeout=False*, *return\_boolean=False*)

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.reverse_ip`(*ip\_addr*)

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes`(*family=None*)

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.subnets`(*interfaces=None*)

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.subnets6`()

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.network.traceroute` (*host*)

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.wol` (*mac, bcast='255.255.255.255', destport=9*)

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

### 21.9.281 salt.modules.neutron

Module for handling OpenStack Neutron calls

**depends**

- neutronclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
 keystone.user: 'admin'
 keystone.password: 'password'
 keystone.tenant: 'admin'
 keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
 keystone.region_name: 'RegionOne'
 keystone.service_type: 'network'

openstack2:
 keystone.user: 'admin'
 keystone.password: 'password'
 keystone.tenant: 'admin'
 keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
 keystone.region_name: 'RegionOne'
 keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

---

**Note:** this is required to use keystone v3 as for authentication.

---

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

`salt.modules.neutron.add_gateway_router` (*router, ext\_network, profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

#### Parameters

- **router** – ID or name of the router
- **ext\_network** – ID or name of the external network the gateway
- **profile** – Profile to build on (Optional)

**Returns** Added Gateway router information

`salt.modules.neutron.add_interface_router` (*router, subnet, profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

#### Parameters

- **router** – ID or name of the router
- **subnet** – ID or name of the subnet
- **profile** – Profile to build on (Optional)

**Returns** Added interface information

`salt.modules.neutron.create_firewall_rule` (*protocol, action, profile=None, \*\*kwargs*)

Creates a new firewall rule

CLI Example:

```

salt '*' neutron.create_firewall_rule protocol action
 tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_
↪VERSION
 source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↪ADDRESS source_port=SOURCE_PORT
 destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED

```

#### Parameters

- **protocol** – Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- **action** – Action for the firewall rule, choose "allow" or "deny".
- **tenant\_id** – The owner tenant ID. (Optional)
- **name** – Name for the firewall rule. (Optional)
- **description** – Description for the firewall rule. (Optional)
- **ip\_version** – IP protocol version, default: 4. (Optional)
- **source\_ip\_address** – Source IP address or subnet. (Optional)
- **destination\_ip\_address** – Destination IP address or subnet. (Optional)
- **source\_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** – Set shared to True, default: False. (Optional)
- **enabled** – To enable this rule, default: True. (Optional)

`salt.modules.neutron.create_floatingip` (*floating\_network*, *port=None*, *profile=None*)  
Creates a new floatingIP

CLI Example:

```

salt '*' neutron.create_floatingip network-name port-name

```

#### Parameters

- **floating\_network** – Network name or ID to allocate floatingIP from
- **port** – Of the port to be associated with the floatingIP (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created floatingIP information

`salt.modules.neutron.create_ikepolicy` (*name*, *profile=None*, *\*\*kwargs*)  
Creates a new IKEPolicy

CLI Example:

```

salt '*' neutron.create_ikepolicy ikepolicy-name
 phase1_negotiation_mode=main auth_algorithm=sha1
 encryption_algorithm=aes-128 pfs=group5

```

#### Parameters

- **name** – Name of the IKE policy
- **phase1\_negotiation\_mode** – IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth\_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption\_algorithm** – Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** – Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** – IKE lifetime attribute. default: seconds (Optional)
- **value** – IKE lifetime attribute. default: 3600 (Optional)
- **ike\_version** – IKE version in lowercase, default: v1 (Optional)
- **profile** – Profile to build on (Optional)

- **kwargs** –

Returns Created IKE policy information

```
salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vp-
nservice, peer_cidrs, peer_address,
peer_id, psk, admin_state_up=True,
profile=None, **kwargs)
```

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
ipsec-policy-name ikepolicy-name vpnservice-name
192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

#### Parameters

- **name** – Set friendly name for the connection
- **ipsecpolicy** – IPsec policy ID or name associated with this connection
- **ikepolicy** – IKE policy ID or name associated with this connection
- **vpnservice** – VPN service instance ID or name associated with this connection
- **peer\_cidrs** – Remote subnet(s) in CIDR format
- **peer\_address** – Peer gateway public IPv4/IPv6 address or FQDN
- **peer\_id** – Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** – Pre-shared key string
- **initiator** – Initiator state in lowercase, default:bi-directional
- **admin\_state\_up** – Set admin state up to true or false, default: True (Optional)
- **mtu** – size for the connection, default:1500 (Optional)
- **dpd\_action** – Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd\_interval** – Dead Peer Detection attribute (Optional)
- **dpd\_timeout** – Dead Peer Detection attribute (Optional)
- **profile** – Profile to build on (Optional)

Returns Created IPsec site connection information

```
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
transform_protocol=esp auth_algorithm=sha1
encapsulation_mode=tunnel encryption_algorithm=aes-128
```

#### Parameters

- **name** – Name of the IPsec policy
- **transform\_protocol** – Transform protocol in lowercase, default: esp (Optional)
- **auth\_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation\_mode** – Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption\_algorithm** – Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** – Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** – IPsec lifetime attribute. default: seconds (Optional)
- **value** – IPsec lifetime attribute. default: 3600 (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created IPsec policy information

`salt.modules.neutron.create_network`(*name*, *router\_ext*=None, *admin\_state\_up*=True, *network\_type*=None, *physical\_network*=None, *segmentation\_id*=None, *shared*=None, *profile*=None)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

#### Parameters

- **name** – Name of network to create
- **admin\_state\_up** – should the state of the network be up? default: True (Optional)
- **router\_ext** – True then if create the external network (Optional)
- **network\_type** – the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical\_network** – the name of the physical network as neutron knows it (Optional)
- **segmentation\_id** – the vlan id or GRE id (Optional)
- **shared** – is the network shared or not (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created network information

`salt.modules.neutron.create_port`(*name*, *network*, *device\_id*=None, *admin\_state\_up*=True, *profile*=None)

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

#### Parameters

- **name** – Name of port to create
- **network** – Network name or ID
- **device\_id** – ID of device (Optional)
- **admin\_state\_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created port information

`salt.modules.neutron.create_router`(*name*, *ext\_network*=None, *admin\_state\_up*=True, *profile*=None)

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

#### Parameters

- **name** – Name of router to create (must be first)
- **ext\_network** – ID or name of the external for the gateway (Optional)
- **admin\_state\_up** – Set admin state up to true or false, default:true (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created router information

`salt.modules.neutron.create_security_group`(*name*=None, *description*=None, *profile*=None)

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
↳description='Security group for servers'
```

#### Parameters

- **name** – Name of security group (Optional)
- **description** – Description of security group (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created security group information

```
salt.modules.neutron.create_security_group_rule(security_group, re-
remote_group_id=None, di-
rection='ingress', proto-
col=None, port_range_min=None,
port_range_max=None, ether-
type='IPv4', profile=None)
```

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

#### Parameters

- **security\_group** – Security group name or ID to add rule
- **remote\_group\_id** – Remote security group name or ID to apply rule (Optional)
- **direction** – Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** – Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port\_range\_min** – Starting port range (Optional)
- **port\_range\_max** – Ending port range (Optional)
- **ethertype** – IPv4/IPv6, default: IPv4 (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created security group rule information

```
salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)
```

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

#### Parameters

- **network** – Network ID or name this subnet belongs to
- **cidr** – CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** – Name of the subnet to create (Optional)
- **ip\_version** – Version to use, default is 4(IPv4) (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created subnet information

```
salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, pro-
file=None)
```

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

#### Parameters

- **subnet** – Subnet unique identifier for the VPN service deployment
- **router** – Router unique identifier for the VPN service
- **name** – Set a name for the VPN service
- **admin\_state\_up** – Set admin state up to true or false, default:True (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created VPN service information

`salt.modules.neutron.delete_firewall_rule` (*firewall\_rule*, *profile=None*)

Deletes the specified `firewall_rule`

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

**Parameters**

- **firewall\_rule** – ID or name of firewall rule to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_floatingip` (*floatingip\_id*, *profile=None*)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

**Parameters**

- **floatingip\_id** – ID of floatingIP to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ikepolicy` (*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** – ID or name of IKE policy to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ipsec_site_connection` (*ipsec\_site\_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** – ID or name of ipsec site connection to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_ipsecpolicy` (*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** – ID or name of IPsec policy to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_network`(*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

**Parameters**

- **network** – ID or name of network to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_port`(*port*, *profile=None*)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

**Parameters**

- **port** – port name or ID
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_quota`(*tenant\_id*, *profile=None*)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** – ID of tenant to quota delete
- **profile** – Profile to build on (Optional)

**Returns** True(Delete succeed) or False(Delete failed)

`salt.modules.neutron.delete_router`(*router*, *profile=None*)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

**Parameters**

- **router** – ID or name of router to delete
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.delete_security_group` (*security\_group*, *profile=None*)

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security\_group** – ID or name of security group to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_security_group_rule` (*security\_group\_rule\_id*, *profile=None*)

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security\_group\_rule\_id** – ID of security group rule to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_subnet` (*subnet*, *profile=None*)

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** – ID or name of subnet to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.delete_vpnservice` (*vpnservice*, *profile=None*)

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

- **vpnservice** – ID or name of vpn service to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

`salt.modules.neutron.get_quotas_tenant` (*profile=None*)

Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)

Returns Quotas information

`salt.modules.neutron.list_agents` (*profile=None*)

List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** agents message.

`salt.modules.neutron.list_extensions` (*profile=None*)

Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of extensions

`salt.modules.neutron.list_firewall_rules` (*profile=None*)

Fetches a list of all firewall rules for a tenant CLI Example:

```
salt '*' neutron.list_firewall_rules
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of firewall rules

`salt.modules.neutron.list_firewalls` (*profile=None*)

Fetches a list of all firewalls for a tenant CLI Example:

```
salt '*' neutron.list_firewalls
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of firewalls

`salt.modules.neutron.list_floatingips` (*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of floatingIP

`salt.modules.neutron.list_ikepolicies` (*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of IKE policy

`salt.modules.neutron.list_ipsec_site_connections` (*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters** **profile** – Profile to build on (Optional)

**Returns** List of IPsec site connection

**salt.modules.neutron.list\_ipsecpolicies** (*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

**Parameters** **profile** – Profile to build on (Optional)

**Returns** List of IPsec policy

**salt.modules.neutron.list\_l3\_agent\_hosting\_routers** (*router, profile=None*)

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

**salt.modules.neutron.list\_networks** (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

**Parameters** **profile** – Profile to build on (Optional)

**Returns** List of network

**salt.modules.neutron.list\_ports** (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

**Parameters** **profile** – Profile to build on (Optional)

**Returns** List of port

**salt.modules.neutron.list\_quotas** (*profile=None*)

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

**Parameters** **profile** – Profile to build on (Optional)

**Returns** List of quotas

`salt.modules.neutron.list_routers(profile=None)`

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of router

`salt.modules.neutron.list_security_group_rules(profile=None)`

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of security group rule

`salt.modules.neutron.list_security_groups(profile=None)`

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of security group

`salt.modules.neutron.list_subnets(profile=None)`

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of subnet

`salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)`

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

**Parameters**

- **retrieve\_all** – True or False, default: True (Optional)
- **profile** – Profile to build on (Optional)

**Returns** List of VPN service

`salt.modules.neutron.remove_gateway_router(router, profile=None)`

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**

- **router** – ID or name of router
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.remove_interface_router` (*router, subnet, profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**

- **router** – ID or name of the router
- **subnet** – ID or name of the subnet
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.show_firewall` (*firewall, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

**Parameters**

- **firewall** – ID or name of firewall to look up
- **profile** – Profile to build on (Optional)

**Returns** firewall information

`salt.modules.neutron.show_firewall_rule` (*firewall\_rule, profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

**Parameters**

- **ipsecpolicy** – ID or name of firewall rule to look up
- **profile** – Profile to build on (Optional)

**Returns** firewall rule information

`salt.modules.neutron.show_floatingip` (*floatingip\_id, profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

**Parameters**

- **floatingip\_id** – ID of floatingIP to look up
- **profile** – Profile to build on (Optional)

**Returns** Floating IP information

`salt.modules.neutron.show_ikepolicy` (*ikepolicy, profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** – ID or name of ikepolicy to look up
- **profile** – Profile to build on (Optional)

**Returns** IKE policy information

`salt.modules.neutron.show_ipsec_site_connection` (*ipsec\_site\_connection*, *profile=None*)  
Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** – ID or name of ipsec site connection to look up
- **profile** – Profile to build on (Optional)

**Returns** IPsec site connection information

`salt.modules.neutron.show_ipsecpolicy` (*ipsecpolicy*, *profile=None*)  
Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** – ID or name of IPsec policy to look up
- **profile** – Profile to build on (Optional)

**Returns** IPsec policy information

`salt.modules.neutron.show_network` (*network*, *profile=None*)  
Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

**Parameters**

- **network** – ID or name of network to look up
- **profile** – Profile to build on (Optional)

**Returns** Network information

`salt.modules.neutron.show_port` (*port*, *profile=None*)  
Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

**Parameters**

- **port** – ID or name of port to look up
- **profile** – Profile to build on (Optional)

**Returns** Port information

`salt.modules.neutron.show_quota` (*tenant\_id*, *profile=None*)  
Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** – ID of tenant
- **profile** – Profile to build on (Optional)

**Returns** Quota information

`salt.modules.neutron.show_router` (*router, profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

**Parameters**

- **router** – ID or name of router to look up
- **profile** – Profile to build on (Optional)

**Returns** Router information

`salt.modules.neutron.show_security_group` (*security\_group, profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

**Parameters**

- **security\_group** – ID or name of security group to look up
- **profile** – Profile to build on (Optional)

**Returns** Security group information

`salt.modules.neutron.show_security_group_rule` (*security\_group\_rule\_id, profile=None*)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group\_rule\_id** – ID of security group rule to look up
- **profile** – Profile to build on (Optional)

**Returns** Security group rule information

`salt.modules.neutron.show_subnet` (*subnet, profile=None*)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

**Parameters**

- **subnet** – ID or name of subnet to look up
- **profile** – Profile to build on (Optional)

**Returns** Subnet information

`salt.modules.neutron.show_vpnservice` (*vpnservice, profile=None, \*\*kwargs*)

Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpn-service-name
```

#### Parameters

- **vpn-service** – ID or name of vpn service to look up
- **profile** – Profile to build on (Optional)

Returns VPN service information

```
salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None,
name=None, description=None, ip_version=None,
source_ip_address=None, destination_ip_address=None,
source_port=None, destination_port=None, shared=None,
enabled=None, profile=None)
```

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
↪action=ACTION
 name=NAME description=DESCRIPTION ip_version=IP_VERSION
 source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↪ADDRESS
 source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
↪enabled=ENABLED
```

#### Parameters

- **firewall\_rule** – ID or name of firewall rule to update.
- **protocol** – Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None". (Optional)
- **action** – Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** – Name for the firewall rule. (Optional)
- **description** – Description for the firewall rule. (Optional)
- **ip\_version** – IP protocol version, default: 4. (Optional)
- **source\_ip\_address** – Source IP address or subnet. (Optional)
- **destination\_ip\_address** – Destination IP address or subnet. (Optional)
- **source\_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** – Set shared to True, default: False. (Optional)
- **enabled** – To enable this rule, default: True. (Optional)
- **profile** – Profile to build on (Optional)

```
salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)
```

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

#### Parameters

- **floatingip\_id** – ID of floatingIP
- **port** – ID or name of port, to associate floatingip to *None* or do not specify to disassociate the floatingip (Optional)
- **profile** – Profile to build on (Optional)

Returns Value of updated floating IP information

`salt.modules.neutron.update_network`(*network*, *name*, *profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

#### Parameters

- **network** – ID or name of network to update
- **name** – Name of this network
- **profile** – Profile to build on (Optional)

**Returns** Value of updated network information

`salt.modules.neutron.update_port`(*port*, *name*, *admin\_state\_up=True*, *profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

#### Parameters

- **port** – Port name or ID
- **name** – Name of this port
- **admin\_state\_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Value of updated port information

`salt.modules.neutron.update_quota`(*tenant\_id*, *subnet=None*, *router=None*, *network=None*, *floatingip=None*, *port=None*, *security\_group=None*, *security\_group\_rule=None*, *profile=None*)

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
network=10 floatingip=30 port=30
```

#### Parameters

- **tenant\_id** – ID of tenant
- **subnet** – Value of subnet quota (Optional)
- **router** – Value of router quota (Optional)
- **network** – Value of network quota (Optional)
- **floatingip** – Value of floatingip quota (Optional)
- **port** – Value of port quota (Optional)
- **security\_group** – Value of security group (Optional)
- **security\_group\_rule** – Value of security group rule (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Value of updated quota

`salt.modules.neutron.update_router`(*router*, *name=None*, *admin\_state\_up=None*, *profile=None*, *\*\*kwargs*)

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
admin_state_up=True
```

#### Parameters

- **router** – ID or name of router to update
- **name** – Name of this router
- **ext\_network** – ID or name of the external for the gateway (Optional)
- **admin\_state\_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)
- **kwargs** –

**Returns** Value of updated router information

`salt.modules.neutron.update_security_group` (*security\_group*, *name=None*, *description=None*, *profile=None*)

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name new-
↳security-group-name
```

#### Parameters

- **security\_group** – ID or name of security group to update
- **name** – Name of this security group (Optional)
- **description** – Description of security group (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Value of updated security group information

`salt.modules.neutron.update_subnet` (*subnet*, *name*, *profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

#### Parameters

- **subnet** – ID or name of subnet to update
- **name** – Name of this subnet
- **profile** – Profile to build on (Optional)

**Returns** Value of updated subnet information

`salt.modules.neutron.update_vpnservice` (*vpnservice*, *desc*, *profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

#### Parameters

- **vpnservice** – ID or name of vpn service to update
- **desc** – Set a description for the VPN service
- **profile** – Profile to build on (Optional)

**Returns** Value of updated VPN service information

## 21.9.282 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends:shade

Example configuration

```
neutron:
 cloud: default
```

```
neutron:
 auth:
 username: admin
 password: password123
 user_domain_name: mydomain
 project_name: myproject
 project_domain_name: myproject
 auth_url: https://example.org:5000/v3
 identity_api_version: 3
```

`salt.modules.neutronng.compare_changes(obj, **kwargs)`  
Compare two dicts returning only keys that exist in the first dict and are different in the second one

`salt.modules.neutronng.get_openstack_cloud(auth=None)`  
Return an openstack\_cloud

`salt.modules.neutronng.get_operator_cloud(auth=None)`  
Return an operator\_cloud

`salt.modules.neutronng.list_networks(auth=None, **kwargs)`  
List networks  
**filters** A Python dictionary of filter conditions to push down  
CLI Example:

```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters='{"tenant_id":
↳ "1dcac318a83b4610b7a7f7ba01465548"}'
```

`salt.modules.neutronng.list_subnets(auth=None, **kwargs)`  
List subnets  
**filters** A Python dictionary of filter conditions to push down  
CLI Example:

```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters='{"tenant_id":
↳ "1dcac318a83b4610b7a7f7ba01465548"}'
```

`salt.modules.neutronng.network_create(auth=None, **kwargs)`  
Create a network  
**name** Name of the network being created  
**shared** [False] If True, set the network as shared  
**admin\_state\_up** [True] If True, Set the network administrative state to "up"  
**external** [False] Control whether or not this network is externally accessible  
**provider** An optional Python dictionary of network provider options  
**project\_id** The project ID on which this network will be created  
CLI Example:

```
salt '*' neutronng.network_create name=network2 shared=True admin_state_
↳ up=True external=True

salt '*' neutronng.network_create name=network3 provider='{"network_type
↳ ": "vlan", "segmentation_id": "4010",
↳ "physical_network": "provider"}' project_
↳ id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.network_delete` (*auth=None, \*\*kwargs*)

Delete a network

**name\_or\_id** Name or ID of the network being deleted

CLI Example:

```
salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.network_get` (*auth=None, \*\*kwargs*)

Get a single network

**filters** A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.network_get name=XLB4
```

`salt.modules.neutronng.security_group_create` (*auth=None, \*\*kwargs*)

Create a security group. Use `security_group_get` to create default.

**project\_id** The project ID on which this security group will be created

CLI Example:

```
salt '*' neutronng.security_group_create name=secgroup1 description=
↳ "Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1 description=
↳ "Very secure security group" project_
↳ id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.security_group_delete` (*auth=None, \*\*kwargs*)

Delete a security group

**name\_or\_id** The name or unique ID of the security group

CLI Example:

```
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

`salt.modules.neutronng.security_group_get` (*auth=None, \*\*kwargs*)

Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

**filters** A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.security_group_get ✖
↳ name=1dcac318a83b4610b7a7f7ba01465548

salt '*' neutronng.security_group_get name=default filters='{
↳ "tenant_id": "2e778bb64ca64a199eb526b5958d8710"}'
```

`salt.modules.neutronng.security_group_rule_create` (*auth=None, \*\*kwargs*)

Create a rule in a security group

**secgroup\_name\_or\_id** The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

**port\_range\_min** The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the `port_range_max` attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**port\_range\_max** The maximum port number in the range that is matched by the security group rule. The `port_range_min` attribute constrains the `port_range_max` attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**protocol** The protocol that is matched by the security group rule. Valid values are `None`, `tcp`, `udp`, and `icmp`.

**remote\_ip\_prefix** The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

**remote\_group\_id** The remote group ID to be associated with this security group rule

**direction** Either `ingress` or `egress`; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

**ethertype** Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

**project\_id** Specify the project ID this security group will be created on (admin-only)

CLI Example:

```
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup1

salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup2 port_range_min=8080 port_range_max=8080 direction='egress'

salt '*' neutronng.security_group_rule_create secgroup_name_or_id=c0e1d1ce-7296-405e-919d-1c08217be529 protocol=icmp project_id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.security_group_rule_delete` (*auth=None*, *\*\*kwargs*)

Delete a security group

**name\_or\_id** The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.security_group_update` (*secgroup=None*, *auth=None*, *\*\*kwargs*)

Update a security group

**secgroup** Name, ID or Raw Object of the security group to update

**name** New name for the security group

**description** New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group" project_id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.setup_clouds` (*auth=None*)

Call functions to create Shade cloud objects in `__context__` to take advantage of Shade's in-memory caching across several states

`salt.modules.neutronng.subnet_create` (*auth=None*, *\*\*kwargs*)

Create a subnet

**network\_name\_or\_id** The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.

**cidr** The CIDR

**ip\_version** The IP version, which is 4 or 6.

**enable\_dhcp** [False] Set to True if DHCP is enabled and False if disabled

**subnet\_name** The name of the subnet

**tenant\_id** The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.

**allocation\_pools** A list of dictionaries of the start and end addresses for the allocation pools.

**gateway\_ip** The gateway IP address. When you specify both `allocation_pools` and `gateway_ip`, you must ensure that the gateway IP does not overlap with the specified allocation pools.

**disable\_gateway\_ip** [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

**dns\_nameservers** A list of DNS name servers for the subnet

**host\_routes** A list of host route dictionaries for the subnet

**ipv6\_ra\_mode** IPv6 Router Advertisement mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.

**ipv6\_address\_mode** IPv6 address mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.

**use\_default\_subnetpool** If True, use the default subnetpool for `ip_version` to obtain a CIDR. It is required to pass None to the `cidr` argument when enabling this option.

CLI Example:

```
salt '*' neutronng.subnet_create network_name_or_id=network1
 subnet_name=subnet1

salt '*' neutronng.subnet_create subnet_name=subnet2 network_name_or_
↳id=network2 enable_dhcp=True allocation_pools='[{"start": "192.168.
↳199.2", "end": "192.168.199.254"}]'
↳gateway_ip='192.168.199.1' cidr=192.168.199.0/24

salt '*' neutronng.subnet_create network_name_or_id=network1 subnet_
↳name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'
```

`salt.modules.neutronng.subnet_delete` (*auth=None, \*\*kwargs*)

Delete a subnet

**name** Name or ID of the subnet to update

CLI Example:

```
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete name=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.subnet_get` (*auth=None, \*\*kwargs*)

Get a single subnet

**filters** A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.subnet_get name=subnet1
```

`salt.modules.neutronng.subnet_update` (*auth=None, \*\*kwargs*)

Update a subnet

**name\_or\_id** Name or ID of the subnet to update

**subnet\_name** The new name of the subnet

**enable\_dhcp** Set to True if DHCP is enabled and False if disabled

**gateway\_ip** The gateway IP address. When you specify both `allocation_pools` and `gateway_ip`, you must ensure that the gateway IP does not overlap with the specified allocation pools.

**disable\_gateway\_ip** [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

**allocation\_pools** A list of dictionaries of the start and end addresses for the allocation pools.

**dns\_nameservers** A list of DNS name servers for the subnet

**host\_routes** A list of host route dictionaries for the subnet

```
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers=["8.8.8.8", "8.8.8.
↪7"]'
```

### 21.9.283 salt.modules.nfs3

Module for managing NFS version 3.

`salt.modules.nfs3.add_export`(*exports='/etc/exports', path=None, hosts=None, options=None*)

Add an export

CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```

`salt.modules.nfs3.del_export`(*exports='/etc/exports', path=None*)

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

`salt.modules.nfs3.list_exports`(*exports='/etc/exports'*)

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

`salt.modules.nfs3.reload_exports`()

Trigger a reload of the exports file to apply changes

CLI Example:

```
salt '*' nfs3.reload_exports
```

### 21.9.284 salt.modules.nftables

Support for nftables

`salt.modules.nftables.append`(*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table & chain.

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
 rule='tcp dport 22 log accept'
```

IPv6:

```
salt '*' nftables.append filter input \
 rule='tcp dport 22 log accept' \
 family=ipv6
```

```
salt.modules.nftables.build_rule(table=None, chain=None, command=None, position="",
 full=None, family='ipv4', **kwargs)
```

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
 connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
 full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
 connstate=related,established jump=accept \
 family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
 full=True match=state state=related,established jump=accept \
 family=ipv6
```

```
salt.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')
```

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
 rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \
 rule='tcp dport 22 log accept' \
 family=ipv6
```

```
salt.modules.nftables.check_chain(table='filter', chain=None, family='ipv4')
```

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

```
salt.modules.nftables.check_table(table=None, family='ipv4')
```

Check for the existence of a table

CLI Example:

```
salt '*' nftables.check_table nat
```

`salt.modules.nftables.delete` (*table*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
 rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
 rule='tcp dport 22 log accept' \
 family=ipv6
```

`salt.modules.nftables.delete_chain` (*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

`salt.modules.nftables.delete_table` (*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

`salt.modules.nftables.flush` (*table='filter'*, *chain=""*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input
```

(continues on next page)

(continued from previous page)

```
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

`salt.modules.nftables.get_rule_handle` (*table='filter', chain=None, rule=None, family='ipv4'*)

Get the handle for a particular rule

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
 rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
 rule='tcp dport 22 log accept' \
 family=ipv6
```

`salt.modules.nftables.get_rules` (*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules

salt '*' nftables.get_rules family=ipv6
```

`salt.modules.nftables.get_saved_rules` (*conf\_file=None*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

`salt.modules.nftables.insert` (*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

**This function accepts a rule in a standard nftables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
 rule='tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
 rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
 rule='tcp dport 22 log accept' \
 family=ipv6

salt '*' nftables.insert filter input position=3 \
```

(continues on next page)

(continued from previous page)

```
rule='tcp dport 22 log accept' \
family=ipv6
```

`salt.modules.nftables.list_tables` (*family='ipv4'*)  
Return a data structure of the current, in-memory tables

CLI Example:

```
salt '*' nftables.list_tables
salt '*' nftables.list_tables family=ipv6
```

`salt.modules.nftables.new_chain` (*table='filter', chain=None, table\_type=None, hook=None, priority=None, family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \
 table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
 table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6
```

`salt.modules.nftables.new_table` (*table, family='ipv4'*)  
New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6
```

`salt.modules.nftables.save` (*filename=None, family='ipv4'*)  
Save the current in-memory rules to disk

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

`salt.modules.nftables.version` ()  
Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

### 21.9.285 salt.modules.nginx

Support for nginx

**salt.modules.nginx.build\_info()**  
Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

**salt.modules.nginx.configtest()**  
test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

**salt.modules.nginx.signal**(*signal=None*)  
Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

**salt.modules.nginx.status**(*url='http://127.0.0.1/status'*)  
Return the data from an Nginx status page as a dictionary. <http://wiki.nginx.org/HttpStubStatusModule>  
**url** The URL of the status page. Defaults to 'http://127.0.0.1/status'  
CLI Example:

```
salt '*' nginx.status
```

**salt.modules.nginx.version()**  
Return server version from nginx -v

CLI Example:

```
salt '*' nginx.version
```

### 21.9.286 salt.modules.nilrt\_ip module

The networking module for NI Linux Real-Time distro

**salt.modules.nilrt\_ip.apply\_network\_settings**(*\*\*settings*)  
Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

**salt.modules.nilrt\_ip.build\_interface**(*iface, iface\_type, enabled, \*\*settings*)  
Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.nilrt_ip.build_network_settings(**settings)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.nilrt_ip.disable(interface)`

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the service was disabled, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.disable interface-label
```

`salt.modules.nilrt_ip.down(interface, iface_type=None)`

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the service was disabled, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.down interface-label
```

`salt.modules.nilrt_ip.enable(interface)`

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the service was enabled, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.enable interface-label
```

`salt.modules.nilrt_ip.get_interface(iface)`

Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.nilrt_ip.get_interfaces_details()`

Get details about all the interfaces on the minion

**Returns** information about all interfaces omitting loopback

**Return type** dictionary

CLI Example:

```
salt '*' ip.get_interfaces_details
```

`salt.modules.nilrt_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)`

Configure specified adapter to use DHCP with linklocal fallback

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.set_dhcp_linklocal_all interface-label
```

`salt.modules.nilrt_ip.set_dhcp_only_all(interface)`

Configure specified adapter to use DHCP only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.dhcp_only_all interface-label
```

`salt.modules.nilrt_ip.set_ethercat(interface, master_id)`

Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it doesn't already use EtherCAT adapter mode, otherwise will return true.

**Parameters**

- **interface** – interface label
- **master\_id** – EtherCAT Master ID

**Returns** True if the settings were applied, otherwise an exception will be thrown.

CLI Example:

```
salt '*' ip.set_ethercat interface-label master-id
```

`salt.modules.nilrt_ip.set_linklocal_only_all(interface)`

Configure specified adapter to use linklocal only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.linklocal_only_all interface-label
```

`salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers)`

Configure specified adapter to use ipv4 manual settings

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

- **interface** (*str*) – interface label
- **address** (*str*) – ipv4 address

- **netmask** (*str*) – ipv4 netmask
- **gateway** (*str*) – ipv4 gateway
- **nameservers** (*str*) – list of nameservers servers separated by spaces

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

`salt.modules.nilrt_ip.up(interface, iface_type=None)`

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters** **interface** (*str*) – interface label

**Returns** True if the service was enabled, otherwise an exception will be thrown.

**Return type** `bool`

CLI Example:

```
salt '*' ip.up interface-label
```

## 21.9.287 salt.modules.nix

### Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the [nix-daemon](#).

This module exposes most of the common nix operations. Currently not meant to be run as a `pkg` module, but explicitly as `nix.*`.

For more information on nix, see the [nix documentation](#).

`salt.modules.nix.collect_garbage()`

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns** How much space was freed and how many derivations were removed

**Return type** `str`

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

`salt.modules.nix.install(*pkgs, **kwargs)`

Installs a single or multiple packages via nix

**Parameters**

- **pkgs** (*list(str)*) – packages to update
- **attributes** (*bool*) – Pass the list of packages or single package as attributes, not package names. default: False

**Returns** Installed packages. Example element: `gcc-3.3.2`

**Return type** `list(str)`

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

`salt.modules.nix.list_pkgs` (*installed=True, attributes=True*)

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

**Parameters**

- **installed** (*bool*) – list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** (*bool*) – show the attributes of the packages when listing all packages. Default: True

**Returns** Packages installed or available, along with their attributes.

**Return type** `list(list(str))`

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

`salt.modules.nix.uninstall` (*\*pkgs*)

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

**Parameters** **pkgs** (*list(str)*) – List, single package to uninstall

**Returns** Packages that have been uninstalled

**Return type** `list(str)`

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

`salt.modules.nix.upgrade` (*\*pkgs*)

Runs an update operation on the specified packages, or all packages if none is specified.

**Parameters** **pkgs** (*list(str)*) – List of packages to update

**Returns** The upgraded packages. Example element: `['libxslt-1.1.0', 'libxslt-1.1.10']`

**Return type** `list(tuple(str, str))`

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

## 21.9.288 salt.modules.nova

Module for handling OpenStack Nova calls

**depends**

- novaclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```

openstack1:
 keystone.user: admin
 keystone.password: verybadpass
 keystone.tenant: admin
 keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
 keystone.user: admin
 keystone.password: verybadpass
 keystone.tenant: admin
 keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'

```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

---

**Note:** This is required to use keystone v3 as for authentication.

---

```

keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'

```

---

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

---

`salt.modules.nova.boot` (*name*, *flavor\_id=0*, *image\_id=0*, *profile=None*, *timeout=300*)

Boot (create) a new instance

**name** Name of the new instance (must be first)

**flavor\_id** Unique integer ID for the flavor

**image\_id** Unique integer ID for the image

**timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from `nova.flavor_list` and `nova.image_list`

```

salt '*' nova.flavor_list
salt '*' nova.image_list

```

`salt.modules.nova.delete` (*instance\_id*, *profile=None*)

Delete an instance

**instance\_id** ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

`salt.modules.nova.flavor_create` (*name*, *flavor\_id=0*, *ram=0*, *disk=0*, *vcpus=1*, *profile=None*)

Add a flavor to nova (nova flavor-create). The following parameters are required:

**name** Name of the new flavor (must be first)

**flavor\_id** Unique integer ID for the new flavor

**ram** Memory size in MB

**disk** Disk size in GB

**vcpus** Number of vcpus

CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

`salt.modules.nova.flavor_delete` (*flavor\_id*, *profile=None*)

Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

`salt.modules.nova.flavor_list` (*profile=None*)

Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

`salt.modules.nova.image_list` (*name=None*, *profile=None*)

Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

`salt.modules.nova.image_meta_delete` (*image\_id=None*, *name=None*, *keys=None*, *profile=None*)

Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

`salt.modules.nova.image_meta_set` (*image\_id=None*, *name=None*, *profile=None*, *\*\*kwargs*)

Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

`salt.modules.nova.keypair_add` (*name*, *pubfile=None*, *pubkey=None*, *profile=None*)

Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubkey=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

**salt.modules.nova.keypair\_delete**(*name, profile=None*)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

**salt.modules.nova.keypair\_list**(*profile=None*)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

**salt.modules.nova.list\_**(*profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_list` function.

CLI Example:

```
salt '*' nova.list
```

**salt.modules.nova.lock**(*instance\_id, profile=None*)

Lock an instance

**instance\_id** ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

**salt.modules.nova.resume**(*instance\_id, profile=None*)

Resume an instance

**instance\_id** ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

**salt.modules.nova.secgroup\_create**(*name, description, profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

**salt.modules.nova.secgroup\_delete**(*name, profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

**salt.modules.nova.secgroup\_list**(*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

`salt.modules.nova.server_by_name`(*name*, *profile=None*)

Return information about a server

**name** Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

`salt.modules.nova.server_list`(*profile=None*)

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

`salt.modules.nova.server_list_detailed`(*profile=None*)

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

`salt.modules.nova.server_show`(*server\_id*, *profile=None*)

Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

`salt.modules.nova.show`(*server\_id*, *profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_show` function.

CLI Example:

```
salt '*' nova.show
```

`salt.modules.nova.suspend`(*instance\_id*, *profile=None*)

Suspend an instance

**instance\_id** ID of the instance to be suspended

CLI Example:

```
salt '*' nova.suspend 1138
```

`salt.modules.nova.volume_attach`(*name*, *server\_name*, *device='/dev/xvdb'*, *profile=None*, *timeout=300*)

Attach a block storage volume

**name** Name of the new volume to attach

**server\_name** Name of the server to attach to

**device** Name of the device on the server

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb'
↪profile=openstack
```

`salt.modules.nova.volume_create` (*name, size=100, snapshot=None, voltype=None, profile=None*)

Create a block storage volume

**name** Name of the new volume (must be first)

**size** Volume size

**snapshot** Block storage snapshot id

**voltype** Type of storage

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

`salt.modules.nova.volume_delete` (*name, profile=None*)

Destroy the volume

**name** Name of the volume

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

`salt.modules.nova.volume_detach` (*name, profile=None, timeout=300*)

Attach a block storage volume

**name** Name of the new volume to attach

**server\_name** Name of the server to detach from

**profile** Profile to build on

CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

`salt.modules.nova.volume_list` (*search\_opts=None, profile=None*)

List storage volumes

**search\_opts** Dictionary of search options

**profile** Profile to use

CLI Example:

```
salt '*' nova.volume_list search_opts={'display_name': "myblock"}
↳profile=openstack
```

`salt.modules.nova.volume_show` (*name, profile=None*)

Create a block storage volume

**name** Name of the volume

**profile** Profile to use

CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

## 21.9.289 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.cache_clean` (*path=None, runas=None, env=None, force=False*)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

**path** The cache subpath to delete, or None to clear the entire cache

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

**force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.cache_list`(*path=None, runas=None, env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

**path** The cache subpath to list, or None to list the entire cache

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_path`(*runas=None, env=None*)

List path of the NPM cache directory.

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_path
```

`salt.modules.npm.install`(*pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry\_run=False, silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

**pkg** A package name in any format accepted by NPM, including a version identifier

**pkgs** A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

**dir** The target directory in which to install the package, or None for global installation

**runas** The user to run NPM with

**registry** The NPM registry to install the package from.

New in version 2014.7.0.

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.

**silent** Whether or not to run NPM install with `-silent` flag.

New in version 2016.3.0.

**dry\_run** Whether or not to run NPM install with `-dry-run` flag.

New in version 2015.8.4.

**silent** Whether or not to run NPM install with `-silent` flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

`salt.modules.npm.list_` (*pkg=None, dir=None, runas=None, env=None, depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

**pkg** Limit package listing by name

**dir** The directory whose packages will be listed, or None for global installation

**runas** The user to run NPM with

New in version 2014.7.0.

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.

**depth** Limit the depth of the packages listed

New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

`salt.modules.npm.uninstall` (*pkg, dir=None, runas=None, env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

**pkg** A package name in any format accepted by NPM

**dir** The target directory from which to uninstall the package, or None for global installation

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

## 21.9.290 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

`systemd-nspawn(1)` is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running `systemd >= 219` will place new containers in `/var/lib/machines`, while those running `systemd < 219` will place them in `/var/lib/container`.

`salt.modules.nspawn.bootstrap_container` (*name, dist=None, version=None*)

Bootstrap a container from package servers, if `dist` is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

`salt.modules.nspawn.bootstrap_salt`(*name*, *config=None*, *approve\_key=True*, *install=True*, *pub\_key=None*, *priv\_key=None*, *bootstrap\_url=None*, *force\_install=False*, *unconditional\_install=False*, *bootstrap\_delay=None*, *bootstrap\_args=None*, *bootstrap\_shell=None*)

Bootstrap a container from package servers, if *dist* is *None* the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

`salt.modules.nspawn.copy_to`(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*)

Copy a file from the host into a container

**name** Container name

**source** File to be copied to the container

**dest** Destination on the container. Must be an absolute path.

**overwrite** [False] Unless this option is set to *True*, then if a file exists at the location specified by the *dest* argument, an error will be raised.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.disable`(*name*)

Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.enable`(*name*)

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.exists`(*name*)

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

`salt.modules.nspawn.info`(*name*, *\*\*kwargs*)

Return info about a container

---

**Note:** The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

---

**start** [False] If *True*, then the container will be started to retrieve the info. A *Started* key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

`salt.modules.nspawn.list_all()`

Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

`salt.modules.nspawn.list_running()`

Lists running nspawn containers

---

**Note:** `nspawn.list` also works to list running containers

---

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_stopped()`

Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.pid(name)`

Returns the PID of a container

**name** Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

`salt.modules.nspawn.poweroff(name)`

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `nspawn.poweroff`.

---

**Note:** `machinectl poweroff` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.pull_dkr(url, name, index)`

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd`  $\geq$  219

---

**url** URL from which to download the container

**name** Name for the new container

**index** URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

`salt.modules.nspawn.pull_raw`(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .qcow2 or raw disk image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd`  $\geq$  219

---

**url** URL from which to download the container

**name** Name for the new container

**verify** [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/linux/
↳ releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz
↳ fedora21
```

`salt.modules.nspawn.pull_tar`(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .tar container image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd`  $\geq$  219

---

**url** URL from which to download the container

**name** Name for the new container

**verify** [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.
↳ 01.tar.gz arch2
```

`salt.modules.nspawn.reboot`(*name*, *kill=False*)

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

---

**Note:** `machinectl reboot` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will instead restart the container via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.remove`(*name*, *stop=False*)

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.retcode`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.retcode` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

`salt.modules.nspawn.run`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

```
salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
 python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcodes=False, keep_env=None)
```

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name** Name of the container in which to run the command  
**cmd** Command to run  
**no\_start** [False] If the container is not running, don't start it  
**preserve\_state** [True] After running the command, return the container to its previous state  
**stdin** [None] Standard input to be used for the command  
**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.  
**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
 python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcodes=False, keep_env=None)
```

Run `cmd.run_stderr` within a container

**name** Name of the container in which to run the command  
**cmd** Command to run  
**no\_start** [False] If the container is not running, don't start it  
**preserve\_state** [True] After running the command, return the container to its previous state  
**stdin** [None] Standard input to be used for the command  
**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.  
**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.  
**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

`salt.modules.nspawn.run_stdout`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run_stdout` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no\_start** [False] If the container is not running, don't start it

**preserve\_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output\_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt** [False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env** [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.nspawn.start`(*name*)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

`salt.modules.nspawn.state`(*name*)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.terminate`(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

---

**Note:** `machinectl terminate` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 21.9.291 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the `nxos` proxy minion look in the documentation for `salt.proxy.nxos`.

`salt.modules.nxos.cmd`(*command*, \**args*, \*\**kwargs*)  
run commands from `__proxy__` *salt.proxy.nxos*  
**command** function from *salt.proxy.nxos* to run  
**args** positional args to pass to *command* function  
**kwargs** key word arguments to pass to *command* function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='5!kjsdfoi$blahblahblah
↪ encrypted=True
```

`salt.modules.nxos.system_info`()  
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

### 21.9.292 salt.modules.nxos\_api module

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**platform** any

---

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

---

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_0101.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html) for more details.

---

## Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api Proxy` (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLerror: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

Example (when not running in a `nxos_api` Proxy Minion):

```
nxos_api:
 username: test
 password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
The command above is available when running in a regular Minion where Salt is
↳ installed

salt '*' nxos_api.show 'show version' raw_text=False
```

**Note:** Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api Proxy`, please follow the documentation notes for a proper setup.

`salt.modules.nxos_api.config`(*commands=None, config\_file=None, template\_engine='jinja', context=None, defaults=None, saltenv='base', \*\*kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config\_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**template\_engine: jinja** The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context** Variables to add to the template context.

**defaults** Default values of the `context_dict`.

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```
salt '*' nxos_api.config commands=["spanning-tree mode mstp"]
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context={'servers': [
↪'1.2.3.4']}]
```

`salt.modules.nxos_api.rpc`(*commands, method='cli', \*\*kwargs*)

Execute an arbitrary RPC request via the Nexus API.

**commands** The commands to be executed.

**method: cli** The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxps_api.rpc 'show version'
```

`salt.modules.nxos_api.show`(*commands*, *raw\_text=True*, *\*\*kwargs*)

Execute one or more show (non-configuration) commands.

**commands** The commands to be executed.

**raw\_text: True** Whether to return raw text or structured data.

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
↪username=test password=test
```

### 21.9.293 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. `server_ip` and `server_port` params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends** pypureomapi Python module

`salt.modules.omapi.add_host`(*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *superse*  
*de\_host=False*)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

`salt.modules.omapi.delete_host`(*mac=None*, *name=None*)

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

### 21.9.294 salt.modules.openbsd\_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

`salt.modules.openbsd_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.get(name)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

### 21.9.295 salt.modules.openbsdpkg

Package support for OpenBSD

---

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

---

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```

`salt.modules.openbsdpkg.install` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{'package': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
```

`salt.modules.openbsdpkg.latest_version` (*\*names, \*\*kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

`salt.modules.openbsdpkg.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{'package_name': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.openbsdpkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Remove a package and extra configuration files.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.openbsdpkg.remove` (*name=None, pkgs=None, purge=False, \*\*kwargs*)

Remove a single package with `pkg_delete`

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

**salt.modules.openbsdpkg.upgrade**(*name=None, pkgs=None, \*\*kwargs*)

Run a full package upgrade (`pkg_add -u`), or upgrade a specific package if **name** or **pkgs** is provided. **name** is ignored when **pkgs** is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

**salt.modules.openbsdpkg.upgrade\_available**(*name*)

Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.openbsdpkg.version**(*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.296 salt.modules.openbsdrctl\_service.py

The `rctl` service module for OpenBSD

**salt.modules.openbsdrctl\_service.available**(*name*)

Return True if the named service is available.

CLI Example:

```
salt '*' service.available sshd
```

**salt.modules.openbsdrctl\_service.disable**(*name, \*\*kwargs*)

Disable the named service to not start at boot.

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.openbsdrctl_service.disabled(name)`

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdrctl_service.enable(name, **kwargs)`

Enable the named service to start at boot.

**flags** [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

`salt.modules.openbsdrctl_service.enabled(name, **kwargs)`

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).

Return False otherwise.

**name** Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

`salt.modules.openbsdrctl_service.get_all()`

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdrctl_service.get_disabled()`

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdrctl_service.get_enabled()`

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdrctl_service.missing(name)`

The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdrctl_service.reload_(name)`

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdrctl_service.restart(name)`

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdrctl_service.start(name)`

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdrctl_service.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdrctl_service.stop(name)`

Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.297 salt.modules.openbsdservice

The service module for OpenBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.openbsdservice.available(name)`

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdservice.disabled(name)`

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdservice.enabled(name, **kwargs)`

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.openbsdservice.get_all()`

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdservice.get_disabled()`

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdservice.get_enabled()`

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdservice.missing(name)`

New in version 2014.7.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdservice.reload_(name)`

New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdservice.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.openbsdservice.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.298 salt.modules.openscap module

Module for OpenSCAP Management

`salt.modules.openscap.xccdf(params)`

Run `oscap xccdf` commands on minions. It uses `cp.push_dir` to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-
↪yast2sec-xccdf.xml"
```

### 21.9.299 salt.modules.openstack\_config

Modify, retrieve, or delete values from OpenStack configuration files.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

`salt.modules.openstack_config.delete`(*filename, section, parameter*)

Delete a value from an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section from which to delete the parameter

**parameter** The parameter to delete

CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.get`(*filename, section, parameter*)

Get a value from an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section from which to search for the parameter

**parameter** The parameter to return

CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.set_`(*filename, section, parameter, value*)

Set a value in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter** The parameter to change

**value** The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

### 21.9.300 salt.modules.openstack\_mng module

Module for OpenStack Management

**codeauthor** Konrad Mosoń <mosonkonrad@gmail.com>

**maturity** new

**depends** openstack-utils

**platform** linux

`salt.modules.openstack_mng.restart_service`(*service\_name, mini-*  
*mum\_running\_time=None*)

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

`salt.modules.openstack_mng.start_service`(*service\_name*)

Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

`salt.modules.openstack_mng.stop_service(service_name)`

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

### 21.9.301 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.openvswitch.bridge_create(br, may_exist=True)`

Creates a new bridge.

**Parameters**

- **br** – A string - bridge name
- **may\_exist** – Bool, if False - attempting to create a bridge that exists returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_create br0
```

`salt.modules.openvswitch.bridge_delete(br, if_exists=True)`

Deletes bridge and all of its ports.

**Parameters**

- **br** – A string - bridge name
- **if\_exists** – Bool, if False - attempting to delete a bridge that does not exist returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_delete br0
```

`salt.modules.openvswitch.bridge_exists(br)`

Tests whether bridge exists as a real or fake bridge.

**Returns** True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_exists br0
```

`salt.modules.openvswitch.bridge_list()`

Lists all existing real and fake bridges.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_list
```

`salt.modules.openvswitch.interface_get_options(port)`

Port's interface's optional parameters.

**Parameters** **port** – A string - port name.

**Returns** String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_options tap0
```

`salt.modules.openvswitch.interface_get_type(port)`

Type of port's interface.

**Parameters** **port** – A string - port name.

**Returns** String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.interface_get_type tap0
```

`salt.modules.openvswitch.port_add(br, port, may_exist=False, internal=False)`

Creates on bridge a new port named port.

**Returns** True on success, else False.

**Parameters**

- **br** – A string - bridge name
- **port** – A string - port name
- **may\_exist** – Bool, if False - attempting to create a port that exists returns False.
- **internal** – A boolean to create an internal interface if one does not exist.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_add br0 8080
```

`salt.modules.openvswitch.port_create_gre(br, port, id, remote)`

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

**Parameters**

- **br** – A string - bridge name.
- **port** – A string - port name.
- **id** – An integer - unsigned 32-bit number, tunnel's key.
- **remote** – A string - remote endpoint's IP address.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10
```

`salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)`

Isolate VM traffic using VLANs.

**Parameters**

- **br** – A string - bridge name.
- **port** – A string - port name.
- **id** – An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** – A boolean to create an internal interface if one does not exist.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

`salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)`

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

**Parameters**

- **br** – A string - bridge name.
- **port** – A string - port name.
- **id** – An integer - unsigned 64-bit number, tunnel's key.

- **remote** – A string - remote endpoint's IP address.
- **dst\_port** – An integer - port to use when creating tunnelport in the switch.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

`salt.modules.openvswitch.port_get_tag(port)`

Lists tags of the port.

**Parameters** **port** – A string - port name.

**Returns** List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_get_tag tap0
```

`salt.modules.openvswitch.port_list(br)`

Lists all of the ports within bridge.

**Parameters** **br** – A string - bridge name.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_list br0
```

`salt.modules.openvswitch.port_remove(br, port, if_exists=True)`

Deletes port.

**Parameters**

- **br** – A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** – A string - port name.
- **if\_exists** – Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.port_remove br0 8080
```

### 21.9.302 salt.modules.opkg module

Support for Opkg

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

**Note:** For version comparison support on `opkg < 0.3.4`, the `opkg-utils` package must be installed.

---

`salt.modules.opkg.available_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.check_extra_requirements(pkgname, pkgver)`

Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.

`salt.modules.opkg.del_repo(repo, **kwargs)`

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo repo
```

`salt.modules.opkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.get_repo(repo, **kwargs)`

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo repo
```

`salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)`

Set package in 'hold' state, meaning it will not be upgraded.

**name** The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.opkg.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

#### Parameters

- **names** – Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.  
**Valid attributes are:** arch, conffiles, conflicts, depends, description, filename, group, install\_date\_time\_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳packager
```

`salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)`

Install the passed package, add refresh=True to update the opkg database.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**version** Install a specific version of the package, e.g. 1.2.3~0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall** [False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-0ubuntu0'}]
```

**sources** A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]
```

**install\_recommends** Whether to install the packages marked as recommended. Default is True.

**only\_upgrade** Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

`salt.modules.opkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.opkg.list_repos(**kwargs)`

Lists all repos on /etc/opkg/\*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.opkg.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.opkg.mod_repo(repo, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

**repo** alias by which opkg refers to the repo.

**uri** the URI to the repo.

**compressed** defines (True or False) if the index file is compressed

**enabled** enable or disable (True or False) repository but do not remove if disabled.

**refresh** enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

`salt.modules.opkg.owner(*paths, **kwargs)`

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported by `opkg`, this function is identical to `pkg.remove`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.opkg.refresh_db(failhard=False, **kwargs)`

Updates the `opkg` database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:

- True: Database updated successfully
- False: Problem updating database

**failhard** If False, return results of failed lines as `False` for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)`

Remove packages using `opkg remove`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

**remove\_dependencies** Remove package and all dependencies

New in version 2019.2.0.

**auto\_remove\_deps** Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
```

(continues on next page)

(continued from previous page)

```
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_remove_
↳deps=True
```

`salt.modules.opkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

**name** The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.opkg.upgrade` (*refresh=True, \*\*kwargs*)

Upgrades all packages via `opkg upgrade`

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.opkg.upgrade_available` (*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.opkg.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.opkg.version_clean` (*version*)

Clean the version string removing extra data. There's nothing do to here for `nipkg.py`, therefore it will always return the given version.

`salt.modules.opkg.version_cmp` (*pkg1, pkg2, ignore\_epoch=False, \*\*kwargs*)

Do a `cmp`-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

**ignore\_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

### 21.9.303 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.

**configuration** This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```
opsgenie_event_poster:
 local.opsgenie.post_data:
 - tgt: 'salt-minion'
 - kwarg:
 name: event.reactor
 api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
 reason: {{ data['data']['reason'] }}
 action_type: Create
```

`salt.modules.opsgenie.post_data` (*api\_key=None, name='OpsGenie Execution Module', reason=None, action\_type=None*)

Post data to OpsGenie. It's designed for Salt's Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:

**api\_key** It's the API Key you've copied while adding integration in OpsGenie.

**reason** It will be used as alert's default message in OpsGenie.

**action\_type** OpsGenie supports the default values Create/Close for `action_type`. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:

**name** It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

### 21.9.304 salt.modules.oracle

Oracle DataBase connection module

**maintainer** Vladimir Bormotov <bormotov@gmail.com>

**maturity** new

**depends** cx\_Oracle

**platform** all

**configuration** module provide connections for multiple Oracle DB instances.

**OS Environment**

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle:
 db:
 <db>:
 uri: connection credentials in format:
 user/password@host[:port]/sid[servicename as {sysdba|sysoper}]
 optional keyword servicename will determine whether it is a sid or
 ↪service_name
 <db>:
 uri:
```

`salt.modules.oracle.client_version()`

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

`salt.modules.oracle.run_query(db, query)`

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

`salt.modules.oracle.show_dbs(*dbs)`

Show databases configuration from pillar. Filter by *\*args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

`salt.modules.oracle.show_env()`

Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

---

**Note:** at first `_connect()` NLS\_LANG will forced to `'AL32UTF8'`

---

`salt.modules.oracle.show_pillar(item=None)`

Show Pillar segment oracle.\* and subitem with notation "item:subitem"

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

`salt.modules.oracle.version(*dbs)`

Server Version (select banner from v\$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

### 21.9.305 salt.modules.osquery

Support for OSQuery - <https://osquery.io>.

New in version 2015.8.0.

**salt.modules.osquery.acpi\_tables** (*attrs=None, where=None*)

Return acpi\_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

**salt.modules.osquery.alf** (*attrs=None, where=None*)

Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

**salt.modules.osquery.alf\_exceptions** (*attrs=None, where=None*)

Return alf\_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

**salt.modules.osquery.alf\_explicit\_auths** (*attrs=None, where=None*)

Return alf\_explicit\_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

**salt.modules.osquery.alf\_services** (*attrs=None, where=None*)

Return alf\_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

**salt.modules.osquery.apps** (*attrs=None, where=None*)

Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

**salt.modules.osquery.apt\_sources** (*attrs=None, where=None*)

Return apt\_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

`salt.modules.osquery.arp_cache` (*attrs=None, where=None*)

Return arp\_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

`salt.modules.osquery.block_devices` (*attrs=None, where=None*)

Return block\_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

`salt.modules.osquery.certificates` (*attrs=None, where=None*)

Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

`salt.modules.osquery.chrome_extensions` (*attrs=None, where=None*)

Return chrome\_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

`salt.modules.osquery.cpuuid` (*attrs=None, where=None*)

Return cpuuid information from osquery

CLI Example:

```
salt '*' osquery.cpuuid
```

`salt.modules.osquery.crontab` (*attrs=None, where=None*)

Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

`salt.modules.osquery.deb_packages` (*attrs=None, where=None*)

Return deb\_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

`salt.modules.osquery.etc_hosts` (*attrs=None, where=None*)

Return etc\_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

`salt.modules.osquery.etc_services` (*attrs=None, where=None*)

Return etc\_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

`salt.modules.osquery.file_` (*attrs=None, where=None*)

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

`salt.modules.osquery.file_changes` (*attrs=None, where=None*)

Return file\_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

`salt.modules.osquery.firefox_addons` (*attrs=None, where=None*)

Return firefox\_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

`salt.modules.osquery.groups` (*attrs=None, where=None*)

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

`salt.modules.osquery.hardware_events` (*attrs=None, where=None*)

Return hardware\_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

`salt.modules.osquery.hash_` (*attrs=None, where=None*)

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

`salt.modules.osquery.homebrew_packages` (*attrs=None, where=None*)

Return homebrew\_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

`salt.modules.osquery.interface_addresses` (*attrs=None, where=None*)

Return interface\_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

`salt.modules.osquery.interface_details` (*attrs=None, where=None*)

Return `interface_details` information from `osquery`

CLI Example:

```
salt '*' osquery.interface_details
```

`salt.modules.osquery.iokit_devicetree` (*attrs=None, where=None*)

Return `iokit_devicetree` information from `osquery`

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

`salt.modules.osquery.iokit_registry` (*attrs=None, where=None*)

Return `iokit_registry` information from `osquery`

CLI Example:

```
salt '*' osquery.iokit_registry
```

`salt.modules.osquery.kernel_extensions` (*attrs=None, where=None*)

Return `kernel_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_extensions
```

`salt.modules.osquery.kernel_info` (*attrs=None, where=None*)

Return `kernel_info` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_info
```

`salt.modules.osquery.kernel_integrity` (*attrs=None, where=None*)

Return `kernel_integrity` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_integrity
```

`salt.modules.osquery.kernel_modules` (*attrs=None, where=None*)

Return `kernel_modules` information from `osquery`

CLI Example:

```
salt '*' osquery.kernel_modules
```

`salt.modules.osquery.keychain_items` (*attrs=None, where=None*)

Return `keychain_items` information from `osquery`

CLI Example:

```
salt '*' osquery.keychain_items
```

`salt.modules.osquery.last` (*attrs=None, where=None*)

Return `last` information from `osquery`

CLI Example:

```
salt '*' osquery.last
```

`salt.modules.osquery.launchd` (*attrs=None, where=None*)

Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

`salt.modules.osquery.listening_ports` (*attrs=None, where=None*)

Return listening\_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

`salt.modules.osquery.logged_in_users` (*attrs=None, where=None*)

Return logged\_in\_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

`salt.modules.osquery.memory_map` (*attrs=None, where=None*)

Return memory\_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

`salt.modules.osquery.mounts` (*attrs=None, where=None*)

Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

`salt.modules.osquery.nfs_shares` (*attrs=None, where=None*)

Return nfs\_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

`salt.modules.osquery.nvram` (*attrs=None, where=None*)

Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

`salt.modules.osquery.os_version` (*attrs=None, where=None*)

Return os\_version information from osquery

CLI Example:

```
salt '*' osquery.os_version
```

`salt.modules.osquery.osquery_extensions` (*attrs=None, where=None*)

Return `osquery_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_extensions
```

`salt.modules.osquery.osquery_flags` (*attrs=None, where=None*)

Return `osquery_flags` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_flags
```

`salt.modules.osquery.osquery_info` (*attrs=None, where=None*)

Return `osquery_info` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_info
```

`salt.modules.osquery.osquery_registry` (*attrs=None, where=None*)

Return `osquery_registry` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_registry
```

`salt.modules.osquery.passwd_changes` (*attrs=None, where=None*)

Return `passwd_changes` information from `osquery`

CLI Example:

```
salt '*' osquery.passwd_changes
```

`salt.modules.osquery.pci_devices` (*attrs=None, where=None*)

Return `pci_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.pci_devices
```

`salt.modules.osquery.preferences` (*attrs=None, where=None*)

Return `preferences` information from `osquery`

CLI Example:

```
salt '*' osquery.preferences
```

`salt.modules.osquery.process_envs` (*attrs=None, where=None*)

Return `process_envs` information from `osquery`

CLI Example:

```
salt '*' osquery.process_envs
```

`salt.modules.osquery.process_memory_map` (*attrs=None, where=None*)

Return `process_memory_map` information from `osquery`

CLI Example:

```
salt '*' osquery.process_memory_map
```

`salt.modules.osquery.process_open_files` (*attrs=None, where=None*)

Return process\_open\_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

`salt.modules.osquery.process_open_sockets` (*attrs=None, where=None*)

Return process\_open\_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

`salt.modules.osquery.processes` (*attrs=None, where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

`salt.modules.osquery.quarantine` (*attrs=None, where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

`salt.modules.osquery.query` (*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

`salt.modules.osquery.routes` (*attrs=None, where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

`salt.modules.osquery.rpm_packages` (*attrs=None, where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

`salt.modules.osquery.safari_extensions` (*attrs=None, where=None*)

Return safari\_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

`salt.modules.osquery.shared_memory` (*attrs=None, where=None*)

Return `shared_memory` information from `osquery`

CLI Example:

```
salt '*' osquery.shared_memory
```

`salt.modules.osquery.shell_history` (*attrs=None, where=None*)

Return `shell_history` information from `osquery`

CLI Example:

```
salt '*' osquery.shell_history
```

`salt.modules.osquery.smbios_tables` (*attrs=None, where=None*)

Return `smbios_tables` information from `osquery`

CLI Example:

```
salt '*' osquery.smbios_tables
```

`salt.modules.osquery.startup_items` (*attrs=None, where=None*)

Return `startup_items` information from `osquery`

CLI Example:

```
salt '*' osquery.startup_items
```

`salt.modules.osquery.suid_bin` (*attrs=None, where=None*)

Return `suid_bin` information from `osquery`

CLI Example:

```
salt '*' osquery.suid_bin
```

`salt.modules.osquery.system_controls` (*attrs=None, where=None*)

Return `system_controls` information from `osquery`

CLI Example:

```
salt '*' osquery.system_controls
```

`salt.modules.osquery.time_` (*attrs=None*)

Return `time` information from `osquery`

CLI Example:

```
salt '*' osquery.time
```

`salt.modules.osquery.usb_devices` (*attrs=None, where=None*)

Return `usb_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.usb_devices
```

`salt.modules.osquery.users` (*attrs=None, where=None*)

Return `users` information from `osquery`

CLI Example:

```
salt '*' osquery.users
```

`salt.modules.osquery.version()`

Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

`salt.modules.osquery.xattr_where_from(attrs=None, where=None)`

Return xattr\_where\_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

`salt.modules.osquery.xprotect_entries(attrs=None, where=None)`

Return xprotect\_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

`salt.modules.osquery.xprotect_reports(attrs=None, where=None)`

Return xprotect\_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

## 21.9.306 salt.modules.out module

### Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

`salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)`

Return the formatted string as HTML.

**data** The JSON serializable object.

**out: nested** The name of the output to use to transform the data. Default: `nested`.

**opts** Dictionary of configuration options. Default: `__opts__`.

**kwargs** Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.html_format '{"key": "value"}' out=yaml
```

`salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)`

Return the formatted outputter string for the Python object.

**data** The JSON serializable object.

**out: nested** The name of the output to use to transform the data. Default: `nested`.

**opts** Dictionary of configuration options. Default: `__opts__`.

**kwargs** Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.out_format '{"key': 'value'}"
```

`salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)`

Return the outputter formatted string, removing the ANSI escape sequences.

**data** The JSON serializable object.

**out: nested** The name of the output to use to transform the data. Default: `nested`.

**opts** Dictionary of configuration options. Default: `__opts__`.

**kwargs** Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.string_format '{"key': 'value'}" out=table
```

### 21.9.307 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best ([https://wiki.archlinux.org/index.php/Arch\\_is\\_the\\_best](https://wiki.archlinux.org/index.php/Arch_is_the_best))

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.pacmanpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.group_diff(name)`

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with `yumpkg.group_diff` for easy support of `state.pkg.group_installed`

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

`salt.modules.pacmanpkg.group_info(name)`

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

`salt.modules.pacmanpkg.group_list()`

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (pacman `-S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**sysupgrade** Whether or not to upgrade the system packages before installing. If `refresh` is set to `True` but `sysupgrade` is not specified, `-u` will be applied

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.pkg.tar.xz"
→}], {"bar": "salt://bar.pkg.tar.xz"}'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

`salt.modules.pacmanpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)`

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
With byrepo=False (default)
{
 'bash': ['4.4.005-2'],
 'nginx': ['1.10.2-2']
}
With byrepo=True
{
 'core': {
 'bash': ['4.4.005-2']
 },
 'extra': {
 'nginx': ['1.10.2-2']
 }
}
```

**fromrepo** [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo** [False] When `True`, the return data for each package will be organized by repository.

**refresh** [False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.pacmanpkg.list_upgrades` (*refresh=False*, *root=None*, *\*\*kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacmanpkg.owner` (*\*paths*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *pkg.version*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

`salt.modules.pacmanpkg.purge` (*name=None*, *pkgs=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo"', "bar"]'
```

`salt.modules.pacmanpkg.refresh_db` (*root=None*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pacmanpkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pacmanpkg.upgrade` (*refresh=False, root=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a `pacman -Syu`

**refresh** Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacmanpkg.upgrade_available` (*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacmanpkg.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

## 21.9.308 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
 pagerduty.api_key: F3Rbyjbve43rfWf2214
 pagerduty.subdomain: mysubdomain
```

**salt.modules.pagerduty.create\_event** (*service\_key=None, description=None, details=None, incident\_key=None, profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
↪ profile=my-pagerduty-account
```

The following parameters are required:

**service\_key** This key can be found by using `pagerduty.list_services`.

**description** This is a short description of the event.

**details** This can be a more detailed description of the event.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

**salt.modules.pagerduty.list\_escalation\_policies** (*profile=None, api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

**salt.modules.pagerduty.list\_incidents** (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

**salt.modules.pagerduty.list\_maintenance\_windows** (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account
```

**salt.modules.pagerduty.list\_policies** (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account
```

**salt.modules.pagerduty.list\_schedules** (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

```
salt.modules.pagerduty.list_services(profile=None, api_key=None)
```

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

```
salt.modules.pagerduty.list_users(profile=None, api_key=None)
```

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```

```
salt.modules.pagerduty.list_windows(profile=None, api_key=None)
```

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

### 21.9.309 salt.modules.pagerduty\_util

Module for managing PagerDuty resource

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty'.

For example:

```
pagerduty:
 pagerduty.api_key: F3Rbyjbve43rFFwF2214
 pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see <https://developer.pagerduty.com/documentation/rest>

```
salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)
```

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state\_information, object\_returned\_from\_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state\_information, comparing the matching values in the object\_returned\_from\_pagerduty, and update any values that differ.

#### Examples

```
create_or_update_resource("user", ["id","name","email"]) create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)
```

```
salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
```

delete any pagerduty resource

Helper method for absent()

### Example

```
delete_resource("users", key, ["id","name","email"]) # delete by id or name or email
```

```
salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdo-
main=None, api_key=None)
```

List escalation\_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

```
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields,
profile='pagerduty', subdomain=None,
api_key=None)
```

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier\_fields. So, for example, you can look up users by email address or name by calling:

```
get_resource('users', key, ['name', 'email'], ...)
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into \_\_context\_\_), then brute force searching through the list and trying to match any of the identifier\_fields. The \_\_context\_\_ cache is purged after any create, update or delete to the resource.

```
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None,
api_key=None)
```

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.get_schedules
```

```
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None,
api_key=None)
```

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.get_services
```

```
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
```

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.get_users
```

```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty',
subdomain=None, api_key=None, **kwargs)
```

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete\_resource() and formats the result as a salt state return value.

### Example

```
resource_absent("users", ["id","name","email"])
```

```
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None,
 profile='pagerduty', subdomain=None,
 api_key=None, **kwargs)
```

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create\_or\_update\_resource() and formats the result as a salt state return value.

### Example

```
resource_present("users", ["id","name","email"])
```

## 21.9.310 salt.modules.pam

Support for pam

```
salt.modules.pam.read_file(file_name)
```

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

## 21.9.311 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

```
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
```

```
maturity new
```

```
depends none
```

```
platform unix
```

New in version 2018.3.0.

### Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

*Palo Alto Proxy Module*

### About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

```
salt.modules.panos.add_config_lock()
```

Prevent other users from changing configuration until the lock is released.

CLI Example:

```
salt '*' panos.add_config_lock
```

`salt.modules.panos.check_antivirus()`  
Get anti-virus information from PaloAlto Networks server

CLI Example:

```
salt '*' panos.check_antivirus
```

`salt.modules.panos.check_software()`  
Get software information from PaloAlto Networks server.

CLI Example:

```
salt '*' panos.check_software
```

`salt.modules.panos.clear_commit_tasks()`  
Clear all commit tasks.

CLI Example:

```
salt '*' panos.clear_commit_tasks
```

`salt.modules.panos.commit()`  
Commits the candidate configuration to the running configuration.

CLI Example:

```
salt '*' panos.commit
```

`salt.modules.panos.deactivate_license(key_name=None)`  
Deactivates an installed license. Required version 7.0.0 or greater.

`key_name(str)`: The file name of the license key installed.

CLI Example:

```
salt '*' panos.deactivate_license key_name=License_File_Name.key
```

`salt.modules.panos.delete_license(key_name=None)`  
Remove license keys on disk.

`key_name(str)`: The file name of the license key to be deleted.

CLI Example:

```
salt '*' panos.delete_license key_name=License_File_Name.key
```

`salt.modules.panos.download_antivirus()`  
Download the most recent anti-virus package.

CLI Example:

```
salt '*' panos.download_antivirus
```

`salt.modules.panos.download_software_file(filename=None, synch=False)`  
Download software packages by filename.

**Parameters**

- **filename** (*str*) – The filename of the PANOS file to download.
- **synch** (*bool*) – If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

`salt.modules.panos.download_software_version` (*version=None, synch=False*)

Download software packages by version number.

**Parameters**

- **version** (*str*) – The version of the PANOS file to download.
- **synch** (*bool*) – If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True
```

`salt.modules.panos.fetch_license` (*auth\_code=None*)

Get new license(s) using from the Palo Alto Network Server.

**auth\_code** The license authorization code.

CLI Example:

```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

`salt.modules.panos.get_address` (*address=None, vsys='1'*)

Get the candidate configuration for the specified `get_address` object. This will not return address objects that are marked as pre-defined objects.

`address(str)`: The name of the address object.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

`salt.modules.panos.get_address_group` (*addressgroup=None, vsys='1'*)

Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

`addressgroup(str)`: The name of the address group.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

`salt.modules.panos.get_admins_active` ()

Show active administrators.

CLI Example:

```
salt '*' panos.get_admins_active
```

`salt.modules.panos.get_admins_all` ()

Show all administrators.

CLI Example:

```
salt '*' panos.get_admins_all
```

`salt.modules.panos.get_antivirus_info()`  
Show information about available anti-virus packages.

CLI Example:

```
salt '*' panos.get_antivirus_info
```

`salt.modules.panos.get_arp()`  
Show ARP information.

CLI Example:

```
salt '*' panos.get_arp
```

`salt.modules.panos.get_cli_idle_timeout()`  
Show timeout information for this administrative session.

CLI Example:

```
salt '*' panos.get_cli_idle_timeout
```

`salt.modules.panos.get_cli_permissions()`  
Show cli administrative permissions.

CLI Example:

```
salt '*' panos.get_cli_permissions
```

`salt.modules.panos.get_disk_usage()`  
Report filesystem disk space usage.

CLI Example:

```
salt '*' panos.get_disk_usage
```

`salt.modules.panos.get_dns_server_config()`  
Get the DNS server configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_dns_server_config
```

`salt.modules.panos.get_domain_config()`  
Get the domain name configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_domain_config
```

`salt.modules.panos.get_dos_blocks()`  
Show the DoS block-ip table.

CLI Example:

```
salt '*' panos.get_dos_blocks
```

`salt.modules.panos.get_fqdn_cache()`

Print FQDNs used in rules and their IPs.

CLI Example:

```
salt '*' panos.get_fqdn_cache
```

`salt.modules.panos.get_ha_config()`

Get the high availability configuration.

CLI Example:

```
salt '*' panos.get_ha_config
```

`salt.modules.panos.get_ha_link()`

Show high-availability link-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_link
```

`salt.modules.panos.get_ha_path()`

Show high-availability path-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_path
```

`salt.modules.panos.get_ha_state()`

Show high-availability state information.

CLI Example:

```
salt '*' panos.get_ha_state
```

`salt.modules.panos.get_ha_transitions()`

Show high-availability transition statistic information.

CLI Example:

```
salt '*' panos.get_ha_transitions
```

`salt.modules.panos.get_hostname()`

Get the hostname of the device.

CLI Example:

```
salt '*' panos.get_hostname
```

`salt.modules.panos.get_interface_counters(name='all')`

Get the counter statistics for interfaces.

**Parameters** `name` (*str*) – The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

`salt.modules.panos.get_interfaces(name='all')`

Show interface information.

Parameters **name** (*str*) – The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

**salt.modules.panos.get\_job**(*jid=None*)

List all a single job by ID.

**jid** The ID of the job to retrieve.

CLI Example:

```
salt '*' panos.get_job jid=15
```

**salt.modules.panos.get\_jobs**(*state='all'*)

List all jobs on the device.

**state** The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:

```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

**salt.modules.panos.get\_lacp**()

Show LACP state.

CLI Example:

```
salt '*' panos.get_lacp
```

**salt.modules.panos.get\_license\_info**()

Show information about owned license(s).

CLI Example:

```
salt '*' panos.get_license_info
```

**salt.modules.panos.get\_license\_tokens**()

Show license token files for manual license deactivation.

CLI Example:

```
salt '*' panos.get_license_tokens
```

**salt.modules.panos.get\_lldp\_config**()

Show lldp config for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_config
```

**salt.modules.panos.get\_lldp\_counters**()

Show lldp counters for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_counters
```

`salt.modules.panos.get_lddp_local()`

Show lldp local info for interfaces.

CLI Example:

```
salt '*' panos.get_lddp_local
```

`salt.modules.panos.get_lddp_neighbors()`

Show lldp neighbors info for interfaces.

CLI Example:

```
salt '*' panos.get_lddp_neighbors
```

`salt.modules.panos.get_local_admins()`

Show all local administrator accounts.

CLI Example:

```
salt '*' panos.get_local_admins
```

`salt.modules.panos.get_logdb_quota()`

Report the logdb quotas.

CLI Example:

```
salt '*' panos.get_logdb_quota
```

`salt.modules.panos.get_master_key()`

Get the master key properties.

CLI Example:

```
salt '*' panos.get_master_key
```

`salt.modules.panos.get_ntp_config()`

Get the NTP configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_ntp_config
```

`salt.modules.panos.get_ntp_servers()`

Get list of configured NTP servers.

CLI Example:

```
salt '*' panos.get_ntp_servers
```

`salt.modules.panos.get_operational_mode()`

Show device operational mode setting.

CLI Example:

```
salt '*' panos.get_operational_mode
```

`salt.modules.panos.get_panorama_status()`

Show panorama connection status.

CLI Example:

```
salt '*' panos.get_panorama_status
```

`salt.modules.panos.get_permitted_ips()`

Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:

```
salt '*' panos.get_permitted_ips
```

`salt.modules.panos.get_platform()`

Get the platform model information and limitations.

CLI Example:

```
salt '*' panos.get_platform
```

`salt.modules.panos.get_predefined_application(application=None)`

Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

`application(str)`: The name of the pre-defined application object.

CLI Example:

```
salt '*' panos.get_predefined_application saltstack
```

`salt.modules.panos.get_security_rule(rulename=None, vsys='1')`

Get the candidate configuration for the specified security rule.

`rulename(str)`: The name of the security rule.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

`salt.modules.panos.get_service(service=None, vsys='1')`

Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

`service(str)`: The name of the service object.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

`salt.modules.panos.get_service_group(servicegroup=None, vsys='1')`

Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

`servicegroup(str)`: The name of the service group.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

`salt.modules.panos.get_session_info()`

Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

`salt.modules.panos.get_snmp_config()`

Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

`salt.modules.panos.get_software_info()`

Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

`salt.modules.panos.get_system_date_time()`

Get the system date/time.

CLI Example:

```
salt '*' panos.get_system_date_time
```

`salt.modules.panos.get_system_files()`

List important files in the system.

CLI Example:

```
salt '*' panos.get_system_files
```

`salt.modules.panos.get_system_info()`

Get the system information.

CLI Example:

```
salt '*' panos.get_system_info
```

`salt.modules.panos.get_system_services()`

Show system services.

CLI Example:

```
salt '*' panos.get_system_services
```

`salt.modules.panos.get_system_state(mask=None)`

Show the system state variables.

**mask** Filters by a subtree or a wildcard.

CLI Example:

```
salt '*' panos.get_system_state
salt '*' panos.get_system_state mask=config.enabled
salt '*' panos.get_system_state mask=config.*
```

**salt.modules.panos.get\_uncommitted\_changes()**

Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.

CLI Example:

```
salt '*' panos.get_uncommitted_changes
```

**salt.modules.panos.get\_users\_config()**

Get the local administrative user account configuration.

CLI Example:

```
salt '*' panos.get_users_config
```

**salt.modules.panos.get\_vlans()**

Show all VLAN information.

CLI Example:

```
salt '*' panos.get_vlans
```

**salt.modules.panos.get\_xpath(xpath=)**

Retrieve a specified xpath from the candidate configuration.

xpath(str): The specified xpath in the candidate configuration.

CLI Example:

```
salt '*' panos.get_xpath /config/shared/service
```

**salt.modules.panos.get\_zone(zone=", vsys='1')**

Get the candidate configuration for the specified zone.

zone(str): The name of the zone.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

**salt.modules.panos.get\_zones(vsys='1')**

Get all the zones in the candidate configuration.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

**salt.modules.panos.install\_antivirus(version=None, latest=False, synch=False, skip\_commit=False)**

Install anti-virus packages.

Parameters

- **version** (str) – The version of the PANOS file to install.

- **latest** (*bool*) – If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch** (*bool*) – If true, the anti-virus will synch to the peer unit.
- **skip\_commit** (*bool*) – If true, the install will skip committing to the device.

CLI Example:

```
salt '*' panos.install_antivirus 8.0.0
```

`salt.modules.panos.install_license()`

Install the license key(s).

CLI Example:

```
salt '*' panos.install_license
```

`salt.modules.panos.install_software(version=None)`

Upgrade to a software package by version.

**Parameters** **version** (*str*) – The version of the PANOS file to install.

CLI Example:

```
salt '*' panos.install_license 8.0.0
```

`salt.modules.panos.reboot()`

Reboot a running system.

CLI Example:

```
salt '*' panos.reboot
```

`salt.modules.panos.refresh_fqdn_cache(force=False)`

Force refreshes all FQDNs used in rules.

**force** Forces all fqdn refresh

CLI Example:

```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```

`salt.modules.panos.remove_config_lock()`

Release config lock previously held.

CLI Example:

```
salt '*' panos.remove_config_lock
```

`salt.modules.panos.resolve_address(address=None, vsys=None)`

Resolve address to ip address. Required version 7.0.0 or greater.

**address** Address name you want to resolve.

**vsys** The vsys name.

CLI Example:

```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

`salt.modules.panos.save_device_config(filename=None)`

Save device configuration to a named file.

**filename** The filename to save the configuration to.

CLI Example:

```
salt '*' panos.save_device_config foo.xml
```

`salt.modules.panos.save_device_state()`

Save files needed to restore device to local disk.

CLI Example:

```
salt '*' panos.save_device_state
```

`salt.modules.panos.set_authentication_profile(profile=None, deploy=False)`

Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

#### Parameters

- **profile** (*str*) – The name of the authentication profile to set.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

`salt.modules.panos.set_hostname(hostname=None, deploy=False)`

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

#### Parameters

- **hostname** (*str*) – The hostname to set
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_hostname newhostname
salt '*' panos.set_hostname newhostname deploy=True
```

`salt.modules.panos.set_management_http(enabled=True, deploy=False)`

Enables or disables the HTTP management service on the device.

CLI Example:

#### Parameters

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_http
salt '*' panos.set_management_http enabled=False deploy=True
```

`salt.modules.panos.set_management_https(enabled=True, deploy=False)`

Enables or disables the HTTPS management service on the device.

CLI Example:

#### Parameters

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_https
salt '*' panos.set_management_https enabled=False deploy=True
```

`salt.modules.panos.set_management_icmp` (*enabled=True, deploy=False*)  
Enables or disables the ICMP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_icmp
salt '*' panos.set_management_icmp enabled=False deploy=True
```

`salt.modules.panos.set_management_ocsp` (*enabled=True, deploy=False*)  
Enables or disables the HTTP OCSP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

`salt.modules.panos.set_management_snmp` (*enabled=True, deploy=False*)  
Enables or disables the SNMP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

`salt.modules.panos.set_management_ssh` (*enabled=True, deploy=False*)  
Enables or disables the SSH management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

`salt.modules.panos.set_management_telnet` (*enabled=True, deploy=False*)  
Enables or disables the Telnet management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) – If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

`salt.modules.panos.set_ntp_authentication` (*target=None, authentication\_type=None, key\_id=None, authentication\_key=None, algorithm=None, deploy=False*)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **target** (*str*) – Determines the target of the authentication. Valid options are primary, secondary, or both.
- **authentication\_type** (*str*) – The authentication type to be used. Valid options are symmetric, autokey, and none.
- **key\_id** (*int*) – The NTP authentication key ID.
- **authentication\_key** (*str*) – The authentication key.
- **algorithm** (*str*) – The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_
↪id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_
↪id=15 authentication_key=mykey algorithm=md5 deploy=True
```

`salt.modules.panos.set_ntp_servers` (*primary\_server=None, secondary\_server=None, deploy=False*)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **primary\_server** (*str*) – The primary NTP server IP address or FQDN.
- **secondary\_server** (*str*) – The secondary NTP server IP address or FQDN.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.
↪ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

`salt.modules.panos.set_permitted_ip` (*address=None, deploy=False*)

Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

- **address** (*str*) – The IPv4 address or network to allow access to add to the Palo Alto device.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

`salt.modules.panos.set_timezone` (*tz=None, deploy=False*)

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

**Parameters**

- **tz** (*str*) – The name of the timezone to set.
- **deploy** (*bool*) – If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```

`salt.modules.panos.shutdown` ()

Shutdown a running system.

CLI Example:

```
salt '*' panos.shutdown
```

`salt.modules.panos.test_fib_route` (*ip=None, vr='vr1'*)

Perform a route lookup within active route table (fib).

*ip* (*str*): The destination IP address to test.

*vr* (*str*): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

`salt.modules.panos.test_security_policy` (*sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False*)

Checks which security policy as connection will match on the device.

*sourcezone* (*str*): The source zone matched against the connection.

*destinationzone* (*str*): The destination zone matched against the connection.

*source* (*str*): The source address. This must be a single IP address.

*destination* (*str*): The destination address. This must be a single IP address.

*protocol* (*int*): The protocol number for the connection. This is the numerical representation of the protocol.

*port* (*int*): The port number for the connection.

*application* (*str*): The application that should be matched.

*category* (*str*): The category that should be matched.

*vsys* (*int*): The numerical representation of the VSYS ID.

allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
↳protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
↳protocol=6 port=22 vsys=2
```

`salt.modules.panos.unlock_admin` (*username=None*)

Unlocks a locked administrator account.

**username** Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

### 21.9.312 salt.modules.parallels module

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the `prlctl` commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the [Parallels Desktop Reference Guide](#).

This module requires the `prlctl` binary to be installed to run most functions. To run `parallels.prlsrvctl`, the `prlsrvctl` binary is required.

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceding double dash `--` as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

`salt.modules.parallels.clone` (*name, new\_name, linked=False, template=False, runas=None*)

Clone a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) – Name/ID of VM to clone
- **new\_name** (*str*) – Name of the new VM
- **linked** (*bool*) – Create a linked virtual machine.
- **template** (*bool*) – Create a virtual machine template instead of a real virtual machine.
- **runas** (*str*) – The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

`salt.modules.parallels.delete` (*name, runas=None*)

Delete a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) – Name/ID of VM to clone
- **runas** (*str*) – The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.delete_snapshot`(*name*, *snap\_name*, *runas=None*, *all=False*)

Delete a snapshot

---

**Note:** Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

---

#### Parameters

- **name** (*str*) – Name/ID of VM whose snapshot will be deleted
- **snap\_name** (*str*) – Name/ID of snapshot to delete
- **runas** (*str*) – The user that the prctl command will be run as
- **all** (*bool*) – Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True
↪runas=macdev
```

`salt.modules.parallels.exec_`(*name*, *command*, *runas=None*)

Run a command on a VM

#### Parameters

- **name** (*str*) – Name/ID of VM whose exec will be returned
- **command** (*str*) – Command to run on the VM
- **runas** (*str*) – The user that the prctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.exists`(*name*, *runas=None*)

Query whether a VM exists

New in version 2016.11.0.

#### Parameters

- **name** (*str*) – Name/ID of VM
- **runas** (*str*) – The user that the prctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

`salt.modules.parallels.list_snapshots`(*name*, *snap\_name=None*, *tree=False*, *names=False*, *runas=None*)

List the snapshots

#### Parameters

- **name** (*str*) – Name/ID of VM whose snapshots will be listed
- **snap\_id** (*str*) – Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) – List snapshots in tree format rather than tabular format
- **names** (*bool*) – List snapshots as ID, name pairs
- **runas** (*str*) – The user that the prctl command will be run as

Example:

```

salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev

```

`salt.modules.parallels.list_vms` (*name=None, info=False, all=False, args=None, runas=None, template=False*)

List information about the VMs

#### Parameters

- **name** (*str*) – Name/ID of VM to list  
Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) – List extra information
- **all** (*bool*) – List all non-template VMs
- **args** (*tuple*) – Additional arguments given to `prctl list`
- **runas** (*str*) – The user that the `prctl` command will be run as
- **template** (*bool*) – List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```

salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms '-o uuid,status' all=True runas=macdev

```

`salt.modules.parallels.prctl` (*sub\_cmd, args=None, runas=None*)

Execute a `prctl` command

#### Parameters

- **sub\_cmd** (*str*) – `prctl` subcommand to execute
- **args** (*str*) – The arguments supplied to `prctl <sub_cmd>`
- **runas** (*str*) – The user that the `prctl` command will be run as

Example:

```

salt '*' parallels.prctl user list runas=macdev
salt '*' parallels.prctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prctl capture 'macvm --file macvm.display.png' runas=macdev

```

`salt.modules.parallels.prlsruvctl` (*sub\_cmd, args=None, runas=None*)

Execute a `prlsruvctl` command

New in version 2016.11.0.

#### Parameters

- **sub\_cmd** (*str*) – `prlsruvctl` subcommand to execute
- **args** (*str*) – The arguments supplied to `prlsruvctl <sub_cmd>`
- **runas** (*str*) – The user that the `prlsruvctl` command will be run as

Example:

```

salt '*' parallels.prlsruvctl info runas=macdev
salt '*' parallels.prlsruvctl usb list runas=macdev
salt -- '*' parallels.prlsruvctl set '--mem-limit auto' runas=macdev

```

`salt.modules.parallels.reset` (*name, runas=None*)

Reset a VM by performing a hard shutdown and then a restart

#### Parameters

- **name** (*str*) – Name/ID of VM to reset

- **runas** (*str*) – The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

`salt.modules.parallels.restart`(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** (*str*) – Name/ID of VM to restart
- **runas** (*str*) – The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

`salt.modules.parallels.revert_snapshot`(*name*, *snap\_name*, *runas=None*)

Revert a VM to a snapshot

Parameters

- **name** (*str*) – Name/ID of VM to revert to a snapshot
- **snap\_name** (*str*) – Name/ID of snapshot to revert to
- **runas** (*str*) – The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

`salt.modules.parallels.snapshot`(*name*, *snap\_name=None*, *desc=None*, *runas=None*)

Create a snapshot

Parameters

- **name** (*str*) – Name/ID of VM to take a snapshot of
- **snap\_name** (*str*) – Name of snapshot
- **desc** (*str*) – Description of snapshot
- **runas** (*str*) – The user that the prlctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean
↳install with updates' runas=macdev
```

`salt.modules.parallels.snapshot_id_to_name`(*name*, *snap\_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** (*str*) – Name/ID of VM whose snapshots are inspected
- **snap\_id** (*str*) – ID of the snapshot
- **strict** (*bool*) – Raise an exception if a name cannot be found for the given `snap_id`
- **runas** (*str*) – The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66
↳runas=macdev
```

`salt.modules.parallels.snapshot_name_to_id(name, snap_name, strict=False, runas=None)`

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

#### Parameters

- **name** (*str*) – Name/ID of VM whose snapshots are inspected
- **snap\_name** (*str*) – Name of the snapshot
- **strict** (*bool*) – Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) – The user that the `prlctl` command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

`salt.modules.parallels.start(name, runas=None)`

Start a VM

#### Parameters

- **name** (*str*) – Name/ID of VM to start
- **runas** (*str*) – The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

`salt.modules.parallels.status(name, runas=None)`

Status of a VM

#### Parameters

- **name** (*str*) – Name/ID of VM whose status will be returned
- **runas** (*str*) – The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

`salt.modules.parallels.stop(name, kill=False, runas=None)`

Stop a VM

#### Parameters

- **name** (*str*) – Name/ID of VM to stop
- **kill** (*bool*) – Perform a hard shutdown
- **runas** (*str*) – The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

### 21.9.313 salt.modules.parted\_partition

Module for managing partitions on POSIX-like systems.

#### depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for `parted(8)` for more information, or the online docs at:

[http://www.gnu.org/software/parted/manual/html\\_chapter/parted\\_2.html](http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html)

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for `sfdisk(8)`.

`salt.modules.parted_partition.align_check(device, part_type, partition)`

Check if partition satisfies the alignment constraint of `part_type`. Type must be "minimal" or "optimal".

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

`salt.modules.parted_partition.check(device, minor)`

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

`salt.modules.parted_partition.cp(device, from_minor, to_minor)`

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

`salt.modules.parted_partition.disk_set(device, flag, state)`

Changes a flag on selected device.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- cylinder\_alignment
- pmbr\_boot
- implicit\_partition\_table

CLI Example:

```
salt '*' partition.disk_set /dev/sda pmbr_boot "on"
```

`salt.modules.parted_partition.disk_toggle(device, flag)`

Toggle the state of <flag> on <device>. Valid flags are the same as the `disk_set` command.

CLI Example:

```
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

`salt.modules.parted_partition.exists(device=)`

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

`salt.modules.parted_partition.get_block_device()`

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

`salt.modules.parted_partition.get_id(device, minor)`

Prints the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

`salt.modules.parted_partition.list_(device, unit=None)`

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

`salt.modules.parted_partition.mkfs(device, fs_type)`

Makes a file system <fs\_type> on partition <device>, destroying all data that resides on that partition. <fs\_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

`salt.modules.parted_partition.mklabel(device, label_type)`

Create a new disklabel (partition table) of label\_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

`salt.modules.parted_partition.mkpart(device, part_type, fs_type=None, start=None, end=None)`

Make a part\_type partition for filesystem fs\_type, beginning at start and ending at end (by default in megabytes). part\_type should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

`salt.modules.parted_partition.mkpartfs(device, part_type, fs_type, start, end)`

Make a <part\_type> partition with a new filesystem of <fs\_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part\_type> should be one of "primary", "logical", or "extended". <fs\_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

`salt.modules.parted_partition.name`(*device, partition, name*)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted_partition.probe`(\**devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted_partition.rescue`(*device, start, end*)

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted_partition.resize`(*device, minor, start, end*)

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted_partition.rm`(*device, minor*)

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted_partition.set_`(*device, minor, flag, state*)

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see [YAML Idiosyncrasies](#)). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid

- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios\_grub
- atvrecv
- diag
- legacy\_boot
- msftdata
- irst
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot '"on"'
```

`salt.modules.parted_partition.set_id(device, minor, system_id)`

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted_partition.system_types()`

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted_partition.toggle(device, partition, flag)`

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

### 21.9.314 salt.modules.pcs module

#### Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

**depends** pcs

New in version 2016.3.0.

`salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)`

Authorize nodes to the cluster

**nodes** a list of nodes which should be authorized to the cluster

**pcsuser** user for communication with PCS (default: hacluster)

**pcspasswd** password for pcsuser (default: hacluster)

**extra\_args** list of extra option for the 'pcs cluster auth' command

CLI Example:

```
salt '*' pcs.auth nodes='[node1.example.org node2.example.org]'
↳pcsuser=hacluster pcspasswd=hoonetorg extra_args="['--force']"
```

`salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)`

Create a CIB-file from the current CIB of the cluster

**cibfile** name/path of the file containing the CIB

**scope** specific section of the CIB (default: configuration)

**extra\_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

`salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)`

Push a CIB-file as the new CIB to the cluster

**cibfile** name/path of the file containing the CIB

**scope** specific section of the CIB (default: configuration)

**extra\_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

`salt.modules.pcs.cluster_node_add(node, extra_args=None)`

Add a node to the pacemaker cluster via pcs command

**node** node that should be added

**extra\_args** list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

`salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)`

Setup pacemaker cluster via pcs command

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster (default: pcscluster)

**extra\_args** list of extra option for the 'pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[node1.example.org node2.example.org]'
↳pcsclustername=pcscluster
```

`salt.modules.pcs.config_show(cibfile=None)`

Show config of cluster

**cibfile** name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

`salt.modules.pcs.is_auth(nodes)`

Check if nodes are already authorized

**nodes** a list of nodes to be checked for authorization to the cluster

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

**salt.modules.pcs.item\_create**(*item*, *item\_id*, *item\_type*, *create*='create', *extra\_args*=None, *cibfile*=None)

Create an item via pcs command (mainly for use with the pcs state module)

**item** config, property, resource, constraint etc.

**item\_id** id of the item

**item\_type** item type

**create** create command (create or set f.e., default: create)

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

**salt.modules.pcs.item\_show**(*item*, *item\_id*=None, *item\_type*=None, *show*='show', *extra\_args*=None, *cibfile*=None)

Show an item via pcs command (mainly for use with the pcs state module)

**item** config, property, resource, constraint etc.

**item\_id** id of the item

**item\_type** item type

**show** show command (probably None, default: show)

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

**salt.modules.pcs.prop\_set**(*prop*, *value*, *extra\_args*=None, *cibfile*=None)

Set the value of a cluster property

**prop** name of the property

**value** value of the property prop

**extra\_args** additional options for the pcs property command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_
↳cluster.cib'
```

**salt.modules.pcs.prop\_show**(*prop*, *extra\_args*=None, *cibfile*=None)

Show the value of a cluster property

**prop** name of the property

**extra\_args** additional options for the pcs property command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
↳cibfile='/tmp/2_node_cluster.cib'
```

**salt.modules.pcs.resource\_create**(*resource\_id*, *resource\_type*, *resource\_options*=None, *cibfile*=None)

Create a resource via pcs command

**resource\_id** name for the resource

**resource\_type** resource type (f.e. ocf:heartbeat:IPAddr2 or VirtualIP)

**resource\_options** additional options for creating the resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type=
↳'ocf:heartbeat:galera' resource_options="['wsrep_cluster_address=gcomm://node1.
↳example.org,node2.example.org,node3.example.org', '--master']" cibfile='/tmp/
↳cib_for_galera.cib'
```

`salt.modules.pcs.resource_show`(*resource\_id*, *extra\_args*=None, *cibfile*=None)

Show a resource via pcs command

**resource\_id** name of the resource

**extra\_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
```

`salt.modules.pcs.stonith_create`(*stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options*=None, *cibfile*=None)

Create a stonith resource via pcs command

**stonith\_id** name for the stonith resource

**stonith\_device\_type** name of the stonith agent fence\_eps, fence\_xvm f.e.

**stonith\_device\_options** additional options for creating the stonith resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
stonith_device_options="['pcmk_host_map=node1.example.
↳org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot',
↳ 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden
↳', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'
```

`salt.modules.pcs.stonith_show`(*stonith\_id*, *extra\_args*=None, *cibfile*=None)

Show the value of a cluster stonith

**stonith\_id** name for the stonith resource

**extra\_args** additional options for the pcs stonith command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'
```

### 21.9.315 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** posix

New in version 2017.7.0.

`salt.modules.pdbedit.create`(*login*, *password*, *password\_hashed*=False, *machine\_account*=False)

Create user account

**login** [string] login name

**password** [string] password

**password\_hashed** [boolean] set if password is a nt hash instead of plain text

**machine\_account** [boolean] set to create a machine trust account instead

CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

`salt.modules.pdbedit.delete`(*login*)

Delete user account

**login** [string] login name

CLI Example:

```
salt '*' pdbedit.delete wash
```

`salt.modules.pdbedit.generate_nt_hash`(*password*)

Generate a NT HASH

CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

`salt.modules.pdbedit.get_user`(*login*, *hashes=False*)

Get user account details

**login** [string] login name

**hashes** [boolean] include NTHASH and LMHASH in verbose output

CLI Example:

```
salt '*' pdbedit.get kaylee
```

`salt.modules.pdbedit.list_users`(*verbose=True*, *hashes=False*)

List user accounts

**verbose** [boolean] return all information

**hashes** [boolean] include NT HASH and LM HASH in verbose output

CLI Example:

```
salt '*' pdbedit.list
```

`salt.modules.pdbedit.modify`(*login*, *password=None*, *password\_hashed=False*, *domain=None*, *profile=None*, *script=None*, *drive=None*, *homedir=None*, *fullname=None*, *account\_desc=None*, *account\_control=None*, *machine\_sid=None*, *user\_sid=None*, *reset\_login\_hours=False*, *reset\_bad\_password\_count=False*)

Modify user account

**login** [string] login name

**password** [string] password

**password\_hashed** [boolean] set if password is a nt hash instead of plain text

**domain** [string] users domain

**profile** [string] profile path

**script** [string] logon script

**drive** [string] home drive

**homedir** [string] home directory

**fullname** [string] full name

**account\_desc** [string] account description

**machine\_sid** [string] specify the machines new primary group SID or rid

**user\_sid** [string] specify the users new primary group SID or rid

**account\_control** [string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home

directory required - L: Automatic Locking - X: Password does not expire

**reset\_login\_hours** [boolean] reset the users allowed logon hours  
**reset\_bad\_password\_count** [boolean] reset the stored bad login counter

**Note:** if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```

### 21.9.316 salt.modules.pecl

Manage PHP pecl extensions.

**salt.modules.pecl.install** (*pecls*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

**pecls** The pecl extensions to install.

**defaults** Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

**salt.modules.pecl.list\_** (*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

**salt.modules.pecl.uninstall** (*pecls*)

Uninstall one or several pecl extensions.

**pecls** The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

**salt.modules.pecl.update** (*pecls*)

Update one or several pecl extensions.

**pecls** The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

### 21.9.317 salt.modules.peeringdb module

## PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to <https://www.peeringdb.com/apidocs/>.

Configuration (in the `opts` or `Pillar`):

```
peeringdb:
 username: salt
 password: 5@1t
```

`salt.modules.peeringdb.get_fac(**kwargs)`

Return the details of the facility identified using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac\\_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

`salt.modules.peeringdb.get_ix(**kwargs)`

Return the details of an IX (Internet Exchange) using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ix/ix\\_list](https://www.peeringdb.com/apidocs/#!/ix/ix_list)

---

CLI Example:

```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

`salt.modules.peeringdb.get_ixfac(**kwargs)`

Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixfac/ixfac\\_list](https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

`salt.modules.peeringdb.get_ixlan(**kwargs)`

Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixlan/ixlan\\_list](https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

`salt.modules.peeringdb.get_ixpfx(**kwargs)`

Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx\\_list](https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

`salt.modules.peeringdb.get_net(**kwargs)`

Return the details of a network identified using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/net/net\\_list](https://www.peeringdb.com/apidocs/#!/net/net_list)

---

CLI Example:

```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

`salt.modules.peeringdb.get_netfac(**kwargs)`

Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac\\_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

`salt.modules.peeringdb.get_netixlan(**kwargs)`

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the `id` argument or the other filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netixlan/netixlan\\_list](https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list)

---

CLI Example:

```
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

`salt.modules.peeringdb.get_org(**kwargs)`

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/org/org\\_list](https://www.peeringdb.com/apidocs/#!/org/org_list)

---

CLI Example:

```
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```

`salt.modules.peeringdb.get_poc(**kwargs)`

Return the details of a person of contact together using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/poc/poc\\_list](https://www.peeringdb.com/apidocs/#!/poc/poc_list)

---

CLI Example:

```
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

## 21.9.318 salt.modules.pf

Control the OpenBSD packet filter (PF).

**codeauthor** Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

`salt.modules.pf.disable()`

Disable the Packet Filter.

CLI example:

```
salt '*' pf.disable
```

`salt.modules.pf.enable()`

Enable the Packet Filter.

CLI example:

```
salt '*' pf.enable
```

`salt.modules.pf.flush(modifier)`

Flush the specified packet filter parameters.

**modifier:** Should be one of the following:

- all
- info
- osfp
- rules
- sources
- states
- tables

Please refer to the OpenBSD [pfctl\(8\)](#) documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.flush states
```

`salt.modules.pf.load(file='/etc/pf.conf', noop=False)`

Load a ruleset from the specific file, overwriting the currently loaded ruleset.

**file:** Full path to the file containing the ruleset.

**noop:** Don't actually load the rules, just parse them.

CLI example:

```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

`salt.modules.pf.loglevel(level)`

Set the debug level which limits the severity of log messages printed by `pf(4)`.

**level:** Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug.

CLI example:

```
salt '*' pf.loglevel emerg
```

`salt.modules.pf.show(modifier)`

Show filter parameters.

**modifier:** Modifier to apply for filtering. Only a useful subset of what `pfctl` supports can be used with Salt.

- rules
- states
- tables

CLI example:

```
salt '*' pf.show rules
```

`salt.modules.pf.table(command, table, **kwargs)`

Apply a command on the specified table.

**table:** Name of the table.

**command:** Command to apply to the table. Supported commands are:

- add

- delete
- expire
- flush
- kill
- replace
- show
- test
- zero

Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", ":::1"]'
```

### 21.9.319 salt.modules.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

### 21.9.320 salt.modules.pillar

Extract the pillar data for this minion

`salt.modules.pillar.ext` (*external*, *pillar=None*)

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported `ext_pillar` types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

**external** A single `ext_pillar` to add to the `ext_pillar` configuration. This must be passed as a single section from the `ext_pillar` configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
... - git:
... - issue38440 https://github.com/terminalmage/git_pillar:
... - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

**pillar** [None] If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. These pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{"git": ["master https://github.com/myuser/myrepo"]}'
salt '*' pillar.ext '{"git": [{"mybranch https://github.com/myuser/myrepo": [{"env
→': 'base'}]}]}'
```

`salt.modules.pillar.fetch`(*key*, *default*=<class 'KeyError'>, *merge*=False, *merge\_nested\_lists*=None, *delimiter*=':', *pillarenv*=None, *saltenv*=None)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge** [False] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists** If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when `merge` is set to `False`.

---

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.file_exists`(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

**path** The path to the file in question. Will be treated as a relative path

**saltenv** Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.filter_by`(*lookup\_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- **lookup\_dict** – A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

```
this will render 'got some salt' if ``role`` begins with
↳ 'salt'
salt '*' pillar.filter_by '{salt*: got some salt, default:
↳ salt is not here}' role
```

- **pillar** – The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** – A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **default** – default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is "default".
- **base** – A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

`salt.modules.pillar.get`(*key*, *default*=<class 'KeyError'>, *merge*=False, *merge\_nested\_lists*=None, *delimiter*=':', *pillarenv*=None, *saltenv*=None)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge** [False] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists** If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when `merge` is set to `False`.

---

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item(*args, **kwargs)`

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

**delimiter** Delimiter used to traverse nested dictionaries.

---

**Note:** This is different from *pillar.get* in that no default value can be specified. *pillar.get* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of *pillar.get* however is when it is desirable to retrieve the values of more than one key, since *pillar.get* can only retrieve one key at a time.

---

New in version 2015.8.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

**saltenv** Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.items(*args, **kwargs)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with *raw()* which returns the pillar data that is currently loaded into the minion.

**pillar** If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. these pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

**pillar\_enc** If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/`ext_pillar` rendering.

---

New in version 2017.7.0.

**pillarenv** Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's *pillarenv* option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

**saltenv** Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

**salt.modules.pillar.keys**(*key*, *delimiter=':'*)

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how *pillar.get* works.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

**salt.modules.pillar.ls**(\**args*)

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as *items()*), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

**salt.modules.pillar.obfuscate**(\**args*)

New in version 2015.8.0.

Same as *items()*, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'somelogin', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:

```
salt '*' pillar.obfuscate
```

**salt.modules.pillar.raw**(*key=None*)

Return the raw pillar data that is currently loaded into the minion.

Contrast with *items()* which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

### 21.9.321 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

#### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

#### State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
 pip.installed:
 - name: colorama
 - cwd: 'C:\salt\bin\scripts'
 - bin_env: 'C:\salt\bin\scripts\pip.exe'
 - upgrade: True
```

#### Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
 pip.installed:
 - cwd: 'C:\salt\bin\scripts'
 - bin_env: 'C:\salt\bin\scripts\pip.exe'
 - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
 - upgrade: True
```

```
restart_service:
```

(continues on next page)

(continued from previous page)

```

service.running:
- name: salt-minion
- enable: True
- watch:
 - pip: install_salt

```

**Note:** If you're having problems, you might try doubling the back slashes. For example, `cwd: 'C:\salt\bin\scripts'`. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.\* and Salt <=2018.3.0. The issue is described here: <https://github.com/saltstack/salt/issues/46163>

```

salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None,
 **kwargs)

```

Return a list of installed packages either globally or in the specified virtualenv

**bin\_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**user** The user under which to run pip

**cwd** Directory from which to run pip

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```

salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv

```

```

salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False,
 no_use_wheel=False, log=None, proxy=None, timeout=None, ed-
 itable=None, find_links=None, index_url=None, extra_index_url=None,
 no_index=False, mirrors=None, build=None, target=None, download=None,
 download_cache=None, source=None, upgrade=False, force_reinstall=False,
 ignore_installed=False, exists_action=None, no_deps=False,
 no_install=False, no_download=False, global_options=None, in-
 stall_options=None, user=None, cwd=None, pre_releases=False, cert=None,
 allow_all_external=False, allow_external=None, allow_unverified=None,
 process_dependency_links=False, saltenv='base', env_vars=None,
 use_vt=False, trusted_host=None, no_cache_dir=False, extra_args=None,
 cache_dir=None, no_binary=None, disable_version_check=False,
 **kwargs)

```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs** Comma separated list of packages to install

**requirements** Path to requirements

**bin\_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, `bin_env` should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to

upgrade itself in Windows.

---

**use\_wheel** Prefer wheel archives (requires pip>=1.4)  
**no\_use\_wheel** Force to not use wheel archives (requires pip>=1.4,<10.0.0)  
**no\_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them  
**log** Log file where a complete (maximum verbosity) record will be kept  
**proxy** Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

---

**Note:** If the the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

**timeout** Set the socket timeout (default 15 seconds)  
**editable** install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)  
**find\_links** URL to search for packages  
**index\_url** Base URL of Python Package Index  
**extra\_index\_url** Extra URLs of package indexes to use in addition to `index_url`  
**no\_index** Ignore package index  
**mirrors** Specific mirror URL(s) to query (automatically adds `-use-mirrors`)

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

**build** Unpack packages into `build` dir  
**target** Install packages into `target` dir  
**download** Download packages into `download` instead of installing them  
**download\_cache** | **cache\_dir** Cache downloaded packages in `download_cache` or `cache_dir` dir  
**source** Check out `editable` packages into `source` dir  
**upgrade** Upgrade all packages to the newest available version  
**force\_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.  
**ignore\_installed** Ignore the installed packages (reinstalling instead)  
**exists\_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup  
**no\_deps** Ignore package dependencies  
**no\_install** Download and unpack all packages, but don't actually install them  
**no\_download** Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)  
**install\_options** Extra arguments to be supplied to the `setup.py` install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `-install-option` options to pass multiple options to `setup.py` install. If you are using an option with a directory path, be sure to use absolute path.  
**global\_options** Extra global options to be supplied to the `setup.py` call before the install command.  
**user** The user under which to run pip  
**cwd** Directory from which to run pip  
**pre\_releases** Include pre-releases in the available versions  
**cert** Provide a path to an alternate CA bundle  
**allow\_all\_external** Allow the installation of all externally hosted files  
**allow\_external** Allow the installation of externally hosted files (comma separated list)  
**allow\_unverified** Allow the installation of insecure and unverifiable files (comma separated list)  
**process\_dependency\_links** Enable the processing of dependency links  
**env\_vars** Set environment variables that some builds will depend on. For example, a Python C-module may

have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{ 'CUSTOM_PATH': '/opt/django_app' }"
```

**trusted\_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

**use\_vt** Use VT terminal emulation (see output while installing)

**no\_cache\_dir** Disable the cache.

**extra\_args** pip keyword and positional arguments not yet implemented in salt

```
salt '*' pip.install pandas extra_args="['--latest-pip-kwarg':'param'], '--
↳latest-pip-arg']"
```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

**disable\_version\_check** Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.
↳com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

`salt.modules.pip.is_installed` (*pkgname=None, bin\_env=None, user=None, cwd=None*)

New in version 2018.3.0.

Filter list of installed apps from `freeze` and return True or False if `pkgname` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

`salt.modules.pip.list_` (*prefix=None, bin\_env=None, user=None, cwd=None, env\_vars=None, \*\*kwargs*)

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

---

CLI Example:

```
salt '*' pip.list salt
```

```
salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)
```

New in version 2017.7.3.

List all available versions of a pip package

**pkg** The package to check

**bin\_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**include\_alpha** Include alpha versions in the list

**include\_beta** Include beta versions in the list

**include\_rc** Include release candidates versions in the list

**user** The user under which to run pip

**cwd** Directory from which to run pip

**index\_url** Base URL of Python Package Index .. versionadded:: 2019.2.0

**extra\_index\_url** Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

```
salt.modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)
```

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

```
salt.modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)
```

Uninstall packages individually or from a pip requirements file

**pkgs** comma separated list of packages to install

**requirements** Path to requirements file

**bin\_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

---

**Note:** If the the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

**timeout** Set the socket timeout (default 15 seconds)

**user** The user under which to run pip

**cwd** Directory from which to run pip  
**use\_vt** Use VT terminal emulation (see output while installing)  
 CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

**salt.modules.pip.upgrade**(*bin\_env=None, user=None, cwd=None, use\_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

---

**Note:** On Windows you can't update salt from pip using salt, so salt will be skipped

---

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

**salt.modules.pip.upgrade\_available**(*pkg, bin\_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

**salt.modules.pip.version**(*bin\_env=None, cwd=None*)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

CLI Example:

```
salt '*' pip.version
```

### 21.9.322 salt.modules.pkg\_resource

Resources needed by pkg providers

**salt.modules.pkg\_resource.add\_pkg**(*pkgs, name, pkgver*)

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{} bind 9
```

**salt.modules.pkg\_resource.check\_extra\_requirements**(*pkgname, pkgver*)

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

`salt.modules.pkg_resource.format_pkg_list` (*packages, versions\_as\_list, attr*)

Formats packages according to parameters for `list_pkgs`.

`salt.modules.pkg_resource.format_version` (*epoch, version, release*)

Formats a version string for `list_pkgs`.

`salt.modules.pkg_resource.pack_sources` (*sources, normalize=True*)

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'
```

`salt.modules.pkg_resource.parse_targets` (*name=None, pkgs=None, sources=None, saltenv='base', normalize=True, \*\*kwargs*)

Parses the input to `pkg.install` and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.sort_pkglist` (*pkgs*)

Accepts a dict obtained from `pkg.list_pkgs()` and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.stringify` (*pkgs*)

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.version` (*\*names, \*\*kwargs*)

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.version_clean(verstr)`

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

### 21.9.323 salt.modules.pkgin

Package support for pkgin based systems, inspired from `freebsd/pkg` module

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.pkgin.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.file_dict(*packages)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.file_list(package)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

**name** The name of the package to be installed.

**refresh** Whether or not to refresh the package database before installing.

**fromrepo** Specify a package repository to install from.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo','bar']
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades.

New in version 2018.3.0.

**refresh** Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.refresh_db(force=False)`

Use pkg update to get latest pkg\_summary

**force** Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove` (*name=None, pkgs=None, \*\*kwargs*)

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pkgin.search` (*pkg\_name*)

Searches for an exact match using `pkgin ^package$`

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.upgrade` (*refresh=True, pkgs=None, \*\*kwargs*)

Run pkg upgrade, if pkgin used. Otherwise do nothing

**refresh** Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs=['foo','bar']
```

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.324 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the `pkgng` module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as `pkgng`, as it will behave like a normal Salt `pkg` provider. The documentation below should not be considered to apply to this module in versions `<= 0.17.x`. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use `pkgng`, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

**providers:**  
**pkg:** `pkgng`

**salt.modules.pkgng.audit** (*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

**jail** Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot** Audit packages within the specified chroot (ignored if `jail` is specified)

**root** Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

**salt.modules.pkgng.autoremove** (*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

**dryrun** Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

**salt.modules.pkgng.backup** (*file\_name, jail=None, chroot=None, root=None*)

Export installed packages into `yaml+mtree` file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

**jail** Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**chroot** Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root** Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.check` (*jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False*)

Sanity checks installed packages

**jail** Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

**chroot** Perform the sanity check in the specified chroot (ignored if `jail` is specified)

**root** Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

**depends** Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

**recompute** Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

**checksum** Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

`salt.modules.pkgng.clean` (*jail=None, chroot=None, root=None, clean\_all=False, dryrun=False*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```

**jail** Cleans the package cache in the specified jail

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

**chroot** Cleans the package cache in the specified chroot (ignored if `jail` is specified)

**root** Cleans the package cache in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

**clean\_all** Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```
salt '*' pkg.clean clean_all=True
```

**dryrun** Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

`salt.modules.pkgng.fetch`(*name*, *jail=None*, *chroot=None*, *root=None*, *fetch\_all=False*, *quiet=False*, *fromrepo=None*, *glob=True*, *regex=False*, *pcre=False*, *local=False*, *depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

**jail** Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot** Fetch package in the specified chroot (ignored if `jail` is specified)

**root** Fetch package in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch\_all** Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet** Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo** Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob** Treat `pkg_name` as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

**regex** Treat `pkg_name` as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

**pcre** Treat `pkg_name` as an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

**local** Skip updating the repository catalogs with `pkg-update(8)`. Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

**depends** Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.hold`(*name=None, pkgs=None, \*\*kwargs*)

Version-lock packages

---

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.lock` instead.

---

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.pkgng.install`(*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall\_requires=False, regex=False, pcre=False, batch=False, \*\*kwargs*)

Install package(s) from a repository

**name** The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

**jail** Install the package into the specified jail

**chroot** Install the package into the specified chroot (ignored if `jail` is specified)

**root** Install the package into the specified root (ignored if `jail` is specified)

**orphan** Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

**force** Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

**local** Do not update the repository catalogs with `pkg-update(8)`. A value of True here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

**dryrun** Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

**quiet** Force quiet output, except when dryrun is used, where `pkg install` will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

**reinstall\_requires** When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

**fromrepo** In multi-repo mode, override the `pkg.conf` ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex** Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

**batch** Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

`salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.list_locked(**kwargs)`

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

**jail** List locked packages within the specified jail

CLI Example:

```
salt '*' pkg.list_locked jail=<jail name or id>
```

**chroot** List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

**root** List locked packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked root=/path/to/chroot
```

`salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

**jail** List the packages in the specified jail

**chroot** List the packages in the specified chroot (ignored if jail is specified)

**root** List the packages in the specified root (ignored if jail is specified)

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.list_upgrades` (*refresh=True, \*\*kwargs*)

List those packages for which an upgrade is available

The `fromrepo` argument is also supported, as used in `pkg states`.

CLI Example:

```
salt '*' pkg.list_upgrades
```

**jail** List upgrades within the specified jail

CLI Example:

```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot** List upgrades within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root** List upgrades within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

`salt.modules.pkgng.lock` (*name, \*\*kwargs*)

Lock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

**jail** Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot** Lock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root** Lock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.locked` (*name, \*\*kwargs*)

Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

**jail** Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

**chroot** Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

**root** Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

`salt.modules.pkgng.parse_config`(*file\_name*='usr/local/etc/pkg.conf')

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

**NOTE:** not working properly right now

`salt.modules.pkgng.refresh_db`(*jail*=None, *chroot*=None, *root*=None, *force*=False)

Refresh PACKAGESITE contents

---

**Note:** This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

---

CLI Example:

```
salt '*' pkg.refresh_db
```

**jail** Refresh the pkg database within the specified jail

**chroot** Refresh the pkg database within the specified chroot (ignored if jail is specified)

**root** Refresh the pkg database within the specified root (ignored if jail is specified)

**force** Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.remove`(*name*=None, *pkgs*=None, *jail*=None, *chroot*=None, *root*=None, *all\_installed*=False, *force*=False, *glob*=False, *dryrun*=False, *recurse*=False, *regex*=False, *pre*=False, *\*\*kwargs*)

Remove a package from the database and system

---

**Note:** This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

**name** The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail** Delete the package from the specified jail

**chroot** Delete the package from the specified chroot (ignored if `jail` is specified)

**root** Delete the package from the specified root (ignored if `jail` is specified)

**all\_installed** Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

**force** Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun** Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse** Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex** Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

**salt.modules.pkgng.restore** (*file\_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by `pkg backup -d` and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail** Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the `pkg` database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot** Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the `pkg` database will be restored is relative to the root of the chroot.

**root** Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the `pkg` database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.search`(*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcr=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail** Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot** Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

**root** Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact** Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

**glob** Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

**regex** Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

**pcr** Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcr=True
```

**comment** Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

**desc** Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

**full** Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

**depends** Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

**size** Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

**quiet** Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

**origin** Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

**prefix** Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

**salt.modules.pkgng.stats** (*local=False, remote=False, jail=None, chroot=None, root=None*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

**local** Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

**remote** Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

**jail** Retrieve stats from the specified jail.

CLI Example:

```

salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True

```

**chroot** Retrieve stats from the specified chroot (ignored if `jail` is specified).

**root** Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```

salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True

```

`salt.modules.pkgng.unhold` (*name=None, pkgs=None, \*\*kwargs*)

Remove version locks

---

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.unlock` instead.

---

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['foo', 'bar']

```

`salt.modules.pkgng.unlock` (*name, \*\*kwargs*)

Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:

```

salt '*' pkg.unlock <package name>

```

**jail** Unlock packages within the specified jail

CLI Example:

```

salt '*' pkg.unlock <package name> jail=<jail name or id>

```

**chroot** Unlock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```

salt '*' pkg.unlock <package name> chroot=/path/to/chroot

```

**root** Unlock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```

salt '*' pkg.unlock <package name> root=/path/to/chroot

```

`salt.modules.pkgng.update_package_site` (*new\_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.updating`(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)  
' Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

**jail** Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

**chroot** Perform the action in the specified chroot (ignored if `jail` is specified)

**root** Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

**filedate** Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

**filename** Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.upgrade`(*\*names*, *\*\*kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

**jail** Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

**chroot** Audit packages within the specified chroot (ignored if `jail` is specified)

**root** Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

**force** Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

**local** Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

**dryrun** Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the `local` option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

`salt.modules.pkgng.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

---

**Note:** This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

**jail** Get package version information for the specified jail

**chroot** Get package version information for the specified chroot (ignored if `jail` is specified)

**root** Get package version information for the specified root (ignored if `jail` is specified)

**with\_origin** [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)`

Do a `cmp`-style comparison on two packages. Return `-1` if `pkg1 < pkg2`, `0` if `pkg1 == pkg2`, and `1` if `pkg1 > pkg2`. Return `None` if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)`

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail** Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot** Perform the check in the specified chroot (ignored if jail is specified)

**root** Perform the check in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

**origin** Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

**quiet** Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

## 21.9.325 salt.modules.pkgutil

Pkgutil support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

**salt.modules.pkgutil.install**(*name=None, refresh=False, version=None, pkgs=None, \*\*kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMCgcc346
```

Multiple Package Installation Options:

**pkgs** A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

**salt.modules.pkgutil.latest\_version**(\*names, \*\*kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades` (*refresh=True, \*\*kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge` (*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.pkgutil.refresh_db`()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.remove` (*name=None, pkgs=None, \*\*kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pkgutil.upgrade(refresh=True)`  
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

`salt.modules.pkgutil.upgrade_available(name)`  
Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

`salt.modules.pkgutil.version(*names, **kwargs)`  
Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

### 21.9.326 salt.modules.portage\_config

Configure portage(5)

`salt.modules.portage_config.append_to_package_conf(conf, atom=", flags=None, string=",  
 overwrite=False)`

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
↳ libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1
↳" flags="['ldap', '-libvirt']"
```

`salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)`  
Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap', '-
↳ libvirt']"
```

`salt.modules.portage_config.enforce_nice_config()`  
Enforce a nice tree structure for /etc/portage/package.\* configuration files.

See also:

**`salt.modules.ebuild.ex_mod_init()`** for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags`(*use, use\_expand\_hidden, usemasked, useforced*)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use\_expand\_hidden: list @param use\_expand\_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use`(*cp*)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use\_expand\_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags`(*cp*)

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist in /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf`(*conf, atom*)

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use`(*cp, use='USE'*)

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse`(*cp*)

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags`(*conf, atom, flags*)

Find out which of the given flags are currently not set. CLI Example:

```
salt '*' portage_config.get_missing_flags use salt ["ldap', '-libvirt', 'openssl
↪']"
```

`salt.modules.portage_config.has_flag`(*conf, atom, flag*)

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

`salt.modules.portage_config.has_use(atom, use)`

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

`salt.modules.portage_config.is_changed_uses(cp)`

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

`salt.modules.portage_config.is_present(conf, atom)`

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

### 21.9.327 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

`salt.modules.postfix.delete(queue_id)`

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

`salt.modules.postfix.hold(queue_id)`

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```

`salt.modules.postfix.requeue(queue_id)`

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

`salt.modules.postfix.set_main`(*key, value, path='/etc/postfix/main.cf'*)

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

`salt.modules.postfix.set_master`(*service, conn\_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command="", write\_conf=True, path='/etc/postfix/master.cf'*)

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn\_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main`(*path='/etc/postfix/main.cf'*)

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master`(*path='/etc/postfix/master.cf'*)

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue`()

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold`(*queue\_id*)

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA
salt '*' postfix.unhold ALL
```

### 21.9.328 salt.modules.postgres

Module to provide Postgres compatibility to salt.

**configuration** In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `'postgres'` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar

**note** This module uses MD5 hashing which may not be compliant with certain security audits.

**note** When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

`salt.modules.postgres.available_extensions` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

`salt.modules.postgres.create_extension` (*name, if\_not\_exists=None, schema=None, ext\_version=None, from\_version=None, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

`salt.modules.postgres.create_metadata` (*name, ext\_version=None, schema=None, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

`salt.modules.postgres.datadir_exists`(*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

**name** Name of the directory to check

`salt.modules.postgres.datadir_init`(*name*, *auth*='password', *user*=None, *password*=None, *encoding*='UTF8', *locale*=None, *waldir*=None, *checksums*=False, *runas*=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

**name** The name of the directory to initialize

**auth** The default authentication method for local connections

**password** The password to set for the postgres user

**user** The database superuser name

**encoding** The default encoding for new databases

**locale** The default locale for new databases

**waldir** The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

**checksums** If True, the cluster will be created with data page checksums.

---

**Note:** Data page checksums are supported since PostgreSQL 9.3.

---

New in version 2019.2.0.

**runas** The system user the operation should be performed on behalf of

`salt.modules.postgres.db_alter`(*name*, *user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *tablespace*=None, *owner*=None, *owner\_recurse*=False, *runas*=None)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

`salt.modules.postgres.db_create`(*name*, *user*=None, *host*=None, *port*=None, *maintenance\_db*=None, *password*=None, *tablespace*=None, *encoding*=None, *lc\_collate*=None, *lc\_ctype*=None, *owner*=None, *template*=None, *runas*=None)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
```

```
salt '*' postgres.db_create 'dbname' template=template_postgis
```

`salt.modules.postgres.db_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

`salt.modules.postgres.db_list`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

`salt.modules.postgres.db_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

`salt.modules.postgres.drop_extension`(*name*, *if\_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.get_available_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.get_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.group_create`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
 host='hostname' port='port' password='password' \
 rolepassword='rolepassword'
```

`salt.modules.postgres.group_remove`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

`salt.modules.postgres.group_update`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
 host='hostname' port='port' password='password' \
 rolepassword='rolepassword'
```

`salt.modules.postgres.has_privileges`(*name*, *object\_name*, *object\_type*, *privileges=None*, *grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
 SELECT,INSERT maintenance_db=db_name
```

**name** Name of the role whose privileges should be checked on *object\_type*

**object\_name** Name of the object on which the check is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE

- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option** If grant\_option is set to True, the grant option check is performed

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```
salt.modules.postgres.installed_extensions(user=None, host=None, port=None,
 maintenance_db=None, password=None,
 runas=None)
```

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

```
salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None,
 maintenance_db=None, password=None,
 runas=None)
```

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

```
salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None,
 maintenance_db=None, password=None,
 runas=None)
```

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

```
salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None,
 port=None, password=None, runas=None)
```

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

**name** Language to install

**maintenance\_db** The database to install the language in

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_exists`(*name*, *maintenance\_db*, *user=None*, *host=None*,  
*port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

**name** Language to check for

**maintenance\_db** The database to check in

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_list`(*maintenance\_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

**maintenance\_db** The database to check

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.language_remove`(*name*, *maintenance\_db*, *user=None*, *host=None*,  
*port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

**name** Language to remove

**maintenance\_db** The database to install the language in

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.owner_to`(*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

`salt.modules.postgres.privileges_grant`(*name*, *object\_name*, *object\_type*, *privileges=None*, *grant\_option=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role to which privileges should be granted

**object\_name** Name of the object on which the grant is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option** If `grant_option` is set to `True`, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.privileges_list`(*name*, *object\_type*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

**name** Name of the object for which the permissions should be returned

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None,
 prepend='public', maintenance_db=None,
 user=None, host=None, port=None, password=None,
 runas=None)
```

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role whose privileges should be revoked

**object\_name** Name of the object on which the revoke is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY

- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**maintenance\_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

`salt.modules.postgres.psycopg_query`(*query*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

**query** The query string.

**user** Database username, if different from config or default.

**host** Database host, if different from config or default.

**port** Database port, if different from the config or default.

**maintenance\_db** The database to run the query against.

**password** User password, if different from the config or default.

**runas** User to run the command as.

**write** Mark query as READ WRITE transaction.

CLI Example:

```
salt '*' postgres.psycopg_query 'select * from pg_stat_activity'
```

`salt.modules.postgres.role_get`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *return\_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

`salt.modules.postgres.schema_create`(*dbname*, *name*, *owner=None*, *user=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
 user='user' \
 db_user='user' db_password='password' \
 db_host='hostname' db_port='port'
```

`salt.modules.postgres.schema_exists`(*dbname*, *name*, *user=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

**dbname** Database name we query on  
**name** Schema name we look for  
**user** The system user the operation should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_get`(*dbname, name, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

**dbname** Database name we query on  
**name** Schema name we look for  
**user** The system user the operation should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_list`(*dbname, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

**dbname** Database name we query on  
**user** The system user the operation should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.schema_remove`(*dbname, name, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

**dbname** Database name we work on  
**schemaname** The schema's name we'll remove  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

`salt.modules.postgres.tablespace_alter`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *new\_name=None*, *new\_owner=None*, *set\_option=None*, *reset\_option=None*, *runas=None*)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{ 'seq_page_cost': '1.1' }"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_create`(*name*, *location*, *options=None*, *owner=None*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_list`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

`salt.modules.postgres.user_create`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *credentials=None*, *inherit=None*, *login=None*, *conndefault=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *valid\_until=None*, *groups=None*, *runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
 host='hostname' port='port' password='password' \
 rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.user_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

`salt.modules.postgres.user_list`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*, *return\_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

`salt.modules.postgres.user_remove`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

`salt.modules.postgres.user_update`(*username*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *connlimit=None*, *replication=None*, *rolepassword=None*, *valid\_until=None*, *groups=None*, *runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
 host='hostname' port='port' password='password' \
 rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.version`(*user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

### 21.9.329 salt.modules.poudriere

Support for poudriere

`salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)`

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

`salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')`

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

`salt.modules.poudriere.create_ports_tree()`

Not working need to run portfetch non interactive

`salt.modules.poudriere.delete_jail(name)`

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

`salt.modules.poudriere.is_jail(name)`

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

`salt.modules.poudriere.list_jails()`

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

`salt.modules.poudriere.list_ports()`

Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

`salt.modules.poudriere.make_pkgng_aware(jname)`

Make jail *jname* pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

`salt.modules.poudriere.parse_config(config_file=None)`

Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

`salt.modules.poudriere.update_jail`(*name*)

Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

`salt.modules.poudriere.update_ports_tree`(*ports\_tree*)

Updates the ports tree, either the default or the *ports\_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

`salt.modules.poudriere.version`()

Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

### 21.9.330 salt.modules.powerpath

powerpath support.

Assumes RedHat

`salt.modules.powerpath.add_license`(*key*)

Add a license

`salt.modules.powerpath.has_powerpath`()

`salt.modules.powerpath.list_licenses`()

returns a list of applied powerpath license keys

`salt.modules.powerpath.remove_license`(*key*)

Remove a license

### 21.9.331 salt.modules.proxy module

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

`salt.modules.proxy.get_ftp_proxy`(*network\_service='Ethernet'*)

Returns the current ftp proxy settings

**network\_service** The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

`salt.modules.proxy.get_http_proxy`(*network\_service='Ethernet'*)

Returns the current http proxy settings

**network\_service** The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

`salt.modules.proxy.get_https_proxy(network_service='Ethernet')`

Returns the current https proxy settings

**network\_service** The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

`salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')`

Returns the current domains that can bypass the proxy

**network\_service** The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

`salt.modules.proxy.get_proxy_win()`

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

`salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the ftp proxy settings

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
↳network_service=Ethernet
```

`salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server** The proxy server to use

**port** The port used by the proxy server

**user** The username to use for the proxy server if required

**password** The password to use if required by the server

**network\_service** The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts** The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_proxy_bypass` (*domains*, *network\_service*=*'Ethernet'*)

Sets the domains that can bypass the proxy

**domains** An array of domains allowed to bypass the proxy

**network\_service** The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

`salt.modules.proxy.set_proxy_win` (*server*, *port*, *types*=*None*, *bypass\_hosts*=*None*)

Sets the http proxy settings, only works with Windows.

**server** The proxy server to use

**password** The password to use if required by the server

**types** The types of proxy connections should be setup with this server. Valid types are:

- http
- https
- ftp

**bypass\_hosts** The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

### 21.9.332 salt.modules.ps

A salt interface to psutil, a system and process library. See <http://code.google.com/p/psutil>.

**depends**

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

`salt.modules.ps.boot_time` (*time\_format*=*None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

**time\_format** Optionally specify a `strftime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. Fri May 2 19:08:32 2014).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

`salt.modules.ps.cpu_percent(interval=0.1, per_cpu=False)`

Return the percent of time the CPU is busy.

**interval** the number of seconds to sample CPU usage over

**per\_cpu** if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.cpu_times(per_cpu=False)`

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

**per\_cpu** if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

`salt.modules.ps.disk_io_counters(device=None)`

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
```

```
salt '*' ps.disk_io_counters device=sda1
```

`salt.modules.ps.disk_partition_usage(all=False)`

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

`salt.modules.ps.disk_partitions(all=False)`

Return a list of disk partitions and their device, mount point, and filesystem type.

**all** if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

`salt.modules.ps.disk_usage(path)`

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

`salt.modules.ps.get_pid_list()`

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

`salt.modules.ps.get_users()`

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

`salt.modules.ps.kill_pid(pid, signal=15)`

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

**pid** PID of process to kill.

**signal** Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**Example:**

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

`salt.modules.ps.lsof(name)`

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

`salt.modules.ps.netstat(name)`

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

`salt.modules.ps.network_io_counters(interface=None)`

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
```

```
salt '*' ps.network_io_counters interface=eth0
```

`salt.modules.ps.num_cpus()`

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

`salt.modules.ps.pgrep(pattern, user=None, full=False)`

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

**pattern** Pattern to search for in the process list.

**user** Limit matches to the given username. Default: All users.

**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**

Find all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```
salt '*' ps.pgrep bash user=tom
```

`salt.modules.ps.pkill` (*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
 [full=(true|false)]
```

**pattern** Pattern to search for in the process list.

**user** Limit matches to the given username. Default: All users.

**signal** Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**

Send SIGHUP to all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.proc_info` (*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs=['pid', 'name']
```

**pid** PID of process to query.

**attrs** Optional list of desired process attributes. The list of possible attributes can be found here: <http://pythonhosted.org/psutil/#psutil.Process>

`salt.modules.ps.psaux` (*name*)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.ss` (*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.swap_memory()`

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.top(num_processes=5, interval=3)`

Return a list of top CPU consuming processes during the interval. `num_processes` = return the top N CPU consuming processes `interval` = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top
salt '*' ps.top 5 10
```

`salt.modules.ps.total_physical_memory()`

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.virtual_memory()`

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.virtual_memory
```

### 21.9.333 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner="", timeout=5)`

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

---

#### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.publish.publish`(*tgt*, *fun*, *arg=None*, *tgt\_type='glob'*, *returner=""*, *timeout=5*,  
*via\_master=None*)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain\_pcre
- pillar
- pillar\_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces ' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

---

### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam', 'spam=cheese']"
```

---

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner`(*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

### 21.9.334 salt.modules.puppet

Execute puppet routines

**salt.modules.puppet.disable**(*message=None*)

New in version 2014.7.0.

Disable the puppet agent

**message** New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

**salt.modules.puppet.enable**()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

**salt.modules.puppet.fact**(*name, puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

**salt.modules.puppet.facts**(*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

**salt.modules.puppet.noop**(\*args, \*\*kwargs)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
↳ tags=basefiles::edit,apache::server
```

**salt.modules.puppet.plugin\_sync**()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run(*args, **kwargs)`

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. – [http://docs.puppetlabs.com/puppet/latest/reference/lang\\_tags.html](http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html)

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
↳ ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
↳ tags=basefiles::edit,apache::server
```

`salt.modules.puppet.status()`

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.summary()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

### 21.9.335 salt.modules.purefa

Management of Pure Storage FlashArray

#### Installation Prerequisites

- You will need the `purestorage` python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

1) From the minion config

```
pure_tags:
 fa:
 san_ip: management vip or hostname for the FlashArray
 api_token: A valid api token for the FlashArray being managed
```

2) From environment (`PUREFA_IP` and `PUREFA_API`)

3) From the pillar (PUREFA\_IP and PUREFA\_API)

**maintainer** Simon Dodsley ([simon@purestorage.com](mailto:simon@purestorage.com))

**maturity** new

**requires** purestorage

**platform** all

New in version 2018.3.0.

**salt.modules.purefa.hg\_create** (*name*, *host=None*, *volume=None*)

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

**name** [string] name of hostgroup (truncated to 63 characters)

**host** [string] name of host to add to hostgroup

**volume** [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

**salt.modules.purefa.hg\_delete** (*name*)

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False is hostgroup is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of hostgroup

CLI Example:

```
salt '*' purefa.hg_delete foo
```

**salt.modules.purefa.hg\_remove** (*name*, *volume=None*, *host=None*)

Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.

**name** [string] name of hostgroup

**volume** [string] name of volume to remove from hostgroup

**host** [string] name of host to remove from hostgroup

CLI Example:

```
salt '*' purefa.hg_remove foo volume=test host=bar
```

**salt.modules.purefa.hg\_update** (*name*, *host=None*, *volume=None*)

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.

**name** [string] name of hostgroup

**host** [string] name of host to add to hostgroup

**volume** [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

`salt.modules.purefa.host_create` (*name*, *iqn=None*, *wwn=None*)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

**name** [string] name of host (truncated to 63 characters)

**iqn** [string] iSCSI IQN of host

**wwn** [string] Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

`salt.modules.purefa.host_delete` (*name*)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.

**name** [string] name of host

CLI Example:

```
salt '*' purefa.host_delete foo
```

`salt.modules.purefa.host_update` (*name*, *iqn=None*, *wwn=None*)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

**name** [string] name of host

**iqn** [string] Additional iSCSI IQN of host

**wwn** [string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

`salt.modules.purefa.pg_create` (*name*, *hostgroup=None*, *host=None*, *volume=None*, *enabled=True*)

Create a protection group on a Pure Storage FlashArray.

**Will return False is the following cases:**

- Protection Grop already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]
↪enabled=[true | false]
```

`salt.modules.purefa.pg_delete` (*name*, *eradicate=False*)

Delete a protecton group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_delete foo
```

**salt.modules.purefa.pg\_eradicate**(*name*)

Eradicate a deleted protecton group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_eradicate foo
```

**salt.modules.purefa.pg\_remove**(*name, hostgroup=None, host=None, volume=None*)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

**name** [string] name of hostgroup

**hostgroup** [string] name of hostgroup to remove from protection group

**host** [string] name of host to remove from hostgroup

**volume** [string] name of volume to remove from hostgroup

CLI Example:

```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

**salt.modules.purefa.pg\_update**(*name, hostgroup=None, host=None, volume=None*)

Update a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

**salt.modules.purefa.snap\_create**(*name, suffix=None*)

Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

**name** [string] name of volume to snapshot

**suffix** [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

`salt.modules.purefa.snap_delete`(*name*, *suffix=None*, *eradicate=False*)

Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

**name** [string] name of volume

**suffix** [string] name of snapshot

**eradicate** [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

`salt.modules.purefa.snap_eradicate`(*name*, *suffix=None*)

Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.

**name** [string] name of volume

**suffix** [string] name of snapshot

CLI Example:

```
salt '*' purefa.snap_eradicate foo suffix=snap
```

`salt.modules.purefa.snap_volume_create`(*name*, *target*, *overwrite=False*)

Create R/W volume from snapshot on a Pure Storage FlashArray.

Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.

**name** [string] name of volume snapshot

**target** [string] name of clone volume

**overwrite** [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

`salt.modules.purefa.volume_attach`(*name*, *host*)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

**name** [string] name of volume

**host** [string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

`salt.modules.purefa.volume_clone`(*name*, *target*, *overwrite=False*)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

**name** [string] name of volume  
**target** [string] name of clone volume  
**overwrite** [boolean] overwrite clone if already exists (default: False)  
 CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

**salt.modules.purefa.volume\_create**(*name, size=None*)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

**name** [string] name of volume (truncated to 63 characters)  
**size** [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

**salt.modules.purefa.volume\_delete**(*name, eradicate=False*)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of volume  
**eradicate** [boolean] Eradicate volume after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.volume_delete foo eradicate=True
```

**salt.modules.purefa.volume\_detach**(*name, host*)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

**name** [string] name of volume  
**host** [string] name of host

CLI Example:

```
salt '*' purefa.volume_detach foo bar
```

**salt.modules.purefa.volume\_eradicate**(*name*)

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False is volume is not in a deleted state.

New in version 2018.3.0.

**name** [string] name of volume

CLI Example:

```
salt '*' purefa.volume_eradicate foo
```

**salt.modules.purefa.volume\_extend**(*name, size*)

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

**name** [string] name of volume

**size** [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_extend foo 10T
```

### 21.9.336 salt.modules.purefb

Management of Pure Storage FlashBlade

#### Installation Prerequisites

- You will need the `purity_fb` python package in your python installation path that is running salt.

```
pip install purity_fb
```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

- From the minion config

```
pure_tags:
fb:
 san_ip: management vip or hostname for the FlashBlade
 api_token: A valid api token for the FlashBlade being managed
```

- From environment (PUREFB\_IP and PUREFB\_API)

- From the pillar (PUREFB\_IP and PUREFB\_API)

**maintainer** Simon Dodsley ([simon@purestorage.com](mailto:simon@purestorage.com))

**maturity** new

**requires** purity\_fb

**platform** all

New in version 2019.2.0.

`salt.modules.purefb.fs_create` (*name*, *size=None*, *proto='NFS'*, *nfs\_rules='\*(rw, no\_root\_squash)'*, *snapshot=False*)

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

**name** [string] name of filesystem (truncated to 63 characters)

**proto** [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS

**snapshot: boolean** (Optional) Are snapshots enabled on the filesystem. Default is False

**nfs\_rules** [string] (Optional) export rules for NFS. If not specified default is `*(rw, no_root_squash)`. Refer to Pure Storage documentation for formatting rules.

**size** [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

`salt.modules.purefb.fs_delete` (*name*, *eradicate=False*)

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

**name** [string] name of filesystem

**eradicate** [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```

`salt.modules.purefb.fs_eradicate` (*name*)

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False is filesystem is not in a deleted state.

New in version 2019.2.0.

**name** [string] name of filesystem

CLI Example:

```
salt '*' purefb.fs_eradicate foo
```

`salt.modules.purefb.fs_extend` (*name*, *size*)

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

**name** [string] name of filesystem

**size** [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_extend foo 10T
```

`salt.modules.purefb.fs_update` (*name*, *rules*, *snapshot=False*)

Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

**name** [string] name of filesystem

**rules** [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.

**snapshot: boolean** (Optional) Enable/Disable snapshots on the filesystem. Default is False

CLI Example:

```
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)'
↪snapshot=True
```

`salt.modules.purefb.snap_create` (*name*, *suffix=None*)

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

**name** [string] name of filesystem to snapshot

**suffix** [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

`salt.modules.purefb.snap_delete` (*name*, *suffix=None*, *eradicate=False*)  
Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

**name** [string] name of filesystem

**suffix** [string] name of snapshot

**eradicate** [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

`salt.modules.purefb.snap_eradicate` (*name*, *suffix=None*)  
Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

**name** [string] name of filesystem

**suffix** [string] name of snapshot

CLI Example:

```
salt '*' purefb.snap_eradicate foo suffix=snap
```

### 21.9.337 salt.modules.pushbullet module

Module for sending messages to Pushbullet (<https://www.pushbullet.com>)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
pushbullet:
 api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```
pushbullet:
 device: "Chrome"
 title: "Example push message"
 body: "Message body."
```

`salt.modules.pushbullet.push_note` (*device=None*, *title=None*, *body=None*)

Pushing a text note.

**Parameters**

- **device** – Pushbullet target device
- **title** – Note title
- **body** – Note body

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example
↪body."
```

### 21.9.338 salt.modules.pushover\_notify

Module for sending messages to Pushover (<https://www.pushover.net>)

New in version 2016.3.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
 token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

`salt.modules.pushover_notify.post_message` (*user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api\_version=1, token=None*)

Send a message to a Pushover user or group.

#### Parameters

- **user** – The user or group to send to, must be key of user or group not email address.
- **message** – The message to send to the PushOver user or group.
- **title** – Specify who the message is from.
- **priority** – The priority of the message, defaults to 0.
- **expire** – The message should expire after N number of seconds.
- **retry** – The number of times the message should be retried.
- **sound** – The sound to associate with the message.
- **api\_version** – The PushOver API version, if not specified in the configuration.
- **token** – The PushOver token, if not specified in the configuration.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳ 'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳ 'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

### 21.9.339 salt.modules.pw\_group

Manage groups on FreeBSD

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.pw_group.add` (*name, gid=None, \*\*kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.adduser` (*name, username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.pw_group.chgid`(*name*, *gid*)  
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.delete`(*name*)  
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.deluser`(*name*, *username*)  
Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.pw_group.getent`(*refresh=False*)  
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.info`(*name*)  
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.members`(*name*, *members\_list*)  
Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

### 21.9.340 salt.modules.pw\_user

Manage users with the pw command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see [here](#).

---

`salt.modules.pw_user.add`(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=""*, *roomnumber=""*, *workphone=""*, *homephone=""*, *createhome=True*, *loginclass=None*, *\*\*kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.pw_user.chfullname`(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.pw_user.chgid`(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.pw_user.chgroups`(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

**name** Username to modify

**groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.pw_user.chhome`(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

**name** Username to modify

**home** New home directory to set

**persist** [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.chhomephone`(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.chloginclass`(*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.chroomnumber` (*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.chshell` (*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.chuid` (*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete` (*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.get_loginclass` (*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.list_users()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.rename(name, new_name)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 21.9.341 salt.modules.pyenv

Manage python installations with pyenv.

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

New in version v2014.04.

`salt.modules.pyenv.default`(*python=None, runas=None*)

Returns or sets the currently defined default python.

**python=None** The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

`salt.modules.pyenv.do`(*cmdline=None, runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

`salt.modules.pyenv.do_with_python`(*python, cmdline, runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

`salt.modules.pyenv.install`(*runas=None, path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

`salt.modules.pyenv.install_python`(*python*, *runas=None*)

Install a python implementation.

**python** The version of python to install, should match one of the versions listed by `pyenv.list`

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

`salt.modules.pyenv.is_installed`(*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

`salt.modules.pyenv.list_`(*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.rehash`(*runas=None*)

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.uninstall_python`(*python*, *runas=None*)

Uninstall a python implementation.

**python** The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update`(*runas=None*, *path=None*)

Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions`(*runas=None*)

List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

## 21.9.342 salt.modules.qemu\_img

### Qemu-img Command Wrapper

The `qemu img` command is wrapped for specific functions

**depends** `qemu-img`

`salt.modules.qemu_img.convert`(*orig, dest, fmt*)

Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image`(*location, size, fmt*)

Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

### 21.9.343 salt.modules.qemu\_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear`(*mnt*)

Pass in the mnt dict returned from nbd\_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"mnt/foo": "/dev/nbd0p1"}'
```

`salt.modules.qemu_nbd.connect`(*image*)

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

`salt.modules.qemu_nbd.init`(*image, root=None*)

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

`salt.modules.qemu_nbd.mount`(*nbd, root=None*)

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

### 21.9.344 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.get_mode(device)`

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.off(device)`

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.on(device)`

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.report(mount)`

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.set_(device, **kwargs)`

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.stats()`

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.warn()`

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

### 21.9.345 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user(name, password=None, runas=None)`

Add a rabbitMQ user via rabbitmqctl user\_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost` (*vhost*, *runas=None*)

Adds a vhost via rabbitmqctl add\_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password` (*name*, *password*, *runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password` (*name*, *password*, *runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password` (*name*, *runas=None*)

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status` (*runas=None*)

return rabbitmq cluster\_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy` (*vhost*, *name*, *runas=None*)

Delete a policy based on rabbitmqctl clear\_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

`salt.modules.rabbitmq.delete_upstream` (*name*, *runas=None*)

Deletes an upstream via rabbitmqctl clear\_parameter.

Parameters

- **name** (*str*) – The name of the upstream to delete.
- **runas** (*str*) – The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.delete_upstream upstream_name
```

New in version 3000.

`salt.modules.rabbitmq.delete_user`(*name*, *runas=None*)

Deletes a user via rabbitmqctl delete\_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost`(*vhost*, *runas=None*)

Deletes a vhost rabbitmqctl delete\_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin`(*name*, *runas=None*)

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin`(*name*, *runas=None*)

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset`(*runas=None*)

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster`(*host*, *user='rabbit'*, *ram\_node=None*, *runas=None*)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.list_available_plugins`(*runas=None*)

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins`(*runas=None*)

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.list_permissions`(*vhost*, *runas=None*)

Lists permissions for vhost via rabbitmqctl list\_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

`salt.modules.rabbitmq.list_policies`(*vhost='/'*, *runas=None*)

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list\_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.list_policies
```

`salt.modules.rabbitmq.list_queues`(*runas=None*, *\*args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_queues_vhost`(*vhost*, *runas=None*, *\*args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_upstreams`(*runas=None*)

Returns a dict of upstreams based on rabbitmqctl list\_parameters.

**Parameters** `runas` (*str*) – The name of the user to run this command as.

CLI Example:

```
salt '*' rabbitmq.list_upstreams
```

New in version 3000.

`salt.modules.rabbitmq.list_user_permissions`(*name*, *runas=None*)

List permissions for a user via rabbitmqctl list\_user\_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

`salt.modules.rabbitmq.list_users`(*runas=None*)

Return a list of users based off of rabbitmqctl user\_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.list_vhosts`(*runas=None*)

Return a list of vhost based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled`(*name*, *runas=None*)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.policy_exists` (*vhost*, *name*, *runas=None*)  
Return whether the policy exists based on rabbitmqctl list\_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset` (*runas=None*)  
Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions` (*vhost*, *user*, *conf='.\*'*, *write='.\*'*, *read='.\*'*, *runas=None*)  
Sets permissions for vhost via rabbitmqctl set\_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

`salt.modules.rabbitmq.set_policy` (*vhost*, *name*, *pattern*, *definition*, *priority=None*, *runas=None*,  
*apply\_to=None*)

Set a policy based on rabbitmqctl set\_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_upstream` (*name*, *uri*, *prefetch\_count=None*, *reconnect\_delay=None*,  
*ack\_mode=None*, *trust\_user\_id=None*, *exchange=None*,  
*max\_hops=None*, *expires=None*, *message\_ttl=None*,  
*ha\_policy=None*, *queue=None*, *runas=None*)

Configures an upstream via rabbitmqctl set\_parameter. This can be an exchange-upstream, a queue-upstream or both.

**Parameters** *name* (*str*) – The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

**Parameters**

- **uri** (*str*) – The AMQP URI(s) for the upstream.
- **prefetch\_count** (*int*) – The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect\_delay** (*int*) – The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack\_mode** (*str*) – Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements

are not used. This is the fastest option, but may lose messages in the event of network or broker failures.

- **trust\_user\_id** (*bool*) – Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

#### Parameters

- **exchange** (*str*) – The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max\_hops** (*int*) – The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.
- **expires** (*int*) – The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message\_ttl** (*int*) – The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is None, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha\_policy** (*str*) – Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is None, meaning the queue is not HA.

The following parameter applies to federated queues only:

#### Parameters

- **queue** (*str*) – The name of the upstream queue. Default is to use the same name as the federated queue.
- **runas** (*str*) – The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_hops=1
↳ trust_user_id=True uri=amqp://hostname
```

New in version 3000.

`salt.modules.rabbitmq.set_user_tags` (*name, tags, runas=None*)

Add user tags via rabbitmqctl set\_user\_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

`salt.modules.rabbitmq.start_app` (*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.status`(*runas=None*)  
return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.stop_app`(*runas=None*)  
Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.upstream_exists`(*name, runas=None*)  
Return whether the upstreamexists based on rabbitmqctl list\_parameters.

**Parameters**

- **name** (*str*) – The name of the upstream to check for.
- **runas** (*str*) – The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

`salt.modules.rabbitmq.user_exists`(*name, runas=None*)  
Return whether the user exists based on rabbitmqctl list\_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.vhost_exists`(*name, runas=None*)  
Return whether the vhost exists based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

### 21.9.346 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

```
rallydev:
username: myuser@example.com
password: 123pass
```

`salt.modules.rallydev.list_items`(*name*)  
List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

`salt.modules.rallydev.list_users()`

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

`salt.modules.rallydev.query_item(name, query_string, order='Rank')`

Query a type of record for one or more items. Requires a valid query string. See <https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp> for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

`salt.modules.rallydev.query_user(query_string, order='UserName')`

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

`salt.modules.rallydev.show_artifact(id_)`

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

`salt.modules.rallydev.show_item(name, id_)`

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

`salt.modules.rallydev.show_user(id_)`

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

`salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)`

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

`salt.modules.rallydev.update_user(id_, field, value)`

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

## 21.9.347 salt.modules.random\_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
 api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
 api_version: 1
```

`salt.modules.random_org.generateBlobs` (*api\_key=None, api\_version=None, \*\*kwargs*)

List all Slack users.

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.
- **format** – Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

**Returns** The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

`salt.modules.random_org.generateDecimalFractions` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generates true random decimal fractions

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.
- **number** – How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** – The number of decimal places to use. Must be within the [1,20] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
↪ replacement=True
```

`salt.modules.random_org.generateGaussians` (*api\_key=None, api\_version=None, \*\*kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

**Parameters**

- **api\_key** – The Random.org api key.

- **api\_version** – The Random.org api version.
- **number** – How many random numbers you need. Must be within the [1,1e4] range.
- **mean** – The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** – The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** – The number of significant digits to use. Must be within the [2,20] range.

**Returns** The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0
↳significantDigits=8
```

`salt.modules.random_org.generateIntegers` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random integers

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.
- **number** – The number of integers to generate
- **minimum** – The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** – The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** – Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

**Returns** A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

`salt.modules.random_org.generateStrings` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random strings.

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.
- **number** – The number of strings to generate.
- **length** – The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** – A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** – Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of strings.

CLI Example:

```

salt '*' random_org.generateStrings number=5 length=8 characters=
↳'abcdefghijklmnopqrstuvwxy'

salt '*' random_org.generateStrings number=10 length=16 characters
↳'abcdefghijklmnopqrstuvwxy'

```

`salt.modules.random_org.generateUUIDs` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate a list of random UUIDs

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.
- **number** – How many random UUIDs you need. Must be within the [1,1e3] range.

**Returns** A list of UUIDs

CLI Example:

```

salt '*' random_org.generateUUIDs number=5

```

`salt.modules.random_org.getUsage` (*api\_key=None, api\_version=None*)

Show current usages statistics

**Parameters**

- **api\_key** – The Random.org api key.
- **api\_version** – The Random.org api version.

**Returns** The current usage statistics.

CLI Example:

```

salt '*' random_org.getUsage

salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳version=1

```

### 21.9.348 salt.modules.rbac\_solaris

Module for Solaris' Role-Based Access Control

`salt.modules.rbac_solaris.auth_add` (*user, auth*)

Add authorization to user

**user** [string] username

**auth** [string] authorization name

CLI Example:

```

salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq

```

`salt.modules.rbac_solaris.auth_get` (*user, computed=True*)

List authorization for user

**user** [string] username

**computed** [boolean] merge results from *auths* command into data from *user\_attr*

CLI Example:

```

salt '*' rbac.auth_get leo

```

`salt.modules.rbac_solaris.auth_list` ()

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

`salt.modules.rbac_solaris.auth_rm(user, auth)`

Remove authorization from user

**user** [string] username

**auth** [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.profile_add(user, profile)`

Add profile to user

**user** [string] username

**profile** [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.profile_get(user, default_hidden=True)`

List profiles for user

**user** [string] username

**default\_hidden** [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

`salt.modules.rbac_solaris.profile_list(default_only=False)`

List all available profiles

**default\_only** [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

`salt.modules.rbac_solaris.profile_rm(user, profile)`

Remove profile from user

**user** [string] username

**profile** [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

`salt.modules.rbac_solaris.role_add(user, role)`

Add role to user

**user** [string] username

**role** [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

`salt.modules.rbac_solaris.role_get(user)`

List roles for user

**user** [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

**salt.modules.rbac\_solaris.role\_list()**

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

**salt.modules.rbac\_solaris.role\_rm(*user, role*)**

Remove role from user

**user** [string] username

**role** [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

### 21.9.349 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

<http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/>

New in version 0.16.0.

**salt.modules.rbenv.default(*ruby=None, runas=None*)**

Returns or sets the currently defined default ruby

**ruby** The version to set as the default. Should match one of the versions listed by *rbenv.versions*. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

**salt.modules.rbenv.do(*cmdline, runas=None, env=None*)**

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

**salt.modules.rbenv.do\_with\_ruby(*ruby, cmdline, runas=None*)**

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

**salt.modules.rbenv.install(*runas=None, path=None*)**

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.install_ruby` (*ruby*, *runas=None*)

Install a ruby implementation.

**ruby** The version of Ruby to install, should match one of the versions listed by `rbenv.list`

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

`salt.modules.rbenv.is_installed` (*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

`salt.modules.rbenv.list` (*runas=None*)

List the installable versions of ruby

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

`salt.modules.rbenv.rehash` (*runas=None*)

Run `rbenv rehash` to update the installed shims

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

`salt.modules.rbenv.uninstall_ruby` (*ruby*, *runas=None*)

Uninstall a ruby implementation.

**ruby** The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

`salt.modules.rbenv.update` (*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

**runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

`salt.modules.rbenv.versions` (*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

### 21.9.350 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.disable`()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.disconnect_session` (*session\_id*)

Disconnect a session.

New in version 2016.11.0.

**Parameters** `session_id` – The numeric Id of the session.

**Returns** A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.enable`()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.get_session` (*session\_id*)

Get information about a session.

New in version 2016.11.0.

**Parameters** `session_id` – The numeric Id of the session.

**Returns** A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

`salt.modules.rdp.list_sessions` (*logged\_in\_users\_only=False*)

List information about the sessions.

New in version 2016.11.0.

**Parameters** `logged_in_users_only` – If True, only return sessions with users logged in.

**Returns** A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

`salt.modules.rdp.logoff_session(session_id)`

Initiate the logoff of a session.

New in version 2016.11.0.

**Parameters** `session_id` – The numeric Id of the session.

**Returns** A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
```

```
salt '*' rdp.logoff_session 99
```

`salt.modules.rdp.status()`

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

### 21.9.351 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration** This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

`salt.modules.redismod.bgrewriteaof(host=None, port=None, db=None, password=None)`

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

`salt.modules.redismod.bgsave(host=None, port=None, db=None, password=None)`

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

`salt.modules.redismod.config_get(pattern='*', host=None, port=None, db=None, password=None)`

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

`salt.modules.redismod.config_set`(*name*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

`salt.modules.redismod.dbsize`(*host=None*, *port=None*, *db=None*, *password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

`salt.modules.redismod.delete`(*\*keys*, *\*\*connection\_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

`salt.modules.redismod.exists`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

`salt.modules.redismod.expire`(*key*, *seconds*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat`(*key*, *timestamp*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall`(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb`(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip`(*host=None, port=None, password=None*)  
Get host information about slave

CLI Example:

```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hdel`(*key, \*fields, \*\*options*)  
Delete one or more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hexists`(*key, field, host=None, port=None, db=None, password=None*)  
Determine if a hash fields exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

`salt.modules.redismod.hget`(*key, field, host=None, port=None, db=None, password=None*)  
Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall`(*key, host=None, port=None, db=None, password=None*)  
Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.hincrby`(*key, field, increment=1, host=None, port=None, db=None, password=None*)  
Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

`salt.modules.redismod.hincrbyfloat`(*key, field, increment=1.0, host=None, port=None, db=None, password=None*)  
Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

`salt.modules.redismod.hlen`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

`salt.modules.redismod.hmget`(*key*, *\*fields*, *\*\*options*)

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hmset`(*key*, *\*\*fieldsvals*)

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

`salt.modules.redismod.hscan`(*key*, *cursor=0*, *match=None*, *count=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

`salt.modules.redismod.hset`(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

`salt.modules.redismod.hsetnx`(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

`salt.modules.redismod.hvals`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

`salt.modules.redismod.info` (*host=None, port=None, db=None, password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

`salt.modules.redismod.key_type` (*key, host=None, port=None, db=None, password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

`salt.modules.redismod.keys` (*pattern='\*', host=None, port=None, db=None, password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

`salt.modules.redismod.lastsave` (*host=None, port=None, db=None, password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

`salt.modules.redismod.llen` (*key, host=None, port=None, db=None, password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

`salt.modules.redismod.lrange` (*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

`salt.modules.redismod.ping` (*host=None, port=None, db=None, password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

`salt.modules.redismod.save` (*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

`salt.modules.redismod.sentinel_get_master_ip`(*master*, *host=None*, *port=None*, *password=None*)

Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

`salt.modules.redismod.set_key`(*key*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

`salt.modules.redismod.shutdown`(*host=None*, *port=None*, *db=None*, *password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

`salt.modules.redismod.slaveof`(*master\_host=None*, *master\_port=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time`(*host=None*, *port=None*, *db=None*, *password=None*)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange`(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

### 21.9.352 salt.modules.reg

Manage the Windows registry

#### Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY\_LOCAL\_MACHINE
- HKEY\_CURRENT\_USER
- HKEY\_USER

#### Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the the key on the CLI:

Using single backslashes: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)

Using double backslashes: SOFTWARE\\Python

#### Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

#### Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.
↳exe\"
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.
↳dll\",TrayApp"
```

In this example these are the values for each:

Hive: HKEY\_LOCAL\_MACHINE

Key and subkeys: SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run

Value:

- There are 3 value names:
  - RTHDVCPL

- *NvBackend*
- *BTMTrayAgent*

- Each value name has a corresponding value

**depends**

- salt.utils.win\_reg

salt.modules.reg.broadcast\_change()

Refresh the windows environment.

---

**Note:** This will only effect new processes and windows. Services will not see the change until the system restarts.

---

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' reg.broadcast_change
```

salt.modules.reg.delete\_key\_recursive(hive, key, use\_32bit\_registry=False)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

**Parameters** **hive** (*str*) – The name of the hive. Can be one of the following

- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_CURRENT\_USER or HKCU
- HKEY\_USER or HKU
- HKEY\_CLASSES\_ROOT or HKCR
- HKEY\_CURRENT\_CONFIG or HKCC

**key** (*str*): The key to remove (looks like a path)

**use\_32bit\_registry** (*bool*): Deletes the 32bit portion of the registry on 64bit installations.

On 32bit machines this is ignored.

**Returns**

A dictionary listing the keys that deleted successfully as well as those that failed to delete.

**Return type** dict

CLI Example:

The following example will remove delete\_me and all its subkeys from the SOFTWARE key in HKEY\_LOCAL\_MACHINE:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

salt.modules.reg.delete\_value(hive, key, vname=None, use\_32bit\_registry=False)

Delete a registry value entry or the default value for a key.

**Parameters**

- **hive** (*str*) – The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name.

- **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use\_32bit\_registry** (*bool*) – Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt' 'version'
```

`salt.modules.reg.import_file` (*source*, *use\_32bit\_registry=False*)

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

- **source** (*str*) – The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. `salt://salt_master_path`)
- **use\_32bit\_registry** (*bool*) – If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

**Returns** True if successful, otherwise an error is raised

**Return type** `bool`

**Raises**

- **ValueError** – If the value of `source` is an invalid path or otherwise causes `cp.cache_file` to return False
- **CommandExecutionError** – If `reg.exe` exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/
↳postinstall_config.reg
```

`salt.modules.reg.key_exists` (*hive*, *key*, *use\_32bit\_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

**Parameters**

- **hive** (*str*) – The hive to connect to
- **key** (*str*) – The key to check
- **use\_32bit\_registry** (*bool*) – Look in the 32bit portion of the registry

**Returns** True if exists, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

`salt.modules.reg.list_keys` (*hive*, *key=None*, *use\_32bit\_registry=False*)

Enumerates the subkeys in a registry key or hive.

**Parameters**

- **hive** (*str*) – The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use\_32bit\_registry** (*bool*) – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns** A list of keys/subkeys under the hive or key.

**Return type** `list`

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.list_values` (*hive*, *key=None*, *use\_32bit\_registry=False*)

Enumerates the values in a registry key or hive.

---

**Note:** The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

---

#### Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use\_32bit\_registry** (*bool*) – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns** A list of values under the hive or key.

**Return type** `list`

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\\CurrentControlSet\\Services\\Tcpip'
↪'
```

`salt.modules.reg.read_value` (*hive*, *key*, *vname=None*, *use\_32bit\_registry=False*)

Reads a registry value entry or the default value for a key. To read the default value, don't pass *vname*

#### Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name.
- **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.
- **use\_32bit\_registry** (*bool*) – Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

#### Returns

A dictionary containing the passed settings as well as the `value_data` if successful. If unsuccessful, sets `success` to `False`.

`bool`: Returns `False` if the key is not found

If *vname* is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns `None` if first unnamed value is empty.

**Return type** `dict`

CLI Example:

The following will get the value of the version value name in the HKEY\_LOCAL\_MACHINE\\SOFTWARE\\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

CLI Example:

The following will get the default value of the HKEY\_LOCAL\_MACHINE\\SOFTWARE\\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

```
salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ',
 use_32bit_registry=False, volatile=False)
```

Sets a value in the registry. If `vname` is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

**Parameters**

- **hive** (*str*) – The name of the hive. Can be one of the following
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name.
- **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*str, int, list, bytes*) – The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:

- REG\_BINARY: Binary data (str in Py2, bytes in Py3)
- REG\_DWORD: int
- REG\_EXPAND\_SZ: str
- REG\_MULTI\_SZ: list of str
- REG\_QWORD: int
- REG\_SZ: str

---

**Note:** When setting REG\_BINARY, string data will be converted to binary.

---

---

**Note:** The type for the (Default) value is always REG\_SZ and cannot be changed.

---

---

**Note:** This parameter is optional. If `vdata` is not passed, the Key will be created with no associated item/value pairs.

---

- **vtype** (*str*) – The value type. The possible values of the `vtype` parameter are indicated above in the description of the `vdata` parameter.
- **use\_32bit\_registry** (*bool*) – Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) – When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This

parameter only has an effect when a key is being created and at no other time.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

This will set the version value to 2015.5.2 in the SOFTWARE\Salt key in the HKEY\_LOCAL\_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
↳ '2015.5.2'
```

CLI Example:

This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG\_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

CLI Example:

In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data'
↳ vtype=REG_SZ vdata="'1.2'"
```

CLI Example:

This is an example of using vtype REG\_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data'
↳ vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:

An example of using vtype REG\_MULTI\_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data'
↳ vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

**salt.modules.reg.value\_exists** (*hive, key, vname, use\_32bit\_registry=False*)

Check that the value/data pair is found in the registry.

New in version 3000.

**Parameters**

- **hive** (*str*) – The hive to connect to
- **key** (*str*) – The key to check in
- **vname** (*str*) – The name of the value/data pair you're checking
- **use\_32bit\_registry** (*bool*) – Look in the 32bit portion of the registry

**Returns** True if exists, otherwise False

**Return type** bool

CLI Example:

```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\CurrentVersion
↳ CommonFilesDir
```

### 21.9.353 salt.modules.rest\_pkg

Package support for the REST example

**salt.modules.rest\_pkg.install** (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, \*\*kwargs*)

**salt.modules.rest\_pkg.installed** (*name, version=None, refresh=False, fromrepo=None, skip\_verify=False, pkgs=None, sources=None, \*\*kwargs*)

```

salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)
salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)
salt.modules.rest_pkg.version(*names, **kwargs)

```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

```

### 21.9.354 salt.modules.rest\_sample\_utils module

Utility functions for the rest\_sample

```

salt.modules.rest_sample_utils.fix_outage()
 "Fix" the outage

```

CLI Example:

```

salt 'rest-sample-proxy' rest_sample.fix_outage

```

```

salt.modules.rest_sample_utils.get_test_string()
 Helper function to test cross-calling to the __proxy__ dunder.

```

CLI Example:

```

salt 'rest-sample-proxy' rest_sample.get_test_string

```

### 21.9.355 salt.modules.rest\_service

Provide the service module for the proxy-minion REST sample

```

salt.modules.rest_service.enabled(name, sig=None)
 Only the 'redbull' service is 'enabled' in the test

```

New in version 2015.8.1.

```

salt.modules.rest_service.get_all()
 Return a list of all available services

```

New in version 2015.8.0.

CLI Example:

```

salt '*' service.get_all

```

```

salt.modules.rest_service.list_()
 Return a list of all available services.

```

CLI Example:

```

salt '*' service.list

```

`salt.modules.rest_service.restart(name, sig=None)`

Restart the specified service with `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.running(name, sig=None)`

Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.start(name, sig=None)`

Start the specified service on the `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.status(name, sig=None)`

Return the status for a service via `rest_sample`. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop(name, sig=None)`

Stop the specified service on the `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

## 21.9.356 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, <https://packages.debian.org/debian-goodies>) and psdel by Sam Morris.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.restartcheck`(*ignorelist=None, blacklist=None, excludepid=None, \*\*kwargs*)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

**Parameters**

- **ignorelist** – string or list of packages to be ignored
- **blacklist** – string or list of file paths to be ignored
- **excludepid** – string or list of process IDs to be ignored
- **verbose** – boolean, enables extensive output
- **timeout** – int, timeout in minute

**Returns** { 'result': False, 'comment': '<reason>' } String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

**Return type** Dict on error

New in version 2015.8.3.

CLI Example: .. code-block:: bash  
salt '\*' restartcheck.restartcheck

### 21.9.357 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

`salt.modules.ret.get_fun`(*returner, fun*)  
Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.get_jid`(*returner, jid*)  
Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids`(*returner*)  
Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions`(*returner*)  
Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

### 21.9.358 salt.modules.rh\_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings`(*\*\*settings*)  
Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_bond`(*iface*, *\*\*settings*)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.rh_ip.build_interface`(*iface*, *iface\_type*, *enabled*, *\*\*settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings`(*\*\*settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes`(*iface*, *\*\*settings*)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down`(*iface*, *iface\_type*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.get_bond`(*iface*)

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.rh_ip.get_interface`(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.get_network_settings`()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.get_routes`(*iface*)  
Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.up`(*iface*, *iface\_type*)  
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

### 21.9.359 salt.modules.rh\_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.rh_service.available`(*name*, *limit=""*)  
Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete`(*name*, *\*\*kwargs*)  
Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable`(*name*, *\*\*kwargs*)  
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled`(*name*)  
Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable`(*name*, *\*\*kwargs*)  
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit="")`

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.get_disabled(limit="")`

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

`salt.modules.rh_service.get_enabled(limit="")`

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

`salt.modules.rh_service.missing(name, limit="")`

The inverse of `service.available`. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

`salt.modules.rh_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.rh_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rh_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rh_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.rh_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.360 salt.modules.riak

Riak Salt Module

`salt.modules.riak.cluster_commit()`

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

`salt.modules.riak.cluster_join(username, hostname)`

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

`salt.modules.riak.cluster_leave(username, hostname)`

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

**salt.modules.riak.cluster\_plan()**

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

**salt.modules.riak.member\_status()**

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

**salt.modules.riak.services()**

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

**salt.modules.riak.start()**

Start Riak

CLI Example:

```
salt '*' riak.start
```

**salt.modules.riak.status()**

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

**salt.modules.riak.stop()**

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

**salt.modules.riak.test()**

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

### 21.9.361 salt.modules.rpm\_lowpkg

Support for rpm

`salt.modules.rpm_lowpkg.bin_pkg_info`(*path*, *saltenv*='base')

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

**path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

**saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if *path* is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm_lowpkg.checksum`(*\*paths*)

Return if the signature of a RPM file is valid.

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm_lowpkg.diff`(*package\_path*, *path*)

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

- **package** – Full pack of the RPM file
- **path** – Full path to the installed file

**Returns** Difference or empty string. For binary files only a notification.

CLI example:

```
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

`salt.modules.rpm_lowpkg.file_dict`(*\*packages*)

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm_lowpkg.file_list`(*\*packages*)

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm_lowpkg.info(*packages, **kwargs)`

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

#### Parameters

- **packages** –
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.  
Valid attributes are: version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **all\_versions** – Return information for all installed versions of the packages

#### Returns

CLI example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
↳versions=True
```

`salt.modules.rpm_lowpkg.list_pkgs(*packages)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm_lowpkg.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm_lowpkg.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm_lowpkg.verify(*packages, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 21.9.362 salt.modules.rpmbuild\_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
 https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
↳python-libnacl.spec
 https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

`salt.modules.rpmbuild_pkgbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)`

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**reporid** The directory to find packages that will be in the repository.

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with `keyid` which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```

gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvYdEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vLzCn4zv0KQta+4alcWivvoP

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub

```

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

---

**Note:** This parameter is not used for making yum repositories.

---

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar = '{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild_pkgbuild.make_src_pkg`(*dest\_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*, *runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
 https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-
↳ libnacl.spec
 https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

**dest\_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**env** A dictionary of environment variables to be set prior to execution.

**template** Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**runas** The user to run the build process as

New in version 2018.3.3.

---

**Note:** using SHA256 as digest and minimum level dist el6

---

### 21.9.363 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into *opts* will overwrite options passed into *pillar*.

`salt.modules.rsync.config`(*conf\_path='/etc/rsyncd.conf'*)

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from *cmd.run\_all*.

Returns the contents of the rsync config file

**conf\_path** [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.rsync`(*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *dryrun=False*, *rsh=None*, *additional\_opts=None*, *saltenv='base'*)

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from *src* to *dst*

**src** The source location where files will be rsynced from.

**dst** The destination location where files will be rsynced to.

**delete** [False] Whether to enable the rsync `-delete` flag, which will delete extraneous files from dest dirs

**force** [False] Whether to enable the rsync `-force` flag, which will force deletion of dirs even if not empty.

**update** [False] Whether to enable the rsync `-update` flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

**passwordfile** A file that contains a password for accessing an rsync daemon. The file should contain just the password.

**exclude** Whether to enable the rsync `-exclude` flag, which will exclude files matching a PATTERN.

**excludefrom** Whether to enable the rsync `-excludefrom` flag, which will read exclude patterns from a file.

**dryrun** [False] Whether to enable the rsync `-dry-run` flag, which will perform a trial run with no changes made.

**rsh** Whether to enable the rsync `-rsh` flag, to specify the remote shell to use.

**additional\_opts** Any additional rsync options, should be specified as a list.

**saltenv**

Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
→passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,
→exclude2/dir]' additional_opts='["--partial", "--bwlimit=5000"]'
```

`salt.modules.rsync.version`()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

## 21.9.364 salt.modules.runit

runit service module (<http://smarden.org/runit>)

This module is compatible with the `service` states, so it can be used to maintain services using the provider argument:

```
myservice:
 service:
 - running
 - provider: runit
```

Provides virtual *service* module on systems using runit as init.

Service management rules (*sv* command):

service \$n is ENABLED if file SERVICE\_DIR/\$n/run exists service \$n is AVAILABLE if ENABLED or if file AVAIL\_SVR\_DIR/\$n/run exists service \$n is DISABLED if AVAILABLE but not ENABLED

SERVICE\_DIR/\$n is normally a symlink to a AVAIL\_SVR\_DIR/\$n folder

Service auto-start/stop mechanism:

*sv* (auto)starts/stops service as soon as SERVICE\_DIR/<service> is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file SERVICE\_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service *sva* is an alias of service *svc* when *AVAIL\_SVR\_DIR/sva* symlinks to folder *AVAIL\_SVR\_DIR/svc*. *svc* can't be enabled if it is already enabled through an alias already enabled, since *sv* files are stored in folder *SERVICE\_DIR/svc/*.

XBPS package management uses a service's alias to provides service alternative(s), such as *chrony* and *openntpd* both aliased to *ntpd*.

`salt.modules.runit.add_svc_avail_path(path)`

Add a path that may contain available services. Return True if added (or already present), False on error.  
**path** directory to add to AVAIL\_SVR\_DIRS

`salt.modules.runit.available(name)`

Returns True if the specified service is available, otherwise returns False.

**name** the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`

Don't start service name at boot Returns True if operation is successful

**name** the service's name

**stop** if True, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`

Return True if the named service is disabled, False otherwise

**name** the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`

Start service name at boot. Returns True if operation is successful

**name** the service's name

**start** [False] If True, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

`salt.modules.runit.enabled(name)`  
Return True if the named service is enabled, False otherwise  
**name** the service's name  
CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.runit.full_restart(name)`  
Calls `runit.restart()`  
**name** the service's name  
CLI Example:

```
salt '*' runit.full_restart <service name>
```

`salt.modules.runit.get_all()`  
Return a list of all available services  
CLI Example:

```
salt '*' runit.get_all
```

`salt.modules.runit.get_disabled()`  
Return a list of all disabled services  
CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.runit.get_enabled()`  
Return a list of all enabled services  
CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.runit.get_svc_alias()`  
Returns the list of service's name that are aliased and their alias path(s)

`salt.modules.runit.get_svc_avail_path()`  
Return list of paths that may contain available services

`salt.modules.runit.get_svc_broken_path(name='*')`  
Return list of broken path(s) in SERVICE\_DIR that match name  
A path is broken if it is a broken symlink or can not be a runit service  
**name** a glob for service name. default is '\*'  
CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

`salt.modules.runit.missing(name)`  
The inverse of `runit.available`. Returns True if the specified service is not available, otherwise returns False.  
**name** the service's name  
CLI Example:

```
salt '*' runit.missing <service name>
```

`salt.modules.runit.reload_(name)`  
Reload service

**name** the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

**salt.modules.runit.remove**(*name*)

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

**name** the service's name

CLI Example:

```
salt '*' service.remove <name>
```

**salt.modules.runit.restart**(*name*)

Restart service

**name** the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

**salt.modules.runit.show**(*name*)

Show properties of one or more units/jobs or the manager

**name** the service's name

CLI Example:

```
salt '*' service.show <service name>
```

**salt.modules.runit.start**(*name*)

Start service

**name** the service's name

CLI Example:

```
salt '*' runit.start <service name>
```

**salt.modules.runit.status**(*name*, *sig=None*)

Return True if service is running

**name** the service's name

**sig** signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

**salt.modules.runit.status\_autostart**(*name*)

Return True if service <name> is autostarted by sv (file \$service\_folder/down does not exist) NB: return False if the service is not enabled.

**name** the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

**salt.modules.runit.stop**(*name*)

Stop service

**name** the service's name

CLI Example:

```
salt '*' runit.stop <service name>
```

### 21.9.365 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

`salt.modules.rvm.do`(*ruby*, *command*, *runas=None*, *cwd=None*, *env=None*)

Execute a command in an RVM controlled environment.

**ruby** Which ruby to use

**command** The rvm command to execute

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**cwd** The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

`salt.modules.rvm.gemset_copy`(*source*, *destination*, *runas=None*)

Copy all gems from one gemset to another.

**source** The name of the gemset to copy, complete with ruby version

**destination** The destination gemset

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

`salt.modules.rvm.gemset_create`(*ruby*, *gemset*, *runas=None*)

Creates a gemset.

**ruby** The ruby version for which to create the gemset

**gemset** The name of the gemset to create

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

`salt.modules.rvm.gemset_delete`(*ruby*, *gemset*, *runas=None*)

Delete a gemset

**ruby** The ruby version to which the gemset belongs

**gemset** The gemset to delete

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty`(*ruby*, *gemset*, *runas=None*)

Remove all gems from a gemset.

**ruby** The ruby version to which the gemset belongs

**gemset** The gemset to empty

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list`(*ruby='default', runas=None*)

List all gemsets for the given ruby.

**ruby** [default] The ruby version for which to list the gemsets

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all`(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

`salt.modules.rvm.get`(*version='stable', runas=None*)

Update RVM

**version** [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

`salt.modules.rvm.install`(*runas=None*)

Install RVM system-wide

**runas** The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

`salt.modules.rvm.install_ruby`(*ruby, runas=None, opts=None, env=None*)

Install a ruby implementation.

**ruby** The version of ruby to install

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**env** Environment to set for the install command. Useful for exporting compilation flags such as RUBY\_CONFIGURE\_OPTS

**opts** List of options to pass to the RVM installer (ie -C, -patch, etc)

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

`salt.modules.rvm.is_installed`(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

`salt.modules.rvm.list_`(*runas=None*)

List all rvm-installed rubies

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

`salt.modules.rvm.reinstall_ruby` (*ruby*, *runas=None*, *env=None*)

Reinstall a ruby implementation

**ruby** The version of ruby to reinstall

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

`salt.modules.rvm.rubygems` (*ruby*, *version*, *runas=None*)

Installs a specific rubygems version in the given ruby

**ruby** The ruby for which to install rubygems

**version** The version of rubygems to install, or 'remove' to use the version that ships with 1.9

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

`salt.modules.rvm.set_default` (*ruby*, *runas=None*)

Set the default ruby

**ruby** The version of ruby to make the default

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

`salt.modules.rvm.wrapper` (*ruby\_string*, *wrapper\_prefix*, *runas=None*, *\*binaries*)

Install RVM wrapper scripts

**ruby\_string** Ruby/gemset to install wrappers for

**wrapper\_prefix** What to prepend to the name of the generated wrapper binaries

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**binaries** [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

### 21.9.366 salt.modules.s3

Connection module for Amazon S3

**configuration** This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

**Warning:** This is literally the pillar key `s3.keyid` or the config option `s3.keyid`, not:

```
s3:
 keyid: blah
```

A `service_url` may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

[http://docs.aws.amazon.com/general/latest/gr/rande.html#s3\\_region](http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region)

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

```
salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None,
 verify_ssl=None, kms_keyid=None, location=None, role_arn=None,
 path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```
salt.modules.s3.get(bucket="", path="", return_bin=False, action=None, local_file=None, key=None,
 keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
 role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

```
salt.modules.s3.head(bucket, path="", key=None, keyid=None, service_url=None, verify_ssl=None,
 kms_keyid=None, location=None, role_arn=None, path_style=None,
 https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket salt myminion s3.head mybucket myfile.png
```

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None,
 keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
 role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 21.9.367 salt.modules.s6 module

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
 service:
 - running
 - provider: s6
```

Note that the enabled argument is not available with this provider.

**codeauthor** Marek Skrobacki <skrobul@skrobul.com>

**salt.modules.s6.available**(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' s6.available foo
```

**salt.modules.s6.full\_restart**(*name*)

Calls s6.restart() function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

**salt.modules.s6.get\_all**()

Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

**salt.modules.s6.missing**(*name*)

The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' s6.missing foo
```

**salt.modules.s6.reload\_**(*name*)

Send a HUP to service via s6

CLI Example:

```
salt '*' s6.reload <service name>
```

**salt.modules.s6.restart**(*name*)

Restart service via s6. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

**salt.modules.s6.start**(*name*)

Starts service via s6

CLI Example:

```
salt '*' s6.start <service name>
```

`salt.modules.s6.status`(*name*, *sig=None*)

Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

`salt.modules.s6.stop`(*name*)

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

`salt.modules.s6.term`(*name*)

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

### 21.9.368 salt.modules.salt\_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.configure_proxy`(*proxyname*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** – Name to be used for this proxy (should match entries in pillar)
- **start** – Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.is_running`(*proxyname*)

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxyname** – String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

### 21.9.369 salt.modules.salt\_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```
{# a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']("Sodium") %}

{% if option_deprecated %}
 <use old syntax>
{% else %}
 <use new syntax>
{% endif %}
```

**salt.modules.salt\_version.equal**(*name*)

Returns a boolean (True) if the minion's current version code name matches the named version.

**name** The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.equal 'Oxygen'
```

**salt.modules.salt\_version.get\_release\_number**(*name*)

Returns the release number of a given release code name in a MAJOR.PATCH format.

If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns None.

**name** The release code name for which to find a release number.

CLI Example:

```
salt '*' salt_version.get_release_number 'Oxygen'
```

**salt.modules.salt\_version.greater\_than**(*name*)

Returns a boolean (True) if the minion's current version code name is greater than the named version.

**name** The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.greater_than 'Sodium'
```

**salt.modules.salt\_version.less\_than**(*name*)

Returns a boolean (True) if the minion's current version code name is less than the named version.

**name** The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.less_than 'Sodium'
```

### 21.9.370 salt.modules.saltcheck

A module for testing the logic of states and highstates

**codeauthor** William Cannon <william.cannon@gmail.com>

**maturity** new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The `saltcheck-tests` folder can be customized using the `saltcheck_test_location` minion configuration setting. This setting is a relative path from the formula's `salt://` path to the test files.

## Usage

Example Default file system layout:

```
/srv/salt/apache/
 init.sls
 config.sls
 saltcheck-tests/
 init.tst
 config.tst
 deployment_validation.tst
```

Alternative example file system layout with custom `saltcheck_test_location`:

## Minion configuration:

```
saltcheck_test_location: tests/integration/saltcheck
```

## Filesystem layout:

```
/srv/salt/apache/
 init.sls
 config.sls
 tests/integration/saltcheck/
 init.tst
 config.tst
 deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in `top.sls`. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

## Saltcheck Keywords

**module\_and\_function:** (str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

**args:** (list) Optional arguments passed to the salt module

**kwargs:** (dict) Optional keyword arguments to be passed to the salt module

**assertion:** (str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and `expected_return`, cause saltcheck to exit with a non-zero exit code.

**expected\_return:** (str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of `module_and_function` is compared to this value in the assertion.

**assertion\_section:** (str) Optional keyword used to parse the `module_and_function` return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

**assertion\_section\_delimiter:** (str) Optional delimiter to use when splitting a nested structure. Defaults to `'`

**print\_result:** (bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to `True`.

**output\_details:** (bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If `print_result` is `False`, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to `False`

**pillar\_data:** (dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

**skip:** (bool) Optional keyword to skip running the individual test

## Sample Cases/Examples

### Basic Example

```
echo_test_hello:
 module_and_function: test.echo
 args:
 - "hello"
 kwargs:
 assertion: assertEquals
 expected_return: 'hello'
```

### Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
 module_and_function: pkg.upgrade_available
 args:
 - {{ package }}
```

(continues on next page)

```
 assertion: assertFalse
 {% endfor %}
```

### Example with setup state including pillar

```
setup_test_environment:
 module_and_function: saltcheck.state_apply
 args:
 - common
 pillar_data:
 data: value

verify_vim:
 module_and_function: pkg.version
 args:
 - vim
 assertion: assertNotEmpty
```

### Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
 module_and_function: pkg.upgrade_available
 args:
 - {{ package }}
 assertion: assertFalse
{% endfor %}
```

### Example with setup state including pillar

```
setup_test_environment:
 module_and_function: saltcheck.state_apply
 args:
 - common
 pillar_data:
 data: value

verify_vim:
 module_and_function: pkg.version
 args:
 - vim
 assertion: assertNotEmpty
```

### Example with skip

```

package_latest:
 module_and_function: pkg.upgrade_available
 args:
 - apache2
 assertion: assertFalse
 skip: True

```

#### Example with `assertion_section`

```

validate_shell:
 module_and_function: user.info
 args:
 - root
 assertion: assertEquals
 expected_return: /bin/bash
 assertion_section: shell

```

#### Example with a nested `assertion_section`

```

validate_smb_signing:
 module_and_function: lgpo.get
 args:
 - 'Machine'
 kwargs:
 return_full_policy_names: True
 assertion: assertEquals
 expected_return: Enabled
 assertion_section: 'Computer Configuration|Microsoft network client: Digitally sign
↪communications (always)
 assertion_section_delimiter: '|'

```

#### Example suppressing print results

```

validate_env_nameNode:
 module_and_function: hadoop.dfs
 args:
 - text
 - /oozie/common/env.properties
 expected_return: nameNode = hdfs://nameservice2
 assertion: assertNotIn
 print_result: False

```

#### Supported assertions

- `assertEquals`
- `assertNotEqual`
- `assertTrue`
- `assertFalse`

- `assertIn`
- `assertNotIn`
- `assertGreater`
- `assertGreaterEqual`
- `assertLess`
- `assertLessEqual`
- `assertEmpty`
- `assertNotEmpty`

**Warning:** The `saltcheck.state_apply` function is an alias for `state.apply`. If using the *ACL system* `saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

`salt.modules.saltcheck.report_highstate_tests` (*saltenv=None*)

Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

`salt.modules.saltcheck.run_highstate_tests` (*saltenv=None*)

Execute all tests for states assigned to the minion through highstate and return results

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

`salt.modules.saltcheck.run_state_tests` (*state, saltenv=None, check\_all=False*)

Execute tests for a salt state and return results Nested states will also be tested

Parameters

- **state** (*str*) – state name for which to run associated .tst test files
- **saltenv** (*str*) – optional saltenv. Defaults to base
- **check\_all** (*bool*) – boolean to run all tests in state/saltcheck-tests directory

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

`salt.modules.saltcheck.run_state_tests_ssh` (*state, saltenv=None, check\_all=False*)

This function is an alias of `run_state_tests`.

Execute tests for a salt state and return results Nested states will also be tested

- param str state** state name for which to run associated .tst test files
- param str saltenv** optional saltenv. Defaults to base
- param bool check\_all** boolean to run all tests in state/saltcheck-tests directory

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

`salt.modules.saltcheck.run_test` (*\*\*kwargs*)

Execute one saltcheck test and return result

Parameters **arg test** (*keyword*) –

CLI Example:

```
salt '*' saltcheck.run_test
 test={'module_and_function': "test.echo",
 "assertion": "assertEqual",
 "expected_return": "This works!",
 "args":["This works!"] }
```

`salt.modules.saltcheck.state_apply`(*state\_name*, *\*\*kwargs*)

Runs `state.apply` with given options to set up test data. Intended to be used for optional test setup or teardown

Reference the `state.apply` module documentation for arguments and usage options

CLI Example:

```
salt '*' saltcheck.state_apply postfix
```

### 21.9.371 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.create`(*name*, *profile*)

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

### 21.9.372 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

**depends**

- esky Python module for update functionality

`salt.modules.saltutil.clear_cache`()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.clear_job_cache`(*hours=24*)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.cmd`(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret=", karg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter`(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret=", kwarg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job`(*jid*)

Return the data for a specific cached job id. Note this only works if `cache_jobs` has previously been set to `True` on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job`(*jid*)

Return the data for a specific job id that is currently running.

**jid** The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
salt my-minion saltutil.find_job 20160503150049487736
my-minion:

 arg:
 - 30
 fun:
 test.sleep
 jid:
 20160503150049487736
 pid:
 9601
 ret:
 tgt:
 my-minion
 tgt_type:
```

(continues on next page)

(continued from previous page)

```

 glob
 user:
 root

```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```

salt my-minion saltutil.find_job 20160503150049487736
my-minion:

```

### `salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```

salt '*' saltutil.is_running state.highstate

```

### `salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```

salt '*' saltutil.kill_all_jobs

```

### `salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```

salt '*' saltutil.kill_job <job id>

```

### `salt.modules.saltutil.list_extmods()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```

salt '*' saltutil.list_extmods

```

### `salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)`

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```

salt '*' saltutil.mmodule base test.ping

```

### `salt.modules.saltutil.refresh_beacons()`

Signal the minion to refresh the beacons.

CLI Example:

```

salt '*' saltutil.refresh_beacons

```

### `salt.modules.saltutil.refresh_grains(**kwargs)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

---

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

---

**refresh\_pillar** [True] Set to False to keep pillar data from being refreshed.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

**salt.modules.saltutil.refresh\_matchers()**

Signal the minion to refresh its matchers.

CLI Example:

```
salt '*' saltutil.refresh_matchers
```

**salt.modules.saltutil.refresh\_modules(\*\*kwargs)**

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

**salt.modules.saltutil.refresh\_pillar(wait=False, timeout=30)**

Signal the minion to refresh the pillar data.

**Parameters**

- **wait** (*bool*, *optional*) – Wait for pillar refresh to complete, defaults to False.
- **timeout** (*int*, *optional*) – How long to wait in seconds, only used when wait is True, defaults to 30.

**Returns** Boolean status, True when the pillar\_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
```

**salt.modules.saltutil.regen\_keys()**

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

**salt.modules.saltutil.revoke\_auth(preserve\_minion\_cache=False)**

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve\_minion\_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

**salt.modules.saltutil.runner(name, arg=None, kwarg=None, full\_return=False, saltenv='base',  
jid=None, \*\*kwargs)**

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master\_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg={'foo': 'bar'}
```

`salt.modules.saltutil.running()`

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

`salt.modules.saltutil.signal_job(jid, sig)`

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)`

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

**refresh** [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
 module.run:
 - name: saltutil.sync_all
 - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod\_whitelist** [None] dictionary of modules to sync based on type

**extmod\_blacklist** [None] dictionary of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

`salt.modules.saltutil.sync_beacons(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)`

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.sync_clouds` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**refresh** [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

`salt.modules.saltutil.sync_engines` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

`salt.modules.saltutil.sync_executors` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3000.

Sync executors from `salt://_executors` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync.

If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

`salt.modules.saltutil.sync_grains` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

`salt.modules.saltutil.sync_log_handlers` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync.

If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

`salt.modules.saltutil.sync_matchers` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2019.2.0.

Sync engine modules from `salt://_matchers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

`salt.modules.saltutil.sync_modules` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to `False` to prevent this refresh.

---

**Important:** If this function is executed using a *module.run* state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
 module.run:
 - name: saltutil.sync_modules
 - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

`salt.modules.saltutil.sync_output` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

Sync outputters from `salt://_output` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.sync_outputters` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.sync_pillar` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

**refresh** [True] Also refresh the execution modules available to the minion, and refresh pillar data.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

---

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.sync_proxymodules` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.sync_renderers` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

`salt.modules.saltutil.sync_returners` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

`salt.modules.saltutil.sync_sdb` (*saltenv=None*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [False] This argument has no affect and is included for consistency with the other sync functions.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```

salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev

```

`salt.modules.saltutil.sync_serializers` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for serializer modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev

```

`salt.modules.saltutil.sync_states` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev

```

`salt.modules.saltutil.sync_thorium` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

**refresh: True** If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** comma-separated list of modules to sync

**extmod\_blacklist** comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

`salt.modules.saltutil.sync_utils` (*saltenv=None*, *refresh=True*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

`salt.modules.saltutil.term_all_jobs`()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

`salt.modules.saltutil.term_job`(*jid*)

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

`salt.modules.saltutil.update` (*version=None*)

Update the salt minion from the URL defined in `opts['update_url']` SaltStack, Inc provides the latest builds here: `update_url: https://repo.saltstack.com/windows/`

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the `update_url` can be downloaded and installed.

This feature requires the minion to be running a `bdist_esky` build.

The version number is optional and will default to the most recent version available at `opts['update_url']`.

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

`salt.modules.saltutil.wheel` (*name*, *\*args*, *\*\*kwargs*)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

**name** The name of the function to run  
**args** Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

**kwargs** Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

### 21.9.373 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

**salt.modules.schedule.add**(*name*, *\*\*kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']
↳" seconds=60
```

**salt.modules.schedule.build\_schedule\_item**(*name*, *\*\*kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

**salt.modules.schedule.copy**(*name*, *target*, *\*\*kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

**salt.modules.schedule.delete**(*name*, *\*\*kwargs*)

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

**salt.modules.schedule.disable**(*\*\*kwargs*)

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

`salt.modules.schedule.disable_job(name, **kwargs)`

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

`salt.modules.schedule.enable(**kwargs)`

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

`salt.modules.schedule.enable_job(name, **kwargs)`

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name)`

List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
```

`salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)`

List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify(name, **kwargs)`

Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.move(name, target, **kwargs)`

Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)`

Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-%dT%H:%M:
↪%S'
```

`salt.modules.schedule.purge(**kwargs)`

Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge
```

`salt.modules.schedule.reload_()`

Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

`salt.modules.schedule.run_job(name, force=False)`

Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

`salt.modules.schedule.save(**kwargs)`

Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

`salt.modules.schedule.show_next_fire_time(name, **kwargs)`

Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

`salt.modules.schedule.skip_job(name, current_time, **kwargs)`

Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

## 21.9.374 salt.modules.scp module

### SCP Module

New in version 2019.2.0.

Module to copy files via [SCP](#)

```
salt.modules.scp_mod.get(remote_path, local_path="", recursive=False, preserve_times=False,
 **kwargs)
```

Transfer files and directories from remote host to the localhost of the Minion.

**remote\_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

**recursive: False** Transfer files and directories recursively.

**preserve\_times: False** Preserve mtime and atime of transferred files and directories.

**hostname** The hostname of the remote device.

**port: 22** The port of the remote device.

**username** The username required for SSH authentication on the device.

**password** Used for password authentication. It is also used for private key decryption if passphrase is not given.

**passphrase** Used for decrypting private keys.

**pkey** An optional private key to use for authentication.

**key\_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.

**socket\_timeout: 10** The channel socket timeout in seconds.

**buff\_size: 16384** The size of the SCP send buffer.

**allow\_agent: True** Set to False to disable connecting to the SSH agent.

**look\_for\_keys: True** Set to False to disable searching for discoverable private key files in ~/.ssh/

**banner\_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth\_timeout** An optional timeout (in seconds) to wait for an authentication response.

**auto\_add\_policy: False** Automatically add the host to the known\_hosts.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False,
 saltenv='base', **kwargs)
```

Transfer files and directories to remote host.

**files** A single path or a list of paths to be transferred.

**remote\_path** The path on the remote device where to store the files.

**recursive: True** Transfer files and directories recursively.

**preserve\_times: False** Preserve mtime and atime of transferred files and directories.

**hostname** The hostname of the remote device.

**port: 22** The port of the remote device.

**username** The username required for SSH authentication on the device.

**password** Used for password authentication. It is also used for private key decryption if passphrase is not given.

**passphrase** Used for decrypting private keys.

**pkey** An optional private key to use for authentication.

**key\_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.  
**socket\_timeout: 10** The channel socket timeout in seconds.  
**buff\_size: 16384** The size of the SCP send buffer.  
**allow\_agent: True** Set to `False` to disable connecting to the SSH agent.  
**look\_for\_keys: True** Set to `False` to disable searching for discoverable private key files in `~/.ssh/`  
**banner\_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.  
**auth\_timeout** An optional timeout (in seconds) to wait for an authentication response.  
**auto\_add\_policy: False** Automatically add the host to the `known_hosts`.  
 CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```

### 21.9.375 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.ls_` (*get\_size=True*)

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

**get\_size** [True] Get the size information for scsi devices. This option should be set to `False` for older OS distributions (RHEL6 and older) due to lack of support for the `'-s'` option in `lsscsi`.

New in version 2015.5.10.

`salt.modules.scsi.rescan_all` (*host*)

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

### 21.9.376 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

```
salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#%&^&*(-_+=)')
```

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
 mysql_user:
 - present
 - host: localhost
 - password: '{{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

```
salt.modules.sdb.set_(uri, value)
```

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 21.9.377 salt.modules.seed

Virtual machine image management tools

```
salt.modules.seed.apply_(path, id=None, config=None, approve_key=True, install=True,
 prep_install=False, pub_key=None, priv_key=None, mount_point=None)
```

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
 [gen_key=(true|false)] [approve_key=(true|false)] \
 [install=(true|false)]
```

**path** Full path to the directory, device, or disk image on the target minion's file system.

**id** Minion id with which to seed the path.

**config** Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

**approve\_key** Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

**install** Install salt-minion, if absent. Default: true.

**prep\_install** Prepare the bootstrap script, but don't run it. Default: false

`salt.modules.seed.mkconfig`(*config=None, tmp=None, id\_=None, approve\_key=True, pub\_key=None, priv\_key=None*)

Generate keys and config and put them in a tmp directory.

**pub\_key** absolute path or file content of an optional preseeded salt key

**priv\_key** absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
 [id_=minion_id] [approve_key=(true|false)]
```

`salt.modules.seed.prep_bootstrap`(*mpt*)

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

### 21.9.378 salt.modules.selinux

Execute calls on selinux

**Note:** This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

`salt.modules.selinux.fcontext_add_or_delete_policy`(*action, name, filetype=None, sel\_type=None, sel\_user=None, sel\_level=None*)

New in version 2017.7.0.

Adds or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**Warning:** Use `selinux.fcontext_add_policy()`, or `selinux.fcontext_delete_policy()`.

Deprecated since version 2019.2.0.

**action** The action to perform. Either `add` or `delete`.

**name** filespec of the file or directory. Regex syntax is allowed.

**file\_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel\_type** SELinux context type. There are many.

**sel\_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

`salt.modules.selinux.fcontext_add_policy`(*name*, *filetype=None*, *sel\_type=None*,  
*sel\_user=None*, *sel\_level=None*)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

**name** filespec of the file or directory. Regex syntax is allowed.

**file\_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel\_type** SELinux context type. There are many.

**sel\_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

`salt.modules.selinux.fcontext_apply_policy`(*name*, *recursive=False*)

New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the `restorecon` command otherwise.

**name** filespec of the file or directory. Regex syntax is allowed.

**recursive** Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.fcontext_delete_policy`(*name*, *filetype=None*, *sel\_type=None*,  
*sel\_user=None*, *sel\_level=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

**name** filespec of the file or directory. Regex syntax is allowed.

**file\_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel\_type** SELinux context type. There are many.

**sel\_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

`salt.modules.selinux.fcontext_get_policy`(*name*, *filetype=None*, *sel\_type=None*,  
*sel\_user=None*, *sel\_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)

- `sel_user`, `sel_role`, `sel_type`, `sel_level` (the selinux context)

For a more in-depth explanation of the selinux context, go to [https://access.redhat.com/documentation/en-US/Red\\_Hat\\_Enterprise\\_Linux/6/html/Security-Enhanced\\_Linux/chap-Security-Enhanced\\_Linux-SELinux\\_Contexts.html](https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html)

**name** filespec of the file or directory. Regex syntax is allowed.

**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

`salt.modules.selinux.fcontext_policy_is_applied`(*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

**name** filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

`salt.modules.selinux.filetype_id_to_string`(*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

`salt.modules.selinux.getconfig`()

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

`salt.modules.selinux.getenforce`()

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.getsebool`(*boolean*)

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.getsemod`(*module*)

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.install_semod`(*module\_path*)

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

`salt.modules.selinux.list_sebool()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.list_semmod()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semmod
```

New in version 2016.3.0.

`salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)`

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type** The SELinux Type. Required.

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

**sel\_range** The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091
```

`salt.modules.selinux.port_delete_policy(name, protocol=None, port=None)`

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

`salt.modules.selinux.port_get_policy(name, sel_type=None, protocol=None, port=None)`

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- sel\_type (the selinux type)
- proto (the protocol)

- port (the port(s) and/or port range(s))

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type** The SELinux Type.

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

**salt.modules.selinux.remove\_semmod**(*module*)

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semmod module_name
```

New in version 2016.11.6.

**salt.modules.selinux.selinux\_fs\_path**()

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

**salt.modules.selinux.setenforce**(*mode*)

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

**salt.modules.selinux.setsebool**(*boolean, value, persist=False*)

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

**salt.modules.selinux.setsebools**(*pairs, persist=False*)

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

**salt.modules.selinux.setsemod**(*module, state*)

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

## 21.9.379 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

**maturity** new

**depends** sense\_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
 rotation: 90
```

**salt.modules.sensehat.clear** (*color=None*)  
Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberrypi' sensehat.clear
salt 'raspberrypi' sensehat.clear '[255, 0, 0]'
```

**salt.modules.sensehat.get\_humidity**()  
Get the percentage of relative humidity from the humidity sensor.

**salt.modules.sensehat.get\_pixel**(*x, y*)  
Returns the color of a single pixel on the LED matrix.  
*x* The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.  
*y* The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

---

**Note:** Please read the note for `get_pixels`

---

**salt.modules.sensehat.get\_pixels**()  
Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

---

**Note:** When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

---

**salt.modules.sensehat.get\_pressure**()  
Gets the current pressure in Millibars from the pressure sensor.

**salt.modules.sensehat.get\_temperature**()  
Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

`salt.modules.sensehat.get_temperature_from_humidity()`

Gets the temperature in degrees Celsius from the humidity sensor.

`salt.modules.sensehat.get_temperature_from_pressure()`

Gets the temperature in degrees Celsius from the pressure sensor.

`salt.modules.sensehat.low_light(low_light=True)`

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberrry' sensehat.low_light
salt 'raspberrry' sensehat.low_light False
```

`salt.modules.sensehat.set_pixel(x, y, color)`

Sets a single pixel on the LED matrix to a specified color.

**x** The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

**y** The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

**color** The new color of the pixel as a list of [R, G, B] values.

CLI Example:

```
salt 'raspberrry' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

`salt.modules.sensehat.set_pixels(pixels)`

Sets the entire LED matrix based on a list of 64 pixel values

**pixels** A list of 64 [R, G, B] color values.

`salt.modules.sensehat.show_image(image)`

Displays an 8 x 8 image on the LED matrix.

**image** The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```
salt 'raspberrry' sensehat.show_image /tmp/my_image.png
```

`salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)`

Displays a single letter on the LED matrix.

**letter** The letter to display

**text\_color** The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).

**back\_color** The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_letter 0
salt 'raspberrry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberrry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

`salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)`

Displays a message on the LED matrix.

**message** The message to display

**msg\_type** The type of the message. Changes the appearance of the message.

Available types are:

```
error: red text
warning: orange text
success: green text
info: blue text
```

**scroll\_speed** The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

**text\_color** The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

**back\_color** The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_message 'Status ok'
salt 'raspberrry' sensehat.show_message 'Something went wrong' error
salt 'raspberrry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberrry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 0, 0]' 0.2
```

### 21.9.380 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

**salt.modules.sensors.sense** (*chip, fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

```
/usr/bin/sensors
```

```
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
```

Given the above, the chip is 'coretemp-isa-0000'.

### 21.9.381 salt.modules.serverdensity\_device

#### Wrapper around Server Density API

New in version 2014.7.0.

**salt.modules.serverdensity\_device.create** (*name, \*\*params*)

Function to create device in Server Density. For more info, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

**salt.modules.serverdensity\_device.delete** (*device\_id*)

Delete a device from Server Density. For more information, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

**salt.modules.serverdensity\_device.get\_sd\_auth** (*val, sd\_auth\_pillar\_name='serverdensity'*)

Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent`(*agent\_key*, *agent\_version=1*)

Function downloads Server Density installation agent, and installs sd-agent with *agent\_key*. Optionally the *agent\_version* would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls`(*\*\*params*)

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on [listing](#) and [searching](#).

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.update`(*device\_id*, *\*\*params*)

Updates device information in Server Density. For more information see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama✘
↳group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama✘
↳group=rock_lamas swapSpace=512
```

## 21.9.382 salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

**depends** servicenow\_rest python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
 instance_name: ''
 username: ''
 password: ''
```

`salt.modules.servicenow.delete_record`(*table*, *sys\_id*)

Delete an existing record

**Parameters**

- **table** (str) – The table name, e.g. sys\_user
- **sys\_id** (str) – The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

`salt.modules.servicenow.non_structured_query` (*table*, *query=None*, *\*\*kwargs*)

Run a non-structed (not a dict) query on a servicenow table. See [http://wiki.servicenow.com/index.php?title=Encoded\\_Query\\_Strings#gsc.tab=0](http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0) for help on constructing a non-structured query string.

**Parameters**

- **table** (str) – The table name, e.g. `sys_user`
- **query** (str) – The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

`salt.modules.servicenow.set_change_request_state` (*change\_id*, *state='approved'*)

Set the approval state of a change request/record

**Parameters**

- **change\_id** (str) – The ID of the change request, e.g. `CHG123545`
- **state** (str) – The target state, e.g. `approved`

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

`salt.modules.servicenow.update_record_field` (*table*, *sys\_id*, *field*, *value*)

Update the value of a record's field in a servicenow table

**Parameters**

- **table** (str) – The table name, e.g. `sys_user`
- **sys\_id** (str) – The unique ID of the record
- **field** (str) – The new value
- **value** (str) – The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

### 21.9.383 salt.modules.slack\_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
 api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.call_hook` (*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon\_emoji=None*)

Send message to Slack incoming webhook.

**Parameters**

- **message** – The topic of message.
- **attachment** – The message to send to the Slack WebHook.

- **color** – The color of border of left side
- **short** – An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** – The identifier of WebHook.
- **channel** – The channel to use instead of the WebHook default.
- **username** – Username to use instead of WebHook default.
- **icon\_emoji** – Icon to use instead of WebHook default.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.find_room`(*name*, *api\_key=None*)

Find a room by name and return it.

**Parameters**

- **name** – The room name.
- **api\_key** – The Slack admin api key.

**Returns** The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.find_user`(*name*, *api\_key=None*)

Find a user by name and return it.

**Parameters**

- **name** – The user name.
- **api\_key** – The Slack admin api key.

**Returns** The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_rooms`(*api\_key=None*)

List all Slack rooms.

**Parameters** **api\_key** – The Slack admin api key.

**Returns** The room list.

CLI Example:

```
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_users`(*api\_key=None*)

List all Slack users.

**Parameters** **api\_key** – The Slack admin api key.

**Returns** The user list.

CLI Example:

```
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)`

Send a message to a Slack channel.

#### Parameters

- **channel** – The channel name, either will work.
- **message** – The message to send to the Slack channel.
- **from\_name** – Specify who the message is from.
- **api\_key** – The Slack api key, if not specified in the configuration.
- **icon** – URL to an image to use as the icon for this message

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
↳from_name="Build Server"
```

## 21.9.384 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)`

Deserialize a Python object using a `serializer` module

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```
{% set python_object = salt.slsutil.deserialize('json',
'{"foo": "Foo!"}') %}
```

`salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)`

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)`

New in version 2019.2.0.

Merge a list of objects into each other in order

#### Parameters

- **lst** (*Iterable*) – List of objects to be merged.
- **strategy** (*String*) – Merge strategy. See `utils.dictupdate`.
- **renderer** (*String*) – Renderer type. Used to determine strategy when strategy is 'smart'.
- **merge\_lists** (*Bool*) – Defines whether to merge embedded object lists.

CLI Example:

```
$ salt-call --output=txt slsutil.merge_all '[[{foo: Foo}, {foo: Bar}]]'
local: {u'foo': u'Bar'}
```

`salt.modules.slsutil.renderer` (*path=None, string=None, default\_renderer='jinja|yaml', \*\*kwargs*)  
Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

#### Parameters

- **path** – The path to a file on Salt's fileserver (any URIs supported by `cp.get_url`) or on the local file system.
- **string** – An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **default\_renderer** – The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** – Keyword args to pass to Salt's `compile_template()` function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!/jinja|yaml
{% set apache = salt.grains.filter_by({
 ...normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!/py
def run():
 apache = __salt__.grains.filter_by({
 ...normal map here but as a python dict...
 }, merge=__salt__.pillar.get('apache:lookup'))
 return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

`salt.modules.slsutil.serialize(serializer, obj, **mod_kwargs)`  
Serialize a Python object using a `serializer` module

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{ 'foo': 'Foo!' }
```

Jinja Example:

```
{% set json_string = salt.slsutil.serialize('json',
 {'foo': 'Foo!'}) %}
```

`salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)`  
Merge `upd` recursively into `dest`

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

### 21.9.385 salt.modules.smartos\_imgadm

Module for running `imgadm` command on SmartOS

`salt.modules.smartos_imgadm.avail(search=None, verbose=False)`

Return a list of available images

**search** [string] search keyword

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

`salt.modules.smartos_imgadm.delete(uuid)`

Remove an installed image

**uuid** [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.docker_to_uuid(uuid)`

Get the image uuid from an imported docker image

New in version 2019.2.0.

`salt.modules.smartos_imgadm.get(uuid)`

Return info on an installed image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

`salt.modules.smartos_imgadm.import_image(uuid, verbose=False)`

Import an image from the repository

**uuid** [string] uuid to import

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

**salt.modules.smartos\_imgadm.list\_installed**(*verbose=False*)

Return a list of installed images

**verbose** [boolean (False)] toggle verbose output

Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

**salt.modules.smartos\_imgadm.show**(*uuid*)

Show manifest of a given image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

**salt.modules.smartos\_imgadm.source\_add**(*source, source\_type='imgapi'*)

Add a new source

**source** [string] source url to add

**source\_type** [string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

**salt.modules.smartos\_imgadm.source\_delete**(*source*)

Delete a source

**source** [string] source url to delete

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```

**salt.modules.smartos\_imgadm.sources**(*verbose=False*)

Return a list of available sources

**verbose** [boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```

**salt.modules.smartos\_imgadm.update\_installed**(*uuid=""*)

Gather info on unknown image(s) (locally installed)

**uuid** [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

`salt.modules.smartos_imgadm.vacuum(verbose=False)`

Remove unused images

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

`salt.modules.smartos_imgadm.version()`

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```

### 21.9.386 salt.modules.smartos\_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

`salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)`

Add a new nictag

**name** [string] name of new nictag

**mac** [string] mac of parent interface or 'etherstub' to create a ether stub

**mtu** [int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

`salt.modules.smartos_nictagadm.delete(name, force=False)`

Delete nictag

**name** [string] nictag to delete

**force** [boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)`

Check if nictags exists

**nictag** [string] one or more nictags to check

**verbose** [boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)`

List all nictags

**include\_etherstubs** [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

`salt.modules.smartos_nictagadm.update`(*name*, *mac=None*, *mtu=None*)

Update a nictag

**name** [string] name of nictag

**mac** [string] optional new mac for nictag

**mtu** [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

`salt.modules.smartos_nictagadm.vms`(*nictag*)

List all vms connect to nictag

**nictag** [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

### 21.9.387 salt.modules.smartos\_virt

virt compatibility module for managing VMs on SmartOS

`salt.modules.smartos_virt.get_macs`(*domain*)

Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.smartos_virt.init`(*\*\*kwargs*)

Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

`salt.modules.smartos_virt.list_active_vms`()

Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.smartos_virt.list_domains`()

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.smartos_virt.list_inactive_vms`()

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.smartos_virt.reboot(domain)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.smartos_virt.setmem(domain, memory)`

Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

`salt.modules.smartos_virt.shutdown(domain)`

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.smartos_virt.start(domain)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.smartos_virt.stop(domain)`

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.smartos_virt.vm_info(domain)`

Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

`salt.modules.smartos_virt.vm_virt_type(domain)`

Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

## 21.9.388 salt.modules.smartos\_vmadm

Module for running vmadm command on SmartOS

`salt.modules.smartos_vmadm.create(from_file=None, **kwargs)`

Create a new vm

**from\_file** [string] json file to create the vm from – if present, all other options will be ignored

**kwargs** [string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{"nic_tag": "admin",
↳ "ip": "198.51.100.123", ...}, {...}]' [...]
```

`salt.modules.smartos_vmadm.create_snapshot`(*vm*, *name*, *key*='uuid')

Create snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_.:%] to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.delete`(*vm*, *key*='uuid')

Delete a vm

**vm** [string] vm to be deleted

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

`salt.modules.smartos_vmadm.delete_snapshot`(*vm*, *name*, *key*='uuid')

Delete snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_.:%] to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.get`(*vm*, *key*='uuid')

Output the JSON object describing a VM

**vm** [string] vm to be targeted

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

`salt.modules.smartos_vmadm.info`(*vm*, *info\_type*='all', *key*='uuid')

Lookup info on running kvm

**vm** [string] vm to be targeted

**info\_type** [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias

```

`salt.modules.smartos_vmadm.list_vms`(*search=None, sort=None, order='uuid, type, ram, state, alias', keyed=True*)

Return a list of VMs

**search** [string] vmadm filter property

**sort** [string] vmadm sort (-s) property

**order** [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias

**keyed** [boolean]

**specified if the output should be an array (False) or dict (True)** For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```

salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'

```

`salt.modules.smartos_vmadm.lookup`(*search=None, order=None, one=False*)

Return a list of VMs using lookup

**search** [string] vmadm filter property

**order** [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias

**one** [boolean] return only one result (vmadm's -1)

CLI Example:

```

salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True

```

`salt.modules.smartos_vmadm.reboot`(*vm, force=False, key='uuid'*)

Reboot a vm

**vm** [string] vm to be rebooted

**force** [boolean] force reboot of vm if true

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname

```

`salt.modules.smartos_vmadm.receive`(*uuid, source*)

Receive a vm from a directory

**uuid** [string] uuid of vm to be received

**source** [string] source directory

CLI Example:

```

salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups

```

`salt.modules.smartos_vmadm.reprovision`(*vm, image, key='uuid'*)

Reprovision a vm

**vm** [string] vm to be reprovisioned

**image** [string] uuid of new image

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
↪11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

`salt.modules.smartos_vmadm.rollback_snapshot`(*vm*, *name*, *key*='uuid')

Rollback snapshot of a vm

**vm** [string] vm to be targeted

**name** [string]

**snapshot name** The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_.:%] to comply with ZFS restrictions.

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.send`(*vm*, *target*, *key*='uuid')

Send a vm to a directory

**vm** [string] vm to be sent

**target** [string] target directory

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

`salt.modules.smartos_vmadm.start`(*vm*, *options*=None, *key*='uuid')

Start a vm

**vm** [string] vm to be started

**options** [string] optional additional options

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=
↪path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.stop`(*vm*, *force*=False, *key*='uuid')

Stop a vm

**vm** [string] vm to be stopped

**force** [boolean] force stop of vm if true

**key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.sysrq`(*vm*, *action*='nmi', *key*='uuid')

Send non-maskable interrupt to vm or capture a screenshot

**vm** [string] vm to be targeted

**action** [string] nmi or screenshot – Default: nmi  
**key** [string [uuid|alias|hostname]] value type of 'vm' parameter  
CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

**salt.modules.smartos\_vmadm.update**(*vm*, *from\_file*=None, *key*='uuid', *\*\*kwargs*)

Update a new vm  
**vm** [string] vm to be updated  
**from\_file** [string] json file to update the vm with – if present, all other options will be ignored  
**key** [string [uuid|alias|hostname]] value type of 'vm' parameter  
**kwargs** [string|int|...] options to update for the vm  
CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_
↳vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_
↳memory=1024
```

## 21.9.389 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

### External References

[Desktop Management Interface \(DMI\)](#)

[System Management BIOS](#)

[DMidecode](#)

**salt.modules.smbios.get**(*string*, *clean*=True)

Get an individual DMI string from SMBIOS info

**string**

The string to fetch. DMidecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer

- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

**clean**

Don't return well-known false information  
(invalid UUID's, serial 000000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records` (*rec\_type=None, fields=None, clean=True*)

Return DMI records from SMBIOS

**type** Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe

Continued on next page

Table 10 – continued from previous page

Type	Information
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

**clean**

Don't return well-known false information  
(invalid UUID's, serial 00000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

**21.9.390 salt.modules.smf\_service**

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see [here](#).

---

**salt.modules.smf\_service.available**(*name*)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the `svcs` command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

**salt.modules.smf\_service.disable**(*name*, *\*\*kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

**salt.modules.smf\_service.disabled**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf_service.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf_service.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf_service.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf_service.get_running()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf_service.get_stopped()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf_service.missing(name)`

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.391 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

**depends**

- smtplib python module

**configuration** This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```

my-smtp-login:
 smtp.server: smtp.domain.com
 smtp.tls: True
 smtp.sender: admin@domain.com
 smtp.username: myuser
 smtp.password: verybadpass

```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```

my-smtp-login:
 smtp.server: smtp.domain.com
 smtp.tls: True
 smtp.sender: admin@domain.com
 smtp.username: myuser
 smtp.password: verybadpass

another-smtp-login:
 smtp.server: smtp.domain.com
 smtp.tls: True
 smtp.sender: admin@domain.com
 smtp.username: myuser
 smtp.password: verybadpass

```

`salt.modules.smtp.send_msg`(*recipient, message, subject='Message from Salt', sender=None, server=None, use\_ssl='True', username=None, password=None, profile=None, attachments=None*)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```

salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile=
↳ 'my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username=
↳ 'myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.
↳ com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username=
↳ 'myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.
↳ com' attachments="['/var/log/messages']"

```

### 21.9.392 salt.modules.solaris\_fmadm

Module for running fmadm and fmdump on Solaris

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** solaris,illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.acquit`(*fmri*)

Acquit resource or acquit case

**fmri:** string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.config()`

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty()`

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush(fmri)`

Flush cached state for resource

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy()`

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list_records(after=None, before=None)`

Display fault management logs

**after** [string] filter events after time, see man fmdump for format

**before** [string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load(path)`

Load specified fault manager module

**path:** string path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired(fmri)`

Notify fault manager that resource has been repaired

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced(fmri)`

Notify fault manager that resource has been replaced

**fmri:** string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.reset`(*module*, *serd=None*)

Reset module or sub-component

**module:** **string** module to unload

**serd** [string] serd sub module

CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.show`(*uuid*)

Display log details

**uuid:** **string** uuid of fault

CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload`(*module*)

Unload specified fault manager module

**module:** **string** module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

### 21.9.393 salt.modules.solaris\_group

Manage groups on Solaris

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.solaris_group.add`(*name*, *gid=None*, *\*\*kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info(name)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

### 21.9.394 salt.modules.solaris\_shadow

Manage the password database on Solaris systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

---

`salt.modules.solaris_shadow.default_hash()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.del_password(name)`

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

New in version 2015.8.8.

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

**password** Plaintext password to be hashed.

**crypt\_salt** Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm** The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.solaris_shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root 1UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.set_warndays(name, warndays)`

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

### 21.9.395 salt.modules.solaris\_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.solaris_system.init(state)`

Change the system runlevel on sysV compatible systems

CLI Example:

`state` [string] Init state

```
salt '*' system.init 3
```

`salt.modules.solaris_system.poweroff()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.solaris_system.reboot(delay=0, message=None)`

Reboot the system

**delay** [int] Optional wait time in seconds before the system will be rebooted.

**message** [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.shutdown(delay=0, message=None)`

Shutdown a running system

**delay** [int] Optional wait time in seconds before the system will be shutdown.

**message** [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

### 21.9.396 salt.modules.solaris\_user

Manage users with the useradd command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

`salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname="", roomnumber="", workphone="", home-phone="", createhome=True, **kwargs)`

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.chfullname(name, fullname)`

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.chgid(name, gid)`

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.chgroups` (*name, groups, append=False*)

Change the groups to which a user belongs

**name** Username to modify

**groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.chhome` (*name, home, persist=False*)

Set a new home directory for an existing user

**name** Username to modify

**home** New home directory to set

**persist** [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.chhomephone` (*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.chroomnumber` (*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.chshell` (*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.chuid` (*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.chworkphone` (*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.delete` (*name, remove=False, force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.solaris_user.rename` (*name, new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

### 21.9.397 salt.modules.solarisipspkg

IPS pkg support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
 pkg.installed:
 - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
 pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
 pkg: pkgutil
```

`salt.modules.solarisipspkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.get_fmri(name, **kwargs)`

Returns FMRI from partial name. Returns empty string (") if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)`

Install the named package using the IPS `pkg` command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

Multiple Package Installation Options:

**pkgs** A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['"foo"', '"bar"']
```

`salt.modules.solarisipspkg.is_installed(name, **kwargs)`

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisipspkg.latest_version(*names, **kwargs)`

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)`

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)`

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

**refresh** [True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisipspkg.normalize_name(name, **kwargs)`

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisipspkg.purge(name, **kwargs)`

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisipspkg.refresh_db`(*full=False*)

Updates the remote repos database.

full : False

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisipspkg.remove`(*name=None, pkgs=None, \*\*kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

`salt.modules.solarisipspkg.search`(*name, versions\_as\_list=False, \*\*kwargs*)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisipspkg.upgrade`(*refresh=False, \*\*kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constraints linked to the version of `pkg://solaris/entire`.

Returns a dictionary containing the changes:

```
{<package>: {'old': '<old-version>',
 'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg update command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisipspkg.upgrade_available(name)`

Check if there is an upgrade available for a certain package. Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisipspkg.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using `pkg_resource`, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

### 21.9.398 salt.modules.solarisipspkg

Package support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.solarisipspkg.install(name=None, sources=None, saltenv='base', **kwargs)`

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'package': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Examples:

```
Installing a data stream pkg that already exists on the minion

salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-
↳sparc-local.pkg"}]'

Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-
↳local.pkg"}]'
```

CLI Example:

```
Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
↳filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/gcc-3.4.
↳6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current\_zone\_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↳sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin\_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↳instance="overwrite"
```

SLS Example:

```
Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
 pkg.installed:
 - sources:
 - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
 - instance: overwrite
```

**Note:** The ID declaration is ignored, as the package name is read from the sources parameter.

CLI Example:

```
Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↪admin_source='salt://pkgs/<adminfile filename>'

Providing your own adminfile when using states

<pkg name>:
 pkg.installed:
 - sources:
 - <pkg name>: salt://pkgs/<pkg filename>
 - admin_source: salt://pkgs/<adminfile filename>
```

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)`

Remove packages with `pkgrm`

**name** The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin\_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.solarispkg.upgrade\_available**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.solarispkg.version**(\**names*, \*\**kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

## 21.9.399 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the `solr.type`. If you have questions or want a feature request please ask.

### Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve `match_index_versions` since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

### Override these in the minion config

**solr.cores** A list of core names e.g. `['core1','core2']`. An empty list indicates non-multicore setup.

**solr.baseurl** The root level URL to access solr via HTTP

**solr.request\_timeout** The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

**solr.type** Possible values are 'master' or 'slave'

**solr.backup\_path** The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

**solr.num\_backups** For versions of solr  $\geq$  3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

**solr.init\_script** The full path to your init script with start/stop options

**solr.dih.options** A list of options to pass to the DIH.

### Required Options for DIH

**clean** [False] Clear the index before importing

**commit** [True] Commit the documents to the index upon completion

**optimize** [True] Optimize the index after commit is complete

**verbose** [True] Get verbose output

**salt.modules.solr.abort\_import** (*handler, host=None, core\_name=None, verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with `solr.type=master`

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

`salt.modules.solr.backup` (*host=None, core\_name=None, append\_core\_to\_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

**append\_core\_to\_path** [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.core_status` (*host=None, core\_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

`salt.modules.solr.delta_import` (*handler, host=None, core\_name=None, options=None, extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**options** [dict (`__opts__`)] A list of options such as clean, optimize commit, verbose, and pause\_replication. leave blank to use `__opts__` defaults. options will be merged with `__opts__`

**extra** [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

`salt.modules.solr.full_import` (*handler, host=None, core\_name=None, options=None, extra=None*)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**options** [dict (\_\_opts\_\_)] A list of options such as clean, optimize commit, verbose, and pause\_replication. leave blank to use \_\_opts\_\_ defaults. options will be merged with \_\_opts\_\_

**extra** [dict ({})] Extra name value pairs to pass to the handler. e.g. [”name=value”]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

**salt.modules.solr.import\_status**(*handler, host=None, core\_name=None, verbose=False*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: 'master'

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. \_\_opts\_\_[’host’] is default.

**core** [str (None)] The core the handler belongs to.

**verbose** [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

**salt.modules.solr.is\_replication\_enabled**(*host=None, core\_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

**host** [str (None)] The solr host to query. \_\_opts\_\_[’host’] is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

**salt.modules.solr.lucene\_version**(*core\_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

**salt.modules.solr.match\_index\_versions**(*host=None, core\_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

`salt.modules.solr.optimize` (*host=None, core\_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

`salt.modules.solr.ping` (*host=None, core\_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.reload_core` (*host=None, core\_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.  
**core\_name** [str] The name of the core to reload  
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

`salt.modules.solr.reload_import_config`(*handler*, *host=None*, *core\_name=None*, *verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

**handler** [str] The name of the data import handler.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core** [str (None)] The core the handler belongs to.

**verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

`salt.modules.solr.replication_details`(*host=None*, *core\_name=None*)

Get the full replication details.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

`salt.modules.solr.set_is_polling`(*polling*, *host=None*, *core\_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

**polling** [boolean] True will enable polling. False will disable it.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

`salt.modules.solr.set_replication_enabled`(*status*, *host=None*, *core\_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

**status** [boolean] Sets the replication status to the specified state.

**host** [str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

**salt.modules.solr.signal**(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

**signal** [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'

CLI Example:

```
salt '*' solr.signal restart
```

**salt.modules.solr.version**(*core\_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

**core\_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

## 21.9.400 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

**salt.modules.solrcloud.BOOL\_PROPS\_LIST = ['transient', 'loadOnStartup']**

Collections options type definition Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1>

**salt.modules.solrcloud.DICT\_OPTIONS\_LIST = ['properties']**

Collection unmodifiable options Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll>

**salt.modules.solrcloud.alias\_exists**(*alias\_name, \*\*kwargs*)

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

**salt.modules.solrcloud.alias\_get\_collections**(*alias\_name, \*\*kwargs*)

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

`salt.modules.solrcloud.alias_set_collections`(*alias\_name*, *collections=None*, *\*\*kwargs*)

Define an alias

Additional parameters (*kwargs*) may be passed, they will be proxied to `http.query`

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

`salt.modules.solrcloud.cluster_status`(*\*\*kwargs*)

Get cluster status

Additional parameters (*kwargs*) may be passed, they will be proxied to `http.query`

CLI Example:

```
salt '*' solrcloud.cluster_status
```

`salt.modules.solrcloud.collection_backup`(*collection\_name*, *location*, *backup\_name=None*, *\*\*kwargs*)

Create a backup for a collection.

Additional parameters (*kwargs*) may be passed, they will be proxied to `http.query`

CLI Example:

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_backup_all`(*location*, *backup\_name=None*, *\*\*kwargs*)

Create a backup for all collection present on the server.

Additional parameters (*kwargs*) may be passed, they will be proxied to `http.query`

CLI Example:

```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_check_options`(*options*)

Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

`salt.modules.solrcloud.collection_create`(*collection\_name*, *options=None*, *\*\*kwargs*)

Create a collection,

Additional parameters (*kwargs*) may be passed, they will be proxied to `http.query`

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection\_name"

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":"/srv/solr/hugePartitionSollection"}}
```

**salt.modules.solrcloud.collection\_creation\_options()**

Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

**salt.modules.solrcloud.collection\_exists(*collection\_name*, *\*\*kwargs*)**

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

**salt.modules.solrcloud.collection\_get\_options(*collection\_name*, *\*\*kwargs*)**

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

**salt.modules.solrcloud.collection\_list(*\*\*kwargs*)**

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

**salt.modules.solrcloud.collection\_reload(*collection*, *\*\*kwargs*)**

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

**salt.modules.solrcloud.collection\_set\_options(*collection\_name*, *options*, *\*\*kwargs*)**

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={"replicationFactor":4}
```

`salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>`  
Core properties type definition. Reference: <https://cwiki.apache.org/confluence/display/solr/Defining+core.properties>

### 21.9.401 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

#### depends

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
 username: alice
 password: abc123
 host: example.splunkcloud.com
 port: 8080
```

`salt.modules.splunk.create_user(email, profile='splunk', **kwargs)`  
create a splunk user by name/email

CLI Example:

```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User"
name=testuser
```

`salt.modules.splunk.delete_user(email, profile='splunk')`  
Delete a splunk user by email

CLI Example:

```
salt myminion splunk_user.delete 'user@example.com'
```

`salt.modules.splunk.get_user(email, profile='splunk', **kwargs)`  
Get a splunk user by name/email

CLI Example:

```
salt myminion splunk.get_user 'user@example.com' user_details=false salt myminion
splunk.get_user 'user@example.com' user_details=true
```

`salt.modules.splunk.list_users(profile='splunk')`  
List all users in the splunk DB

CLI Example:

```
salt myminion splunk.list_users
```

`salt.modules.splunk.update_user(email, profile='splunk', **kwargs)`  
Create a splunk user by email

CLI Example:

```
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"
```

### 21.9.402 salt.modules.splunk\_search

Module for interop with the Splunk API

New in version 2015.5.0.

### depends

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
 username: alice
 password: abc123
 host: example.splunkcloud.com
 port: 8080
```

`salt.modules.splunk_search.create` (*name*, *profile='splunk'*, *\*\*kwargs*)

Create a splunk search

CLI Example:

```
splunk_search.create 'my search name' search='error msg'
```

`salt.modules.splunk_search.delete` (*name*, *profile='splunk'*)

Delete a splunk search

CLI Example:

```
splunk_search.delete 'my search name'
```

`salt.modules.splunk_search.get` (*name*, *profile='splunk'*)

Get a splunk search

CLI Example:

```
splunk_search.get 'my search name'
```

`salt.modules.splunk_search.list_` (*profile='splunk'*)

List splunk searches (names only)

CLI Example: `splunk_search.list`

`salt.modules.splunk_search.list_all` (*prefix=None*, *app=None*, *owner=None*, *description\_contains=None*, *name\_not\_contains=None*, *profile='splunk'*)

Get all splunk search details. Produces results that can be used to create an sls file.

if `app` or `owner` are specified, results will be limited to matching saved searches.

if `description_contains` is specified, results will be limited to those where "description\_contains in description" is true if `name_not_contains` is specified, results will be limited to those where "name\_not\_contains not in name" is true.

If `prefix` parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:

1. **Make a "backup" of all existing searches** `$ salt-call splunk_search.list_all -out=txt | sed "s/local: //" > legacy_searches.sls`
2. **Get all searches with new prefixed names** `$ salt-call splunk_search.list_all "prefix=**MANAGED BY SALT**" -out=txt | sed "s/local: //" > managed_searches.sls`
3. **Insert the managed searches into splunk** `$ salt-call state.sls managed_searches.sls`
4. Manually verify that the new searches look right
5. Delete the original searches `$ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls`  
`salt-call state.sls remove_legacy_searches.sls`

6. Get all searches again, verify no changes `$ salt-call splunk_search.list_all -out=txt | sed "s/local: //" > final_searches.sls $ diff final_searches.sls managed_searches.sls`

`salt.modules.splunk_search.update` (*name*, *profile='splunk'*, *\*\*kwargs*)

Update a splunk search

CLI Example:

```
splunk_search.update 'my search name' sharing=app
```

### 21.9.403 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.fetch` (*db=None*, *sql=None*)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.indexes` (*db=None*)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.indices` (*db=None*)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.modify` (*db=None*, *sql=None*)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

`salt.modules.sqlite3.sqlite_version` ()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.tables` (*db=None*)

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.version` ()

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

### 21.9.404 salt.modules.ssh

Manage client ssh components

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

```
salt.modules.ssh.auth_keys(user=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)
```

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

```
salt.modules.ssh.check_key(user, key, enc, comment, options, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
```

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

```
salt.modules.ssh.check_key_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
```

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

```
salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)
```

Check the record in known\_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

```
salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)
```

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

`salt.modules.ssh.hash_known_hosts` (*user=None, config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

**user** hash known hosts of this user

**config** path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.host_keys` (*keydir=None, private=True, certs=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

`salt.modules.ssh.key_is_encrypted` (*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.recv_known_host_entries` (*hostname, enc=None, port=None, hash\_known\_hosts=True, timeout=5, fingerprint\_hash\_type=None*)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

**hostname** The name of the remote host (e.g. "github.com")

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**port** Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

**fingerprint\_hash\_type** The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.rm_auth_key`(*user*, *key*, *config*='.ssh/authorized\_keys', *fingerprint\_hash\_type*=None)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.rm_auth_key_from_file`(*user*, *source*, *config*='.ssh/authorized\_keys', *saltenv*='base', *fingerprint\_hash\_type*=None)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.rm_known_host`(*user*=None, *hostname*=None, *config*=None, *port*=None)

Remove all keys belonging to hostname from a known\_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.set_auth_key`(*user*, *key*, *enc*='ssh-rsa', *comment*="", *options*=None, *config*='.ssh/authorized\_keys', *cache\_keys*=None, *fingerprint\_hash\_type*=None)

Add a key to the authorized\_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with `user@host`, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

`salt.modules.ssh.set_auth_key_from_file`(*user*, *source*, *config*='.ssh/authorized\_keys', *saltenv*='base', *fingerprint\_hash\_type*=None)

Add a key to the authorized\_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`salt.modules.ssh.set_known_host`(*user*=None, *hostname*=None, *fingerprint*=None, *key*=None, *port*=None, *enc*=None, *config*=None, *hash\_known\_hosts*=True, *timeout*=5, *fingerprint\_hash\_type*=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known\_hosts file.

If such a record does already exists in there, do nothing.

**user** The user who owns the ssh authorized keys file to modify

**hostname** The name of the remote host (e.g. "github.com")

**fingerprint** The fingerprint of the key which must be present in the known\_hosts file (optional if key specified)

**key** The public key which must be presented in the known\_hosts file (optional if fingerprint specified)

**port** optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to "/etc/ssh/ssh\_known\_hosts". If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.  
**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=
↳ '.ssh/known_hosts'
```

`salt.modules.ssh.user_keys` (*user=None, pubfile=None, prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
↳ home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=["'user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 21.9.405 salt.modules.ssh\_pkg

Service support for the REST example

`salt.modules.ssh_pkg.install` (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, \*\*kwargs*)

`salt.modules.ssh_pkg.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

`salt.modules.ssh_pkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

### 21.9.406 salt.modules.ssh\_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

`salt.modules.ssh_service.enabled` (*name, sig=None*)

Only the 'redbull' service is 'enabled' in the test

`salt.modules.ssh_service.get_all` ()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.ssh_service.list_()`

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.restart(name, sig=None)`

Restart the specified service with rest\_sample CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.running(name, sig=None)`

Return whether this service is running.

`salt.modules.ssh_service.start(name, sig=None)`

Start the specified service on the ssh\_sample

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.status(name, sig=None)`

Return the status for a service via ssh\_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**Parameters**

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.stop(name, sig=None)`

Stop the specified service on the rest\_sample

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.407 salt.modules.snapper module

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

**codeauthor** Duncan Mac-Vicar P. <dmacvicar@suse.de>

**codeauthor** Pablo Suárez Hernández <psuarezhernandez@suse.de>

**depends** dbus Python module.

**depends** snapper <http://snapper.io>, available in most distros

**maturity** new

platform Linux

`salt.modules.snapper.changed_files` (*config='root', num\_pre=None, num\_post=None*)

Returns the files changed between two snapshots

**config** Configuration name.

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

`salt.modules.snapper.create_baseline` (*tag='baseline', config='root'*)

Creates a snapshot marked as baseline

**tag** Tag name for the baseline

**config** Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

`salt.modules.snapper.create_config` (*name=None, subvolume=None, fstype=None, template=None, extra\_opts=None*)

Creates a new Snapper configuration

**name** Name of the new Snapper configuration.

**subvolume** Path to the related subvolume.

**fstype** Filesystem type of the subvolume.

**template** Configuration template to use. (Default: default)

**extra\_opts** Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳extra_opts='{ "NUMBER_CLEANUP": False}'
```

`salt.modules.snapper.create_snapshot` (*config='root', snapshot\_type='single', pre\_number=None, description=None, cleanup\_algorithm='number', userdata=None, \*\*kwargs*)

Creates an snapshot

**config** Configuration name.

**snapshot\_type** Specifies the type of the new snapshot. Possible values are single, pre and post.

**pre\_number** For post snapshots the number of the pre snapshot must be provided.

**description** Description for the snapshot. If not given, the salt job will be used.

**cleanup\_algorithm** Set the cleanup algorithm for the snapshot.

**number** Deletes old snapshots when a certain number of snapshots is reached.

**timeline** Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

**empty-pre-post** Deletes pre/post snapshot pairs with empty diffs.

**userdata** Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI example:

```
salt '*' snapper.create_snapshot
```

`salt.modules.snapper.delete_snapshot` (*snapshots\_ids=None, config='root'*)

Deletes an snapshot

**config** Configuration name. (Default: root)

**snapshots\_ids** List of the snapshots IDs to be deleted.

CLI example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

`salt.modules.snapper.diff` (*config='root', filename=None, num\_pre=None, num\_post=None*)

Returns the differences between two snapshots

**config** Configuration name.

**filename** if not provided the showing differences between snapshots for all "text" files

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

`salt.modules.snapper.diff_jid` (*jid, config='root'*)

Returns the changes applied by a *jid*

**jid** The job id to lookup

**config** Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

`salt.modules.snapper.get_config` (*name='root'*)

Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

`salt.modules.snapper.get_snapshot` (*number=0, config='root'*)

Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot 1
```

`salt.modules.snapper.list_configs` ()

List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

`salt.modules.snapper.list_snapshots` (*config='root'*)

List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

`salt.modules.snapper.modify_snapshot` (*snapshot\_id=None, description=None, userdata=None, cleanup=None, config='root'*)

Modify attributes of an existing snapshot.

**config** Configuration name. (Default: root)

**snapshot\_id** ID of the snapshot to be modified.

**cleanup** Change the cleanup method of the snapshot. (str)

**description** Change the description of the snapshot. (str)

**userdata** Change the userdata dictionary of the snapshot. (dict)

CLI example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata={'foo': 'bar'}
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

`salt.modules.snapper.run` (*function, \*args, \*\*kwargs*)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

**function** Salt function to call.

**config** Configuration name. (default: "root")

**description** A description for the snapshots. (default: None)

**userdata** Data to include in the snapshot metadata. (default: None)

**cleanup\_algorithm** Snapper cleanup algorithm. (default: "number")

**\*args** args for the function to call. (default: None)

**\*\*kwargs** kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt\_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args=['/etc/motd', 'some text']
```

`salt.modules.snapper.set_config` (*name='root', \*\*kwargs*)

Set configuration values

CLI example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

`salt.modules.snapper.status` (*config='root', num\_pre=None, num\_post=None*)

Returns a comparison between two snapshots

**config** Configuration name.

**num\_pre** first snapshot ID to compare. Default is last snapshot

**num\_post** last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

`salt.modules.snapper.status_to_string(dbus_status)`

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

`salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)`

Undo all file changes that happened between `num_pre` and `num_post`, leaving the files into the state of `num_pre`.

**Warning:** If one of the files has changes after `num_post`, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in `num_pre`.

You to undo changes between `num_pre` and the current version of the files use `num_post=0`.

CLI Example:

```
salt '*' snapper.undo
```

`salt.modules.snapper.undo_jid(jid, config='root')`

Undo the changes applied by a salt job

**jid** The job id to lookup

**config** Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

## 21.9.408 salt.modules.state

Control the state system on the minion.

### State Caching

When a `highstate` is called, the minion automatically caches a copy of the last high data. If you then run a `highstate` with `cache=True` it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

`salt.modules.state.apply_(mods=None, **kwargs)`

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

### APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in `top.sls`:

- test** Run states in test-only (dry-run) mode

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↳exclude'}]"
```

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

## APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE .SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

Run the states configured in a more deeply nested directory such as salt://my/
↳organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

**test** Run states in test-only (dry-run) mode

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

**sync\_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

---

**Note:** This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

---

New in version 2017.7.8,2018.3.3,2019.2.0.

`salt.modules.state.check_request` (`name=None`)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.clear_cache` ()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.clear_request` (*name=None*)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.disable` (*states*)

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate, test.succeed_without_changes
```

---

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

---

`salt.modules.state.enable` (*states*)

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

---

**Note:** To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

---

`salt.modules.state.event` (*tagmatch='\*', count=-1, quiet=False, sock\_dir=None, pretty=False, node='minion'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

**Parameters**

- **tagmatch** – the event is written to stdout for each tag that matches this glob or regular expression.
- **count** – this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** – do not print to stdout; just block
- **sock\_dir** – path to the Salt master's event socket file.
- **pretty** – Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.

- **node** – Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.get_pauses` (*jid=None*)

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a `jid` if you only desire to see a single pause data set.

`salt.modules.state.high` (*data*, *test=None*, *queue=False*, *\*\*kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}]'
```

`salt.modules.state.highstate` (*test=None*, *queue=False*, *\*\*kwargs*)

Retrieve the state data from the salt master for this minion and execute it

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.highstate stuff pillar={'foo': "bar"}
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc** Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of `sls` names, a comma-separated string of `sls` names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
→exclude'}]"
```

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file\_roots, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_
→exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.id_exists`(*ids*, *mods*, *test=None*, *queue=False*, *\*\*kwargs*)

Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to `state.sls_exists`, returns True or False. The default environment is base, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv** Specify a salt fileserver environment from which to look for the SLS files specified in the *mods* argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

`salt.modules.state.list_disabled`()

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

`salt.modules.state.low`(*data*, *queue=False*, *\*\*kwargs*)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

`salt.modules.state.orchestrate`(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- Docs for the ``salt`` state module <salt.states.saltmod>

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

`salt.modules.state.pause` (*jid*, *state\_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the *jid* of the running state and can optionally pass in a duration in seconds. If a *state\_id* is not passed then the *jid* referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
 pkg.installed: []
```

The *state\_id* to pass to *pause* is *vim*

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

`salt.modules.state.pkg` (*pkg\_path*, *pkg\_sum*, *hash\_type*, *test=None*, *\*\*kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using `salt-ssh`.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

`salt.modules.state.request` (*mods=None*, *\*\*kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via `salt-call state.run_request`. All arguments match those of `state.apply`.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

`salt.modules.state.resume` (*jid*, *state\_id=None*)

Remove a pause from a *jid*, allowing it to continue. If the *state\_id* is not specified then the a general pause will be resumed.

The given *state\_id* is the id got a given state execution, so given a state that looks like this:

```
vim:
 pkg.installed: []
```

The *state\_id* to pass to *rm\_pause* is *vim*

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

`salt.modules.state.run_request` (*name='default', \*\*kwargs*)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.running` (*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.show_highstate` (*queue=False, \*\*kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.show_low_sls` (*mods, test=None, queue=False, \*\*kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

`salt.modules.state.show_lowstate` (*queue=False, \*\*kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.show_sls` (*mods, test=None, queue=False, \*\*kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

**salt.modules.state.show\_state\_usage** (*queue=False, \*\*kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the *pillar* kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

**salt.modules.state.show\_states** (*queue=False, \*\*kwargs*)

Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

**salt.modules.state.show\_top** (*queue=False, \*\*kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

**salt.modules.state.single** (*fun, name, test=None, queue=False, \*\*kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

**salt.modules.state.sls** (*mods, test=None, exclude=None, queue=False, sync\_mods=None, \*\*kwargs*)

Execute the states in one or more SLS files

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls stuff pillar={'foo': 'bar'}
```

---

**Note:** Values passed this way will override existing Pillar values set via *pillar\_roots* or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="{['id': 'id_to_exclude'], ['sls':
→ 'sls_to_exclude']}"
```

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**sync\_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

CLI Example:

```
Run the states configured in salt://example.sls (or salt://example/init.sls)
salt '*' state.apply example

Run the states configured in salt://core.sls (or salt://core/init.sls)
and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

Run the states configured in a more deeply nested directory such as salt://my/
→ nested/state.sls (or salt://my/nested/state/init.sls)
```

(continues on next page)

(continued from previous page)

```
salt '*' state.sls my.nested.state

salt '*' state.sls core exclude="{['id': 'id_to_exclude'], {'sls': 'sls_to_exclude'
→ '']}"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.sls_exists(mods, test=None, queue=False, **kwargs)`

Tests for the existence the of a specific SLS or list of SLS files on the master. Similar to `state.show_sls`, rather than returning state details, returns True or False. The default environment is base, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv** Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

`salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)`

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

**id** ID to call

**mods** Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

**saltenv** [base] Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar="{\"foo\": \"bar\"}"
```

---

**Note:** Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

---

New in version 2018.3.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module

salt '*' state.sls_id my_state my_module,a_common_module
```

`salt.modules.state.soft_kill(jid, state_id=None)`

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the `jid` of the running state. If a `state_id` is not passed then the `jid` referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
 pkg.installed: []
```

The `state_id` to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

`salt.modules.state.template`(*tem*, *queue=False*, *\*\*kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.template_str`(*tem*, *queue=False*, *\*\*kwargs*)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.top`(*topfn*, *test=None*, *queue=False*, *\*\*kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_
↳ exclude'}]"
```

### 21.9.409 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.all_status`()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.cpuinfo`()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.cputats()`

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cputats
```

`salt.modules.status.custom()`

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cputats.custom: ['cpu', 'ctxt', 'btime', 'processes']
```

Where status refers to status.py, cputats is the function where we get our data, and custom is this function. It is followed by a list of keys that we want returned.

This function is meant to replace all `_status()`, which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

`salt.modules.status.diskstats()`

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

`salt.modules.status.diskusage(*args)`

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage # usage for all filesystems
salt '*' status.diskusage / /tmp # usage for / and /tmp
salt '*' status.diskusage ext? # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

`salt.modules.status.loadavg()`

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

`salt.modules.status.master` (*master=None, connected=True*)  
New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

`salt.modules.status.meminfo`()  
Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

`salt.modules.status.netdev`()  
Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

`salt.modules.status.netstats`()  
Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

`salt.modules.status.nproc`()  
Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

`salt.modules.status.pid`(*sig*)  
Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process

via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

**salt.modules.status.ping\_master**(*master*)

New in version 2016.3.0.

Sends ping request to the given master. Fires '\_\_\_master\_failback' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

**salt.modules.status.procs**()

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

**salt.modules.status.proxy\_reconnect**(*proxy\_name*, *opts=None*)

Forces proxy minion reconnection when not alive.

**proxy\_name** The virtual name of the proxy module.

**opts: None** Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

**salt.modules.status.time\_**(*format='%A, %d. %B %Y %I:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

**salt.modules.status.uptime**()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

**salt.modules.status.version()**

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

**salt.modules.status.vmstats()**

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

**salt.modules.status.w()**

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

## 21.9.410 salt.modules.statuspage

### StatusPage

Handle requests for the [StatusPage API](#).

In the minion configuration file, the following block is required:

```
statuspage:
 api_key: <API_KEY>
 page_id: <PAGE_ID>
```

New in version 2017.7.0.

```
salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None,
 api_key=None, api_version=None, **kwargs)
```

Insert a new entry under a specific endpoint.

**endpoint:** **incidents** Insert under this specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version:** **1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_
↳id='993vgplshj12'
```

Example output:

```

minion:

 comment:
 out:

 result:
 True

```

`salt.modules.statuspage.delete` (*endpoint='incidents', id=None, api\_url=None, page\_id=None, api\_key=None, api\_version=None*)

Remove an entry from an endpoint.

**endpoint: incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```

minion:

 comment:
 out:
 None
 result:
 True

```

`salt.modules.statuspage.retrieve` (*endpoint='incidents', api\_url=None, page\_id=None, api\_key=None, api\_version=None*)

Retrieve a specific endpoint from the Statuspage API.

**endpoint: incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```

```

`salt.modules.statuspage.update`(*endpoint='incidents', id=None, api\_url=None, page\_id=None, api\_key=None, api\_version=None, \*\*kwargs*)

Update attribute(s) of a specific endpoint.

**id** The unique ID of the endpoint entry.

**endpoint: incidents** Endpoint name.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```

### 21.9.411 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

**salt.modules.supervisord.add**(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Activates any updates in config for process/group.

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

**salt.modules.supervisord.custom**(*command*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Run any custom supervisord command

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

**salt.modules.supervisord.options**(*name*, *conf\_file=None*)

New in version 2014.1.0.

Read the config file and return the config options for a given process

**name** Name of the configured process

**conf\_file** path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

**salt.modules.supervisord.remove**(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Removes process/group from active config

**user** user to run supervisorctl as

**conf\_file** path to supervisord config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

**salt.modules.supervisord.reread**(*user=None*, *conf\_file=None*, *bin\_env=None*)

Reload the daemon's configuration files

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.reread
```

**salt.modules.supervisord.restart** (*name='all', user=None, conf\_file=None, bin\_env=None*)  
 Restart the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.restart <service>
salt '*' supervisorctl.restart <group>:
```

**salt.modules.supervisord.start** (*name='all', user=None, conf\_file=None, bin\_env=None*)  
 Start the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.start <service>
salt '*' supervisorctl.start <group>:
```

**salt.modules.supervisord.status** (*name=None, user=None, conf\_file=None, bin\_env=None*)  
 List programs and its state

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.status
```

**salt.modules.supervisord.status\_raw** (*name=None, user=None, conf\_file=None, bin\_env=None*)  
 Display the raw output of status

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.status_raw
```

**salt.modules.supervisord.stop** (*name='all', user=None, conf\_file=None, bin\_env=None*)  
 Stop the named service. Process group names should not include a trailing asterisk.

**user** user to run supervisorctl as  
**conf\_file** path to supervisor config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
 CLI Example:

```
salt '*' supervisorctl.stop <service>
salt '*' supervisorctl.stop <group>:
```

`salt.modules.supervisord.update`(*user=None, conf\_file=None, bin\_env=None, name=None*)  
Reload config and add/remove/update as necessary  
**user** user to run supervisorctl as  
**conf\_file** path to supervisord config file  
**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed  
**name** name of the process group to update. if none then update any process group that has changes  
CLI Example:

```
salt '*' supervisord.update
```

### 21.9.412 salt.modules.suse\_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

`salt.modules.suse_apache.a2dismod`(*mod*)  
Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.suse_apache.a2enmod`(*mod*)  
Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.suse_apache.check_mod_enabled`(*mod*)  
Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

### 21.9.413 salt.modules.svn

Subversion SCM

`salt.modules.svn.add`(*cwd, targets, user=None, username=None, password=None, \*opts*)  
Add files to be tracked by the Subversion working-copy checkout  
**cwd** The path to the Subversion repository  
**targets** [None] files and directories to pass to the command as arguments  
**user** [None] Run svn as a user other than what the minion runs as  
**username** [None] Connect to the Subversion server as another user  
**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

`salt.modules.svn.checkout`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Download a working copy of the remote Subversion repository directory or file

**cwd** The path to the Subversion repository

**remote** [None] URL to checkout

**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

`salt.modules.svn.commit`(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Commit the current directory, files, or directories to the remote Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files and directories to pass to the command as arguments Default: svn uses ``

**msg** [None] Message to attach to the commit log

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

`salt.modules.svn.diff`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files and directories to pass to the command as arguments Default: svn uses ``

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

`salt.modules.svn.export`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *revision='HEAD'*, *\*opts*)

Create an unversioned copy of a tree.

**cwd** The path to the Subversion repository

**remote** [None] URL and path to file or directory checkout

**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

`salt.modules.svn.info`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *fmt='str'*)

Display the Subversion information from the checkout.

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments svn uses `` by default

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

**fmt** [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

`salt.modules.svn.remove`(*cwd*, *targets*, *msg=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Remove files and directories from the Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments

**msg** [None] Message to attach to the commit log

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

`salt.modules.svn.status`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Display the status of the current directory, files, or directories in the Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files, directories, and URLs to pass to the command as arguments Default: svn uses ``

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

`salt.modules.svn.switch`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

**cwd** The path to the Subversion repository

**remote** [None] URL to switch

**target** [None] The name to give the file or directory working copy Default: svn uses the remote basename

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

`salt.modules.svn.update`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Update the current directory, files, or directories from the remote Subversion repository

**cwd** The path to the Subversion repository

**targets** [None] files and directories to pass to the command as arguments Default: svn uses ``

**user** [None] Run svn as a user other than what the minion runs as

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

**username** [None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

## 21.9.414 salt.modules.swarm

### Docker Swarm Module using Docker's Python SDK

**codeauthor** Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

### Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

### Docker Python SDK

```
pip install -U docker
```

More information: <https://docker-py.readthedocs.io/en/stable/>

`salt.modules.swarm.joinswarm`(*remote\_addr=<class 'int'>*, *listen\_addr=<class 'int'>*, *token=<class 'str'>*)

Join a Swarm Worker to the cluster

**remote\_addr** The manager node you want to connect to for the swarm

**listen\_addr** Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)

**token** Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0'
↪ token='SWMTKN-1-64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-
↪06trjugdu7x2z47j938s54il'
```

`salt.modules.swarm.leave_swarm`(*force=<class 'bool'>*)

Force the minion to leave the swarm

**force** Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

**salt.modules.swarm.node\_ls** (*server=<class 'str'>*)

Displays Information about Swarm Nodes with passing in the server

**server** The minion/server name

CLI Example:

```
salt '*' swarm.node_ls server=minion1
```

**salt.modules.swarm.remove\_node** (*node\_id=<class 'str'>, force=<class 'bool'>*)

Remove a node from a swarm and the target needs to be a swarm manager

**node\_id** The node id from the return of `swarm.node_ls`

**force** Forcefully remove the node/minion from the service

CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjb9rwmqahc2a91snvolm5 force=false
```

**salt.modules.swarm.remove\_service** (*service=<class 'str'>*)

Remove Swarm Service

**service** The name of the service

CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

**salt.modules.swarm.service\_create** (*image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target\_port=<class 'int'>, published\_port=<class 'int'>*)

Create Docker Swarm Service Create

**image** The docker image

**name** Is the service name

**command** The docker command to run in the container at launch

**hostname** The hostname of the containers

**replicas** How many replicas you want running in the swarm

**target\_port** The target port on the container

**published\_port** port thats published on the host/os

CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service
↳command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

**salt.modules.swarm.swarm\_init** (*advertise\_addr=<class 'str'>, listen\_addr=<class 'int'>, force\_new\_cluster=<class 'bool'>*)

Initialize Docker on Minion as a Swarm Manager

**advertise\_addr** The ip of the manager

**listen\_addr** Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567

**force\_new\_cluster** Force a new cluster if True is passed

CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0'
↳force_new_cluster=False
```

`salt.modules.swarm.swarm_service_info` (*service\_name*=<class 'str'>)

Swarm Service Information

**service\_name** The name of the service that you want information on about the service

CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

`salt.modules.swarm.swarm_tokens` ()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

`salt.modules.swarm.update_node` (*availability*=<class 'str'>, *node\_name*=<class 'str'>, *role*=<class 'str'>, *node\_id*=<class 'str'>, *version*=<class 'int'>)

Updates docker swarm nodes/needs to target a manager node/minion

**availability** Drain or Active

**node\_name** minion/node

**role** role of manager or worker

**node\_id** The Id and that can be obtained via `swarm.node_ls`

**version** Is obtained by `swarm.node_ls`

CLI Example:

```
salt '*' docker_util.update_node availability=drain node_name=minion2
↳role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

## 21.9.415 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

### depends

- swiftclient Python module

**configuration** This module is not usable until the user, tenant, auth URL, and password or `auth_key` are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
 keystone.user: admin
 keystone.tenant: admin
 keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
 keystone.password: verybadpass
 # or
 keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

(continues on next page)

(continued from previous page)

```

openstack2:
 keystone.user: admin
 keystone.tenant: admin
 keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
 keystone.password: verybadpass
 # or
 keystone.auth_key: 303802934809284k2j34lkj2l3kj43k

```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting `keystone.auth_version = 1` is recommended.

`salt.modules.swift.delete` (*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.get` (*cont=None*, *path=None*, *local\_file=None*, *return\_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.head`()

`salt.modules.swift.put` (*cont*, *path=None*, *local\_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

### 21.9.416 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

**salt.modules.sysbench.cpu()**

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

**salt.modules.sysbench.fileio()**

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

**salt.modules.sysbench.memory()**

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

**salt.modules.sysbench.mutex()**

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

**salt.modules.sysbench.ping()**

**salt.modules.sysbench.threads()**

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

### 21.9.417 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

<https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt>

New in version 2016.3.0.

`salt.modules.sysfs.attr` (*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, it's destination is returned

**Returns** value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

`salt.modules.sysfs.interfaces` (*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
 "r": [
 "state",
 "partial_stripes_expensive",
 "writeback_rate_debug",
 "stripe_size",
 "dirty_data",
 "stats_total/cache_hits",
 "stats_total/cache_bypass_misses",
 "stats_total/bypassed",
 "stats_total/cache_readaheads",
 "stats_total/cache_hit_ratio",
 "stats_total/cache_miss_collisions",
 "stats_total/cache_misses",
 "stats_total/cache_bypass_hits",
],
 "rw": [
 "writeback_rate",
 "writeback_rate_update_seconds",
 "cache_mode",
 "writeback_delay",
 "label",
 "writeback_running",
 "writeback_metadata",
 "running",
 "writeback_rate_p_term_inverse",
 "sequential_cutoff",
 "writeback_percent",
 "writeback_rate_d_term",
 "readahead"
],
 "w": [
 "stop",
 "clear_stats",
 "attach",
 "detach"
]
}
```

---

Note:

- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

`salt.modules.sysfs.read(key, root="")`

Read from SysFS

**Parameters** **key** – file or path in SysFS; if key is a list then root will be prefixed on each key

**Returns** the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=True)`

Return the basename of a SysFS key path

**Parameters**

- **key** – the location to resolve within SysFS
- **full** – full path instead of basename

**Returns** fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`

Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor
→ 'performance'
```

## 21.9.418 salt.modules.syslog\_ng

Module for getting information about syslog-ng

**maintainer** Tibor Benke <btibi@sch.bme.hu>

**maturity** new

**depends** cmd

**platform** all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

**class** `salt.modules.syslog_ng.Argument` (*value=""*)

A TypedParameterValue has one or more Arguments. For example this can be the value of `key_file`.

Does not need examples.

**build()**

**class** salt.modules.syslog\_ng.**Buildable**(*iterable*, *join\_body\_on=""*, *ap-  
pend\_extra\_newline=True*)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with it's children.

**build\_body()**

Builds the body of a syslog-ng configuration object.

**build\_header()**

Builds the header of a syslog-ng configuration object.

**build\_tail()**

Builds the tail of a syslog-ng configuration object.

**class** salt.modules.syslog\_ng.**GivenStatement**(*value*, *add\_newline=True*)

This statement returns a string without modification. It can be used to use existing configuration snippets.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with it's children.

**class** salt.modules.syslog\_ng.**NamedStatement**(*type*, *id=""*, *options=None*)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

**class** salt.modules.syslog\_ng.**Option**(*type=""*, *params=None*)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

**add\_parameter(param)****build()**

Builds the textual representation of the whole configuration object with it's children.

**class** salt.modules.syslog\_ng.**Parameter**(*iterable=None*, *join\_body\_on=""*)

An Option has one or more Parameter instances.

Does not need examples.

**class** salt.modules.syslog\_ng.**ParameterValue**(*iterable=None*, *join\_body\_on=""*)

A TypedParameter can have one or more values.

Does not need examples.

**class** salt.modules.syslog\_ng.**SimpleParameter**(*value=""*)

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
 file(
 '/var/log/messages'
```

(continues on next page)

(continued from previous page)

```
);
};
```

`/var/log/messages` is a `SimpleParameter`.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with it's children.

**class** `salt.modules.syslog_ng.SimpleParameterValue` (*value=""*)

A `ParameterValue` which holds a simple type, like a string or a number.

For example in `ip(127.0.0.1)` `127.0.0.1` is a `SimpleParameterValue`.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with it's children.

**class** `salt.modules.syslog_ng.Statement` (*type, id="", options=None, has\_name=True*)

It represents a `syslog-ng` configuration statement, e.g. `source`, `destination`, `filter`.

Does not need examples.

**add\_child** (*option*)

**build\_header** ()

Builds the header of a `syslog-ng` configuration object.

**build\_tail** ()

Builds the tail of a `syslog-ng` configuration object.

**exception** `salt.modules.syslog_ng.SyslogNgError`

**class** `salt.modules.syslog_ng.TypedParameter` (*type="", values=None*)

A `Parameter`, which has a type:

```
destination d_tcp {
 tcp(
 ip(127.0.0.1)
);
};
```

`ip(127.0.0.1)` is a `TypedParameter`.

Does not need examples.

**add\_value** (*value*)

**build** ()

Builds the textual representation of the whole configuration object with it's children.

**class** `salt.modules.syslog_ng.TypedParameterValue` (*type="", arguments=None*)

We have to go deeper...

A `TypedParameter` can have a 'parameter', which also have a type. For example `key_file` and `cert_file`:

```
source demo_tls_source {
 tcp(
 ip(0.0.0.0)
 port(1999)
);
};
```

(continues on next page)

(continued from previous page)

```

 tls(
 key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
 cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
)
);
};

```

Does not need examples.

**add\_argument**(*arg*)

**build**()

Builds the textual representation of the whole configuration object with it's children.

**class** salt.modules.syslog\_ng.UnnamedStatement(*type*, *options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog\_ng.config(*name*, *config*, *write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

*name* : the id of the Salt document or it is the format of <statement name>.id  
*config* : the parsed YAML code  
*write* : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```

salt '*' syslog_ng.config name='s_local' config="[{ 'tcp': [{ 'ip': '127.0.0.1' }, {
↪ 'port': 1233 }] }]"

```

salt.modules.syslog\_ng.config\_test(*syslog\_ng\_sbin\_dir=None*, *cfgfile=None*)

Runs syntax check against *cfgfile*. If *syslog\_ng\_sbin\_dir* is specified, it is added to the PATH during the test.

CLI Example:

```

salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
↪syslog-ng.conf

```

salt.modules.syslog\_ng.get\_config\_file()

Returns the configuration directory, which contains *syslog-ng.conf*.

CLI Example:

```

salt '*' syslog_ng.get_config_file

```

salt.modules.syslog\_ng.modules(*syslog\_ng\_sbin\_dir=None*)

Returns the available modules. If *syslog\_ng\_sbin\_dir* is specified, it is added to the PATH during the execution of the command *syslog-ng*.

CLI Example:

```

salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin

```

salt.modules.syslog\_ng.reload\_(*name*)

Reloads *syslog-ng*. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.set_binary_path(name)`

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.set_config_file(name)`

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

`salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)`

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
↪ config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

`salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None)`

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

`salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)`

Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng-ctl`.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.stop(name=None)`

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

`salt.modules.syslog_ng.version`(*syslog\_ng\_sbin\_dir=None*)

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.write_config`(*config, newlines=2*)

Writes the given parameter `config` into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.write_version`(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

## 21.9.419 salt.modules.sysmod

The `sys` module provides information about the available functions on the minion

`salt.modules.sysmod.argspec`(*module=""*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

`salt.modules.sysmod.doc`(*\*args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

`salt.modules.sysmod.list_functions(*args, **kwargs)`

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

`salt.modules.sysmod.list_modules(*args)`

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

`salt.modules.sysmod.list_renderers(*args)`

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

`salt.modules.sysmod.list_returner_functions(*args, **kwargs)`

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

`salt.modules.sysmod.list_returners(*args)`

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

`salt.modules.sysmod.list_runner_functions(*args, **kwargs)`

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

`salt.modules.sysmod.reload_modules()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.renderer_doc(*args)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.renderer_argspec` (*module=*)

Return the argument specification of functions in Salt renderer modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_argspec xmpp
salt '*' sys.renderer_argspec xmpp smtp
salt '*' sys.renderer_argspec
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_argspec 'sqlite3.*'
```

`salt.modules.sysmod.renderer_doc` (*\*args*)

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc sqlite3
salt '*' sys.renderer_doc sqlite3.get_fun
salt '*' sys.renderer_doc sqlite3.get_fun etcd.get_fun
```

Renderer names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.renderer_doc 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec` (*module=*)

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.runner_doc` (*\*args*)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

`salt.modules.sysmod.state_argspec`(*module=""*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.state_doc`(*\*args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.state_schema`(*module=""*)

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 21.9.420 salt.modules.sysrc

sysrc module for FreeBSD

`salt.modules.sysrc.get(**kwargs)`  
Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

`salt.modules.sysrc.remove(name, **kwargs)`  
Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

`salt.modules.sysrc.set_(name, value, **kwargs)`  
Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

### 21.9.421 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

---

**Note:** If you have configured a wrapper such as `molly-guard` to intercept *interactive* shutdown commands, be aware that calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

---

`salt.modules.system.get_computer_desc()`  
Get PRETTY\_HOSTNAME value stored in `/etc/machine-info` If this file doesn't exist or the variable doesn't exist return False.

**Returns** Value of PRETTY\_HOSTNAME if this does not exist False.

**Return type** `str`

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.get_computer_name()`  
Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.system.get_reboot_required_witnessed()`  
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

**Returns** True if the a reboot request was witnessed, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.system.get_system_date(utc_offset=None)`

Get the system date

**Parameters** `utc_offset` (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system date.

**Return type** `str`

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.get_system_date_time(utc_offset=None)`

Get the system date/time.

**Parameters** `utc_offset` (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system time in YYYY-MM-DD hh:mm:ss format.

**Return type** `str`

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.get_system_time(utc_offset=None)`

Get the system time.

**Parameters** `utc_offset` (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system time in HH:MM:SS AM/PM format.

**Return type** `str`

CLI Example:

```
salt '*' system.get_system_time
```

`salt.modules.system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.system.has_settable_hwclock()`

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

`salt.modules.system.init(runlevel)`

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.system.poweroff()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.system.reboot(at_time=None)`

Reboot the system

**at\_time** The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

`salt.modules.system.set_computer_desc(desc)`

Set PRETTY\_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

**Parameters** **desc** (*str*) – The computer description

**Returns** False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

`salt.modules.system.set_computer_name(hostname)`

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

`salt.modules.system.set_reboot_required_witnessed()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

**Returns** True if successful, otherwise False

**Return type** `bool`

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.system.set_system_date(newdate, utc_offset=None)`

Set the system date. Use <mm-dd-yy> format for the date.

**Parameters** **newdate** (*str*) – The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not

passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

#### Parameters

- **years** (*int*) – Years digit, ie: 2015
- **months** (*int*) – Months digit: 1 - 12
- **days** (*int*) – Days digit: 1 - 31
- **hours** (*int*) – Hours digit: 0 - 23
- **minutes** (*int*) – Minutes digit: 0 - 59
- **seconds** (*int*) – Seconds digit: 0 - 59
- **utc\_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** True if successful. Otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.set_system_time` (*newtime*, *utc\_offset=None*)

Set the system time.

#### Parameters

- **newtime** (*str*) – The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- **utc\_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns True if successful. Otherwise False.

**Return type** `bool`

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

`salt.modules.system.shutdown` (*at\_time=None*)

Shutdown a running system

**at\_time** The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

## 21.9.422 salt.modules.system\_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications()`

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

`salt.modules.system_profiler.receipts()`

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

### 21.9.423 salt.modules.systemd\_service

Provides the service module for systemd

New in version 0.10.0.

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.systemd_service.available(name)`

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.systemd_service.disable(name, no_block=False, root=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.systemd_service.disabled`(*name*, *root=None*)

Return if the named service is disabled from starting on boot

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.systemd_service.enable`(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*, *root=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

**no\_block** [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to `True` to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

**unmask\_runtime** [False] Set to `True` to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd_service.enabled`(*name*, *root=None*, *\*\*kwargs*)

Return if the named service is enabled to start on boot

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd_service.execs`(*root=None*)

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd_service.force_reload`(*name*, *no\_block=True*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd_service.get_all` (*root=None*)

Return a list of all available services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd_service.get_disabled` (*root=None*)

Return a list of all disabled services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd_service.get_enabled` (*root=None*)

Return a list of all enabled services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd_service.get_running` ()

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd_service.get_static` (*root=None*)

New in version 2015.8.5.

Return a list of all static services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd_service.mask` (*name, runtime=False, root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is

done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with `systemd`

**runtime** [`False`] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

`salt.modules.systemd_service.masked(name, runtime=False, root=None)`

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

**runtime** [`False`] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

**root** Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

`salt.modules.systemd_service.missing(name)`

New in version 2014.1.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with `systemd`

**no\_block** [False] Set to True to reload the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

**salt.modules.systemd\_service.restart**(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.systemd\_service.show**(*name*, *root=None*)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

**salt.modules.systemd\_service.start**(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**unmask\_runtime** [False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.systemd\_service.status**(*name, sig=None, wait=3*)

Check whether or not a service is active. If the name contains globbing, a dict mapping service names to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**name** The name of the service to check

**sig** Not implemented, but required to be accepted as it is passed by service states

**wait** [3] If the service is in the process of changing states (i.e. it is in either the `activating` or `deactivating` state), wait up to this amount of seconds (checking again periodically) before determining whether the service is active.

New in version 2019.2.3.

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.systemd\_service.stop**(*name, no\_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with `systemd`

**no\_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

**salt.modules.systemd\_service.systemctl\_reload**()

New in version 0.15.0.

Reloads `systemctl`, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

**salt.modules.systemd\_service.unmask\_**(*name, runtime=False, root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with systemd  
**runtime** [False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

### 21.9.424 salt.modules.telegram

Module for sending messages via Telegram.

**configuration** In order to send a message via the Telegram, certain configuration is required in `/etc/salt/minion` on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
```

`salt.modules.telegram.post_message` (*message*, *chat\_id=None*, *token=None*)

Send a message to a Telegram chat.

**Parameters**

- **message** – The message to send to the Telegram chat.
- **chat\_id** – (optional) The Telegram chat id.
- **token** – (optional) The Telegram API token.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

### 21.9.425 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

**configuration** This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available [here](#).

In the minion's config file:

```
telemetry.telemetry_api_keys:
- abc123 # Key 1
- efg321 # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

**depends** requests

`salt.modules.telemetry.create_alarm` (*deployment\_id*, *metric\_name*, *data*, *api\_key=None*, *profile='telemetry'*)

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

```
salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None,
 api_key=None, profile='telemetry')
```

**delete an alert specified by alert\_id or if not specified blows away all the alerts** in the current deployment.  
Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

```
salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
```

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

```
salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None,
 profile='telemetry')
```

Get all alert definitions associated with a given deployment or if metric\_name is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry salt
myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

```
salt.modules.telemetry.get_notification_channel_id(notify_channel, profile,
 file='telemetry')
```

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

**notify\_channel** Email escalation policy

**profile** A dict of telemetry config information.

CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry
```

```
salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None,
 file='telemetry')
```

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

## 21.9.426 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

```
salt.modules.temp.dir(suffix="", prefix='tmp', parent=None)
```

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

`salt.modules.temp.file(suffix="", prefix='tmp', parent=None)`

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

## 21.9.427 salt.modules.test

Module for running arbitrary tests

`salt.modules.test.arg(*args, **kwargs)`

Print out the data passed into the function `*args` and ``kwargs`, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns `{"args": args, "kwargs": kwargs}`.

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_clean(*args, **kwargs)`

Like `test.arg` but cleans `kwargs` of the `__pub*` items CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_repr(*args, **kwargs)`

Print out the data passed into the function `*args` and ``kwargs`, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns `{"args": repr(args), "kwargs": repr(kwargs)}`.

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_type(*args, **kwargs)`

Print out the types of the `args` and `kwargs`. This is used to test the types of the `args` and `kwargs` passed down to the minion

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

`salt.modules.test.assertion(assertion)`

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

`salt.modules.test.attr_call()`

Call `grains.items` via the attribute

CLI Example:

```
salt '*' test.attr_call
```

`salt.modules.test.collatz`(*start*)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.conf_test`()

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.cross_test`(*func*, *args=None*)

Execute a minion function via the `__salt__` object in the test module, used to verify that the minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.echo`(*text*)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.exception`(*message='Test Exception'*)

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.false_`()

Always return False

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.fib`(*num*)

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.get_opts`()

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.kwarg(**kwargs)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.missing_func()`

`salt.modules.test.module_report()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.not_loaded()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

`salt.modules.test.opts_pkg()`

Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

`salt.modules.test.outputter(data)`

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

`salt.modules.test.ping()`

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:

```
salt '*' test.ping
```

`salt.modules.test.provider(module)`

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

`salt.modules.test.providers()`

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

`salt.modules.test.raise_exception(name, *args, **kwargs)`

Raise an exception. Built-in exceptions and those in `salt.exceptions` can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return `False`.

This function is designed to test Salt's exception and return code handling.

CLI Example:

```
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError "Something
↳went wrong"
```

`salt.modules.test.rand_sleep(max=60)`

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

`salt.modules.test.random_hash(size=999999999, hash_type=None)`

New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from `test.rand_str` to `test.random_hash`

Generates a random number between 1 and `size`, then returns a hash of that number. If no `hash_type` is passed, the `hash_type` specified by the minion's `hash_type` config option is used.

CLI Example:

```
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

`salt.modules.test.retcode(code=42)`

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

`salt.modules.test.sleep(length)`

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

`salt.modules.test.stack()`

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

`salt.modules.test.true_()`

Always return True

CLI Example:

```
salt '*' test.true
```

`salt.modules.test.try_(module, return_try_exception=False, **kwargs)`

Try to run a module command. On an exception return None. If `return_try_exception` is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```
<pre>
{% for i in range(0,230) %}
 {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
 ↳'+i)|yaml(False) }}
{% endfor %}
</pre>
```

`salt.modules.test.tty(*args, **kwargs)`

Deprecated! Moved to cmdmod.

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

`salt.modules.test.version()`

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

`salt.modules.test.versions()`

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

`salt.modules.test.versions_information()`

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

`salt.modules.test.versions_report()`

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

## 21.9.428 salt.modules.testinfra module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically

generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the `testinfra.modules` namespace.

### 21.9.429 salt.modules.test\_virtual

Module for running arbitrary tests with a `__virtual__` function

`salt.modules.test_virtual.ping()`

### 21.9.430 salt.modules.textfsm\_mod module

#### TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

#### depends

- textfsm Python library

---

**Note:** For Python 2/3 compatibility, it is more recommended to install the `jtextfsm` library: `pip install jtextfsm`.

---

`salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')`

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

**template\_path** The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**raw\_text: None** The unstructured text to be parsed.

**raw\_text\_file: None** Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

CLI Example:

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
↳file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_
↳text='Hostname: router.abc ... snip ...'
```

Jinja template example:

```
{%- set raw_text = 'Hostname: router.abc ... snip ...' -%}
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/
↳juniper_version_template', raw_text) -%}
```

Raw text example:

```

Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]

```

TextFSM Example:

```

Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)

Start
Support multiple chassis systems.
^\S+:\$\$ -> Continue.Record
^${Chassis}:\$\$
^Model: ${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
^JUNOS Online Documentation \[${Documentation}\]
^JUNOS Routing Software Suite \[${Routing}\]

```

Output example:

```

{
 "comment": "",
 "result": true,
 "out": [
 {
 "kernel": "9.1S3.5",
 "documentation": "9.1S3.5",
 "boot": "9.1S3.5",
 "crypto": "9.1S3.5",
 "chassis": "",
 "routing": "9.1S3.5",
 "base": "9.1S3.5",
 "model": "mx960"
 }
]
}

```

`salt.modules.textfsm_mod.index`(*command*, *platform=None*, *platform\_grain\_name=None*, *platform\_column\_name=None*, *output=None*, *output\_file=None*, *textfsm\_path=None*, *index\_file=None*, *saltenv='base'*, *include\_empty=False*, *include\_pat=None*, *exclude\_pat=None*)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

**command** The command executed on the device, to get the output.

**platform** The platform name, as defined in the TextFSM index file.

---

**Note:** For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

---

**platform\_grain\_name** The name of the grain used to identify the platform name in the TextFSM index file.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

---

---

**Note:** This option is ignored when `platform` is specified.

---

**platform\_column\_name: Platform** The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

---

**Note:** This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

**output** The raw output from the device, to be parsed and extract the structured data.

**output\_file** The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

**textfsm\_path** The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

---

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

**index\_file: index** The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

**saltenv: base** Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

**include\_empty: False** Include empty files under the `textfsm_path`.

**include\_pat** Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

**exclude\_pat** Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

---

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

---

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
↳juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
↳example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
↳example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
↳platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usgae inside a Jinja template:

```
{%- set command = 'sh ver' -%}
{%- set output = salt.net.cli(command) -%}
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

### 21.9.431 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.get_offset()`

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.timezone.get_zone()`

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

---

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.timezone.set_zone(timezone)`

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values are also allowed, see below

---

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

`salt.modules.timezone.zone_compare(timezone)`

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

---

**Note:** On Solaris-link operating systems only a string comparison is done.

---

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems only a string comparison is done.

---

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

### 21.9.432 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

**depends** PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration** Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
salt-call tls.create_ca my_little \
days=5 \
CN='My Little CA' \
C=US \
ST=Utah \
L=Salt Lake City \
O=Saltstack \
emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.
→ crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."

salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"
→ "
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
 cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"
↪"
```

```
salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
 cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)
```

```
salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
 cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."
↪"
```

```
salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)
```

```
salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
 cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↪MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
salt-call tls.create_csr my_little CN=www.anothersometh.ing \
 cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
↪server.csr."
```

```
salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
 cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
↪completely_different.crt
```

**salt.modules.tls.ca\_exists** (*ca\_name*, *cacert\_path=None*, *ca\_filename=None*)

Verify whether a Certificate Authority (CA) already exists

- ca\_name** name of the CA
- cacert\_path** absolute path to ca certificates root directory
- ca\_filename** alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

**salt.modules.tls.cert\_base\_path** (*cacert\_path=None*)

Return the base path for certs from CLI or from options

- cacert\_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

`salt.modules.tls.cert_info(cert, digest='sha256')`

Return information for a particular certificate  
**cert** path to the certificate PEM file or string

Changed in version 2018.3.4.

**digest** what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

`salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fix-mode=False, cacert_path=None, ca_filename=None, digest='sha256', on-lyif=None, unless=None, replace=False)`

Create a Certificate Authority (CA)

**ca\_name** name of the CA

**bits** number of RSA key bits, default is 2048

**days** number of days the CA will be valid, default is 365

**CN** common name in the request, default is "localhost"

**C** country, default is "US"

**ST** state, default is "Utah"

**L** locality, default is "Centerville", the city where SaltStack originated

**O** organization, default is "SaltStack"

**OU** organizational unit, default is None

**emailAddress** email address for the CA owner, default is None

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

```
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None,
 ca_filename=None, cert_path=None,
 cert_filename=None, digest='sha256',
 cert_type=None, type_ext=False, replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by create\_csr. If it does not, this method does nothing.

**ca\_name** name of the CA

**CN** common name matching the certificate signing request

**days** number of days certificate is valid, default is 365 (1 year)

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**cert\_path** full path to the certificates directory

**cert\_filename** alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of cert\_type. type\_ext will be completely overridden.

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP\_get\_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

**cert\_type** string. Either 'server' or 'client' (see create\_csr() for details).

If create\_csr(type\_ext=True) this function **must** be called with the same cert\_type so it can find the CSR file.

---

**Note:** create\_csr() defaults to cert\_type='server'; therefore, if it was also called with type\_ext, cert\_type becomes a required argument for create\_ca\_signed\_cert()

---

**type\_ext** bool. If set True, use cert\_type as an extension to the CN when formatting the filename.

e.g.: some\_subject\_CN\_server.crt or some\_subject\_CN\_client.crt

This facilitates the context where both types are required for the same subject

If cert\_filename is *not None*, setting type\_ext has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

```
salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt
Lake City', O='SaltStack', OU=None, emailAddress=None,
subjectAltName=None, cacert_path=None, ca_filename=None,
csr_path=None, csr_filename=None, digest='sha256', type_ext=False,
cert_type='server', replace=False)
```

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca\_name** name of the CA

**bits** number of RSA key bits, default is 2048

**CN** common name in the request, default is "localhost"

**C** country, default is "US"

**ST** state, default is "Utah"

**L** locality, default is "Centerville", the city where SaltStack originated

**O** organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

**OU** organizational unit, default is None

**emailAddress** email address for the request, default is None

**subjectAltName** valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

```
examples: ['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51',
'email:me@i.like.pie.com']
```

---

**Note:** some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to <https://1.2.3.4> will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.

**cert\_type** Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
 'basicConstraints': 'CA:FALSE',
 'extendedKeyUsage': 'serverAuth',
 'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
 'basicConstraints': 'CA:FALSE',
 'extendedKeyUsage': 'clientAuth',
 'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

**type\_ext** boolean. Whether or not to extend the filename with CN\_[cert\_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some\_subject\_CN.csr and some\_subject\_CN.key will then be saved

**replace** Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

`salt.modules.tls.create_empty_crl`(*ca\_name*, *cacert\_path*=None, *ca\_filename*=None, *crl\_file*=None)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

**ca\_name** name of the CA

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

**crl\_file** full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
→ crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.create_pkcs12`(*ca\_name*, *CN*, *passphrase*=", *cacert\_path*=None, *replace*=False)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

**ca\_name** name of the CA

**CN** common name matching the certificate signing request

**passphrase** used to unlock the PKCS#12 certificate when loaded into the browser

**cacert\_path** absolute path to ca certificates root directory

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

`salt.modules.tls.create_self_signed_cert`(*tls\_dir*='tls', *bits*=2048, *days*=365, *CN*='localhost', *C*='US', *ST*='Utah', *L*='Salt Lake City', *O*='SaltStack', *OU*=None, *emailAddress*=None, *cacert\_path*=None, *cert\_filename*=None, *digest*='sha256', *replace*=False)

Create a Self-Signed Certificate (CERT)

**tls\_dir** location appended to the `ca.cert_base_path`, default is 'tls'

**bits** number of RSA key bits, default is 2048

**CN** common name in the request, default is "localhost"

**C** country, default is "US"

**ST** state, default is "Utah"

**L** locality, default is "Centerville", the city where SaltStack originated

**O** organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

**OU** organizational unit, default is None

**emailAddress** email address for the request, default is None

**cacert\_path** absolute path to ca certificates root directory

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

`salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)`

Get the certificate path or content

**ca\_name** name of the CA

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)`

Get the certificate path or content

**ca\_name** name of the CA

**CN** common name of the certificate

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to certificates root directory

**cert\_filename** alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
↳etc/certs
```

`salt.modules.tls.get_ca_signed_key`(*ca\_name*, *CN='localhost'*, *as\_text=False*, *cacert\_path=None*, *key\_filename=None*)

Get the certificate path or content

**ca\_name** name of the CA

**CN** common name of the certificate

**as\_text** if true, return the certificate content instead of the path

**cacert\_path** absolute path to certificates root directory

**key\_filename** alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
 ↳ as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_expiration_date`(*cert*, *date\_format='%Y-%m-%d'*)

New in version 2019.2.0.

Get a certificate's expiration date

**cert** Full path to the certificate

**date\_format** By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:

```
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'
```

`salt.modules.tls.get_extensions`(*cert\_type*)

Fetch X509 and CSR extension definitions from `tls:extensions:` (`common|server|client`) or set them to standard defaults.

New in version 2015.8.0.

**cert\_type**: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

`salt.modules.tls.maybe_fix_ssl_version`(*ca\_name*, *cacert\_path=None*, *ca\_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

**ca\_name** ca authority name

**cacert\_path** absolute path to ca certificates root directory

**ca\_filename** alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

`salt.modules.tls.revoke_cert`(*ca\_name*, *CN*, *cacert\_path=None*, *ca\_filename=None*, *cert\_path=None*, *cert\_filename=None*, *crl\_file=None*)

Revoke a certificate.

New in version 2015.8.0.

**ca\_name** Name of the CA.

**CN** Common name matching the certificate signing request.

**cacert\_path** Absolute path to ca certificates root directory.

**ca\_filename** Alternative filename for the CA.

**cert\_path** Path to the cert file.

**cert\_filename** Alternative filename for the certificate, useful when using special characters in the CN.

**crl\_file** Full path to the CRL file.

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
↪ crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.set_ca_path(cacert_path)`

If wanted, store the aforementioned `cacert_path` in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

### 21.9.433 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

**configuration**

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
 user: <username>
 passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the `conf/tomcat-users.xml` file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
 <role rolename="manager-script"/>
 <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

**Note:**

- More information about tomcat manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>

- if you use only this module for deployments you might want to restrict access to the manager only from localhost for more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

- Tested on:

**JVM Vendor:** Sun Microsystems Inc.

**JVM Version:** 1.6.0\_43-b01

**OS Architecture:** amd64

**OS Name:** Linux

**OS Version:** 2.6.32-358.el6.x86\_64

**Tomcat Version:** Apache Tomcat/7.0.37

```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager',
 saltenv='base', timeout=180, temp_war_location=None, version=True)
```

Deploy a WAR file

**war** absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the `salt.modules.cp.get_file` function

**context** the context path to deploy

**force** [False] set True to deploy the webapp even one is deployed in the context

**url** [`http://localhost:8080/manager`] the URL of the server manager webapp

**saltenv** [base] the environment for WAR file in used by `salt.modules.cp.get_url` function

**timeout** [180] timeout for HTTP request

**temp\_war\_location** [None] use another location to temporarily copy to war file by default the system's temp directory is used

**version** [?] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
↪manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
↪manager
```

```
salt.modules.tomcat.extract_war_version(war)
```

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the `war file name`

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

**salt.modules.tomcat.fullversion()**

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

**salt.modules.tomcat.leaks** (*url='http://localhost:8080/manager', timeout=180*)

Find memory leaks in tomcat

**url** [<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

**salt.modules.tomcat.ls** (*url='http://localhost:8080/manager', timeout=180*)

list all the deployed webapps

**url** [<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

**salt.modules.tomcat.passwd** (*passwd, user=", alg='sha1', realm=None*)

This function replaces the \$CATALINA\_HOME/bin/digest.sh script convert a clear-text password to the \$CATALINA\_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

**salt.modules.tomcat.reload\_** (*app, url='http://localhost:8080/manager', timeout=180*)

Reload the webapp

**app** the webapp context path

**url** [<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

**salt.modules.tomcat.serverinfo** (*url='http://localhost:8080/manager', timeout=180*)

return details about the server

**url** [<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

`salt.modules.tomcat.sessions`(*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
 return the status of the webapp sessions  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.signal`(*signal*=None)  
 Signals catalina to start, stop, securestart, forcestop.  
 CLI Example:

```
salt '*' tomcat.signal start
```

`salt.modules.tomcat.start`(*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
 Start the webapp  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.status`(*url*='http://localhost:8080/manager', *timeout*=180)  
 Used to test if the tomcat manager is up  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

`salt.modules.tomcat.status_webapp`(*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
 return the status of the webapp (stopped | running | missing)  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.stop`(*app*, *url*='http://localhost:8080/manager', *timeout*=180)  
 Stop the webapp  
**app** the webapp context path  
**url** [http://localhost:8080/manager] the URL of the server manager webapp  
**timeout** [180] timeout for HTTP request  
 CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.undeploy`(*app*, *url*='http://localhost:8080/manager', *timeout*=180)

Undeploy a webapp

**app** the webapp context path

**url** [`http://localhost:8080/manager`] the URL of the server manager webapp

**timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.version`()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

## 21.9.434 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

`salt.modules.trafficserver.alarms`()

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

`salt.modules.trafficserver.bounce_cluster`()

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

`salt.modules.trafficserver.bounce_local`(*drain*=False)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

**drain** This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

`salt.modules.trafficserver.clear_alarms`(*alarm*)

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT\_ALARM\_PROXY\_CONFIG\_ERROR”).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

`salt.modules.trafficserver.clear_cluster`()

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

`salt.modules.trafficserver.clear_node()`

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

`salt.modules.trafficserver.match_config(regex)`

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

`salt.modules.trafficserver.match_metric(regex)`

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.offline(path)`

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`

Restart the `traffic_manager` and `traffic_server` processes on the local node.

**drain** This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`

Set the value of a Traffic Server configuration variable.

**variable** Name of a Traffic Server configuration variable.

**value** The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

`salt.modules.trafficserver.shutdown()`

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

`salt.modules.trafficserver.startup()`

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

`salt.modules.trafficserver.status()`

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

`salt.modules.trafficserver.zero_cluster()`

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

`salt.modules.trafficserver.zero_node()`

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

### 21.9.435 salt.modules.travisci

Commands for working with travisci.

**depends** pyOpenSSL >= 16.0.0

`salt.modules.travisci.verify_webhook(signature, body)`

Verify the webhook signature from travisci

**signature** The signature header from the webhook header

**body** The full payload body from the webhook post

---

**Note:** The body needs to be the urlencoded version of the body.

---

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
↳%3A183791261%2C%22repository...''
```

### 21.9.436 salt.modules.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <alicsyed@gmail.com>

**maturity** new

**depends** tuned-adm

**platform** Linux

**salt.modules.tuned.active()**

Return current active profile

CLI Example:

```
salt '*' tuned.active
```

**salt.modules.tuned.list\_()**

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

**salt.modules.tuned.off()**

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

**salt.modules.tuned.profile(profile\_name)**

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

### 21.9.437 salt.modules.twilio\_notify

Module for notifications via Twilio

New in version 2014.7.0.

**depends**

- twilio python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with *pillar\_opts* set to True).

For example:

```
my-twilio-account:
 twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
 twilio.auth_token: mytoken
```

`salt.modules.twilio_notify.send_sms`(*profile, body, to, from\_*)  
Send an sms

CLI Example:

```
twilio.send_sms my-twilio-account 'Test sms' '+1801999999' '+1801111111'
```

### 21.9.438 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

`salt.modules.udev.env`(*dev*)  
Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

`salt.modules.udev.exportdb`()  
Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

`salt.modules.udev.info`(*dev*)  
Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

`salt.modules.udev.links`(*dev*)  
Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

`salt.modules.udev.name`(*dev*)  
Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

`salt.modules.udev.path`(*dev*)  
Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

### 21.9.439 salt.modules.upstart\_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of `"initctl show-config"` to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] <http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting>

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-added
↳card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
↳PREVLEVEL=S)
stop on runlevel [016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart_service.disable(name, **kwargs)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart_service.disabled(name)`  
Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart_service.enable(name, **kwargs)`  
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart_service.enabled(name, **kwargs)`  
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart_service.force_reload(name)`  
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart_service.full_restart(name)`  
Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart_service.get_all()`  
Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart_service.get_disabled()`  
Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart_service.get_enabled()`  
Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart_service.missing(name)`  
The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

#### Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.upstart_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 21.9.440 salt.modules.uptime

### Wrapper around uptime API

`salt.modules.uptime.check_exists(name)`

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

`salt.modules.uptime.checks_list()`

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

`salt.modules.uptime.create(name, **params)`

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation <https://github.com/fzaninotto/uptime> for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

`salt.modules.uptime.delete(name)`

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

### 21.9.441 salt.modules.useradd

Manage users with the useradd command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

`salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname="", roomnumber="", workphone="", homephone="", other="", createhome=True, loginclass=None, nologinit=False, root=None)`

Add a user to the minion

**name** Username LOGIN to add

**uid** User ID of the new account

**gid** Name or ID of the primary group of the new account

**groups** List of supplementary groups of the new account

**home** Home directory of the new account

**shell** Login shell of the new account

**unique** Allow to create users with duplicate

**system** Create a system account

**fullname** GECOS field for the full name

**roomnumber** GECOS field for the room number

**workphone** GECOS field for the work phone

**homephone** GECOS field for the home phone

**other** GECOS field for other information

**createhome** Create the user's home directory

**loginclass** Login class for the new account (OpenBSD)

**nologinit** Do not add the user to the lastlog and faillog databases

**root** Directory to chroot into

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.chfullname` (*name, fullname, root=None*)

Change the user's Full Name

**name** User to modify

**fullname** GECOS field for the full name

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.chgid` (*name, gid, root=None*)

Change the default group of the user

**name** User to modify

**gid** Force use GID as new primary group

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.chgroups` (*name, groups, append=False, root=None*)

Change the groups to which this user belongs

**name** User to modify

**groups** Groups to set for the user

**append** [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

**root** Directory to chroot into

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.chhome` (*name, home, persist=False, root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

**name** User to modify

**home** New home directory for the user account

**persist** Move contents of the home directory to the new location

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.chhomephone` (*name, homephone, root=None*)

Change the user's Home Phone

**name** User to modify

**homephone** GECOS field for the home phone

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.chloginclass` (*name, loginclass, root=None*)

Change the default login class of the user

**name** User to modify

**loginclass** Login class for the new account  
**root** Directory to chroot into

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.chloginclass foo staff
```

**salt.modules.useradd.chother** (*name, other, root=None*)

Change the user's other GECOS attribute

**name** User to modify

**other** GECOS field for other information

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chother foobar
```

**salt.modules.useradd.chroomnumber** (*name, roomnumber, root=None*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

**salt.modules.useradd.chshell** (*name, shell, root=None*)

Change the default shell of the user

**name** User to modify

**shell** New login shell for the user account

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

**salt.modules.useradd.chuid** (*name, uid, root=None*)

Change the uid for a named user

**name** User to modify

**uid** New UID for the user account

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chuid foo 4376
```

**salt.modules.useradd.chworkphone** (*name, workphone, root=None*)

Change the user's Work Phone

**name** User to modify

**workphone** GECOS field for the work phone

**root** Directory to chroot into

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

**salt.modules.useradd.delete** (*name, remove=False, force=False, root=None*)

Remove a user from the minion

**name** Username to delete

**remove** Remove home directory and mail spool

**force** Force some actions that would fail otherwise  
**root** Directory to chroot into  
CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.get_loginclass(name)`

Get the login class of the user  
**name** User to get the information

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.getent(refresh=False, root=None)`

Return the list of all info for all users  
**refresh** Force a refresh of user information  
**root** Directory to chroot into  
CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.info(name, root=None)`

Return user information  
**name** User to get the information  
**root** Directory to chroot into  
CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.list_groups(name)`

Return a list of groups the named user belongs to  
**name** User to get the information  
CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.list_users(root=None)`

Return a list of all users  
**root** Directory to chroot into  
CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.primary_group(name)`

Return the primary group of the named user  
  
New in version 2016.3.0.  
**name** User to get the information  
CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.rename`(*name*, *new\_name*, *root=None*)

Change the username for a named user

**name** User to modify

**new\_name** New value of the login name

**root** Directory to chroot into

CLI Example:

```
salt '*' user.rename name new_name
```

### 21.9.442 salt.modules.uwsgi

uWSGI stats server <https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html>

**maintainer** Peter Baumgartner <pete@lincolnloop.com>

**maturity** new

**platform** all

`salt.modules.uwsgi.stats`(*socket*)

Return the data from `uwsgi -connect-and-read` as a dictionary.

**socket** The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock
```

```
salt '*' uwsgi.stats 127.0.0.1:5050
```

### 21.9.443 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant\_sdb\_data".

**requirements:**

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for `sdb://vagrant_sdb_data`

Configuration example:

```
file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
 driver: sqlite3
 database: /var/cache/salt/vagrant.sqlite
 table: sdb
 create_table: True
```

`salt.modules.vagrant.destroy`(*name*)

Destroy and delete a virtual machine. (`vagrant destroy -f`)

This also removes the `salt_id` name defined by `vagrant.init`.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

`salt.modules.vagrant.get_machine_id(machine, cwd)`

returns the `salt_id` name of the Vagrant VM

**Parameters**

- **machine** – the Vagrant machine name
- **cwd** – the path to Vagrantfile

**Returns** `salt_id` name

`salt.modules.vagrant.get_ssh_config(name, network_mask=”, get_private_key=False)`

Retrieve hints of how you might connect to a Vagrant VM.

**Parameters**

- **name** – the `salt_id` of the machine
- **network\_mask** – a CIDR mask to search for the VM’s address
- **get\_private\_key** – (default: False) return the key used for ssh login

**Returns** a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_
↪key=True
```

The returned dictionary contains:

- `key_filename`: the name of the private key file on the VM host computer
- `ssh_username`: the username to be used to log in to the VM
- `ssh_host`: the IP address used to log in to the VM. (This will usually be `127.0.0.1`)
- `ssh_port`: the TCP port used to log in to the VM. (This will often be `2222`)
- `[ip_address:]` (if `network_mask` is defined. see below)
- `[private_key:]` (if `get_private_key` is True) the private key for `ssh_username`

About `network_mask`:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are “`ssh_port`” and “`ssh_host`”. The `ssh_host` is usually the localhost (`127.0.0.1`). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a `config.vm.network “public_network”` statement in your `Vagrantfile`.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM’s address for you. The host machine will send an “ifconfig” command to the VM (using ssh to `ssh_host:ssh_port`) and return the IP address of the first interface it can find which matches your mask.

`salt.modules.vagrant.get_vm_info(name)`

get the information for a VM.

**Parameters** **name** – `salt_id` name

**Returns** dictionary of {‘machine’: x, ‘cwd’: y, ...}.

`salt.modules.vagrant.init(name, cwd=None, machine=”, runas=None, start=False, vagrant_provider=”, vm=None)`

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The `salt_id` assigned here is the key field for that database and must be unique.

**Parameters**

- **name** – The salt\_id name you will use to control this VM
- **cwd** – The path to the directory where the Vagrantfile is located
- **machine** – The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** – The username on the host who owns the Vagrant work files.
- **start** – (default: False) Start the virtual machine now.
- **vagrant\_provider** – The name of a Vagrant VM provider (if not the default).
- **vm** – Optionally, all the above information may be supplied in this dictionary.

**Returns** A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

`salt.modules.vagrant.list_active_vms` (*cwd=None*)

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms cwd=/projects/project_1
```

`salt.modules.vagrant.list_domains` ()

Return a list of the salt\_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

`salt.modules.vagrant.list_inactive_vms` (*cwd=None*)

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

`salt.modules.vagrant.pause` (*name*)

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

`salt.modules.vagrant.reboot` (*name, provision=False*)

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

#### Parameters

- **name** – The salt\_id name you will use to control this VM
- **provision** – (False) also re-run the Vagrant provisioning scripts.

`salt.modules.vagrant.shutdown(name)`

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as `vagrant.stop`. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

`salt.modules.vagrant.start(name)`

Start (vagrant up) a virtual machine defined by `salt_id` name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

`salt.modules.vagrant.stop(name)`

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```

`salt.modules.vagrant.version()`

Return the version of Vagrant on the minion

CLI Example:

```
salt '*' vagrant.version
```

`salt.modules.vagrant.vm_state(name="", cwd=None)`

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the `cwd` directory.

CLI Example:

```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and `salt_id` name.

```
datum = {'machine': _, # Vagrant machine name,
 'state': _, # string indicating machine state, like 'running'
 'provider': _, # the Vagrant VM provider
 'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the `machine` parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

## 21.9.444 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

---

**Note:** These functions are designed to work with all implementations of Varnish from 3.x onwards

---

`salt.modules.varnish.ban(ban_expression)`  
Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

`salt.modules.varnish.ban_list()`  
List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

`salt.modules.varnish.param_set(param, value)`  
Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

`salt.modules.varnish.param_show(param=None)`  
Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

`salt.modules.varnish.purge()`  
Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

`salt.modules.varnish.version()`  
Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

### 21.9.445 salt.modules.vault module

Functions to interact with Hashicorp Vault.

**maintainer** SaltStack

**maturity** new

**platform** all

**note** If you see the following error, you'll need to upgrade requests to atleast 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext_
↳pillar vault: {'error': "request() got an unexpected keyword argument 'json'}
```

**configuration** The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or `/etc/salt/master.d/vault.conf`:

```
vault:
 url: https://vault.service.domain:8200
 verify: /etc/ssl/certs/ca-certificates.crt
 role_name: minion_role
 auth:
 method: approle
 role_id: 11111111-2222-3333-4444-111111111111
 secret_id: 11111111-1111-1111-1111-111111111111
 policies:
 - saltstack/minions
 - saltstack/minion/{minion}
 .. more policies
 keys:
 - n63/TbrQuL3xaIW7ZZpuXj/tIfnK1/MbVx04vT3wYD2A
 - S90wCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
 - F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
 - 1cYtvjKJNDVam9c7HNqJUfINK4PYyAXIpjkpN/sIuzPv
 - 3pPK5X6vGtwLhN0Fv1U2elahECz3HpRUFNXJFYLw6lid
```

**url** Url to your Vault installation. Required.

**verify** For details please see <http://docs.python-requests.org/en/master/user/advanced/#ssl-cert-verification>

New in version 2018.3.0.

**role\_name** Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

For details please see: <https://www.vaultproject.io/api/auth/token/index.html#create-token>  
Example configuration: <https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration>

**auth** Currently only token and approle auth types are supported. Required.

Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: <https://www.vaultproject.io/docs/auth/approle.html>

The token must be able to create tokens with the policies that should be assigned to minions.

You can still use the token auth via a OS environment variable via this config example:

```
vault:
 url: https://vault.service.domain:8200
 auth:
 method: token
 token: sdb://osenv/VAULT_TOKEN
 osenv:
 driver: env
```

And then export the VAULT\_TOKEN variable in your OS:

```
export VAULT_TOKEN=11111111-1111-1111-1111-111111111111
```

**policies** Policies that are assigned to minions when requesting a token. These can either be static, eg `saltstack/minions`, or templated, eg `saltstack/minion/{minion}`. `{minion}` is shorthand for `grains[id]`. Grains are also available, for example like this: `my-policies/{grains[os]}`

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

```
grains:
 roles:
 - web
 - database
```

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If `policies` is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

**keys** List of keys to use to unseal vault server with the `vault.unseal` runner.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```
peer_run:
 .*:
 - vault.generate_token
```

`salt.modules.vault.delete_secret(path)`

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

`salt.modules.vault.list_secrets(path)`

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

`salt.modules.vault.read_secret(path, key=None)`

Return the value of key at path in vault, or entire secret

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
 first: {{ supersecret.first }}
 second: {{ supersecret.second }}
```

`salt.modules.vault.write_raw(path, raw)`

Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password": "bar"}'
```

`salt.modules.vault.write_secret`(*path*, *\*\*kwargs*)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

## 21.9.446 salt.modules.vbox\_guest

VirtualBox Guest Additions installer

`salt.modules.vbox_guest.additions_install`(*\*\*kwargs*)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See <https://www.virtualbox.org/manual/ch04.html#idp52733088> for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

### Parameters

- **reboot** (*bool*) – reboot computer to complete installation
- **upgrade\_os** (*bool*) – upgrade OS (to ensure the latests version of kernel and developer tools are installed)

**Returns** version of VirtualBox Guest Additions or string with error

`salt.modules.vbox_guest.additions_mount`()

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

**Returns** True or OSError exception

`salt.modules.vbox_guest.additions_remove`(*\*\*kwargs*)

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

**Parameters** **force** (*bool*) – force VirtualBox Guest Additions removing

**Returns** True if VirtualBox Guest Additions were removed successfully else False

`salt.modules.vbox_guest.additions_umount(mount_point)`  
Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

**Parameters** `mount_point` – directory VirtualBox Guest Additions is mounted to  
**Returns** True or an string with error

`salt.modules.vbox_guest.additions_version()`  
Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

**Returns** version of VirtualBox Guest Additions or False if they are not installed

`salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`  
Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument `users`. Access will be denied to the users not listed in `users` argument.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

**Parameters**

- **name** (*str*) – name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) – list of names of users to grant access to auto-mounted shared folders to (if specified, `name` will not be taken into account)

**Returns** list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`  
List users who have access to auto-mounted shared folders.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

**Returns** list of users who have access to auto-mounted shared folders

### 21.9.447 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

```
autoload_vboxdrv: True
```

The default for this setting is `False`.

**depends** virtualbox

```
salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None,
 file_out=None, mformat=None, variant=None, exist-
 ing=False, **kwargs)
```

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

```
salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snap-
 shot_uuid=None, snapshot_name=None, mode='machine',
 options=None, basefolder=None, new_uuid=None, register=False,
 groups=None, **kwargs)
```

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

```
salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, base-
 folder=None, new_uuid=None, **kwargs)
```

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

```
salt.modules.vboxmanage.destroy(name)
```

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

```
salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')
```

Return a list of a specific type of item. The following items are available:

```
vms runningvms ostones hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers
hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks
groups webcams screenshotformats
```

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

```
salt.modules.vboxmanage.list_nodes()
```

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

```
salt.modules.vboxmanage.list_nodes_full()
```

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.list_nodes_min()`

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.list_ostypes()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.register(filename)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.start(name)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.stop(name)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

`salt.modules.vboxmanage.unregister(name, delete=False)`

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

`salt.modules.vboxmanage.vboxcmd()`

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

### 21.9.448 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
victorops:
api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

```
salt.modules.victorops.create_event(message_type=None, routing_key='everybody',
 **kwargs)
```

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters **message\_type** – One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing\_key** – The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity\_id** – The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** – Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp\_fmt The date format for the timestamp parameter.

Parameters

- **state\_start\_time** – The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state\_start\_time\_fmt** – The date format for the timestamp parameter.
- **state\_message** – Any additional status information from the alert item.
- **entity\_is\_host** – Used within VictorOps to select the appropriate display format for the incident.
- **entity\_display\_name** – Used within VictorOps to display a human-readable name for the entity.
- **ack\_message** – A user entered comment for the acknowledgment.
- **ack\_author** – The user that acknowledged the incident.

**Returns** A dictionary with result, entity\_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone
↳' entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key=
↳'everyone' entity_id='hostname/diskspace' ack_message=
↳'Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone
↳' entity_id='hostname/diskspace'
```

The following parameters are required: message\_type

### 21.9.449 salt.modules.virt

Work with virtual machines managed by libvirt

**depends** libvirt Python module

## Connection

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
 connection:
 uri: lxc:///
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```
virt:
 connection:
 uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
 auth:
 username: user
 password: secret
```

## Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the `ssh`, `libssh` and `libssh2` transports. Note that `libssh2` is likely to fail as it doesn't read the `known_hosts` file. Libvirt may also have been built without `libssh` or `libssh2` support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

## Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using `connection`, `username` and `password` parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the `virt:connection` is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///
```

The calls not using the libvirt connection setup are:

- `seed_non_shared_migrate`
- `virt_type`
- `is_*hyper`
- all migration functions
- [libvirt ESX URI format](#)
- [libvirt URI format](#)
- [libvirt authentication configuration](#)

```
salt.modules.virt.capabilities(**kwargs)
 Return the hypervisor connection capabilities.
```

**Parameters**

- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

`salt.modules.virt.cpu_baseline`(*full=False, migratable=False, out='libvirt', \*\*kwargs*)

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

**Parameters**

- **full** – Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** – Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** – 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.cpu_baseline
```

`salt.modules.virt.create_xml_path`(*path, \*\*kwargs*)

Start a transient domain based on the XML-file path passed to the function

**Parameters**

- **path** – path to a file containing the libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.create_xml_str`(*xml, \*\*kwargs*)

Start a transient domain based on the XML passed to the function

**Parameters**

- **xml** – libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.ctrl_alt_del`(*vm\_*, *\*\*kwargs*)

Sends CTRL+ALT+DEL to a VM

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

`salt.modules.virt.define_vol_xml_path`(*path*, *\*\*kwargs*)

Define a volume based on the XML-file path passed to the function

Parameters

- **path** – path to a file containing the libvirt XML definition of the volume
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_vol_xml_str`(*xml*, *\*\*kwargs*)

Define a volume based on the XML passed to the function

Parameters

- **xml** – libvirt XML definition of the storage volume
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is `default` unless changed with a configuration like this:

```
virt:
 storagepool: mine
```

`salt.modules.virt.define_xml_path`(*path*, *\*\*kwargs*)

Define a persistent domain based on the XML-file path passed to the function

**Parameters**

- **path** – path to a file containing the libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_xml_str`(*xml*, *\*\*kwargs*)

Define a persistent domain based on the XML passed to the function

**Parameters**

- **xml** – libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

`salt.modules.virt.delete_snapshots`(*name*, *\*names*, *\*\*kwargs*)

Delete one or more snapshots of the given VM.

**Parameters**

- **name** – domain name
- **names** – names of the snapshots to remove
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

`salt.modules.virt.domain_capabilities`(*emulator=None, arch=None, machine=None, domain=None, \*\*kwargs*)

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

**Parameters**

- **emulator** – return the capabilities for the given emulator binary
- **arch** – return the capabilities for the given CPU architecture
- **machine** – return the capabilities for the given emulated machine type
- **domain** – return the capabilities for the given virtualization type.
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided the libvirt default domain capabilities will be returned.

CLI Example:

```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

`salt.modules.virt.freecpu`(*\*\*kwargs*)

Return an int representing the number of unallocated cpus on this hypervisor

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.virt.freemem`(*\*\*kwargs*)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.virt.full_info`(*\*\*kwargs*)

Return the `node_info`, `vm_info` and `freemem`

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.

- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.virt.get_disks`(*vm\_*, *\*\*kwargs*)

Return the disks of a named vm

**Parameters**

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_disks <domain>
```

`salt.modules.virt.get_graphics`(*vm\_*, *\*\*kwargs*)

Returns the information on vnc for a given vm

**Parameters**

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

`salt.modules.virt.get_hypervisor`()

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:

- kvm
- xen

CLI Example:

```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm and xen hypervisors support

`salt.modules.virt.get_macs`(*vm\_*, *\*\*kwargs*)

Return a list off MAC addresses from the named vm

**Parameters**

- **vm** – name of the domain

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.virt.get_nics`(*vm\_*, *\*\*kwargs*)

Return info about the network interfaces of a named vm

**Parameters**

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_nics <domain>
```

`salt.modules.virt.get_profiles`(*hypervisor=None*, *\*\*kwargs*)

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

**Parameters**

- **hypervisor** – override the default machine type.
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi
```

`salt.modules.virt.get_xml`(*vm\_*, *\*\*kwargs*)

Returns the XML for a given vm

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.

- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_xml <domain>
```

```
salt.modules.virt.init(name, cpu, mem, image=None, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', enable_vnc=False, enable_qcow=False, graphics=None, os_type=None, arch=None, boot=None, **kwargs)
```

Initialize a new vm

#### Parameters

- **name** – name of the virtual machine to create
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **image** – Path to a disk image to use as the first disk (Default: None). Deprecated in favor of the `disks` parameter. To set (or change) the image of a disk, add the following to the disks definitions:

```
{
 'name': 'name_of_disk_to_change',
 'image': '/path/to/the/image'
}
```

- **nic** – NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the `interfaces` parameter. If set to None, no profile will be used.
- **interfaces** – List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in [Network Interfaces Definitions](#).

New in version 2019.2.0.

- **hypervisor** – the virtual machine type. By default the value will be computed according to the virtual host capabilities.
- **start** – True to start the virtual machine after having defined it (Default: True)
- **disk** – Disk profile to use (Default: 'default'). If set to None, no profile will be used.
- **disks** – List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in [Disks Definitions](#).

New in version 2019.2.0.

- **saltenv** – Fileserver environment (Default: 'base'). See [cp module for more details](#)
- **seed** – True to seed the disk image. Only used when the `image` parameter is provided. (Default: True)
- **install** – install salt minion if absent (Default: True)
- **pub\_key** – public key to seed with (Default: None)
- **priv\_key** – public key to seed with (Default: None)
- **seed\_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')
- **enable\_vnc** – True to setup a vnc display for the VM (Default: False)

Deprecated in favor of the `graphics` parameter. Could be replaced with the following:

```
graphics={'type': 'vnc'}
```

Deprecated since version 2019.2.0.

- **graphics** – Dictionary providing details on the graphics device to create. (Default: None) See *Graphics Definition* for more details on the possible values.

New in version 2019.2.0.

- **os\_type** – type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm.

New in version 2019.2.0.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is preferred over `i686`.

New in version 2019.2.0.

- **enable\_qcow** – True to create a QCOW2 overlay image, rather than copying the image (Default: False).

Deprecated in favor of `disks` parameter. Add the following to the disks definitions to create an overlay image of a template disk image with an image set:

```
{
 'name': 'name_of_disk_to_change',
 'overlay_image': True
}
```

Deprecated since version 2019.2.0.

- **pool** – Path of the folder where the image files are located for vmware/esx hypervisors.

Deprecated in favor of `disks` parameter. Add the following to the disks definitions to set the vmware datastore of a disk image:

```
{
 'name': 'name_of_disk_to_change',
 'pool': 'mydatastore'
}
```

Deprecated since version Flurorine.

- **dmac** – Default MAC address to use for the network interfaces. By default MAC addresses are automatically generated.

Deprecated in favor of `interfaces` parameter. Add the following to the interfaces definitions to force the mac address of a NIC:

```
{
 'name': 'name_of_nic_to_change',
 'mac': 'MY:MA:CC:ADD:RE:SS'
}
```

Deprecated since version 2019.2.0.

- **config** – minion configuration to use when seeding. See *seed module for more details*
- **boot\_dev** – String of space-separated devices to boot from (Default: 'hd')
- **serial\_type** – Serial device type. One of 'pty', 'tcp' (Default: None)

- **telnet\_port** – Telnet port to use for serial device of type `tcp`.
- **console** – True to add a console device along with serial one (Default: True)
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

- **boot** – Specifies kernel for the virtual machine, as well as boot parameters for the virtual machine. This is an optional parameter, and all of the keys are optional within the dictionary. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file, and will modify the XML accordingly.

```
{
 'kernel': '/root/f8-i386-vmlinux',
 'initrd': '/root/f8-i386-initrd',
 'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/'
}
```

New in version 3000.

## Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:

- name** Name of the network interface. This is only used as a key to merge with the profile data
- type** Network type. One of 'bridge', 'network'
- source** The network source, typically the bridge or network name
- mac** The desired mac address, computed if None (Default: None).
- model** The network card model (Default: depends on the hypervisor)

## Disks Definitions

Disk dictionaries can contain the following properties:

- name** Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.
- format** Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)
- size** Disk size in MiB
- pool** Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor)
- model** One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt [disk element](#) documentation for the allowed bus types.

- image** Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: None)
- overlay\_image** True to create a QCOW2 disk image with `image` as backing file. If False the file pointed to by the `image` property will simply be copied. (Default: False)
- source\_file** Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be None for devices that have no associated image like cdroms.
- device** Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

## Graphics Definition

The graphics dictionary can have the following properties:

**type** Graphics type. The possible values are `none`, `'spice'`, `'vnc'` and other values allowed as a libvirt graphics type (Default: `None`)

See the libvirt [graphics element](#) documentation for more details on the possible types.

**port** Port to export the graphics on for `vnc`, `spice` and `rdp` types.

**tls\_port** Port to export the graphics over a secured connection for `spice` type.

**listen** Dictionary defining on what address to listen on for `vnc`, `spice` and `rdp`. It has a `type` property with `address` and `None` as possible values, and an `address` property holding the IP or hostname to listen on.

By default, not setting the `listen` part of the dictionary will default to listen on all addresses.

## CLI Example

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can be changed with such a configuration:

```
virt:
 images: /data/my/vm/images/
```

`salt.modules.virt.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.virt.is_kvm_hyper()`

Returns a bool whether or not this node is a KVM hypervisor

CLI Example:

```
salt '*' virt.is_kvm_hyper
```

Deprecated since version 2019.2.0.

`salt.modules.virt.is_xen_hyper()`

Returns a bool whether or not this node is a XEN hypervisor

CLI Example:

```
salt '*' virt.is_xen_hyper
```

Deprecated since version 2019.2.0.

`salt.modules.virt.list_active_vms(**kwargs)`

Return a list of names for active virtual machine on the minion

Parameters

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.virt.list_domains(**kwargs)`

Return a list of available domains.

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.virt.list_inactive_vms(**kwargs)`

Return a list of names for inactive virtual machine on the minion

**Parameters**

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.virt.list_networks(**kwargs)`

List all virtual networks.

**Parameters**

- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

`salt.modules.virt.list_pools(**kwargs)`

List all storage pools.

**Parameters**

- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_pools
```

`salt.modules.virt.list_snapshots` (*domain=None, \*\*kwargs*)

List available snapshots for certain vm or for all.

Parameters

- **domain** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

`salt.modules.virt.migrate` (*vm\_, target, ssh=False*)

Shared storage migration

Parameters

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
 tunnel: True
```

For more details on tunnelled data migrations, report to <https://libvirt.org/migration.html#transporttunnel>

`salt.modules.virt.migrate_non_shared` (*vm\_, target, ssh=False*)

Attempt to execute non-shared storage "all" migration

Parameters

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
 tunnel: True
```

For more details on tunnelled data migrations, report to <https://libvirt.org/migration.html#transporttunnel>

`salt.modules.virt.migrate_non_shared_inc`(*vm\_*, *target*, *ssh=False*)

Attempt to execute non-shared storage "all" migration

**Parameters**

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
 tunnel: True
```

For more details on tunnelled data migrations, report to <https://libvirt.org/migration.html#transporttunnel>

`salt.modules.virt.network_define`(*name*, *bridge*, *forward*, *ipv4\_config=None*, *ipv6\_config=None*, *\*\*kwargs*)

Create libvirt network.

**Parameters**

- **name** – Network name
- **bridge** – Bridge name
- **forward** – Forward mode(bridge, router, nat)
- **vport** – Virtualport type
- **tag** – Vlan tag
- **autostart** – Network autostart (default True)
- **start** – Network start (default True)
- **ipv4\_config** (*dict or None*) – IP v4 configuration Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
- **ipv6\_config** (*dict or None*) – IP v6 configuration Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

\*\* IP configuration definition

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

**cidr** CIDR notation for the network. For example '192.168.124.0/24'

**dhcp\_ranges** A list of dictionary with 'start' and 'end' properties.

CLI Example:

```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

`salt.modules.virt.network_get_xml`(*name*, *\*\*kwargs*)

Return the XML definition of a virtual network

**Parameters**

- **name** – libvirt network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults

- **password** – password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.network_get_xml default
```

`salt.modules.virt.network_info`(*name=None, \*\*kwargs*)

Return informations on a virtual network provided its name.

Parameters

- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_info default
```

`salt.modules.virt.network_set_autostart`(*name, state='on', \*\*kwargs*)

Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

Parameters

- **name** – virtual network name
- **state** – 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.network_set_autostart <pool> <on | off>
```

`salt.modules.virt.network_start`(*name, \*\*kwargs*)

Start a defined virtual network.

Parameters

- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_start default
```

`salt.modules.virt.network_stop`(*name, \*\*kwargs*)

Stop a defined virtual network.

Parameters

- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_stop default
```

`salt.modules.virt.network_undefine`(*name*, *\*\*kwargs*)

Remove a defined virtual network. This does not stop the virtual network.

Parameters

- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_undefine default
```

`salt.modules.virt.node_info`(*\*\*kwargs*)

Return a dict with information about this node

Parameters

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.virt.pause`(*vm\_*, *\*\*kwargs*)

Pause the named vm

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pause <domain>
```

`salt.modules.virt.pool_build`(*name*, *\*\*kwargs*)

Build a defined libvirt storage pool.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_build default
```

`salt.modules.virt.pool_capabilities(**kwargs)`

Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the `computed` property.

Parameters

- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_capabilities
```

`salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_initiator=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)`

Create libvirt pool.

Parameters

- **name** – Pool name
- **ptype** – Pool type. See [libvirt documentation](#) for the possible values.
- **target** – Pool full path target
- **permissions** – Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **source\_devices** – List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to [this libvirt page](#) for more informations on the use of `part_separator`

- **source\_dir** – Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: None)
- **source\_initiator** – Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.

- **source\_adapter** – SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to [this libvirt page](#) for the meaning and possible values of these properties.

- **source\_hosts** – List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)

- **source\_auth** – Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
 'type': 'ceph',
 'username': 'admin',
 'secret': {
 'type': 'uuid',
 'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
 }
}
```

```
source_auth={
 'type': 'chap',
 'username': 'myname',
 'secret': {
 'type': 'usage',
 'value': 'mycluster_myname'
 }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source\_name** – Identifier of name-based sources.
- **source\_format** – String representing the source format. The possible values are depending on the source type. See [libvirt documentation](#) for the possible values.
- **start** – Pool start (default True)
- **transient** – When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force `start` to True. (Default: False)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

### Permissions definition

The permissions are described by a dictionary containing the following keys:

**mode** The octal representation of the permissions. (Default: `0711`)

**owner** the numeric user ID of the owner. (Default: from the parent folder)

**group** the numeric ID of the group. (Default: from the parent folder)

**label** the SELinux label. (Default: `None`)

### CLI Example:

Local folder pool:

```
salt '*' virt.pool_define somepool dir target=/srv/mypool
↪ permissions="{ 'mode': '0744' 'owner': 107, 'group': 107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_define myshare netfs source_format=cifs
↪ source_dir=samba_share source_hosts=["example.com"] target=/mnt/
↪ cifs
```

New in version 2019.2.0.

`salt.modules.virt.pool_delete`(*name*, *\*\*kwargs*)

Delete the resources of a defined libvirt storage pool.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_delete default
```

`salt.modules.virt.pool_get_xml`(*name*, *\*\*kwargs*)

Return the XML definition of a virtual storage pool

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_get_xml default
```

`salt.modules.virt.pool_info`(*name=None*, *\*\*kwargs*)

Return informations on a storage pool provided its name.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_info default
```

`salt.modules.virt.pool_list_volumes`(*name*, *\*\*kwargs*)

List the volumes contained in a defined libvirt storage pool.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_list_volumes <pool>
```

`salt.modules.virt.pool_refresh(name, **kwargs)`

Refresh a defined libvirt storage pool.

**Parameters**

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_refresh default
```

`salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)`

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

**Parameters**

- **name** – libvirt storage pool name
- **state** – 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

`salt.modules.virt.pool_start(name, **kwargs)`

Start a defined libvirt storage pool.

**Parameters**

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_start default
```

`salt.modules.virt.pool_stop(name, **kwargs)`

Stop a defined libvirt storage pool.

**Parameters**

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_stop default
```

`salt.modules.virt.pool_undefine`(*name*, *\*\*kwargs*)

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

#### Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_undefine default
```

`salt.modules.virt.pool_update`(*name*, *p\_type*, *target=None*, *permissions=None*, *source\_devices=None*, *source\_dir=None*, *source\_initiator=None*, *source\_adapter=None*, *source\_hosts=None*, *source\_auth=None*, *source\_name=None*, *source\_format=None*, *test=False*, *\*\*kwargs*)

Update a libvirt storage pool if needed. If called with `test=True`, this is also reporting whether an update would be performed.

#### Parameters

- **name** – Pool name
- **p\_type** – Pool type. See [libvirt documentation](#) for the possible values.
- **target** – Pool full path target
- **permissions** – Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **source\_devices** – List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to [this libvirt page](#) for more informations on the use of `part_separator`

- **source\_dir** – Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: None)
- **source\_initiator** – Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.

- **source\_adapter** – SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwnn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to [this libvirt page](#) for the meaning and possible values of these properties.

- **source\_hosts** – List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source\_auth** – Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and

value keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
 'type': 'ceph',
 'username': 'admin',
 'secret': {
 'type': 'uuid',
 'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
 }
}
```

```
source_auth={
 'type': 'chap',
 'username': 'myname',
 'secret': {
 'type': 'usage',
 'uuid': 'mycluster_myname'
 }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the `libvirt` secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source\_name** – Identifier of name-based sources.
- **source\_format** – String representing the source format. The possible values are depending on the source type. See [libvirt documentation](#) for the possible values.
- **test** – run in dry-run mode if set to True
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

### Example:

Local folder pool:

```
salt '*' virt.pool_update somepool dir target=/srv/mypool
↪ permissions="{ 'mode': '0744' 'owner': 107, 'group': 107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_update myshare netfs source_format=cifs
↪ source_dir=samba_share source_hosts="['example.com']" target=/mnt/
↪ cifs
```

New in version 3000.

`salt.modules.virt.purge`(*vm\_*, *dirs*=False, *removables*=None, *\*\*kwargs*)

Recursively destroy and delete a persistent virtual machine, pass True for `dir`'s to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

Pass `removables=False` to avoid deleting `cdrom` and `floppy` images. To avoid disruption, the default but dangerous value is True. This will be changed to the safer False default value in Sodium.

#### Parameters

- **vm** – domain name
- **dirs** – pass True to remove containing directories

- **removables** – pass True to remove removable devices  
New in version 2019.2.0.
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.purge <domain> removables=False
```

`salt.modules.virt.reboot`(*name*, *\*\*kwargs*)

Reboot a domain via ACPI request

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset`(*vm\_*, *\*\*kwargs*)

Reset a VM by emulating the reset button on a physical machine

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume`(*vm\_*, *\*\*kwargs*)

Resume the named vm

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.resume <domain>
```

`salt.modules.virt.revert_snapshot` (*name*, *vm\_snapshot=None*, *cleanup=False*, *\*\*kwargs*)

Revert snapshot to the previous from current (if available) or to the specific.

Parameters

- **name** – domain name
- **vm\_snapshot** – name of the snapshot to revert
- **cleanup** – Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

`salt.modules.virt.seed_non_shared_migrate` (*disks*, *force=False*)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

- **disks** – the list of disk data as provided by `virt.get_disks`
- **force** – skip checking the compatibility of source and target disk images if True. (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

`salt.modules.virt.set_autostart` (*vm\_*, *state='on'*, *\*\*kwargs*)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

- **vm** – domain name
- **state** – 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

`salt.modules.virt.setmem`(*vm\_*, *memory*, *config=False*, *\*\*kwargs*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

**Parameters**

- **vm** – name of the domain
- **memory** – memory amount to set in MB
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

`salt.modules.virt.setvcpus`(*vm\_*, *vcpus*, *config=False*, *\*\*kwargs*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

**Parameters**

- **vm** – name of the domain
- **vcpus** – integer representing the number of CPUs to be assigned
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

`salt.modules.virt.shutdown`(*vm\_*, *\*\*kwargs*)

Send a soft shutdown signal to the named vm

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.virt.snapshot`(*domain*, *name*=None, *suffix*=None, *\*\*kwargs*)

Create a snapshot of a VM.

#### Parameters

- **domain** – domain name
- **name** – Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix** – Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

`salt.modules.virt.start`(*name*, *\*\*kwargs*)

Start a defined domain

#### Parameters

- **vm** – domain name
  - **connection** – libvirt connection URI, overriding defaults
- New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
- New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.virt.stop`(*name*, *\*\*kwargs*)

Hard power down the virtual machine, this is equivalent to pulling the power.

#### Parameters

- **vm** – domain name
  - **connection** – libvirt connection URI, overriding defaults
- New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
- New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.stop <domain>
```

`salt.modules.virt.undefine`(*vm\_*, *\*\*kwargs*)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

#### Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.undefine <domain>
```

`salt.modules.virt.update`(*name*, *cpu=0*, *mem=0*, *disk\_profile=None*, *disks=None*, *nic\_profile=None*, *interfaces=None*, *graphics=None*, *live=True*, *boot=None*, *\*\*kwargs*)

Update the definition of an existing domain.

#### Parameters

- **name** – Name of the domain to update
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **disk\_profile** – disk profile to use
- **disks** – Disk definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic\_profile** – network interfaces profile to use
- **interfaces** – Network interface definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** – The new graphics definition as defined in [Graphics Definition](#). If not set, the graphics will not be changed. To remove a graphics device, set this parameter to `{'type': 'none'}`.
- **live** – `False` to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If `True`, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: `True`)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults
- **boot** – Specifies kernel for the virtual machine, as well as boot parameters for the virtual machine. This is an optional parameter, and all of the keys are optional within the dictionary. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file, and will modify the XML accordingly.

```
{
 'kernel': '/root/f8-i386-vmlinux',
 'initrd': '/root/f8-i386-initrd',
 'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/'
}
```

New in version 3000.

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```
{
 'definition': True,
 'cpu': True,
 'mem': True,
 'disks': {'attached': [list of actually attached disks],
 'detached': [list of actually detached disks]},
 'nics': {'attached': [list of actually attached nics],
 'detached': [list of actually detached nics]},
 'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.update domain cpu=2 mem=1024
```

`salt.modules.virt.virt_type()`

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

`salt.modules.virt.vm_cputime(vm_=None, **kwargs)`

Return cputime used by the vms on this hyper in a list of dicts:

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
 'your-vm': {
 'cputime' <int>
 'cputime_percent' <int>
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.virt.vm_diskstats(vm_=None, **kwargs)`

Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** – domain name

- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
 'your-vm': {
 'rd_req' : 0,
 'rd_bytes' : 0,
 'wr_req' : 0,
 'wr_bytes' : 0,
 'errs' : 0
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

`salt.modules.virt.vm_info`(*vm\_=None, \*\*kwargs*)

Return detailed information about the vms on this hyper in a list of dicts:

#### Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
 'your-vm': {
 'cpu': <int>,
 'maxMem': <int>,
 'mem': <int>,
 'state': '<state>',
 'cputime' <int>
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.virt.vm_netstats`(*vm\_=None, \*\*kwargs*)

Return combined network counters used by the vms on this hyper in a list of dicts:

**Parameters**

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
 'your-vm': {
 'rx_bytes' : 0,
 'rx_packets' : 0,
 'rx_errs' : 0,
 'rx_drop' : 0,
 'tx_bytes' : 0,
 'tx_packets' : 0,
 'tx_errs' : 0,
 'tx_drop' : 0
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state`(*vm\_=None, \*\*kwargs*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

**Parameters**

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

`salt.modules.virt.volume_delete`(*pool, volume, \*\*kwargs*)

Delete a libvirt managed volume.

**Parameters**

- **pool** – libvirt storage pool name
- **volume** – name of the volume to delete

- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_delete <pool> <volume>
```

`salt.modules.virt.volume_infos`(*pool=None, volume=None, \*\*kwargs*)

Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

Parameters

- **pool** – libvirt storage pool name (default: None)
- **volume** – name of the volume to get infos from (default: None)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_infos <pool> <volume>
```

## 21.9.450 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

`salt.modules.virtualenv_mod.create`(*path, venv\_bin=None, system\_site\_packages=False, distribute=False, clear=False, python=None, extra\_search\_dir=None, never\_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use\_vt=False, saltenv='base', \*\*kwargs*)

Create a virtualenv

**path** The path to the virtualenv to be created

**venv\_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

**system\_site\_packages** [False] Passthrough argument given to virtualenv or pyvenv

**distribute** [False] Passthrough argument given to virtualenv

**pip** [False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear** [False] Passthrough argument given to virtualenv or pyvenv

**python** [None (default)] Passthrough argument given to virtualenv

**extra\_search\_dir** [None (default)] Passthrough argument given to virtualenv

**never\_download** [None (default)] Passthrough argument given to virtualenv if True

**prompt** [None (default)] Passthrough argument given to virtualenv if not None

**symlinks** [None] Passthrough argument given to pyvenv if True

**upgrade** [None] Passthrough argument given to pyvenv if True

**user** [None] Set ownership for the virtualenv

---

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

---

**runas** [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

**use\_vt** [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

**saltenv** ['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

---

**Note:** The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

---

CLI Example:

```

salt '*' virtualenv.create /path/to/new/virtualenv

Example of using --always-copy environment variable (in case your fs doesn't
↳support symlinks).
This will copy files into the virtualenv instead of symlinking them.

.. code-block:: yaml

- env:
 - VIRTUALENV_ALWAYS_COPY: 1

```

`salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)`

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

**venv** Path to the virtualenv.

**distribution** Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```

salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution

```

`salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)`

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

New in version 2016.3.0.

**resource** Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```

salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.
↳xml

```

`salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)`

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

New in version 2016.3.0.

**resource** Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

**salt.modules.virtualenv\_mod.get\_site\_packages**(*venv*)

Return the path to the site-packages directory of a virtualenv

**venv** Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

**salt.modules.virtualenv\_mod.virtualenv\_ver**(*venv\_bin*, *user=None*, *\*\*kwargs*)

return virtualenv version if exists

### 21.9.451 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).

New in version 2019.2.0.

**codeauthor** Jasper Lievisse Adriaanse <jasper@openbsd.org>

---

**Note:** This module requires the *vmctl* service to be running on the OpenBSD target machine.

---

**salt.modules.vmctl.create\_disk**(*name*, *size*)

Create a VMM disk with the specified *name* and *size*.

**size:** Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

```
salt '*' vmctl.create_disk /path/to/disk.img size=10G
```

**salt.modules.vmctl.load**(*path*)

Load additional configuration from the specified file.

**path** Path to the configuration file.

CLI Example:

```
salt '*' vmctl.load path=/etc/vm.switches.conf
```

**salt.modules.vmctl.reload**()

Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:

```
salt '*' vmctl.reload
```

**salt.modules.vmctl.reset**(*all=False*, *vms=False*, *switches=False*)

Reset the running state of VMM or a subsystem.

**all:** Reset the running state.

**switches:** Reset the configured switches.

**vms:** Reset and terminate all VMs.

CLI Example:

```
salt '*' vmctl.reset all=True
```

`salt.modules.vmctl.start`(*name=None, id=None, bootpath=None, disk=None, disks=None, local\_iface=False, memory=None, nics=0, switch=None*)

Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

**bootpath:** Path to a kernel or BIOS image to load.

**disk:** Path to a single disk to use.

**disks:** List of multiple disks to use.

**local\_iface:** Whether to add a local network interface. See "LOCAL INTERFACES" in the `vmctl(8)` manual page for more information.

**memory:** Memory size of the VM specified in megabytes.

**switch:** Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```
salt '*' vmctl.start 2 # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk='/disk.
↳img'
```

`salt.modules.vmctl.status`(*name=None, id=None*)

List VMs running on the host, or only the VM specified by `id`. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

CLI Example:

```
salt '*' vmctl.status # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

`salt.modules.vmctl.stop`(*name=None, id=None*)

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

CLI Example:

```
salt '*' vmctl.stop name=alpine
```

## 21.9.452 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**codeauthor** Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

### Dependencies

- pyVmomi Python Module
- ESXCLI

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

## vSphere Automation SDK

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-python.git
```

---

**Note:** The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

---

The module is currently in version 1.0.3 (as of 8/26/2019)

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

---

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

## About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the `pyVmomi` Python library and the `ESXCLI` package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_hosts` kwarg. For example:

```
salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user>
↳ <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:

 esxi-1.example.com:

 Coredump Config:

 enabled:
 False
 esxi-2.example.com:

 Coredump Config:

 enabled:
 True
 host_vnic:
 vmk0
 ip:
 coredump-location.example.com
 port:
 6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-
↳password>
local:

10.4.28.150:

 Coredump Config:

 enabled:
 True
 host_vnic:
 vmk0
 ip:
 coredump-location.example.com
 port:
 6500
```

```
salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids,
 safety_checks=True, service_instance=None)
 vice_instance=None)
```

Adds capacity disks to the disk group with the specified cache disk.

**cache\_disk\_id** The canonical name of the cache disk.

**capacity\_disk\_ids** A list containing canonical names of the capacity disks to add.

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.add_capacity_to_diskgroup
 cache_disk_id='naa.0000000000000001'
 capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003']
```

```
salt.modules.vsphere.add_host_to_dvs(host, username, password, vmknic_name, vm-
 nic_name, dvs_name, target_portgroup_name, up-
 link_portgroup_name, protocol=None, port=None,
 host_names=None)
```

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

**host** The location of the vCenter server.

**username** The username used to login to the vCenter server.

**password** The password used to login to the vCenter server.

**vmknic\_name** The name of the virtual NIC to migrate.

**vmnic\_name** The name of the physical NIC to migrate.

**dvs\_name** The name of the Distributed Virtual Switch.

**target\_portgroup\_name** The name of the distributed portgroup in which to migrate the virtual NIC.

**uplink\_portgroup\_name** The name of the uplink portgroup in which to migrate the physical NIC.

**protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

**host\_names**: An array of VMware host names to migrate

CLI Example:

```
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
 username='administrator@vsphere.corp.com' password='vsphere_password'
 vmknic_name='vmk0' vmnic_name='vmnic0' dvs_name='DSwitch'
```

(continues on next page)

(continued from previous page)

```
target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-DVUplinks-
↪181'
protocol='https' port='443', host_names=["'esxi1.corp.com','esxi2.corp.com',
↪'esxi3.corp.com']"
```

Return Example:

```
somehost:

esxi1.corp.com:

 dvs:
 DSwitch
 portgroup:
 DPortGroup
 status:
 True
 uplink:
 DSwitch-DVUplinks-181
 vmknic:
 vmk0
 vmnic:
 vmnic0
esxi2.corp.com:

 dvs:
 DSwitch
 portgroup:
 DPortGroup
 status:
 True
 uplink:
 DSwitch-DVUplinks-181
 vmknic:
 vmk0
 vmnic:
 vmnic0
esxi3.corp.com:

 dvs:
 DSwitch
 portgroup:
 DPortGroup
 status:
 True
 uplink:
 DSwitch-DVUplinks-181
 vmknic:
 vmk0
 vmnic:
 vmnic0
message:
success:
 True
```

This was very difficult to figure out. VMware's PyVmomi documentation at

<https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst> (which is a copy

of the official documentation here: [https://www.vmware.com/support/developer/converter-sdk/conv60\\_apireference/vim.DistributedVirtualSwitch.html](https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html)

says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called `Add-VDSwitchPhysicalNetworkAdapter` that does what we want. I used Onyx (<https://labs.vmware.com/flings/onyx>) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```
<UpdateNetworkConfig xmlns="urn:vim25">
 <_this type="HostNetworkSystem">networkSystem-187</_this>
 <config>
 <vswitch>
 <changeOperation>edit</changeOperation>
 <name>vSwitch0</name>
 <spec>
 <numPorts>7812</numPorts>
 </spec>
 </vswitch>
 <proxySwitch>
 <changeOperation>edit</changeOperation>
 <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
 <spec>
 <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">
 <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
 </backing>
 </spec>
 </proxySwitch>
 <portgroup>
 <changeOperation>remove</changeOperation>
 <spec>
 <name>Management Network</name><vlanId>-1</vlanId><vswitchName /><policy /
→ </spec>
 </portgroup>
 <vnic>
 <changeOperation>edit</changeOperation>
 <device>vmk0</device>
 <portgroup />
 <spec>
 <distributedVirtualPort>
 <switchUuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</switchUuid>
 <portgroupKey>dvportgroup-191</portgroupKey>
 </distributedVirtualPort>
 </spec>
 </vnic>
 </config>
 <changeMode>modify</changeMode>
 </UpdateNetworkConfig>
```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.add_license` (*key, description, safety\_checks=True, service\_instance=None*)

Adds a license to the vCenter or ESXi host

**key** License key.

**description** License description added in as a label.

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

**salt.modules.vsphere.assign\_default\_storage\_policy\_to\_datastore** (*policy*, *datastore*, *service\_instance=None*)

Assigns a storage policy as the default policy to a datastore.

**policy** Name of the policy to assign.

**datastore** Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.assign_storage_policy_to_datastore
policy='policy name' datastore=ds1
```

**salt.modules.vsphere.assign\_license** (*license\_key*, *license\_name*, *entity*, *entity\_display\_name*, *safety\_checks=True*, *service\_instance=None*)

Assigns a license to an entity

**license\_key** Key of the license to assign See `_get_entity` docstrings for format.

**license\_name** Display name of license

**entity** Dictionary representation of an entity

**entity\_display\_name** Entity name used in logging

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.assign_license license_key=000000:000000
license name=test entity={type:cluster,datacenter:dc,cluster:cl}
```

**salt.modules.vsphere.attach\_tag** (*object\_id*, *tag\_id*, *managed\_obj='ClusterComputeResource'*, *server=None*, *username=None*, *password=None*, *service\_instance=None*)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (*CategoryModel.cardinality*) and associability (*CategoryModel.associable\_types*) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```
salt vm_minion vsphere.attach_tag domain-c2283
↪urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-38865467cfbe:GLOBAL
```

#### Parameters

- **object\_id** (*str*) – The identifier of the input object.
- **tag\_id** (*str*) – The identifier of the tag object.
- **managed\_obj** (*str*) – Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) – Target DNS or IP of vCenter center.
- **username** (*basestring*) – Username associated with the vCenter center.
- **password** (*basestring*) – Password associated with the vCenter center.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.

**Return type** list of tags

**Raise** Unauthorized if you do not have the privilege to read the object.

**Raise** Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.compare_vm_configs`(*new\_config*, *current\_config*)

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference

**new\_config**: New config dictionary with every available parameter

**current\_config**: Currently deployed configuration

`salt.modules.vsphere.configure_host_cache`(*enabled*, *datastore=None*, *swap\_size\_MiB=None*, *service\_instance=None*)

Configures the host cache on the selected host.

**enabled**: Boolean flag specifying whether the host cache is enabled.

**datastore**: Name of the datastore that contains the host cache. Must be set if `enabled` is `True`.

**swap\_size\_MiB**: Swap size in Mibibytes. Needs to be set if `enabled` is `True`. Must be smaller than the datastore size.

**service\_instance**: Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.configure_host_cache enabled=False

salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
 swap_size_MiB=1024
```

`salt.modules.vsphere.coredump_network_enable`(*host*, *username*, *password*, *enabled*, *protocol=None*, *port=None*, *esxi\_hosts=None*, *credstore=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

**host**: The location of the host.

**username**: The username used to login to the host, such as `root`.

**password**: The password used to login to the host.

**enabled**: Python `True` or `False` to enable or disable coredumps.

**protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**esxi\_hosts**: If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**: Optionally set to path to the credential store file.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
 ↪True esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.create_cluster`(*cluster\_dict*, *datacenter=None*, *cluster=None*, *service\_instance=None*)

Creates a cluster.

Note: `cluster_dict['name']` will be overridden by the `cluster` param value

**config\_dict**: Dictionary with the config values of the new cluster.

**datacenter**: Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default

value is None.

**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.  
**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

`salt.modules.vsphere.create_datacenter` (*datacenter\_name*, *service\_instance=None*)  
 Creates a datacenter.

Supported proxies: esxdatacenter

**datacenter\_name** The datacenter name

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_datacenter dc1
```

`salt.modules.vsphere.create_diskgroup` (*cache\_disk\_id*, *capacity\_disk\_ids*, *safety\_checks=True*,  
*service\_instance=None*)

Creates disk group on an ESXi host with the specified cache and capacity disks.

**cache\_disk\_id** The canonical name of the disk to be used as a cache. The disk must be `ssd`.

**capacity\_disk\_ids** A list containing canonical names of the capacity disks. Must contain at least one id. Default is `True`.

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is `True`.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.0000000000000001'
capacity_disk_ids=['naa.0000000000000002', naa.0000000000000003]'
```

`salt.modules.vsphere.create_dvportgroup` (*portgroup\_dict*, *portgroup\_name*, *dvs*, *service\_instance=None*)

Creates a distributed virtual portgroup.

Note: The `portgroup_name` param will override any name already set in `portgroup_dict`.

**portgroup\_dict** Dictionary with the config values the portgroup should be created with (example in `salt.states.dvs`).

**portgroup\_name** Name of the portgroup to be created.

**dvs** Name of the DVS that will contain the portgroup.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
portgroup_name=pg1 dvs=dvs1
```

`salt.modules.vsphere.create_dvs` (*dvs\_dict*, *dvs\_name*, *service\_instance=None*)

Creates a distributed virtual switch (DVS).

Note: The `dvs_name` param will override any name set in `dvs_dict`.

**dvs\_dict** Dict representation of the new DVS (example in `salt.states.dvs`)

**dvs\_name** Name of the DVS to be created.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

`salt.modules.vsphere.create_storage_policy` (*policy\_name*, *policy\_dict*, *service\_instance=None*)

Creates a storage policy.

Supported capability types: scalar, set, range.

**policy\_name** Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.

**policy\_dict** Dictionary containing the changes to apply to the policy. (example in `salt.states.pbm`)

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
 policy_dict="$policy_dict"
```

`salt.modules.vsphere.create_tag`(*name, description, category\_id, server=None, username=None, password=None, service\_instance=None*)

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

#### Parameters

- **server** (*basestring*) – Target DNS or IP of vCenter client.
- **username** (*basestring*) – Username associated with the vCenter client.
- **password** (*basestring*) – Password associated with the vCenter client.
- **name** (*str*) – Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) – Given description of tag category.
- **category\_id** (*str*) – Value of `category_id` representative of the category created previously.

**Returns** The identifier of the created tag.

**Return type** *str*

**Raise** `AlreadyExists` if the name provided in the `create_spec` is the name of an already existing tag in the input category.

**Raise** `InvalidArgument` if any of the input information in the `create_spec` is invalid.

**Raise** `NotFound` if the category for in the given `create_spec` does not exist in the system.

**Raise** `Unauthorized` if you do not have the privilege to create tag.

`salt.modules.vsphere.create_tag_category`(*name, description, cardinality, server=None, username=None, password=None, service\_instance=None*)

Create a category with given cardinality.

CLI Example:

```
salt vm_minion vsphere.create_tag_category
```

#### Parameters

- **name** (*str*) – Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) – Given description of tag category.
- **cardinality** (*str*) – The associated cardinality (`SINGLE`, `MULTIPLE`) of the category.
- **server** (*basestring*) – Target DNS or IP of vCenter center.
- **username** (*basestring*) – Username associated with the vCenter center.
- **password** (*basestring*) – Password associated with the vCenter center.

**Returns** Identifier of the created category.

**Return type** *str*

**Raise** `AlreadyExists` if the name provided in the `create_spec` is the name of an already existing category.

**Raise** `InvalidArgument` if any of the information in the `create_spec` is invalid.

**Raise** Unauthorized if you do not have the privilege to create a category.

```
salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)
```

Creates a virtual machine container.

CLI Example:

```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...
```

**vm\_name** Name of the virtual machine

**cpu** Properties of CPUs for freshly created machines

**memory** Memory size for freshly created machines

**image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

**version** Virtual machine container hardware version

**datacenter** Datacenter where the virtual machine will be deployed (mandatory)

**datastore** Datastore where the virtual machine files will be placed

**placement** Resource pool or cluster or host or folder where the virtual machine will be deployed

**devices** interfaces

```
interfaces:
 adapter: 'Network adapter 1'
 name: vlan100
 switch_type: distributed or standard
 adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
 mac: '00:11:22:33:44:55'
 connectable:
 allow_guest_control: True
 connected: True
 start_connected: True
```

disks

```
disks:
 adapter: 'Hard disk 1'
 size: 16
 unit: GB
 address: '0:0'
 controller: 'SCSI controller 0'
 thin_provision: False
 eagerly_scrub: False
 datastore: 'myshare'
 filename: 'vm/mydisk.vmdk'
```

scsi\_devices

```
scsi_devices:
 controller: 'SCSI controller 0'
 type: paravirtual
 bus_sharing: no_sharing
```

serial\_ports

```
serial_ports:
 adapter: 'Serial port 1'
 type: network
```

(continues on next page)

(continued from previous page)

```
backing:
 uri: 'telnet://something:port'
 direction: <client|server>
 filename: 'service_uri'
connectable:
 allow_guest_control: True
 connected: True
 start_connected: True
yield: False
```

cd\_drives

```
cd_drives:
 adapter: 'CD/DVD drive 0'
 controller: 'IDE 0'
 device_type: datastore_iso_file
 datastore_iso_file:
 path: path_to_iso
 connectable:
 allow_guest_control: True
 connected: True
 start_connected: True
```

**advanced\_config** Advanced config parameters to be set for the virtual machine

`salt.modules.vsphere.create_vmfs_datastore` (*datastore\_name*, *disk\_id*, *vmfs\_major\_version*, *safety\_checks=True*, *service\_instance=None*)

Creates a ESXi host disk group with the specified cache and capacity disks.

**datastore\_name** The name of the datastore to be created.

**disk\_id** The disk id (canonical name) on which the datastore is created.

**vmfs\_major\_version** The VMFS major version.

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
vmfs_major_version=5
```

`salt.modules.vsphere.delete_advanced_configs` (*vm\_name*, *datacenter*, *advanced\_configs*, *service\_instance=None*)

Removes extra config parameters from a virtual machine

**vm\_name** Virtual machine name

**datacenter** Datacenter name where the virtual machine is available

**advanced\_configs** List of advanced config values to be removed

**service\_instance** vCenter service instance for connection and configuration

`salt.modules.vsphere.delete_tag` (*tag\_id*, *server=None*, *username=None*, *password=None*, *service\_instance=None*)

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

**Parameters**

- **tag\_id** (*str*) – The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** (*basestring*) – Target DNS or IP of vCenter center.

- **username** (*basestring*) – Username associated with the vCenter center.
  - **password** (*basestring*) – Password associated with the vCenter center.
- Raise** AlreadyExists if the name provided in the create\_spec is the name of an already existing category.
- Raise** InvalidArgument if any of the information in the create\_spec is invalid.
- Raise** Unauthorized if you do not have the privilege to create a category.

`salt.modules.vsphere.delete_tag_category`(*category\_id*, *server=None*, *username=None*, *password=None*, *service\_instance=None*)

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

#### Parameters

- **category\_id** (*str*) – The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
  - **server** (*basestring*) – Target DNS or IP of vCenter center.
  - **username** (*basestring*) – Username associated with the vCenter center.
  - **password** (*basestring*) – Password associated with the vCenter center.
- Raise** NotFound if the tag for the given tag\_id does not exist in the system.
- Raise** Unauthorized if you do not have the privilege to delete the tag.
- Raise** Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.delete_vm`(*name*, *datacenter*, *placement=None*, *power\_off=False*, *service\_instance=None*)

Deletes a virtual machine defined by name and placement

**name** Name of the virtual machine

**datacenter** Datacenter of the virtual machine

**placement** Placement information of the virtual machine

**service\_instance** vCenter service instance for connection and configuration

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.disconnect`(*service\_instance*)

Disconnects from a vCenter or ESXi host

---

**Note:** Should be used by state functions, not invoked directly.

---

**service\_instance** Service instance (vim.ServiceInstance)

CLI Example:

See note above.

`salt.modules.vsphere.enable_firewall_ruleset`(*host*, *username*, *password*, *ruleset\_enable*, *ruleset\_name*, *protocol=None*, *port=None*, *esxi\_hosts=None*, *credstore=None*)

Enable or disable an ESXi firewall rule set.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**ruleset\_enable** True to enable the ruleset, false to disable.

**ruleset\_name** Name of ruleset to target.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If *host* is a vCenter host, then use *esxi\_hosts* to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** A standard `cmd.run_all` dictionary, per host.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True
↳ 'syslog'

Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password
↳ True 'syslog' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.erase_disk_partitions` (*disk\_id=None, scsi\_address=None, service\_instance=None*)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the *scsi\_address*. **disk\_id** Canonical name of the disk. Either *disk\_id* or *scsi\_address* needs to be specified (*disk\_id* supersedes *scsi\_address*).

**scsi\_address** Scsi address of the disk. *disk\_id* or *scsi\_address* needs to be specified (*disk\_id* supersedes *scsi\_address*).

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhba0:C0:T0:L0'

salt '*' vsphere.erase_disk_partitions disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.esxcli_cmd` (*cmd\_str, host=None, username=None, password=None, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**cmd\_str** The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If *host* is a vCenter host, then use *esxi\_hosts* to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password 'system
↳ coredump network get'

Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↳ 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_advanced_configs` (*vm\_name, datacenter, service\_instance=None*)

Returns extra config parameters from a virtual machine advanced config list

**vm\_name** Virtual machine name

**datacenter** Datacenter name where the virtual machine is available  
**service\_instance** vCenter service instance for connection and configuration

```
salt.modules.vsphere.get_coredump_network_config(host, username, password,
 protocol=None, port=None,
 esxi_hosts=None, credstore=None)
```

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard `cmd.run_all` dictionary, per host.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↳ password esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None,
 port=None, esxi_hosts=None, credstore=None)
```

Show status of all firewall rule sets.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_host_cache(service_instance=None)
```

Returns the host cache configuration on the proxy host.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.get_host_cache
```

`salt.modules.vsphere.get_host_datetime`(*host*, *username*, *password*, *protocol=None*, *port=None*,  
*host\_names=None*)

Get the date/time information for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get date/time information.

If `host_names` is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_ntp_config`(*host*, *username*, *password*, *protocol=None*, *port=None*,  
*host\_names=None*)

Get the NTP configuration information for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get ntp configuration information.

If `host_names` is not provided, the NTP configuration will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_proxy_type`()

Returns the proxy type retrieved either from the pillar or from the proxy minion's config. Returns `<undefined>` otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

`salt.modules.vsphere.get_service_instance_via_proxy`(*service\_instance=None*)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

---

**Note:** Should be used by state functions not invoked directly.

---

**CLI Example:** See note above

`salt.modules.vsphere.get_service_policy`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None*)

Get the service name's policy for a given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get service policy information.

If `host_names` is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**

```
Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd'
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_service_running`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None*)

Get the service name's running state for a given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbttd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host\_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host\_names is not provided, the service's running state will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'
↪ host_names=['esxi-1.host.com, esxi-2.host.com']
```

**salt.modules.vsphere.get\_ssh\_key**(*host, username, password, protocol=None, port=None, certificate\_verify=False*)

Retrieve the authorized\_keys entry for root. This function only works for ESXi, not vCenter.

**Parameters**

- **host** – The location of the ESXi Host
- **username** – Username to connect as
- **password** – Password for the ESXi web endpoint
- **protocol** – defaults to https, can be http if ssl is disabled on ESXi
- **port** – defaults to 443 for https
- **certificate\_verify** – If true require that the SSL connection present a valid certificate

**Returns** True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_
↪ verify=True
```

**salt.modules.vsphere.get\_syslog\_config**(*host, username, password, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Retrieve the syslog configuration.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
↪ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)`

Returns vm object properties.

**name** Name of the virtual machine.

**datacenter** Datacenter name

**vm\_properties** List of vm properties.

**traversal\_spec** Traversal Spec object(s) for searching.

**parent\_ref** Container Reference object for searching under a given object.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

`salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)`

Queries and converts the virtual machine properties to the available format from the schema. If the `objects` attribute is True the config objects will have extra properties, like 'object' which will include the `vim.vm.device.VirtualDevice`, this is necessary for deletion and update actions.

**name** Name of the virtual machine

**datacenter** Datacenter's name where the virtual machine is available

**objects** Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set

**service\_instance** vCenter service instance for connection and configuration

`salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)`

Queries the virtual machine config file and returns `vim.host.DatastoreBrowser.SearchResults` object on success None on failure

**name** Name of the virtual machine

**datacenter** Datacenter name

**datastore** Datastore where the virtual machine files are stored

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

`salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None)`

Get the VMotion enabled status for a given host or a list of `host_names`. Returns True if VMotion is enabled, False if it is not enabled.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VMotion is enabled.

If `host_names` is not provided, the VMotion status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vsan_eligible_disks`(*host, username, password, protocol=None, port=None, host\_names=None*)

Returns a list of VSAN-eligible disks for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If `host_names` is not provided, the VSAN-eligible disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vsan_enabled`(*host, username, password, protocol=None, port=None, host\_names=None*)

Get the VSAN enabled status for a given host or a list of `host_names`. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VSAN enabled.

If `host_names` is not provided, the VSAN status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

### `salt.modules.vsphere.get_service_instance_via_proxy` (*fn*)

Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (`vim.ServiceInstance`) to the decorated function.

Supported proxies: `esxi`, `esxcluster`, `esxdatacenter`.

#### Notes

1. The decorated function must have a `service_instance` parameter or a `**kwargs` type argument (name of argument is not important); 2. If the `service_instance` parameter is already defined, the value is passed through to the decorated function; 3. If the `service_instance` parameter is not defined, the connection is created using the proxy details and the service instance is returned.

CLI Example: None, this is a decorator

### `salt.modules.vsphere.list_assigned_licenses` (*entity*, *entity\_display\_name*, *license\_keys=*`None`, *service\_instance=*`None`)

Lists the licenses assigned to an entity

**entity** Dictionary representation of an entity. See `_get_entity` docstrings for format.

**entity\_display\_name** Entity name used in logging

**license\_keys**: List of license keys to be retrieved. Default is `None`.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.list_assigned_licenses
 entity={type:cluster,datacenter:dc,cluster:cl}
 entity_display_name=cl
```

### `salt.modules.vsphere.list_attached_tags` (*object\_id*, *managed\_obj='ClusterComputeResource'*, *server=*`None`, *username=*`None`, *password=*`None`, *service\_instance=*`None`)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

#### Parameters

- **object\_id** (*str*) – The identifier of the input object.
- **managed\_obj** (*str*) – Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) – Target DNS or IP of vCenter center.
- **username** (*basestring*) – Username associated with the vCenter center.
- **password** (*basestring*) – Password associated with the vCenter center.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.

**Return type** list of tags

**Raise** Unauthorized if you do not have the privilege to read the object.

**Raise** Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.list_capability_definitions` (*service\_instance=None*)  
Returns a list of the metadata of all capabilities in the vCenter.  
**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_capabilities
```

`salt.modules.vsphere.list_cluster` (*datacenter=None, cluster=None, service\_instance=None*)  
Returns a dict representation of an ESX cluster.  
**datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.  
**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.  
**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

esxcluster proxy
salt '*' vsphere.list_cluster
```

`salt.modules.vsphere.list_clusters` (*host, username, password, protocol=None, port=None*)  
Returns a list of clusters for the the specified host.  
**host** The location of the host.  
**username** The username used to login to the host, such as `root`.  
**password** The password used to login to the host.  
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.  
**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.  
CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datacenters` (*host, username, password, protocol=None, port=None*)  
Returns a list of datacenters for the the specified host.  
**host** The location of the host.  
**username** The username used to login to the host, such as `root`.  
**password** The password used to login to the host.  
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.  
**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.  
CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datacenters_via_proxy` (*datacenter\_names=None, service\_instance=None*)  
Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.  
Supported proxies: `esxdatacenter`  
**datacenter\_names** List of datacenter names. Default is None.  
**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_datacenters_via_proxy
```

(continues on next page)

(continued from previous page)

```

salt '*' vsphere.list_datacenters_via_proxy dc1

salt '*' vsphere.list_datacenters_via_proxy dc1,dc2

salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]

```

`salt.modules.vsphere.list_datastore_clusters`(*host, username, password, protocol=None, port=None*)

Returns a list of datastore clusters for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```

salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password

```

`salt.modules.vsphere.list_datastores`(*host, username, password, protocol=None, port=None*)

Returns a list of datastores for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```

salt '*' vsphere.list_datastores 1.2.3.4 root bad-password

```

`salt.modules.vsphere.list_datastores_via_proxy`(*datastore\_names=None, backing\_*  
*ing\_disk\_ids=None, backing\_*  
*ing\_disk\_scsi\_addresses=None, ser-*  
*vice\_instance=None*)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: `esxi`, `esxcluster`, `esxdatacenter`

**datastore\_names** List of the names of datastores to filter on

**backing\_disk\_ids** List of canonical names of the backing disks of the datastores to filter. Default is `None`.

**backing\_disk\_scsi\_addresses** List of scsi addresses of the backing disks of the datastores to filter. Default is `None`.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```

salt '*' vsphere.list_datastores_via_proxy

salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]

```

`salt.modules.vsphere.list_default_storage_policy_of_datastore`(*datastore, service\_instance=None*)

Returns a list of datastores assign the the storage policies.

**datastore** Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

`salt.modules.vsphere.list_default_vsan_policy` (*service\_instance=None*)

Returns the default vsan storage policy.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_storage_policies
```

```
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

`salt.modules.vsphere.list_disk_partitions` (*disk\_id=None*, *scsi\_address=None*, *service\_instance=None*)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the `scsi_address`.  
**disk\_id** Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**scsi\_address** Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
```

```
salt '*' vsphere.list_disk_partitions disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.list_diskgroups` (*cache\_disk\_ids=None*, *service\_instance=None*)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

**cache\_disk\_ids**: List of cache disk canonical names of the disk groups to be retrieved. Default is None.

**use\_proxy\_details** Specify whether to use the proxy minion's details instead of the arguments

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_diskgroups
```

```
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.0000000000000001]'
```

`salt.modules.vsphere.list_disks` (*disk\_ids=None*, *scsi\_addresses=None*, *service\_instance=None*)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

**disk\_ids**: List of disk canonical names to be retrieved. Default is None.

**scsi\_addresses** List of scsi addresses of disks to be retrieved. Default is None

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_disks
```

```
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
```

```
salt '*' vsphere.list_disks
 scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

`salt.modules.vsphere.list_dvportgroups` (*dvs=None*, *portgroup\_names=None*, *service\_instance=None*)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

**dvs** Name of the DVS containing the portgroups. Default value is None.

**portgroup\_names** List of portgroup names to look for. If None, all portgroups are returned. Default value is None

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```

salt '*' vsphere.list_dvporgroups

salt '*' vsphere.list_dvportgroups dvs=dvs1

salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]

salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]

```

`salt.modules.vsphere.list_dvs`(*host, username, password, protocol=None, port=None*)

Returns a list of distributed virtual switches for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```

salt '*' vsphere.list_dvs 1.2.3.4 root bad-password

```

`salt.modules.vsphere.list_dvss`(*datacenter=None, dvs\_names=None, service\_instance=None*)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

**datacenter** The datacenter to look for DVSs in. Default value is `None`.

**dvs\_names** List of DVS names to look for. If `None`, all DVSs are returned. Default value is `None`.

```

salt '*' vsphere.list_dvss

salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]

```

`salt.modules.vsphere.list_folders`(*host, username, password, protocol=None, port=None*)

Returns a list of folders for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```

salt '*' vsphere.list_folders 1.2.3.4 root bad-password

```

`salt.modules.vsphere.list_hosts`(*host, username, password, protocol=None, port=None*)

Returns a list of hosts for the the specified VMware environment.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```

salt '*' vsphere.list_hosts 1.2.3.4 root bad-password

```

`salt.modules.vsphere.list_hosts_via_proxy`(*hostnames=None, datacenter=None, cluster=None, service\_instance=None*)

Returns a list of hosts for the the specified VMware environment. The list of hosts can be filtered by datacenter

name and/or cluster name

**hostnames** Hostnames to filter on.

**datacenter\_name** Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

**cluster\_name** Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy

salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]

salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

**salt.modules.vsphere.list\_licenses**(*service\_instance=None*)

Lists all licenses on a vCenter.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_licenses
```

**salt.modules.vsphere.list\_networks**(*host, username, password, protocol=None, port=None*)

Returns a list of networks for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list\_non\_ssds**(*host, username, password, protocol=None, port=None, host\_names=None*)

Returns a list of Non-SSD disks for the given host or list of `host_names`.

---

**Note:** In the `pyVmomi StorageSystem`, `ScsiDisks` may, or may not have an `ssd` attribute. This attribute indicates if the `ScsiDisk` is SSD backed. As this option is optional, if a relevant disk in the `StorageSystem` does not have `ssd = true`, it will end up in the `non_ssds` list here.

---

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If `host_names` is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password host_
↪names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_resourcepools`(*host*, *username*, *password*, *protocol=None*, *port=None*)

Returns a list of resource pools for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_ssds`(*host*, *username*, *password*, *protocol=None*, *port=None*, *host\_names=None*)

Returns a list of SSDs for the given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve SSDs.

If `host_names` is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password host_
↪names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_storage_policies`(*policy\_names=None*, *service\_instance=None*)

Returns a list of storage policies.

**policy\_names** Names of policies to list. If `None`, all policies are listed. Default is `None`.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

`salt.modules.vsphere.list_tag_categories`(*server=None*, *username=None*, *password=None*, *service\_instance=None*)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

Parameters

- **server** (*basestring*) – Target DNS or IP of vCenter center.
- **username** (*basestring*) – Username associated with the vCenter center.
- **password** (*basestring*) – Password associated with the vCenter center.

Returns Value(s) of category\_id.

Return type list of str

```
salt.modules.vsphere.list_tags(server=None, username=None, password=None, service_instance=None)
```

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

Parameters

- **server** (*basestring*) – Target DNS or IP of vCenter center.
- **username** (*basestring*) – Username associated with the vCenter center.
- **password** (*basestring*) – Password associated with the vCenter center.

Returns Value(s) of tag\_id.

Return type list of str

```
salt.modules.vsphere.list_uplink_dvportgroup(dvs, service_instance=None)
```

Returns the uplink portgroup of a distributed virtual switch.

**dvs** Name of the DVS containing the portgroup.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

```
salt.modules.vsphere.list_vapps(host, username, password, protocol=None, port=None)
```

Returns a list of vApps for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_vms(host, username, password, protocol=None, port=None)
```

Returns a list of VMs for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

`salt.modules.vsphere.power_off_vm`(*name*, *datacenter=None*, *service\_instance=None*)

Powers off a virtual machine specified by it's name.

**name** Name of the virtual machine

**datacenter** Datacenter of the virtual machine

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.power_off_vm name=my_vm
```

`salt.modules.vsphere.power_on_vm`(*name*, *datacenter=None*, *service\_instance=None*)

Powers on a virtual machine specified by it's name.

**name** Name of the virtual machine

**datacenter** Datacenter of the virtual machine

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.power_on_vm name=my_vm
```

`salt.modules.vsphere.register_vm`(*name*, *datacenter*, *placement*, *vmx\_path*, *service\_instance=None*)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list

**name** Name of the virtual machine

**datacenter** Datacenter of the virtual machine

**placement** Placement dictionary of the virtual machine, host or cluster

**vmx\_path**: Full path to the vmx file, datastore name should be included

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.remove_capacity_from_diskgroup`(*cache\_disk\_id*, *capacity\_disk\_ids*, *data\_evacuation=True*, *safety\_checks=True*, *service\_instance=None*)

Remove capacity disks from the disk group with the specified cache disk.

**cache\_disk\_id** The canonical name of the cache disk.

**capacity\_disk\_ids** A list containing canonical names of the capacity disks to add.

**data\_evacuation** Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

**safety\_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_capacity_from_diskgroup
 cache_disk_id='naa.0000000000000001'
 capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003']
```

`salt.modules.vsphere.remove_datastore`(*datastore*, *service\_instance=None*)

Removes a datastore. If multiple datastores an error is raised.

**datastore** Datastore name

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_datastore ds_name
```

`salt.modules.vsphere.remove_diskgroup`(*cache\_disk\_id*, *data\_accessibility=True*, *service\_instance=None*)

Remove the diskgroup with the specified cache disk.

**cache\_disk\_id** The canonical name of the cache disk.

**data\_accessibility** Specifies whether to ensure data accessibility. Default value is True.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.0000000000000001'
```

**salt.modules.vsphere.remove\_dvportgroup**(*portgroup*, *dvs*, *service\_instance=None*)

Removes a distributed virtual portgroup.

**portgroup** Name of the portgroup to be removed.

**dvs** Name of the DVS containing the portgroups.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

**salt.modules.vsphere.rename\_datastore**(*datastore\_name*, *new\_datastore\_name*, *service\_instance=None*)

Renames a datastore. The datastore needs to be visible to the proxy.

**datastore\_name** Current datastore name.

**new\_datastore\_name** New datastore name.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.rename_datastore old_name new_name
```

**salt.modules.vsphere.reset\_syslog\_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *syslog\_config=None*, *esxi\_hosts=None*, *credstore=None*)

Reset the syslog service to its default settings.

Valid **syslog\_config** values are **logdir**, **loghost**, **logdir-unique**, **default-rotate**, **default-size**, **default-timeout**, or **all** for all of these.

**host** The location of the host.

**username** The username used to login to the host, such as **root**.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is **https**.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**syslog\_config** List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.

**esxi\_hosts** If host is a vCenter host, then use **esxi\_hosts** to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

**syslog\_config** can be passed as a quoted, comma-separated string, e.g.

```
Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
→syslog_config='logdir,loghost'

Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
→syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.service\_restart**(*host*, *username*, *password*, *service\_name*, *protocol=None*, *port=None*, *host\_names=None*)

Restart the named service for the given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to restart the service.

If `host_names` is not provided, the service will be restarted for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.service_start`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None*)

Start the named service for the given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd

- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host\_names argument is required to tell vCenter the hosts for which to start the service.

If host\_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'
→ host_names=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.service_stop`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None*)

Stop the named service for the given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host\_names argument is required to tell vCenter the hosts for which to stop the service.

If host\_names is not provided, the service will be stopped for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'
```

(continues on next page)

(continued from previous page)

```
Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'
↳host_names=['esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.set\_advanced\_configs**(*vm\_name*, *datacenter*, *advanced\_configs*, *service\_instance=None*)

Appends extra config parameters to a virtual machine advanced config list

**vm\_name** Virtual machine name

**datacenter** Datacenter name where the virtual machine is available

**advanced\_configs** Dictionary with advanced parameter key value pairs

**service\_instance** vCenter service instance for connection and configuration

**salt.modules.vsphere.set\_coredump\_network\_config**(*host*, *username*, *password*, *dump\_ip*, *protocol=None*, *port=None*, *host\_vnic='vmk0'*, *dump\_port=6500*, *esxi\_hosts=None*, *credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see *coredump\_network\_enable*) before these parameters may be set.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**dump\_ip** IP address of host that will accept the dump.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts** If *host* is a vCenter host, then use *esxi\_hosts* to execute this function on a list of one or more ESXi machines.

**host\_vnic** Host VNIC port through which to communicate. Defaults to `vmk0`.

**dump\_port** TCP port to use for the dump, defaults to 6500.

**credstore** Optionally set to path to the credential store file.

**Returns** A standard `cmd.run_all` dictionary with a *success* key added, per host. *success* will be True if the set succeeded, False otherwise.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_
↳ip.host.com'

Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
↳password 'dump_ip.host.com' esxi_hosts=['esxi-1.host.com, esxi-2.
↳host.com]'
```

**salt.modules.vsphere.set\_ntp\_config**(*host*, *username*, *password*, *ntp\_servers*, *protocol=None*, *port=None*, *host\_names=None*)

Set NTP configuration for a given host of list of *host\_names*.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**ntp\_servers** A list of servers that should be added to and configured for the specified host's NTP configuration.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to configure ntp servers.

If `host_names` is not provided, the NTP servers will be configured for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100,
↪192.174.1.200]'

Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.
↪100, 192.174.1.200]' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.set_service_policy`(*host*, *username*, *password*, *service\_name*,  
*service\_policy*, *protocol=None*, *port=None*,  
*host\_names=None*)

Set the service name's policy for a given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtid
- lsassd
- lwiod
- netlogond
- ntpd
- sfcdb-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**service\_policy** The policy to set for the service. For example, 'automatic'.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to set the service policy.

If `host_names` is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
↪'automatic'

Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd'
↪'automatic' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

(continues on next page)

(continued from previous page)

```

salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, con-
fig_value, protocol=None, port=None, fire-
wall=True, reset_service=True, esxi_hosts=None,
credstore=None)

```

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

**host** ESXi or vCenter host to connect to.

**username** User to connect as, usually root.

**password** Password to connect with.

**syslog\_config** Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (-))

Valid `syslog_config` values are `logdir`, `loghost`, `default-rotate``, ``default-size`, `default-timeout`, and `logdir-unique`.

**config\_value** Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall** Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service** After a successful parameter set, reset the service. Defaults to `True`.

**esxi\_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```

Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
↪ loghost ssl://localhost:5432,tcp://10.1.0.1:1514

Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
↪ loghost ssl://localhost:5432,tcp://10.1.0.1:1514 esxi_hosts=
↪ '[esxi-1.host.com, esxi-2.host.com]'

```

```

salt.modules.vsphere.supports_proxies(*proxy_types)

```

Decorator to specify which proxy types are supported by a function

**proxy\_types**: Arbitrary list of strings with the supported types of proxies

```

salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None,
port=None, esxi_hosts=None, credstore=None)

```

Reload the syslog service so it will pick up any changes.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.  
**esxi\_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.  
**credstore** Optionally set to path to the credential store file.

**Returns** A standard `cmd.run_all` dictionary. This dictionary will at least have a `retcode` key. If `retcode` is 0 the command was successful.

CLI Example:

```
Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
↪ esxi_hosts=['esxi-1.host.com, esxi-2.host.com']
```

`salt.modules.vsphere.system_info`(*host, username, password, protocol=None, port=None*)

Return system information about a VMware environment.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

`salt.modules.vsphere.test_vcenter_connection`(*service\_instance=None*)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

`salt.modules.vsphere.unregister_vm`(*name, datacenter, placement=None, power\_off=False, service\_instance=None*)

Unregisters a virtual machine defined by name and placement

**name** Name of the virtual machine

**datacenter** Datacenter of the virtual machine

**placement** Placement information of the virtual machine

**service\_instance** vCenter service instance for connection and configuration

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.update_cluster`(*cluster\_dict, datacenter=None, cluster=None, service\_instance=None*)

Updates a cluster.

**config\_dict** Dictionary with the config values of the new cluster.

**datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is `None`.

**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is `None`.

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

```
esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1
```

(continues on next page)

(continued from previous page)

```
esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

**salt.modules.vsphere.update\_dvportgroup**(*portgroup\_dict*, *portgroup*, *dvs*, *service\_instance=True*)

Updates a distributed virtual portgroup.

**portgroup\_dict** Dictionary with the values the portgroup should be update with (example in salt.states.dvs).

**portgroup** Name of the portgroup to be updated.

**dvs** Name of the DVS containing the portgroups.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
 portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
 portgroup=pg1 dvs=dvs1
```

**salt.modules.vsphere.update\_dvs**(*dvs\_dict*, *dvs*, *service\_instance=None*)

Updates a distributed virtual switch (DVS).

**Note: Updating the product info, capability, uplinks of a DVS is not supported** so the corresponding entries in *dvs\_dict* will be ignored.

**dvs\_dict** Dictionary with the values the DVS should be update with (example in salt.states.dvs)

**dvs** Name of the DVS to be updated.

**service\_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

**salt.modules.vsphere.update\_host\_datetime**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host\_names=None*)

Update the date/time on the given host or list of *host\_names*. This function should be used with caution since network delays and execution delays can result in time skews.

**host** The location of the host.

**username** The username used to login to the host, such as *root*.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is *https*.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the *host\_names* argument is required to tell vCenter which hosts should update their date/time.

If *host\_names* is not provided, the date/time will be updated for the *host* location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
 ↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.update\_host\_password**(*host*, *username*, *password*, *new\_password*, *protocol=None*, *port=None*)

Update the password for a given host.

---

**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

---

**host** The location of the ESXi host.

**username** The username used to login to the ESXi host, such as `root`.

**password** The password used to login to the ESXi host.

**new\_password** The new password that will be updated for the provided username on the ESXi host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-
↳bad-password
```

`salt.modules.vsphere.update_storage_policy`(*policy, policy\_dict, service\_instance=None*)

Updates a storage policy.

Supported capability types: scalar, set, range.

**policy** Name of the policy to update.

**policy\_dict** Dictionary containing the changes to apply to the policy. (example in `salt.states.pbm`)

**service\_instance** Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

```
salt '*' vsphere.update_storage_policy policy='policy name'
policy_dict="$policy_dict"
```

`salt.modules.vsphere.update_vm`(*vm\_name, cpu=None, memory=None, image=None, version=None, interfaces=None, disks=None, scsi\_devices=None, serial\_ports=None, datacenter=None, datastore=None, cd\_dvd\_drives=None, sata\_controllers=None, advanced\_configs=None, service\_instance=None*)

Updates the configuration of the virtual machine if the config differs

**vm\_name** Virtual Machine name to be updated

**cpu** CPU configuration options

**memory** Memory configuration options

**version** Virtual machine container hardware version

**image** Virtual machine guest OS version identifier `VirtualMachineGuestOsIdentifier`

**interfaces** Network interfaces configuration options

**disks** Disks configuration options

**scsi\_devices** SCSI devices configuration options

**serial\_ports** Serial ports configuration options

**datacenter** Datacenter where the virtual machine is available

**datastore** Datastore where the virtual machine config files are available

**cd\_dvd\_drives** CD/DVD drives configuration options

**advanced\_config** Advanced config parameters to be set for the virtual machine

**service\_instance** vCenter service instance for connection and configuration

`salt.modules.vsphere.upload_ssh_key`(*host, username, password, ssh\_key=None, ssh\_key\_file=None, protocol=None, port=None, certificate\_verify=False*)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**Parameters**

- **host** – The location of the ESXi Host
- **username** – Username to connect as

- **password** – Password for the ESXi web endpoint
- **ssh\_key** – Public SSH key, will be added to `authorized_keys` on ESXi
- **ssh\_key\_file** – File containing the SSH key. Use `'ssh_key'` or `ssh_key_file`, but not both.
- **protocol** – defaults to `https`, can be `http` if `ssl` is disabled on ESXi
- **port** – defaults to `443` for `https`
- **certificate\_verify** – If true require that the SSL connection present a valid certificate

**Returns** Dictionary with a `'status'` key, True if upload is successful. If upload is unsuccessful, `'status'` key will be False and an `'Error'` key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file='/etc/
↳salt/my_keys/my_key.pub'
```

`salt.modules.vsphere.vmotion_disable`(*host, username, password, protocol=None, port=None, host\_names=None*)

Disable vMotion for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names** List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VMotion.

If `host_names` is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password
↳host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vmotion_enable`(*host, username, password, protocol=None, port=None, host\_names=None, device='vmk0'*)

Enable vMotion for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names** List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VMotion.

If `host_names` is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**device** The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
↳host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_add_disks`(*host*, *username*, *password*, *protocol=None*, *port=None*,  
*host\_names=None*)

Add any VSAN-eligible disks to the VSAN System for the given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If `host_names` is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
↳host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_disable`(*host*, *username*, *password*, *protocol=None*, *port=None*,  
*host\_names=None*)

Disable VSAN for a given host or list of `host_names`.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VSAN.

If `host_names` is not provided, VSAN will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
↳names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_enable`(*host*, *username*, *password*, *protocol=None*, *port=None*,  
*host\_names=None*)

Enable VSAN for a given host or list of host\_names.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host\_names argument is required to tell vCenter which hosts should enable VSAN.

If host\_names is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password host_
--names='[esxi-1.host.com, esxi-2.host.com]'
```

### 21.9.453 salt.modules.webutil

Support for `htpasswd` command. Requires the `apache2-utils` package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the `webutil` module. This allows other functions that don't use `htpasswd` to use the `webutil` module name.

`salt.modules.webutil.useradd`(*pwfile*, *user*, *password*, *opts=""*, *runas=None*)

Add a user to `htpasswd` file using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created.

**pwfile** Path to `htpasswd` file

**user** User name

**password** User password

**opts** Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas** The system user to run `htpasswd` command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.webutil.userdel`(*pwfile*, *user*, *runas=None*, *all\_results=False*)

Delete a user from the specified `htpasswd` file.

**pwfile** Path to `htpasswd` file

**user** User name

**runas** The system user to run `htpasswd` command with

**all\_results** Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

`salt.modules.webutil.verify` (*pwfile, user, password, opts=""*, *runas=None*)

Return True if the htpasswd file exists, the user has an entry, and their password matches.

**pwfile** Fully qualified path to htpasswd file

**user** User name

**password** User password

**opts** Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

### 21.9.454 salt.modules.win\_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.list_()`

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

### 21.9.455 salt.modules.win\_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

`salt.modules.win_certutil.add_store` (*source, store, saltenv='base'*)

Add the given cert into the given Certificate Store

**source** The source certificate file this can be in the form salt://path/to/file

**store** The certificate store to add the certificate to

**saltenv** The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

`salt.modules.win_certutil.del_store` (*source, store, saltenv='base'*)

Delete the given cert into the given Certificate Store

**source** The source certificate file this can be in the form salt://path/to/file

**store** The certificate store to delete the certificate from

**saltenv** The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

`salt.modules.win_certutil.get_cert_serial(cert_file)`

Get the serial number of a certificate file

**cert\_file** The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

`salt.modules.win_certutil.get_stored_cert_serials(store)`

Get all of the certificate serials in the specified store

**store** The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

## 21.9.456 salt.modules.win\_dacl

Manage DACLs on Windows

**depends**

- winreg Python module

`salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)`

add an ace to an object

**path**: path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) **user**: user to add

**permission**: permissions for the user **acetype**: either allow/deny for each user/permission (ALLOW, DENY)

**propagation**: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this
↳key and subkeys
 salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey'
↳'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

`salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)`

Checks a path to verify the ACE (access control entry) specified exists

**Parameters**

- **path** – path to the file/reg key
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – user that the ACL is for
- **permission** – permission to test for (READ, FULLCONTROL, etc)
- **acetype** – the type of ACE (ALLOW or DENY)
- **propagation** – the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** – the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

`salt.modules.win_dacl.check_inheritance`(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

**Parameters**

- **path** – path of the registry key or file system object to check
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

**class** `salt.modules.win_dacl.daclConstants`

DACL constants used throughout the module

**getAceTypeBit**(*t*)

returns the acetype bit of a text value

**getAceTypeText**(*t*)

returns the textual representation of a acetype bit

**getObjectTypeBit**(*t*)

returns the bit value of the string object type

**getPermissionBit**(*t*, *m*)

returns a permission bit of the string permission value for the specified object type

**getPermissionText**(*t*, *m*)

returns the permission textual representation of a specified permission bit/object type

**getPropagationBit**(*t*, *p*)

returns the propagation bit of a text value

**getPropagationText**(*t*, *p*)

returns the textual representation of a propagation bit

**getSecurityHkey**(*s*)

returns the necessary string value for an HKEY for the win32security module

**processPath**(*path*, *objectType*)

processes a **path/object type combo** and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

`salt.modules.win_dacl.disable_inheritance`(*path*, *objectType*, *copy=True*)

Disable inheritance on an object

**Parameters**

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** – True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

`salt.modules.win_dacl.enable_inheritance`(*path*, *objectType*, *clear=False*)

enable/disable inheritance on an object

**Parameters**

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** – True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get`(*path, objectType, user=None*)

Get the ACL of an object. Will filter by user if one is provided.

Parameters

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace`(*path, objectType, user, permission=None, acetype=None, propagation=None*)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated
↳to this key and subkeys
 salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_
↳MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↳'
```

### 21.9.457 salt.modules.win\_disk

Module for gathering disk information on Windows

**depends**

- win32api Python module

`salt.modules.win_disk.usage`()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

## 21.9.458 salt.modules.win\_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

`salt.modules.win_dism.add_capability` (*capability*, *source=None*, *limit\_access=False*, *image=None*, *restart=False*)

Install a capability

### Parameters

- **capability** (*str*) – The capability to install
- **source** (*Optional[str]*) – The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit\_access** (*Optional[bool]*) – Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

### Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.add_feature` (*feature*, *package=None*, *source=None*, *limit\_access=False*, *enable\_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

### Parameters

- **feature** (*str*) – The feature to install
- **package** (*Optional[str]*) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) – The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit\_access** (*Optional[bool]*) – Prevent DISM from contacting Windows Update for the source package
- **enable\_parent** (*Optional[bool]*) – True will enable all parent features of the specified feature
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.add_package` (*package*, *ignore\_check=False*, *prevent\_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

### Parameters

- **package** (*str*) – The package to install. Can be a .cab file, a .msu file, or a folder

---

**Note:** An `.msu` package is supported only when the target image is offline, either mounted or applied.

---

- **ignore\_check** (*Optional[bool]*) – Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) – Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.available_capabilities` (*image=None*)

List the capabilities available on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

**Returns** A list of available capabilities

**Return type** `list`

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.available_features` (*image=None*)

List the features available on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Returns** A list of available features

**Return type** `list`

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.get_capabilities` (*image=None*)

List all capabilities on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

**Returns** A list of capabilities

**Return type** `list`

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.get_features` (*package=None, image=None*)

List features on the system or in a package

**Parameters**

- **package** (*Optional[str]*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of features

**Return type** `list`

CLI Example:

```
Return all features on the system
salt '*' dism.get_features

Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
↳x86~en~1.0.0.0
```

`salt.modules.win_dism.installed_capabilities` (*image=None*)

List the capabilities installed on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

**Returns** A list of installed capabilities

**Return type** `list`

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.installed_features` (*image=None*)

List the features installed on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of installed features

**Return type** `list`

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.installed_packages` (*image=None*)

List the packages installed on the system

**Parameters** **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A list of installed packages

**Return type** `list`

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.package_info(package, image=None)`

Display information about a package

**Parameters**

- **package** (*str*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

`salt.modules.win_dism.remove_capability(capability, image=None, restart=False)`

Uninstall a capability

**Parameters**

- **capability** (*str*) – The capability to be removed
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)`

Disables the feature.

**Parameters**

- **feature** (*str*) – The feature to uninstall
- **remove\_payload** (*Optional[bool]*) – Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** `dict`

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

`salt.modules.win_dism.remove_package(package, image=None, restart=False)`

Uninstall a package

**Parameters**

- **package** (*str*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** dict

CLI Example:

```
Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.
↪0.0.0

Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

### 21.9.459 salt.modules.win\_dns\_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.add_dns` (*ip*, *interface='Local Area Connection'*, *index=1*)

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.dns_dhcp` (*interface='Local Area Connection'*)

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.get_dns_config` (*interface='Local Area Connection'*)

Get the type of DNS configuration (dhcp / static).

**Parameters**

- **interface** (*str*) – The name of the network interface. This is the
- **in the Network Connection Details for the device** (*Description*) –

**Returns** True if DNS is configured, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

`salt.modules.win_dns_client.get_dns_servers` (*interface='Local Area Connection'*)

Return a list of the configured DNS servers of the specified interface

**Parameters**

- **interface** (*str*) – The name of the network interface. This is the name as
- **appears in the Control Panel under Network Connections** (*it*)

**Returns** A list of dns servers

**Return type** list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

`salt.modules.win_dns_client.rm_dns(ip, interface='Local Area Connection')`

Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

### 21.9.460 salt.modules.win\_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

**depends**

- PowerShell 5.0

`salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')`

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

**Parameters**

- **path** (*str*) – Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** (*str*) – Path to the directory that contains the .mof file on the file\_roots. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.
- **salt\_env** (*str*) – The salt environment to use when copying your source. Default is 'base'

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

To apply a config that already exists on the the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/
↪WebSiteConfiguration
```

`salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')`

Compile a config from a PowerShell script (.ps1)

**Parameters**

- **path** (*str*) – Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.

- **source** (*str*) – Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If `source` is not passed, the config script located at `path` will be compiled. Optional.
- **config\_name** (*str*) – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config\_data** (*str*) – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) – The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt\_env** (*str*) – The salt environment to use when copying the source. Default is `'base'`

**Returns** A dictionary containing the results of the compilation

**Return type** `dict`

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

### `salt.modules.win_dsc.get_config()`

Get the current DSC Configuration

**Returns** A dictionary representing the DSC Configuration on the machine

**Return type** `dict`

**Raises** `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.get_config
```

### `salt.modules.win_dsc.get_config_status()`

Get the status of the current DSC Configuration

**Returns**

A dictionary representing the status of the current DSC Configuration on the machine

**Return type** `dict`

CLI Example:

```
salt '*' dsc.get_config_status
```

### `salt.modules.win_dsc.get_lcm_config()`

Get the current Local Configuration Manager settings

**Returns**

A dictionary representing the Local Configuration Manager settings on the machine

**Return type** `dict`

CLI Example:

```
salt '*' dsc.get_lcm_config
```

`salt.modules.win_dsc.remove_config(reset=False)`

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

**Parameters** `reset` (*bool*) – Attempts to reset the DSC configuration by removing the following from `C:\Windows\System32\Configuration`:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

**Warning:** `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory. If you wait a few minutes and run again, it may complete successfully.

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

`salt.modules.win_dsc.restore_config()`

Reapplies the previous configuration.

New in version 2017.7.5.

---

**Note:** The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

---

**Returns** True if successfully restored

**Return type** `bool`

**Raises** `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.restore_config
```

`salt.modules.win_dsc.run_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')`

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

**Parameters**

- **path** (*str*) – The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) – The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config\_name** (*str*) – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config\_data** (*str*) – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) – The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt\_env** (*str*) – The salt environment to use when copying the source. Default is 'base'

**Returns** True if successfully compiled and applied, otherwise False

**Return type** `bool`

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

```
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None, re-
fresh_freq=None, reboot_if_needed=None, ac-
tion_after_reboot=None, refresh_mode=None, cer-
tificate_id=None, configuration_id=None, al-
low_module_overwrite=None, debug_mode=False,
status_retention_days=None)
```

For detailed descriptions of the parameters see: <https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig>

**config\_mode** (*str*): How the LCM applies the configuration. Valid values are:

- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

**config\_mode\_freq** (*int*): How often, in minutes, the current configuration is checked and applied. Ignored if `config_mode` is set to `ApplyOnly`. Default is 15.

**refresh\_mode** (*str*): How the LCM gets configurations. Valid values are:

- Disabled
- Push
- Pull

**refresh\_freq (int):** How often, in minutes, the LCM checks for updated configurations. (pull mode only)  
Default is 30.

**reboot\_if\_needed (bool):** Reboot the machine if needed after a configuration is applied. Default is False.

**action\_after\_reboot (str):** Action to take after reboot. Valid values are:

- ContinueConfiguration
- StopConfiguration

**certificate\_id (guid):** A GUID that specifies a certificate used to access the configuration: (pull mode)

**configuration\_id (guid):** A GUID that identifies the config file to get from a pull server. (pull mode)

**allow\_module\_overwrite (bool):** New configs are allowed to overwrite old ones on the target node.

**debug\_mode (str):** Sets the debug level. Valid values are:

- None
- ForceModuleImport
- All

**status\_retention\_days (int):** Number of days to keep status of the current config.

---

**Note:** Either `config_mode_freq` or `refresh_freq` needs to be a multiple of the other. See documentation on MSDN for more details.

---

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.test_config()`

Tests the current applied DSC Configuration

**Returns** True if successfully applied, otherwise False

**Return type** bool

CLI Example:

```
salt '*' dsc.test_config
```

### 21.9.461 salt.modules.win\_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

**depends**

- win32api
- win32file
- win32con
- salt.utils.win\_dacl

**exception** salt.modules.win\_file.WindowsError

`salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)`

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

**Parameters**

- **path (str)** – The full path to the directory.

- **ret** (*dict*) – A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner** (*str*) – The owner to set for the directory.
- **grant\_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to check/grant, ie: `{'user': {'perms': 'basic_permission'}}`. Default is None.
- **deny\_perms** (*dict*) – A dictionary containing the user/group and permissions to check/deny. Default is None.
- **inheritance** (*bool*) – True will check if inheritance is enabled and enable it. ``False will check if inheritance is disabled and disable it. Default is True.
- **reset** (*bool*) – True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

**Returns** A dictionary of changes that have been made

**Return type** dict

CLI Example:

```
To see changes to ``C:\Temp`` if the 'Users' group is given 'read & execute'
↳permissions.
salt '*' file.check_perms C:\Temp\ {} Administrators "{ 'Users': { 'perms': 'read_
↳execute' } }"

Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "{ 'Users': { 'perms': 'read_
↳execute', 'applies_to': 'this_folder_only' } }"

Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators "{ 'jsnuffy': { 'perms': [
↳'read_attributes', 'read_ea'], 'applies_to': 'files_only' } }"
```

`salt.modules.win_file.chgrp`(*path, group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chgrp`.

To set group permissions use `file.set_perms`

**Parameters**

- **path** (*str*) – The path to the file or directory
- **group** (*str*) – The group (unused)

**Returns** None

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.chown`(*path, user, group=None, pgroup=None, follow\_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

#### Parameters

- **path** (*str*) – The path to the file or directory
- **user** (*str*) – The name of the user to own the file
- **group** (*str*) – The group (not used)
- **pgroup** (*str*) – The primary group to assign
- **follow\_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.chpgrp`(*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

#### Parameters

- **path** (*str*) – The path to the file or directory
- **pgroup** (*str*) – The primary group to assign

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```

`salt.modules.win_file.get_attributes`(*path*)

Return a dictionary object with the Windows file attributes for a file.

**Parameters** **path** (*str*) – The path to the file or directory

**Returns** A dictionary of file attributes

**Return type** `dict`

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

`salt.modules.win_file.get_gid`(*path*, *follow\_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API

compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgid`.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **follow\_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

`salt.modules.win_file.get_group(path, follow_symlinks=True)`

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgroup`.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **follow\_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

`salt.modules.win_file.get_mode(path)`

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

**Parameters** **path** (*str*) – The path to the file or directory

**Returns** None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

`salt.modules.win_file.get_pgid(path, follow_symlinks=True)`

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

- **path** (*str*) – The path to the file or directory

- **follow\_symlinks** (*bool*) – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the primary group

**Return type** *str*

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

`salt.modules.win_file.get_pgroup`(*path*, *follow\_symlinks=True*)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the `get_pgid` function which will return the SID, including for the system 'None' group.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **follow\_symlinks** (*bool*) – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the primary group

**Return type** *str*

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.get_uid`(*path*, *follow\_symlinks=True*)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **follow\_symlinks** (*bool*) – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The uid of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.get_user`(*path*, *follow\_symlinks=True*)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **follow\_symlinks** (*bool*) – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the owner

**Return type** *str*

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.gid_to_group(gid)`

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `uid_to_user`.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.

**Parameters** `gid` (*str*) – The gid of the group

**Returns** The name of the group

**Return type** `str`

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.group_to_gid(group)`

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if None is given, " is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.

**Parameters** `group` (*str*) – The name of the group

**Returns** The gid of the group

**Return type** `str`

CLI Example:

```
salt '*' file.group_to_gid administrators
```

`salt.modules.win_file.is_link(path)`

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

**Parameters** `path` (*str*) – The path to a file or directory

**Returns** True if path is a symlink, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.lchown(path, user, group=None, pgroup=None)`

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

#### Parameters

- **path** (*str*) – The path to the file or directory
- **user** (*str*) – The name of the user to own the file
- **group** (*str*) – The group (not used)
- **pgroup** (*str*) – The primary group to assign

**Returns** True if successful, otherwise error

**Return type** `bool`

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.makedirs_` (*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the parent directory containing this path is available.

#### Parameters

- **path** (*str*) – The full path to the directory.

---

**Note:** The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

---

- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant\_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny\_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns** True if successful

**Return type** bool

**Raises** *CommandExecutionError* – If unsuccessful

CLI Example:

```
To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators '{"Users': {'perms': 'read_execute
↪'}}"

Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators '{"Users': {'perms': 'read_execute
↪', 'applies_to': 'this_folder_only'}}"

Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators '{"jsnuffly': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.makedirs_perms`(*path*, *owner=None*, *grant\_perms=None*,  
*deny\_perms=None*, *inheritance=True*, *reset=True*)

Set owner and permissions for each directory created.

**Parameters**

- **path** (*str*) – The full path to the directory.
- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant\_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to
↪': 'this_folder'}}
```

- **deny\_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

**Returns** True if successful, otherwise raises an error

**Return type** bool

CLI Example:

```
To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute'}}" (continues on next page)
```

(continued from previous page)

```
Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute', 'applies_to': 'this_folder_only'}}"

Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"jsnuffy': {'perms': [
↪'read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

`salt.modules.win_file.mkdir` (*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the directory is available and permissions are set.

#### Parameters

- **path** (*str*) – The full path to the directory.
- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant\_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'
↪}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to
↪': 'this_folder'}}
```

- **deny\_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

**Returns** True if successful

**Return type** bool

**Raises** `CommandExecutionError` – If unsuccessful

CLI Example:

```
To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute'}}"

Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute',
↪'applies_to': 'this_folder_only'}}"

Specify advanced attributes with a list
```

(continues on next page)

(continued from previous page)

```
salt '*' file.mkdir C:\Temp\ Administrators '{"jsnuffly': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.readlink(path)`

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

**Parameters** `path` (*str*) – The path to the symlink

**Returns** The path that the symlink points to

**Return type** `str`

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.win_file.remove(path, force=False)`

Remove the named file or directory

**Parameters**

- **path** (*str*) – The path to the file or directory to remove.
- **force** (*bool*) – Remove even if marked Read-Only. Default is False

**Returns** True if successful, False if unsuccessful

**Return type** `bool`

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.set_attributes(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)`

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **archive** (*bool*) – Sets the archive attribute. Default is None
- **hidden** (*bool*) – Sets the hidden attribute. Default is None
- **normal** (*bool*) – Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- **notIndexed** (*bool*) – Sets the indexed attribute. Default is None
- **readonly** (*bool*) – Sets the readonly attribute. Default is None
- **system** (*bool*) – Sets the system attribute. Default is None
- **temporary** (*bool*) – Sets the temporary attribute. Default is None

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.set_mode(path, mode)`

Set the mode of a file

This just calls `get_mode`, which returns None because we don't use mode on Windows

**Parameters**

- **path** – The path to the file or directory
- **mode** – The mode (not used)

**Returns** None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.set_perms` (*path*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Set permissions for the given path

**Parameters**

- **path** (*str*) – The full path to the directory.
- **grant\_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`.

A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.

- **deny\_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the `deny` portion of the DACL. Default is `None`.

- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.
- **reset** (*bool*) – If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – If unsuccessful

CLI Example:

```
To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ "{Users': {'perms': 'read_execute'}}"

Locally using salt call
salt-call file.set_perms C:\Temp\ "{Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"
```

(continues on next page)

(continued from previous page)

```
Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ '{"jsnuffly': {'perms': ['read_attributes', 'read_
↪ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.stats` (*path*, *hash\_type*='sha256', *follow\_symlinks*=True)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

**Parameters**

- **path** (*str*) – The path to the file or directory
- **hash\_type** (*str*) – The type of hash to return
- **follow\_symlinks** (*bool*) – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** A dictionary of file/directory stats

**Return type** `dict`

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink` (*src*, *link*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

**Parameters**

- **src** (*str*) – The path to a file or directory
- **link** (*str*) – The path to the link

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.uid_to_user` (*uid*)

Convert a uid to a user name

**Parameters** **uid** (*str*) – The user id to lookup

**Returns** The name of the user

**Return type** `str`

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.user_to_uid` (*user*)

Convert user name to a uid

**Parameters** **user** (*str*) – The user to lookup

**Returns** The user id of the user

**Return type** `str`

CLI Example:

```
salt '*' file.user_to_uid myusername
```

## 21.9.462 salt.modules.win\_firewall

Module for configuring Windows Firewall using `netsh`

`salt.modules.win_firewall.add_rule`(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

**Parameters**

- **name** (*str*) – The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) – The protocol. Can be any of the following:
  - A number between 0 and 255
  - `icmpv4`
  - `icmpv6`
  - `tcp`
  - `udp`
  - `any`
- **action** (*Optional[str]*) – The action the rule performs. Can be any of the following:
  - `allow`
  - `block`
  - `bypass`
- **dir** (*Optional[str]*) – The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) – The remote IP. Can be any of the following:
  - `any`
  - `localsubnet`
  - `dns`
  - `dhcp`
  - `wins`
  - `defaultgateway`
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1
↪'
```

`salt.modules.win_firewall.delete_rule` (*name=None, localport=None, protocol=None, dir=None, remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

**Parameters**

- **name** (*str*) – The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** (*Optional[str]*) – The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** (*Optional[str]*) – The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** (*Optional[str]*) – The direction of the rule.
- **remoteip** (*Optional[str]*) – The remote IP of the rule.

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.disable` (*profile='allprofiles'*)

Disable firewall profile

**Parameters** **profile** (*Optional[str]*) – The name of the profile to disable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable` (*profile='allprofiles'*)

New in version 2015.5.0.

Enable firewall profile

**Parameters** **profile** (*Optional[str]*) – The name of the profile to enable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

**Returns** True if successful

**Return type** `bool`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.get_all_profiles(store='local')`

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters** `store` (`str`) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- `lgpo`
- `local`

Default is `local`

**Returns** A dictionary containing the specified settings for each profile

**Return type** `dict`

CLI Example:

```
Get all firewall settings for all profiles
salt * firewall.get_all_settings

Get all firewall settings for all profiles as defined by local group
policy

salt * firewall.get_all_settings lgpo
```

`salt.modules.win_firewall.get_all_settings(domain, store='local')`

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (`str`) – The firewall profile to query. Valid options are:
  - `domain`
  - `public`
  - `private`

- **store** (`str`) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- `lgpo`
- `local`

Default is `local`

**Returns** A dictionary containing the specified settings

**Return type** `dict`

CLI Example:

```
Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

Get all firewall settings for connections on the domain profile as
defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

`salt.modules.win_firewall.get_config()`

Get the status of all the firewall profiles

**Returns** A dictionary of all profiles on the system

**Return type** `dict`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.get_rule(name='all')`

New in version 2015.5.0.

Display all matching rules as specified by name

**Parameters** `name` (*Optional[str]*) – The full name of the rule. `all` will return all rules.

Default is `all`

**Returns** A dictionary of all rules or rules that match the name exactly

**Return type** `dict`

**Raises** `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.get_settings(profile, section, store='local')`

Get the firewall property from the specified profile in the specified store as returned by `netsh advfirewall`.

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) – The firewall profile to query. Valid options are:
  - `domain`
  - `public`
  - `private`
- **section** (*str*) – The property to query within the selected profile. Valid options are:
  - `firewallpolicy` : inbound/outbound behavior
  - `logging` : firewall logging settings
  - `settings` : firewall properties
  - `state` : firewalls state (on | off)
- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`

Default is `local`

**Returns** A dictionary containing the properties for the specified profile

**Return type** `dict`

**Raises**

- `CommandExecutionError` – If an error occurs
- `ValueError` – If the parameters are incorrect

CLI Example:

```
Get the inbound/outbound firewall settings for connections on the
local domain profile
salt * win_firewall.get_settings domain firewallpolicy
```

(continues on next page)

(continued from previous page)

```
Get the inbound/outbound firewall settings for connections on the
domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

`salt.modules.win_firewall.rule_exists(name)`

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

**Parameters** `name` (*str*) – The name of the rule

**Returns** True if exists, otherwise False

**Return type** `bool`

CLI Example:

```
Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

`salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')`

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) – The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **inbound** (*str*) – The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
 Default is None
- **outbound** (*str*) – The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
 Default is None
- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is local

**Returns** True if successful

**Return type** `bool`

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
Set the inbound setting for the domain profile to block inbound
connections
```

(continues on next page)

(continued from previous page)

```

salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

Set the outbound setting for the domain profile to allow outbound
connections
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

Set inbound/outbound settings for the domain profile in the group
policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'
↳outbound='allowoutbound' store='lgpo'

```

`salt.modules.win_firewall.set_logging_settings` (*profile*, *setting*, *value*, *store*='local')

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

#### Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (*str*) – The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize
- **value** (*str*) – The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

allowedconnections:

- enable
- disable
- notconfigured

droppedconnections:

- enable
- disable
- notconfigured

filename:

- Full path and name of the firewall log file
- notconfigured

maxfilesize:

- 1 - 32767
- notconfigured

---

**Note:** notconfigured can only be used when using the lgpo store

---

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

**Returns** True if successful

**Return type** bool

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

Don't log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections
↳value=disable

Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log

You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot
↳%\system32\LogFiles\Firewall\pfirewall.log

Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

`salt.modules.win_firewall.set_settings(profile, setting, value, store='local')`

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

#### Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (*str*) – The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **value** (*str*) – The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

---

**Note:** `notconfigured` can only be used when using the `lgpo` store

---

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is `local`

**Returns** True if successful

**Return type** `bool`

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

`salt.modules.win_firewall.set_state(profile, state, store='local')`

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

#### Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **state** (*str*) – The firewall state. Valid options are:
  - on
  - off
  - notconfigured

---

**Note:** `notconfigured` can only be used when using the `lgpo` store

---

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is `local`

**Returns** True if successful

**Return type** `bool`

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

Turn the firewall on when the public profile is active and set that in
the local group policy
salt * firewall.set_state public on lgpo
```

## 21.9.463 salt.modules.win\_groupadd

Manage groups on Windows

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.win_groupadd.add(name, **kwargs)`

Add the specified group

**Parameters** **name** (*str*) – The name of the group to add

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.adduser` (*name*, *username*, *\*\*kwargs*)

Add a user to a group

**Parameters**

- **name** (*str*) – The name of the group to modify
- **username** (*str*) – The name of the user to add to the group

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.delete` (*name*, *\*\*kwargs*)

Remove the named group

**Parameters** **name** (*str*) – The name of the group to remove

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.win_groupadd.deluser` (*name*, *username*, *\*\*kwargs*)

Remove a user from a group

**Parameters**

- **name** (*str*) – The name of the group to modify
- **username** (*str*) – The name of the user to remove from the group

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' group.deluser foo username
```

`salt.modules.win_groupadd.getent` (*refresh=False*)

Return info on all groups

**Parameters** **refresh** (*bool*) – Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False

**Returns** A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.info` (*name*)

Return information about a group

**Parameters** **name** (*str*) – The name of the group for which to get information

**Returns** A dictionary of information about the group

**Return type** dict

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.win_groupadd.list_groups` (*refresh=False*)

Return a list of groups

**Parameters** **refresh** (*bool*) – Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False

**Returns** A list of groups on the machine

**Return type** `list`

CLI Example:

```
salt '*' group.list_groups
```

`salt.modules.win_groupadd.members` (*name, members\_list, \*\*kwargs*)

Ensure a group contains only the members in the list

**Parameters**

- **name** (*str*) – The name of the group to modify
- **members\_list** (*str*) – A single user or a comma separated list of users. The group will contain only the users specified in this list.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

## 21.9.464 salt.modules.win\_iis module

Microsoft IIS site management via WebAdministration powershell module

**maintainer** Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

**platform** Windows

**depends** PowerShell

**depends** WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

`salt.modules.win_iis.create_app` (*name, site, sourcepath, apppool=None*)

Create an IIS application.

---

**Note:** This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

---

**Parameters**

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **appool** (*str*) – The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
↳ apppool='site0'
```

`salt.modules.win_iis.create_apppool`(*name*)

Create an IIS application pool.

**Note:** This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

**Parameters** *name* (*str*) – The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

`salt.modules.win_iis.create_backup`(*name*)

Backup an IIS Configuration on the System.

New in version 2017.7.0.

**Note:** Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

**Parameters** *name* (*str*) – The name to give the backup

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

`salt.modules.win_iis.create_binding`(*site*, *hostheader*=", *ipaddress*='\*', *port*=80, *protocol*='http', *sslflags*=None)

Create an IIS Web Binding.

**Note:** This function only validates against the binding `ipaddress:port:hostheader` combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

**Parameters**

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding. Usually a hostname.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.
- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*'
↳ port='80'
```

```
salt.modules.win_iis.create_cert_binding(name, site, hostheader="", ipaddress="", port=443,
 sslflags=0)
```

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** The web binding that the certificate is being assigned to must already exist.

---

#### Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **sslflags** (*int*) – Flags representing certificate type and certificate storage of the binding.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example.com' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name, sourcepath, apppool="", hostheader="", ipaddress="",
 port=80, protocol='http')
```

Create a basic website in IIS.

---

**Note:** This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

---

#### Parameters

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.
- **hostheader** (*str*) – The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding. (http, https, etc.)

**Returns** True if successful, otherwise False.

**Return type** bool

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool=
↳ 'TestPool'
```

`salt.modules.win_iis.create_vdir`(*name*, *site*, *sourcepath*, *app*='')  
Create an IIS virtual directory.

---

**Note:** This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

---

#### Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **app** (*str*) – The IIS application.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath=
↳ 'C:\inetpub\vdirs\vd0'
```

`salt.modules.win_iis.get_container_setting`(*name*, *container*, *settings*)  
Get the value of the setting for the IIS container.

New in version 2016.11.0.

#### Parameters

- **name** (*str*) – The name of the IIS container.
- **container** (*str*) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) – A dictionary of the setting names and their values.

**Returns** A dictionary of the provided settings and their values.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools'
settings="['processModel.identityType']"
```

`salt.modules.win_iis.get_webapp_settings`(*name*, *site*, *settings*)  
New in version 2017.7.0.

Get the value of the setting for the IIS web application.

---

**Note:** Params are case sensitive

---

#### Parameters

- **name** (*str*) – The name of the IIS web application.
- **site** (*str*) – The site name contains the web application. Example: Default Web Site
- **settings** (*str*) – A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

**Returns** A dictionary of the provided settings and their values.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
settings=["physicalPath','applicationPool']"
```

`salt.modules.win_iis.get_webconfiguration_settings(name, settings)`

Get the webconfiguration settings for the IIS PSPATH.

**Parameters**

- **name** (*str*) – The PSPATH of the IIS webconfiguration settings.
- **settings** (*list*) – A list of dictionaries containing setting name and filter.

**Returns** A list of dictionaries containing setting name, filter and value.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:\'
↳'enabled', 'filter': 'system.webServer/security/authentication/
↳anonymousAuthentication']]"
```

`salt.modules.win_iis.list_appools()`

List all configured IIS application pools.

**Returns** A dictionary of IIS application pools and their details.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_appools
```

`salt.modules.win_iis.list_apps(site)`

Get all configured IIS applications for the specified site.

**Parameters** **site** (*str*) – The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.list_backups()`

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

---

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

---

**Returns** A dictionary of IIS Configurations backed up on the system.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_backups
```

`salt.modules.win_iis.list_bindings(site)`

Get all configured IIS bindings for the specified site.

**Parameters** **site** (*str*) – The name if the IIS Site

**Returns** A dictionary of the binding names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_cert_bindings`(*site*)

List certificate bindings for an IIS site.

New in version 2016.11.0.

**Parameters** **site** (*str*) – The IIS site name.

**Returns** A dictionary of the binding names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_sites`()

List all the currently deployed websites.

**Returns** A dictionary of the IIS sites and their properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.list_vdirs`(*site*, *app=*'/')

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

**Parameters**

- **site** (*str*) – The IIS site name.

- **app** (*str*) – The IIS application.

**Returns** A dictionary of the virtual directory names and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.list_worker_processes`(*apppool*)

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

**Parameters** **apppool** (*str*) – The application pool to query

**Returns** A dictionary of worker processes with their process IDs

**Return type** `dict`

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.modify_binding`(*site*, *binding*, *hostheader=None*, *ipaddress=None*, *port=None*, *sslflags=None*)

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

**Parameters**

- **site** (*str*) – The IIS site name.

- **binding** (*str*) – The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: `ipaddress:port:hostheader`. For example, `*:80:` or `*:80:salt.com`

- **hostheader** (*str*) – The host header of the binding. Usually the hostname.

- **ipaddress** (*str*) – The IP address of the binding.

- **port** (*int*) – The TCP port of the binding.

- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

The following will set the host header of binding \*:80: for site0 to example.com

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.
↳com'
```

**salt.modules.win\_iis.modify\_site**(*name*, *sourcepath=None*, *apppool=None*)

Modify a basic website in IIS.

New in version 2017.7.0.

**Parameters**

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.

**Returns** True if successful, otherwise False.

**Return type** bool

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool=
↳'NewTestPool'
```

**salt.modules.win\_iis.remove\_app**(*name*, *site*)

Remove an IIS application.

**Parameters**

- **name** (*str*) – The application name.
- **site** (*str*) – The IIS site name.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

**salt.modules.win\_iis.remove\_apppool**(*name*)

Remove an IIS application pool.

**Parameters** **name** (*str*) – The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

**salt.modules.win\_iis.remove\_backup**(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

**Parameters** **name** (*str*) – The name of the backup to remove

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

`salt.modules.win_iis.remove_binding(site, hostheader="", ipaddress="", port=80)`

Remove an IIS binding.

**Parameters**

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*'
↳ 'port='80'
```

`salt.modules.win_iis.remove_cert_binding(name, site, hostheader="", ipaddress="", port=443)`

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** This function only removes the certificate from the web binding. It does not remove the web binding itself.

---

**Parameters**

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example.com' ipaddress='*' port='443'
```

`salt.modules.win_iis.remove_site(name)`

Delete a website from IIS.

**Parameters** **name** (*str*) – The IIS site name.

**Returns** True if successful, otherwise False

**Return type** `bool`

---

**Note:** This will not remove the application pool used by the site.

---

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

`salt.modules.win_iis.remove_vdir(name, site, app='')`

Remove an IIS virtual directory.

**Parameters**

- **name** (*str*) – The virtual directory name.

- **site** (*str*) – The IIS site name.
- **app** (*str*) – The IIS application.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

**salt.modules.win\_iis.restart\_appool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

**Parameters** **name** (*str*) – The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.restart_appool name='MyTestPool'
```

**salt.modules.win\_iis.restart\_site**(*name*)

Restart a Web Site in IIS.

New in version 2017.7.0.

**Parameters** **name** (*str*) – The name of the website to restart.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

**salt.modules.win\_iis.set\_container\_setting**(*name, container, settings*)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) – The name of the IIS container.
- **container** (*str*) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) – A dictionary of the setting names and their values.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
settings="{ 'managedPipeLineMode': 'Integrated' }"
```

**salt.modules.win\_iis.set\_webapp\_settings**(*name, site, settings*)

New in version 2017.7.0.

Configure an IIS application.

---

**Note:** This function only configures an existing app. Params are case sensitive.

---

**Parameters**

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.

- **settings** (*str*) – A dictionary of the setting names and their values. - physical-Path: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
↳'physicalPath': 'C:\site0', 'apppool': 'site0'}"
```

`salt.modules.win_iis.set_webconfiguration_settings` (*name*, *settings*)

Set the value of the setting for an IIS container.

**Parameters**

- **name** (*str*) – The PSPath of the IIS webconfiguration settings.
- **settings** (*list*) – A list of dictionaries containing setting name, filter and value.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings="[{'name':
↳'enabled', 'filter': 'system.webServer/security/authentication/
↳anonymousAuthentication', 'value': False}]"
```

`salt.modules.win_iis.start_appool` (*name*)

Start an IIS application pool.

New in version 2017.7.0.

**Parameters** **name** (*str*) – The name of the App Pool to start.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.start_appool name='MyTestPool'
```

`salt.modules.win_iis.start_site` (*name*)

Start a Web Site in IIS.

New in version 2017.7.0.

**Parameters** **name** (*str*) – The name of the website to start.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

`salt.modules.win_iis.stop_appool` (*name*)

Stop an IIS application pool.

New in version 2017.7.0.

**Parameters** **name** (*str*) – The name of the App Pool to stop.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.stop_appool name='MyTestPool'
```

`salt.modules.win_iis.stop_site(name)`

Stop a Web Site in IIS.

New in version 2017.7.0.

**Parameters** `name` (*str*) – The name of the website to stop.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

### 21.9.465 salt.modules.win\_ip

The networking module for Windows based systems

`salt.modules.win_ip.disable(iface)`

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

`salt.modules.win_ip.enable(iface)`

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

`salt.modules.win_ip.get_all_interfaces()`

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

`salt.modules.win_ip.get_default_gateway()`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

`salt.modules.win_ip.get_interface(iface)`

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.get_subnet_length(mask)`

Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.is_disabled(iface)`  
Returns True if interface is disabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.is_enabled(iface)`  
Returns True if interface is enabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.raw_interface_configs()`  
Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.set_dhcp_all(iface)`  
Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_dns(iface)`  
Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_ip(iface)`  
Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.set_static_dns(iface, *addrs)`  
Set static DNS configuration on a Windows NIC

**Parameters**

- **iface** (*str*) – The name of the interface to set
- **addrs** – One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.

**Returns** A dictionary containing the new DNS settings

**Return type** dict

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1
↪'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.
↪252' '192.168.1.253'
```

`salt.modules.win_ip.set_static_ip`(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

**iface** The name of the interface to manage

**addr** IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

**gateway** [None] If specified, the default gateway will be set to this value.

**append** [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
↳ gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
↳ append=True
```

## 21.9.466 salt.modules.win\_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

### Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

### Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

### Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

#### depends

- pywin32 Python module
- lxml
- uuid
- struct
- salt.utils.win\_reg

`salt.modules.win_lgpo.get`(*policy\_class=None*, *return\_full\_policy\_names=True*, *hierarchical\_return=False*, *adml\_language='en-US'*, *return\_not\_configured=False*)

Get a policy value

Parameters

- **policy\_class** (*str*) – Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return\_full\_policy\_names** (*bool*) – True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **hierarchical\_return** (*bool*) – True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **adml\_language** (*str*) – The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return\_not\_configured** (*bool*) – Include Administrative Template policies that are 'Not Configured' in the return data

**Returns** A dictionary containing the policy values for the specified class

**Return type** `dict`

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

```
salt.modules.win_lgpo.get_policy(policy_name, policy_class, adml_language='en-US',
 return_value_only=True, return_full_policy_names=True,
 hierarchical_return=False)
```

Get the current settings for a single policy on the machine

**Parameters**

- **policy\_name** (*str*) – The name of the policy to retrieve. Can be the any of the names or aliases returned by `lgpo.get_policy_info`
- **policy\_class** (*str*) – The policy class. Must be one of `machine` or `user`
- **adml\_language** (*str*) – The language code for the adml file to use for localization. The default is en-US
- **return\_value\_only** (*bool*) – True will return only the value for the policy, without the name of the policy. `return_full_policy_names` and `hierarchical_return` will be ignored. Default is True
- **return\_full\_policy\_names** (*bool*) – Returns the full policy name regardless of what was passed in `policy_name`

---

**Note:** This setting applies to sub-elements of the policy if they exist. The value passed in `policy_name` will always be used as the policy name when this setting is False

---

- **hierarchical\_return** (*bool*) – Returns a hierarchical view of the policy showing its parents

**Returns** A dictionary containing the policy settings

**Return type** `dict`

CLI Example:

```
Using the policy id
salt * lgpo.get_policy LockoutDuration machine
salt * lgpo.get_policy AutoUpdateCfg machine

Using the full name
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine
```

(continues on next page)

(continued from previous page)

```
Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure Automatic
↳Updates" machine
```

`salt.modules.win_lgpo.get_policy_info`(*policy\_name*, *policy\_class*, *adml\_language*='en-US')

Returns information about a specified policy

**Parameters**

- **policy\_name** (*str*) – The name of the policy to lookup
- **policy\_class** (*str*) – The class of policy, i.e. machine, user, both
- **adml\_language** (*str*) – The ADML language to use for Administrative Template data lookup

**Returns** Information about the specified policy

**Return type** dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:

 message:
 policy_aliases:
 - Turn off the "Order Prints" picture task
 - ShellRemoveOrderPrints_2
 - System\Internet Communication Management\Internet Communication
↳settings\Turn off the "Order Prints" picture task
 policy_class:
 machine
 policy_elements:
 policy_found:
 True
 policy_name:
 ShellRemoveOrderPrints_2
 rights_assignment:
 False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```
PS>salt-call --local lgpo.get_policy_info "Turn off the ``"Order Prints``"
↳picture task" machine

local:

 message:
```

(continues on next page)

(continued from previous page)

```

policy_aliases:
 - Turn off the "Order Prints" picture task
 - ShellRemoveOrderPrints_2
 - System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task
policy_class:
 machine
policy_elements:
policy_found:
 True
policy_name:
 Turn off the "Order Prints" picture task
rights_assignment:
 False

```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```

internet_communications_settings:
 lgpo.set:
 - computer_policy:
 Turn off the "Order Prints" picture task: Enabled

```

```

internet_communications_settings:
 lgpo.set:
 - computer_policy:
 ShellRemoveOrderPrints_2: Enabled

```

When using the full path, it might be a good idea to use single quotes around the path:

```

internet_communications_settings:
 lgpo.set:
 - computer_policy:
 'System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task': 'Enabled'

```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints\_2" come from the `.admx` files. If you know nothing about `.admx`/`.adml` relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```

PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml |
↪Select-String "Order Prints"

C:\windows\PolicyDefinitions\en-US\ICM.adml:152: <string id=
↪"ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153: <string id=
↪"ShellRemoveOrderPrints_Help">This policy setting specifies whether the "Order
↪Prints Online" task is available from Picture Tasks in Windows folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online Wizard is
↪used to download a list of providers and allow users to order prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy setting,
↪ the task "Order Prints Online" is removed from Picture Tasks in File Explorer
↪folders.

```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy,

then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx |
↪Select-String "ShellRemoveOrderPrints"

C:\windows\PolicyDefinitions\ICM.admx:661: <policy name=
↪"ShellRemoveOrderPrints_1" class="User" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)"
↪key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName=
↪"NoOnlinePrintsWizard">
C:\windows\PolicyDefinitions\ICM.admx:671: <policy name=
↪"ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)"
↪key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName=
↪"NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the `class="Machine"` and `class="User"` (which details if it is a computer policy or user policy respectively) the `ShellRemoveOrderPrints_2` is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

```
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumula-
 tive_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

#### Parameters

- **computer\_policy** (*dict*) – A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:

These policies can be specified using the GUI display name or the key name from the `_policy_info` class in this module. The GUI display name is also contained in the `_policy_info` class in this module.

Administrative Template Policies:

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the `get_policy_info` function for the policy name to view

the element ID/names that the module will accept.

- **user\_policy** (*dict*) – The same setup as the computer\_policy, except with data to configure the local user policy.
- **cumulative\_rights\_assignments** (*bool*) – Determine how user rights assignment policies are configured.

If True, user right assignment specifications are simply added to the existing policy

If False, only the users specified will get the right (any existing will have the right revoked)

- **adml\_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True is successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{ 'LockoutDuration': 2, 'RestrictAnonymous':
↳ 'Enabled', 'AuditProcessTracking': 'Success, Failure' }"
```

```
salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True,
adml_language='en-US')
```

Set a single computer policy

**Parameters**

- **name** (*str*) – The name of the policy to configure
- **setting** (*str*) – The setting to configure the named policy with
- **cumulative\_rights\_assignments** (*bool*) – Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml\_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

```
salt.modules.win_lgpo.set_user_policy(name, setting, adml_language='en-US')
```

Set a single user policy

**Parameters**

- **name** (*str*) – The name of the policy to configure
- **setting** (*str*) – The setting to configure the named policy with
- **adml\_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True if successful, Otherwise False

**Return type** bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control
↳ Panel" Enabled
```

### 21.9.467 salt.modules.win\_license module

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

**salt.modules.win\_license.activate()**

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

**salt.modules.win\_license.info()**

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

**salt.modules.win\_license.install(*product\_key*)**

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

**salt.modules.win\_license.installed(*product\_key*)**

Check to see if the product key is already installed.

**Note:** This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

**salt.modules.win\_license.licensed()**

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

**salt.modules.win\_license.uninstall()**

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

### 21.9.468 salt.modules.win\_network

Module for gathering and managing network information

**salt.modules.win\_network.connect(*host*, *port=None*, *\*\*kwargs*)**

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```

salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↳ timeout=3

```

`salt.modules.win_network.dig(host)`

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```

salt '*' network.dig archlinux.org

```

`salt.modules.win_network.get_route(ip)`

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```

salt '*' network.get_route 10.10.10.10

```

`salt.modules.win_network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```

salt '*' network.hw_addr 'Wireless Connection #1'

```

`salt.modules.win_network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```

salt '*' network.hw_addr 'Wireless Connection #1'

```

`salt.modules.win_network.in_subnet(cidr)`

Returns True if host is within specified subnet, otherwise False

CLI Example:

```

salt '*' network.in_subnet 10.0.0.0/16

```

`salt.modules.win_network.interfaces()`

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```

salt '*' network.interfaces

```

`salt.modules.win_network.interfaces_names()`

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.ip_addrs` (*interface=None*, *include\_loopback=False*, *cidr=None*, *type=None*)

Returns a list of IPv4 addresses assigned to the host.

**interface** Only IP addresses from that interface will be returned.

**include\_loopback** [False] Include loopback 127.0.0.1 IPv4 address.

**cidr**

Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

**type** If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.ip_addrs6` (*interface=None*, *include\_loopback=False*, *cidr=None*)

Returns a list of IPv6 addresses assigned to the host.

**interface** Only IP addresses from that interface will be returned.

**include\_loopback** [False] Include loopback ::1 IPv6 address.

**cidr** Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

`salt.modules.win_network.ipaddrs` (*interface=None*, *include\_loopback=False*, *cidr=None*, *type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host.

**interface** Only IP addresses from that interface will be returned.

**include\_loopback** [False] Include loopback 127.0.0.1 IPv4 address.

**cidr**

Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

**type** If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.ipaddrs6` (*interface=None*, *include\_loopback=False*, *cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host.

**interface** Only IP addresses from that interface will be returned.

**include\_loopback** [False] Include loopback ::1 IPv6 address.

**cidr** Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

**salt.modules.win\_network.is\_private**(*ip\_addr*)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

**salt.modules.win\_network.netstat**()

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

**salt.modules.win\_network.nslookup**(*host*)

Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

**salt.modules.win\_network.ping**(*host*, *timeout=False*, *return\_boolean=False*)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

**salt.modules.win\_network.subnets**()

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

**salt.modules.win\_network.traceroute**(*host*)

Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

### 21.9.469 salt.modules.win\_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

**salt.modules.win\_ntp.get\_servers()**  
Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

**salt.modules.win\_ntp.set\_servers(\*servers)**  
Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

### 21.9.470 salt.modules.win\_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM\_SETTINGCHANGE message <http://support.microsoft.com/kb/104011>

**salt.modules.win\_path.add**(*path*, *index=None*, *\*\*kwargs*)  
Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.  
**path** Directory to add to path  
**index** Optionally specify an index at which to insert the directory  
**rehash** [True] If the registry was updated, and this value is set to True, sends a WM\_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:

```
Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

**salt.modules.win\_path.exists**(*path*)  
Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash  
**Returns** boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

**salt.modules.win\_path.get\_path**()  
Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.rehash()`

Send a WM\_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

---

**Note:** This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The `salt-minion`, if running as a service, will not see changes to the environment until the system is restarted. See [MSDN Documentation](#)

---

CLI Example:

```
salt '*' win_path.rehash
```

`salt.modules.win_path.remove(path, **kwargs)`

Remove the directory from the SYSTEM path

**Returns** boolean True if successful, False if unsuccessful

**rehash** [True] If the registry was updated, and this value is set to True, sends a WM\_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```
Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

## 21.9.471 salt.modules.win\_pkg

A module to manage software on Windows

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

The following functions require the existence of a *windows repository* metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

---

`salt.modules.win_pkg.compare_versions(ver1="", oper='==', ver2="")`

Compare software package versions. Made public for use with Jinja

**Parameters**

- **ver1** (*str*) – A software version to compare
- **oper** (*str*) – The operand to use to compare
- **ver2** (*str*) – A software version to compare

**Returns** True if the comparison is valid, otherwise False

**Return type** bool

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.genrepo(**kwargs)`

Generate package metadata db based on files within the winrepo\_source\_dir

**Kwargs:**

**saltenv** (*str*): Salt environment. Default: base

**verbose** (**bool**): Return verbose data structure which includes 'success\_list', a list of all sls files and the package names contained within. Default False.

**failhard** (**bool**): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

---

**Note:**

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.
- 

**Returns** A dictionary of the results of the command

**Return type** dict

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

`salt.modules.win_pkg.get_package_info(name, saltenv='base')`

Return package info. Returns empty map if package not available.

`salt.modules.win_pkg.get_repo_data(saltenv='base')`

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

**Parameters** **saltenv** (*str*) – Salt environment. Default base

**Returns** A dict containing contents of metadata db.

**Return type** dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) on the system using winrepo

**Parameters**

- **name** (*str*) – The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (*bool*) – Boolean value representing whether or not to refresh the winrepo db. Default `False`.
- **pkgs** (*list*) – A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

will install the latest version of foo and version 1.2.3 of
↳bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

**version** (*str*): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```
Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

**extra\_install\_flags** (*str*): Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

**saltenv** (*str*): Salt environment. Default `'base'`

**report\_reboot\_exit\_codes** (*bool*): If the installer exits with a recognized exit code indicating that a reboot is required, the module function

`win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to `True`.

New in version 2016.11.0.

## Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'package': {'old': '<old-version>',
 'new': '<new-version>'}}
```

**Return type** `dict`

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
 4.2.8:
 installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
 full_name: Meinberg NTP Windows Client
 locale: en_US
 reboot: False
 cache_file: 'salt://win/repo/ntp/install.ini'
 install_flags: '/'
 ↳USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
 uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
 4.2.8:
 installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
 full_name: Meinberg NTP Windows Client
 locale: en_US
 reboot: False
 cache_dir: True
 install_flags: '/'
 ↳USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
 uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

---

**Note:** Since this is looking for the latest version available, a `refresh_db` will be triggered by default. This can take some time. To avoid this set `refresh` to `False`.

---

**Parameters** `names` (*str*) – A single or multiple names to lookup

**Kwargs:** `saltenv` (*str*): Salt environment. `Default base refresh` (*bool*): Refresh package metadata. `Default True`

**Returns** A dictionary of packages with the latest version available

**Return type** `dict`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.win_pkg.list_available(*names, **kwargs)`

Return a list of available versions of the specified package.

**Parameters** `names` (*str*) – One or more package names

**Kwargs:**

`saltenv` (*str*): The salt environment to use. Default `base`.

`refresh` (*bool*): Refresh package metadata. Default `False`.

`return_dict_always` (*bool*): Default `False` dict when a single package name is queried.

**Returns** The package name with its available versions

**Return type** `dict`

```
{'<package name>': ['<version>', '<version>',]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

`salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)`

List the packages currently installed.

---

**Note:** To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to `False`.

---

**Parameters**

- **versions\_as\_list** (*bool*) – Returns the versions as a list
- **include\_components** (*bool*) – Include sub components of installed software. Default is `True`
- **include\_updates** (*bool*) – Include software updates and Windows updates. Default is `True`

**Kwargs:**

`saltenv` (*str*): The salt environment to use. Default `base`

`refresh` (*bool*): Refresh package metadata. Default `False`

**Returns** A dictionary of installed software with versions installed

**Return type** `dict`

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades on this system

**Parameters** `refresh` (*bool*) – Refresh package metadata. Default `True`

**Kwargs:** `saltenv` (*str*): Salt environment. Default `base`

**Returns** A dictionary of packages with available upgrades

**Return type** `dict`

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

New in version 0.16.0.

**Parameters**

- **name** (*str*) – The name of the package to be deleted.
- **version** (*str*) – The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **pkgs** (*list*) – A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

**Kwargs:** `saltenv` (*str*): Salt environment. `Default base refresh` (*bool*): Refresh package metadata. `Default False`

**Returns** A dict containing the changes.

**Return type** `dict`

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.refresh_db` (*\*\*kwargs*)

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

`C:\salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p`

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (*.sls*) from *winrepo\_source\_dir* (default `salt://win/repo-ng`) and cache them in `<cachedir>files<saltenv><winrepo_source_dir>` (default: `C:\salt\var\cache\salt\minion\files\base\win\repo-ng`)
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from `pkg.genrepo`

The default *winrepo* directory on the master is `/srv/salt/win/repo-ng`. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

---

**Note:**

- Hidden directories (directories beginning with `.'`, such as `'.git'`) will be ignored.

---

**Note:** There is no need to call `pkg.refresh_db` every time you work with the `pkg` module. Automatic refresh will occur based on the following minion configuration settings:

- `winrepo_cache_expire_min`
- `winrepo_cache_expire_max`

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages

available to it.

**Warning:** Directories and files fetched from `<winrepo_source_dir>` (`/srv/salt/win/repo-ng`) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see [Windows Software Repository](#)

Arguments:

`saltenv` (str): Salt environment. Default: `base`

`verbose` (bool): Return a verbose data structure which includes 'success\_list', a list of all sls files and the package names contained within. Default is 'False'

`failhard` (bool): If `True`, an error will be raised if any repo SLS files fails to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

**Returns** A dictionary containing the results of the database refresh.

**Return type** `dict`

**Note:** A result with a `total: 0` generally means that the files are in the wrong location on the master. Try running the following command on the minion: `salt-call -l debug pkg.refresh saltenv=base`

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove` (`name=None`, `pkgs=None`, `**kwargs`)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

**Parameters**

- **name** (str) – The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** (list) – A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:**

**version** (str): The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

`saltenv` (str): Salt environment. Default `base` `refresh` (bool): Refresh package metadata. Default `False`

**Returns**

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{<package>: {'current': 'not installed'}}
```

**Return type** dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.win\_pkg.upgrade**(\*\*kwargs)

Upgrade all software. Currently not implemented

**Kwargs:** saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default True.

**Note:** This feature is not yet implemented for Windows.

**Returns** Empty dict, until implemented

**Return type** dict

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.win\_pkg.upgrade\_available**(name, \*\*kwargs)

Check whether or not an upgrade is available for a given package

**Parameters** name (str) – The name of a single package

**Kwargs:** refresh (bool): Refresh package metadata. Default True saltenv (str): The salt environment. Default base

**Returns** True if new version available, otherwise False

**Return type** bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.win\_pkg.version**(\*names, \*\*kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Parameters** name (str) – One or more package names

**Kwargs:** saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default False.

**Returns** version string when a single package is specified. dict: The package name(s) with the installed versions.

**Return type** str

```
{['<version>', '<version>', []] OR
{'<package name>': ['<version>', '<version>', []]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

## 21.9.472 salt.modules.win\_pki module

Microsoft certificate management via the PKI Client PowerShell module. <https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient>

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. [https://technet.microsoft.com/en-us/library/hh848636\(v=wps.620\).aspx](https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx)

**platform** Windows

**depends**

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

`salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')`

Export the certificate to a file from the given certificate store.

**Parameters**

- **name** (*str*) – The destination path for the exported certificate file.
- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **cert\_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

`salt.modules.win_pki.get_cert_file(name, cert_format='cer', password='')`

Get the details of the certificate file.

**Parameters**

- **name** (*str*) – The filesystem path of the certificate file.
- **cert\_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A dictionary of the certificate thumbprints and properties.

**Return type** `dict`

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

`salt.modules.win_pki.get_certs(context='LocalMachine', store='My')`

Get the available certificates in the given store.

**Parameters**

- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

**Returns** A dictionary of the certificate thumbprints and properties.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_certs
```

`salt.modules.win_pki.get_stores()`

Get the certificate location contexts and their corresponding stores.

**Returns** A dictionary of the certificate location contexts and stores.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_stores
```

`salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password="", saltenv='base')`

Import the certificate file into the given certificate store.

**Parameters**

- **name** (*str*) – The path of the certificate file to import.
- **cert\_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **exportable** (*bool*) – Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) – The environment the file resides in.

**Returns** A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

`salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')`

Remove the certificate from the given certificate store.

**Parameters**

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

**Returns** A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

`salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name="")`

Check the certificate for validity.

**Parameters**

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **untrusted\_root** (*bool*) – Whether the root certificate is required to be trusted in chain building.
- **dns\_name** (*str*) – The DNS name to verify as valid for the certificate.

- **eku** (*str*) – The enhanced key usage object identifiers to verify for the certificate chain.

**Returns** A boolean representing whether the certificate was considered valid.

**Return type** `bool`

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

### 21.9.473 salt.modules.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

**salt.modules.win\_powercfg.get\_disk\_timeout** (*scheme=None*)

Get the current disk timeout of the given scheme

**Parameters** **scheme** (*str*) – The scheme to use, leave as `NONE` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** `dict`

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

**salt.modules.win\_powercfg.get\_hibernate\_timeout** (*scheme=None*)

Get the current hibernate timeout of the given scheme

**scheme** (*str*): The scheme to use, leave as `NONE` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** `dict`

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

**salt.modules.win\_powercfg.get\_monitor\_timeout** (*scheme=None*)

Get the current monitor timeout of the given scheme

**Parameters** **scheme** (*str*) – The scheme to use, leave as `NONE` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

**Returns** A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

`salt.modules.win_powercfg.get_standby_timeout` (*scheme=None*)

Get the current standby timeout of the given scheme

**scheme** (*str*): The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

**Returns** A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

`salt.modules.win_powercfg.set_disk_timeout` (*timeout, power='ac', scheme=None*)

Set the disk timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) – The amount of time in minutes before the disk will timeout
- **power** (*str*) – Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) – The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns** True if successful, otherwise False

Return type `bool`

CLI Example:

```
Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_hibernate_timeout` (*timeout, power='ac', scheme=None*)

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) – The amount of time in minutes before the computer hibernates
- **power** (*str*) – Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) – The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns** True if successful, otherwise False

Return type `bool`

CLI Example:

```
Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_monitor_timeout(timeout, power='ac', scheme=None)`

Set the monitor timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) – The amount of time in minutes before the monitor will timeout
- **power** (*str*) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (*str*) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

`salt.modules.win_powercfg.set_standby_timeout(timeout, power='ac', scheme=None)`

Set the standby timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) – The amount of time in minutes before the computer sleeps
- **power** (*str*) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (*str*) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

## 21.9.474 salt.modules.win\_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**

- PowerShell 5.0
- PSGet

Support for PowerShell

`salt.modules.win_psget.avail_modules(desc=False)`

List available modules in registered Powershell module repositories.

Parameters **desc** (bool) – If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

`salt.modules.win_psget.bootstrap()`

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

`salt.modules.win_psget.get_repository(name)`

Get the details of a local PSGet repository

Parameters **name** (str) – Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

`salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)`

Install a Powershell module from powershell gallery on the system.

Parameters

- **name** (str) – Name of a Powershell module
- **minimum\_version** (str) – The maximum version to install, e.g. 1.23.2
- **required\_version** (str) – Install a specific version
- **scope** (str) – The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) – The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

`salt.modules.win_psget.list_modules(desc=False)`

List currently installed PSGet Modules on the system.

Parameters **desc** (bool) – If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

`salt.modules.win_psget.register_repository(name, location, installation_policy=None)`

Register a PSGet repository on the local machine

Parameters

- **name** (str) – The name for the repository
- **location** (str) – The URI for the repository
- **installation\_policy** (str) – The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
↳packages
```

`salt.modules.win_psget.remove(name)`

Remove a Powershell DSC module from the system.

Parameters **name** (str) – Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

`salt.modules.win_psget.update`(*name*, *maximum\_version=None*, *required\_version=None*)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** (str) – Name of a Powershell module
- **maximum\_version** (str) – The maximum version to install, e.g. 1.23.2
- **required\_version** (str) – Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

### 21.9.475 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

`file_client:` `local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

`salt.modules.winrepo.genrepo`()

Generate winrepo\_cache file based on sls files in the winrepo\_dir

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.winrepo.show_sls`(*name*, *saltenv='base'*)

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run `pkg.refresh_db` to pull the latest software definitions from the master.

---

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

---

Parameters

- **str** (*saltenv*) – The name/path of the package you want to view. This can be the
- **path to a file on the minion file system or a file on the local (full) –**
- **cache.** (*minion*) –
- **str** – The default environment is base

**Returns** Returns a dictionary containing the rendered data structure

**Return type** dict

---

**Note:** To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have `.sls` files organized in subdirectories you'll have to denote them with `..`. For example, if you have a `test` directory in the winrepo root with a `gvim.sls` file inside, would target that file like so: `test.gvim`. Directories can be targeted as well as long as they contain an `init.sls` inside. For example, if you have a `node` directory with an `init.sls` inside, target that like so: `node`.

---

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

`salt.modules.winrepo.update_git_repos` (*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

---

**Important:** This function requires *Git for Windows* to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

---

**clean** [False] Clean repo cachedirs which are not configured under *winrepo\_remotes*.

---

**Note:** This option only applies if either *pygit2* or *GitPython* is installed into Salt's bundled Python.

---

**Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

## 21.9.476 salt.modules.win\_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

**maintainer** Shane Lee <slee@saltstack.com>

**platform** Windows Server 2008R2 or greater

**depends** PowerShell module ServerManager

`salt.modules.win_servermanager.install` (*feature, recurse=False, restart=False, source=None, exclude=None*)

Install a feature

---

**Note:** Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

---

---

**Note:** Some features take a long time to complete un/installation, set `-t` with a long timeout

---

### Parameters

- **feature** (*str, list*) – The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.

New in version 2018.3.0: Added the ability to pass a list of features to be installed.

- **recurse** (*Optional[bool]*) – Install all sub-features. Default is False
- **restart** (*Optional[bool]*) – Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in `exclude` requires a reboot to be properly removed. Default is False
- **source** (*Optional[str]*) – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **exclude** (*Optional[str]*) – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in “exclude“ is not a sub-feature of one of the installed items it will still be removed.**

**Returns** A dictionary containing the results of the install

**Return type** `dict`

CLI Example:

```
Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

Install the TFTP Client and the SNMP Service passing a comma-delimited
string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

Install the XPS Viewer, SNMP Service, and Remote Access passing a
list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install ["XPS-Viewer", 'SNMP-Service', 'RemoteAccess']
↳" True recurse=True exclude="Web-Server"
```

`salt.modules.win_servermanager.list_available()`

List available features to install

**Returns** A list of available features as returned by the `Get-WindowsFeature` PowerShell command

**Return type** `str`

CLI Example:

```
salt '*' win_servermanager.list_available
```

`salt.modules.win_servermanager.list_installed()`

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

**Returns** A dictionary of installed features

**Return type** `dict`

CLI Example:

```
salt '*' win_servermanager.list_installed
```

`salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)`

Remove an installed feature

---

**Note:** Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

---

#### Parameters

- **feature** (*str*, *list*) – The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.  
New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **remove\_payload** (*Optional[bool]*) – True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- **restart** (*Optional[bool]*) – Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

**Returns** A dictionary containing the results of the uninstall

**Return type** `dict`

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

### 21.9.477 salt.modules.win\_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

`salt.modules.win_service.available`(*name*)

Check if a service is available on the system.

**Parameters** **name** (*str*) – The name of the service to check

**Returns** True if the service is available, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.create`(*name*, *bin\_path*, *exe\_args=None*, *display\_name=None*, *description=None*, *service\_type='own'*, *start\_type='manual'*, *start\_delayed=False*, *error\_control='normal'*, *load\_order\_group=None*, *dependencies=None*, *account\_name='.\LocalSystem'*, *account\_password=None*, *run\_interactive=False*, *\*\*kwargs*)

Create the named service.

New in version 2015.8.0.

#### Parameters

- **name** (*str*) – Specifies the service name. This is not the `display_name`
- **bin\_path** (*str*) – Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe\_args** (*str*) – Any additional arguments required by the service binary.
- **display\_name** (*str*) – The name to be displayed in the service manager. If not passed, the name will be used
- **description** (*str*) – A description of the service

- **service\_type** (*str*) – Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start\_type** (*str*) – Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual` (default): Service must be started manually
  - `disabled`: Service cannot be started
- **start\_delayed** (*bool*) – Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error\_control** (*str*) – The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - `normal` (normal): Error is logged and a message box is displayed
  - `severe`: Error is logged and computer attempts a restart with the last known good configuration
  - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - `ignore`: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** (*str*) – The name of the load order group to which this service belongs
- **dependencies** (*list*) – A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) – The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - `NT AuthorityLocalService`
  - `NT AuthorityNetworkService`
  - `NT AuthorityLocalSystem`
  - `.LocalSystem`
- **account\_password** (*str*) – The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run\_interactive** (*bool*) – If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** A dictionary containing information about the new service

**Return type** `dict`

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

`salt.modules.win_service.create_win_salt_restart_task()`

Create a task in Windows task scheduler to enable restarting the salt-minion

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.delete`(*name*, *timeout=90*)

Delete the named service

**Parameters**

- **name** (*str*) – The name of the service to delete
- **timeout** (*int*) – The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

**Returns**

**True** if successful, otherwise **False**. Also returns **True** if the service is not present

**Return type** `bool`

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.win_service.disable`(*name*, *\*\*kwargs*)

Disable the named service to start at boot

**Parameters** **name** (*str*) – The name of the service to disable

**Returns** True if disabled, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.win_service.disabled`(*name*)

Check to see if the named service is disabled to start on boot

**Parameters** **name** (*str*) – The name of the service to check

**Returns** True if the service is disabled

**Return type** `bool`

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.win_service.enable`(*name*, *start\_type='auto'*, *start\_delayed=False*, *\*\*kwargs*)

Enable the named service to start at boot

**Parameters**

- **name** (*str*) – The name of the service to enable.
- **start\_type** (*str*) – Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start\_delayed** (*bool*) – Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to Auto. If `service_type` is not passed, but the service is already set to Auto, then the flag will be set.

**Returns** True if successful, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

**Parameters** `name` (*str*) – The name of the service to check

**Returns** True if the service is set to start

**Return type** `bool`

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.execute_salt_restart_task()`

Run the Windows Salt restart task

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.get_all()`

Return all installed services

**Returns** Returns a list of all services on the system.

**Return type** `list`

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.win_service.get_disabled()`

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

**Returns** A list of disabled services.

**Return type** `list`

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.win_service.get_enabled()`

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

**Returns** A list of enabled services

**Return type** `list`

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.win_service.get_service_name(*args)`

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

**Returns** A dictionary of display names and service names

**Return type** `dict`

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

`salt.modules.win_service.getsid(name)`

Return the SID for this windows service

**Parameters** `name` (*str*) – The name of the service for which to return the SID

**Returns** A string representing the SID for the service

**Return type** `str`

CLI Example:

```
salt '*' service.getsid <service name>
```

`salt.modules.win_service.info(name)`

Get information about a service on the system

**Parameters** `name` (*str*) – The name of the service. This is not the display name. Use `get_service_name` to find the service name.

**Returns** A dictionary containing information about the service.

**Return type** `dict`

CLI Example:

```
salt '*' service.info spooler
```

`salt.modules.win_service.missing(name)`

The inverse of `service.available`.

**Parameters** `name` (*str*) – The name of the service to check

**Returns** True if the service is missing, False otherwise

**Return type** `bool`

CLI Example:

```
salt '*' service.missing <service name>
```

`salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)`

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) – The name of the service. Can be found using the `service.get_service_name` function
- **bin\_path** (*str*) – The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe\_args** (*str*) – Any arguments required by the service executable
- **display\_name** (*str*) – The name to display in the service manager
- **description** (*str*) – The description to display for the service
- **service\_type** (*str*) – Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process

- share: Service shares a process with one or more other services
- **start\_type** (*str*) – Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start\_delayed** (*bool*) – Set the service to Auto(Delayed Start). Only valid if the start\_type is set to Auto. If service\_type is not passed, but the service is already set to Auto, then the flag will be set.
- **error\_control** (*str*) – The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** (*str*) – The name of the load order group to which this service belongs
- **dependencies** (*list*) – A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) – The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem
  - .LocalSystem
- **account\_password** (*str*) – The password for the account name specified in account\_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run\_interactive** (*bool*) – If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** dict

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart(name, timeout=90)`

Restart the named service. This issues a stop command followed by a start.

**Parameters**

- **name** – The name of the service to restart.

---

**Note:** If the name passed is salt-minion a scheduled task is created and executed to restart the salt-minion service.

---

- **timeout** (*int*) – The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

**Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

New in version 2017.7.9,2018.3.4.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start(name, timeout=90)`

Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

#### Parameters

- **name** (*str*) – The name of the service to start
- **timeout** (*int*) – The time in seconds to wait for the service to start before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

#### Returns

**True** if successful, otherwise **False**. Also returns **True** if the service is already started

**Return type** bool

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.status(name, *args, **kwargs)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**Parameters** **name** (*str*) – The name of the service to check

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.win_service.stop(name, timeout=90)`

Stop the specified service

#### Parameters

- **name** (*str*) – The name of the service to stop
- **timeout** (*int*) – The time in seconds to wait for the service to stop before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

#### Returns

**True** if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type `bool`

CLI Example:

```
salt '*' service.stop <service name>
```

## 21.9.478 salt.modules.win\_shadow

Manage the shadow file

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

---

`salt.modules.win_shadow.info(name)`

Return information for the specified user This is just returns dummy data so that salt states can work.

**Parameters** `name` (*str*) – The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.win_shadow.require_password_change(name)`

Require the user to change their password the next time they log in.

**Parameters** `name` – The name of the user account to require a password change.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

`salt.modules.win_shadow.set_expire(name, expire)`

Set the expiration date for a user account.

**Parameters**

- **name** – The name of the user account to edit.
- **expire** – The date the account will expire.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

`salt.modules.win_shadow.set_password(name, password)`

Set the password for a named user.

**Parameters**

- **name** (*str*) – The name of the user account
- **password** (*str*) – The new password

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.unlock_account(name)`

Unlocks a user account.

**Parameters** `name` – The name of the user account to unlock.

**Returns** True if successful. False if unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

## 21.9.479 salt.modules.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

**depends** wmi

`salt.modules.win_smtp_server.get_connection_ip_list`(*as\_wmi\_format=False*,  
*server='SmtpSvc/1'*)

Get the IPGrant list for the SMTP virtual server.

**Parameters**

- **as\_wmi\_format** (*bool*) – Returns the connection IPs as a list in the format WMI expects.
- **server** (*str*) – The SMTP server name.

**Returns** A dictionary of the IP and subnet pairs.

**Return type** `dict`

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

`salt.modules.win_smtp_server.get_log_format`(*server='SmtpSvc/1'*)

Get the active log format for the SMTP virtual server.

**Parameters** **server** (*str*) – The SMTP server name.

**Returns** A string of the log format name.

**Return type** `str`

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

`salt.modules.win_smtp_server.get_log_format_types`()

Get all available log format names and ids.

**Returns** A dictionary of the log format names and ids.

**Return type** `dict`

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

`salt.modules.win_smtp_server.get_relay_ip_list`(*server='SmtpSvc/1'*)

Get the RelayIpList list for the SMTP virtual server.

**Parameters** **server** (*str*) – The SMTP server name.

**Returns** A list of the relay IPs.

**Return type** `list`

---

**Note:** A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

---

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

`salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')`

Get the value of the setting for the SMTP virtual server.

**Parameters**

- **settings** (*str*) – A list of the setting names.
- **server** (*str*) – The SMTP server name.

**Returns** A dictionary of the provided settings and their values.

**Return type** `dict`

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings=["MaxRecipients"]
```

`salt.modules.win_smtp_server.get_servers()`

Get the SMTP virtual server names.

**Returns** A list of the SMTP virtual servers.

**Return type** `list`

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

`salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')`

Set the IPGrant list for the SMTP virtual server.

**Parameters**

- **addresses** (*str*) – A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) – Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) – The SMTP server name.

**Returns** A boolean representing whether the change succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{ '127.0.0.1': '255.255.255.255' }"
```

`salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')`

Set the active log format for the SMTP virtual server.

**Parameters**

- **log\_format** (*str*) – The log format name.
- **server** (*str*) – The SMTP server name.

**Returns** A boolean representing whether the change succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

`salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtpSvc/1')`

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
'255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

#### Parameters

- **addresses** (*str*) – A list of the relay IPs. The order of the list is important.
- **server** (*str*) – The SMTP server name.

**Returns** A boolean representing whether the change succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1
↪']"
```

`salt.modules.win_smtp_server.set_server_setting(settings, server='SmtSvc/1')`  
Set the value of the setting for the SMTP virtual server.

**Note:** The setting names are case-sensitive.

#### Parameters

- **settings** (*str*) – A dictionary of the setting names and their values.
- **server** (*str*) – The SMTP server name.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{ 'MaxRecipients': '500' }"
```

## 21.9.480 salt.modules.win\_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

`salt.modules.win_snmp.get_agent_service_types()`

Get the sysServices types that can be configured.

**Returns** A list of service types.

**Return type** `list`

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

`salt.modules.win_snmp.get_agent_settings()`

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

**Returns** A dictionary of the agent settings.

**Return type** `dict`

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

`salt.modules.win_snmp.get_auth_traps_enabled()`

Determine whether the host is configured to send authentication traps.

**Returns** True if traps are enabled, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

`salt.modules.win_snmp.get_community_names()`

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
 Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
 Read Only
```

**Returns** A dictionary of community names and permissions.

**Return type** `dict`

CLI Example:

```
salt '*' win_snmp.get_community_names
```

`salt.modules.win_snmp.get_permission_types()`

Get the permission types that can be configured for communities.

**Returns** A list of permission types.

**Return type** `list`

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

`salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)`

Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**

- **contact** (*str, optional*) – The SNMP contact.
- **location** (*str, optional*) – The SNMP location.
- **services** (*list, optional*) – A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: `['None']`

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'
↳services="['Physical']"
```

`salt.modules.win_snmp.set_auth_traps_enabled(status=True)`

Manage the sending of authentication traps.

Parameters **status** (*bool*) – True to enable traps. False to disable.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

`salt.modules.win_snmp.set_community_names` (*communities*)

Manage the SNMP accepted community names and their permissions.

---

**Note:** Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a `CommandExecutionError`

---

Parameters **communities** (*dict*) – A dictionary of SNMP community names and permissions.

The possible permissions can be found via `win_snmp.get_permission_types`.

Returns True if successful, otherwise False

Return type *bool*

Raises ***CommandExecutionError*** – If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{ 'TestCommunity': 'Read Only' }"
```

### 21.9.481 `salt.modules.win_status`

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

**depends**

- `wmi`

**class** `salt.modules.win_status.SYSTEM_PERFORMANCE_INFORMATION`

**AvailablePagedPoolPages**

Structure/Union member

**AvailablePages**

Structure/Union member

**CacheIoCount**

**salt.modules.win\_status.cpuload()**

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

**salt.modules.win\_status.cputats()**

Return information about the CPU.

**Returns** dict: A dictionary containing information about the CPU stats

CLI Example:

```
salt * status.cputats
```

**salt.modules.win\_status.diskusage** (*human\_readable=False, path=None*)

New in version 2015.8.0.

Return the disk usage for this minion

**human\_readable** [False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

**salt.modules.win\_status.loadavg()**

Returns counter information related to the load of the machine

**Returns** A dictionary of counters**Return type** dict

CLI Example:

```
salt * status.loadavg
```

**salt.modules.win\_status.master** (*master=None, connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.meminfo()`

Return information about physical and virtual memory on the system

**Returns** A dictionary of information about memory on the system

**Return type** `dict`

CLI Example:

```
salt * status.meminfo
```

`salt.modules.win_status.procs(count=False)`

Return the process data

**count** [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

`salt.modules.win_status.saltmem(human_readable=False)`

New in version 2015.8.0.

Returns the amount of memory that salt is using

**human\_readable** [False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

`salt.modules.win_status.uptime(human_readable=False)`

New in version 2015.8.0.

Return the system uptime for the machine

**Parameters** **human\_readable** (*bool*) – Return uptime in human readable format if True, otherwise return seconds. Default is False

---

**Note:** Human readable format is `days, hours:min:sec`. Days will only be displayed if more than 0

---

**Returns** The uptime in seconds or human readable format depending on the value of `human_readable`

**Return type** `str`

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

`salt.modules.win_status.vstats()`

Return information about the virtual memory on the machine

**Returns** A dictionary of virtual memory stats

**Return type** `dict`

CLI Example:

```
salt * status.vmstats
```

## 21.9.482 salt.modules.win\_system

Module for managing windows systems.

### depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

Support for reboot, shutdown, etc

### salt.modules.win\_system.get\_computer\_desc()

Get the Windows computer description

**Returns** Returns the computer description if found. Otherwise returns False.

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

### salt.modules.win\_system.get\_computer\_name()

Get the Windows computer name

**Returns** Returns the computer name if found. Otherwise returns False.

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

### salt.modules.win\_system.get\_domain\_workgroup()

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

**Returns** The name of the domain or workgroup

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

### salt.modules.win\_system.get\_hostname()

Get the hostname of the windows minion

New in version 2016.3.0.

**Returns** Returns the hostname of the windows minion

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

### `salt.modules.win_system.get_pending_component_servicing()`

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

**Returns** True if there are pending Component Based Servicing tasks, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

### `salt.modules.win_system.get_pending_computer_name()`

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.

**Returns** Returns the pending name if pending restart. Returns None if not pending restart.

**Return type** `str`

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

### `salt.modules.win_system.get_pending_domain_join()`

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

**Returns** True if there is a pending domain join action, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_domain_join
```

### `salt.modules.win_system.get_pending_file_rename()`

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

**Returns** True if there are pending file rename operations, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_file_rename
```

### `salt.modules.win_system.get_pending_reboot()`

Determine whether there is a reboot pending.

New in version 2016.11.0.

**Returns** True if the system is pending reboot, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' system.get_pending_reboot
```

### `salt.modules.win_system.get_pending_servermanager()`

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

**Returns** True if there are pending Server Manager tasks, otherwise False

**Return type** bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

`salt.modules.win_system.get_pending_update()`

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

**Returns** True if there are pending updates, otherwise False

**Return type** bool

CLI Example:

```
salt '*' system.get_pending_update
```

`salt.modules.win_system.get_reboot_required_witnessed()`

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

**Returns** True if the Requires reboot registry flag is set to 1, otherwise False

**Return type** bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.win_system.get_system_date()`

Get the Windows system date

**Returns** Returns the system date

**Return type** str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.win_system.get_system_info()`

Get system information.

---

**Note:** Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

---

**Returns** Dictionary containing information about the system to include name, description, version, etc...

**Return type** dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

`salt.modules.win_system.get_system_time()`

Get the system time.

**Returns** Returns the system time in HH:MM:SS AM/PM format.

**Return type** str

CLI Example:

```
salt 'minion-id' system.get_system_time
```

`salt.modules.win_system.halt`(*timeout=5, in\_seconds=False*)

Halt a running system.

Parameters

- **timeout** (*int*) – Number of seconds before halting the system. Default is 5 seconds.
- **in\_seconds** (*bool*) – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.halt 5 True
```

`salt.modules.win_system.init`(*runlevel*)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.win_system.join_domain`(*domain, username=None, password=None, account\_ou=None, account\_exists=False, restart=False*)

Join a computer to an Active Directory domain. Requires a reboot.

Parameters

- **domain** (*str*) – The domain to which the computer should be joined, e.g. `example.com`
- **username** (*str*) – Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like `user@domain.tld` or simply `user`
- **password** (*str*) – Password of the specified user
- **account\_ou** (*str*) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers, ou=departm_432, dc=my-company, dc=com`
- **account\_exists** (*bool*) – If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
- **restart** (*bool*) – True will restart the computer after a successful join. Default is False

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise False

Return type `dict`

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
 username='joinuser' password='joinpassword' \
 account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
 account_exists=False, restart=True
```

`salt.modules.win_system.lock`()

Lock the workstation.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.poweroff`(*timeout=5*, *in\_seconds=False*)

Power off a running system.

Parameters

- **timeout** (*int*) – Number of seconds before powering off the system. Default is 5 seconds.
- **in\_seconds** (*bool*) – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.poweroff 5
```

`salt.modules.win_system.reboot`(*timeout=5*, *in\_seconds=False*, *wait\_for\_reboot=False*, *only\_on\_pending\_reboot=False*)

Reboot a running system.

Parameters

- **timeout** (*int*) – The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in\_seconds** (*bool*) – **True** will cause the **timeout** parameter to be in seconds. **False** will be in minutes. Default is **False**.

New in version 2015.8.0.

- **wait\_for\_reboot** (*bool*) – **True** will sleep for `timeout + 30` seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is **False**.

New in version 2015.8.0.

- **only\_on\_pending\_reboot** (*bool*) – If this is set to **True**, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to **True** could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is **False**.

Returns True if successful (a reboot will occur), otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
 module.run:
 - name: system.reboot
 - only_on_pending_reboot: True
 - order: last
```

`salt.modules.win_system.set_computer_desc`(*desc=None*)

Set the Windows computer description

Parameters **desc** (*str*) – The computer description

Returns Description if successful, otherwise False

Return type `str`

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.set_computer_name(name)`

Set the Windows computer name

**Parameters** `name` (*str*) – The new name to give the computer. Requires a reboot to take effect.

**Returns** Returns a dictionary containing the old and new names if successful. `False` if not.

**Return type** `dict`

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.set_hostname(hostname)`

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

**Parameters** `hostname` (*str*) – The hostname to set

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

`SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data`

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of `1`.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use `<mm-dd-yy>` format for the date.

**Parameters** `newdate` (*str*) – The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time` (*years=None, months=None, days=None, hours=None, minutes=None, seconds=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

**Parameters**

- **years** (*int*) – Years digit, ie: 2015
- **months** (*int*) – Months digit: 1 - 12
- **days** (*int*) – Days digit: 1 - 31
- **hours** (*int*) – Hours digit: 0 - 23
- **minutes** (*int*) – Minutes digit: 0 - 59
- **seconds** (*int*) – Seconds digit: 0 - 59

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

`salt.modules.win_system.set_system_time` (*newtime*)

Set the system time.

**Parameters** **newtime** (*str*) – The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.shutdown` (*message=None, timeout=5, force\_close=True, reboot=False, in\_seconds=False, only\_on\_pending\_reboot=False*)

Shutdown a running system.

**Parameters**

- **message** (*str*) – The message to display to the user before shutting down.
- **timeout** (*int*) – The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If `timeout` is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If `timeout` is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

- **in\_seconds** (*bool*) – **True** will cause the **timeout** parameter to be in seconds. **False** will be in minutes. Default is **False**.  
New in version 2015.8.0.
- **force\_close** (*bool*) – **True** will force close all open applications. **False** will

- display a dialog box instructing the user to close open applications. Default is `True`.
- **reboot** (*bool*) – `True` restarts the computer immediately after shutdown. `False` powers down the system. Default is `False`.
- **only\_on\_pending\_reboot** (*bool*) – If this is set to `True`, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
- **only\_on\_pending\_reboot** – If `True` the shutdown will only proceed if there is a reboot pending. `False` will shutdown the system. Default is `False`.

**Returns** `True` if successful (a shutdown or reboot will occur), otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

`salt.modules.win_system.shutdown_abort()`

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

`salt.modules.win_system.shutdown_hard()`

Shutdown a running system with no timeout or warning.

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.shutdown_hard
```

`salt.modules.win_system.start_time_service()`

Start the Windows time service

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.start_time_service
```

`salt.modules.win_system.stop_time_service()`

Stop the Windows time service

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

CLI Example:

```
salt '*' system.stop_time_service
```

`salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)`

Unjoin a computer from an Active Directory Domain. Requires a restart.

**Parameters**

- **username** (*str*) – Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.

- **password** (*str*) – The password of the specified user
- **domain** (*str*) – The domain from which to unjoin the computer. Can be None
- **workgroup** (*str*) – The workgroup to join the computer to. Default is WORKGROUP

New in version 2015.8.2/2015.5.7.

- **disable** (*bool*) – True to disable the computer account in Active Directory. Default is False
- **restart** (*bool*) – True will restart the computer after successful unjoin. Default is False

New in version 2015.8.2/2015.5.7.

**Returns** Returns a dictionary if successful, otherwise False

**Return type** dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
 password='unjoinpassword' disable=True \
 restart=True
```

### 21.9.483 salt.modules.win\_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

**salt.modules.win\_task.add\_action** (*name=None, location='\'', action\_type='Execute', \*\*kwargs*)

Add an action to a task.

#### Parameters

- **name** (*str*) – The name of the task to which to add the action.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **action\_type** (*str*) – The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action\_type:

#### Execute

Execute a command or an executable

**cmd** (*str*): (required) The command or executable to run.

**arguments** (*str*): (optional) Arguments to be passed to the command or executable.

To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

- `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

**start\_in** (*str*): (optional) The current working directory for the command.

#### Email

Send and email. Requires `server`, `from`, and `to` or `cc`.

**from (str):** The sender  
**reply\_to (str):** Who to reply to  
**to (str):** The recipient  
**cc (str):** The CC recipient  
**bcc (str):** The BCC recipient  
**subject (str):** The subject of the email  
**body (str):** The Message Body of the email  
**server (str):** The server used to send the email  
**attachments (list):** A list of attachments. These will be the paths to the files to attach. ie: `attachments=["C:\attachment1.txt', 'C:\attachment2.txt']"`

#### Message

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

**title (str):** The dialog box title.  
**message (str):** The dialog box message body

**Returns** A dictionary containing the task configuration

**Return type** `dict`

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```

salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)

```

Add a trigger to a Windows Scheduled task

---

**Note:** Arguments are parsed by the YAML loader and are subject to yml's idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See [YAML IDIOSYNCRASIES](#) for more details.

---

#### Parameters

- **name (str)** – The name of the task to which to add the trigger.
- **location (str)** – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **trigger\_type (str)** – The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot

- OnLogon
- OnSessionChange
- **trigger\_enabled** (*bool*) – Boolean value that indicates whether the trigger is enabled.
- **start\_date** (*str*) – The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start\_time** (*str*) – The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end\_date** (*str*) – The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end\_time** (*str*) – The time when the trigger is deactivated. If this is not passed with `end_date` it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random\_delay** (*str*) – The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

---

**Note:** This parameter applies to the following trigger types

- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- 
- **repeat\_interval** (*str*) – The amount of time between each restart of the task. Valid values are:
    - 5 minutes
    - 10 minutes
    - 15 minutes
    - 30 minutes

- 1 hour
- **repeat\_duration** (*str*) – How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day
- **repeat\_stop\_at\_duration\_end** (*bool*) – Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.
- **execution\_time\_limit** (*str*) – The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)
- **delay** (*str*) – The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

---

**Note:** This parameter applies to the following trigger types:

- OnLogon
  - OnBoot
  - Event
  - OnTaskCreation
  - OnSessionChange
- 

## kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

### Event

The trigger will be fired by an event.

**subscription** (**str**): An event definition in xml format that fires the trigger. The easiest way to get this would be to create an event in Windows Task Scheduler and then copy the xml text.

### Once

No special parameters required.

### Daily

The task will run daily.

**days\_interval** (**int**): The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

### Weekly

The task will run weekly.

**weeks\_interval (int):** The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

**days\_of\_week (list):** Sets the days of the week on which the task runs. Should be a list. ie: [ 'Monday', 'Wednesday', 'Friday' ]. Valid entries are the names of the days of the week.

#### *Monthly*

The task will run monthly.

**months\_of\_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: [ 'January', 'July' ]. Valid entries are the full names of all the months.

**days\_of\_month (list):** Sets the days of the month during which the task runs. Should be a list. ie: [ 1, 15, 'Last' ]. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

**last\_day\_of\_month (bool):** Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

---

**Note:** You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last\_day\_of\_month' equal to True.

---

#### *MonthlyDay*

The task will run monthly on the specified day.

**months\_of\_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: [ 'January', 'July' ]. Valid entries are the full names of all the months.

**weeks\_of\_month (list):** Sets the weeks of the month during which the task runs. Should be a list. ie: [ 'First', 'Third' ]. Valid options are:

- First
- Second
- Third
- Fourth

**last\_week\_of\_month (bool):** Boolean value that indicates that the task runs on the last week of the month.

**days\_of\_week (list):** Sets the days of the week during which the task runs. Should be a list. ie: [ 'Monday', 'Wednesday', 'Friday' ]. Valid entries are the names of the days of the week.

#### *OnIdle*

No special parameters required.

#### *OnTaskCreation*

No special parameters required.

#### *OnBoot*

No special parameters required.

#### *OnLogon*

No special parameters required.

#### *OnSessionChange*

The task will be triggered by a session change.

**session\_user\_name (str):** Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

**state\_change (str):** Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:

- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
- RemoteConnect: When a user connects via Remote Desktop
- RemoteDisconnect: When a user disconnects via Remote Desktop
- SessionLock: When the workstation is locked
- SessionUnlock: When the workstation is unlocked

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↳enabled=True start_date=2016/12/1 start_time="'12:01'"
```

`salt.modules.win_task.clear_triggers`(*name*, *location*='\')

Remove all triggers from the task.

**Parameters**

- **name** (*str*) – The name of the task from which to clear all triggers.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

`salt.modules.win_task.create_folder`(*name*, *location*='\')

Create a folder in which to create tasks.

**Parameters**

- **name** (*str*) – The name of the folder. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.create_task`(*name*, *location*='\', *user\_name*='System', *password*=None, *force*=False, *\*\*kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- `edit_task()`
- `add_action()`
- `add_trigger()`

**Parameters**

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user\_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

- **force** (*bool*) – If the task exists, overwrite the existing task.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
↳type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-1
↳start_time=01:00
```

```
salt.modules.win_task.create_task_from_xml(name, location='\\', xml_text=None,
 xml_path=None, user_name='System', pass-
 word=None)
```

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **xml\_text** (*str*) – A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.
- **xml\_path** (*str*) – The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`
- **user\_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

```
salt.modules.win_task.delete_folder(name, location='\\')
```

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) – The name of the folder to delete.
- **location** (*str*) – A string value representing the location of the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

```
salt.modules.win_task.delete_task(name, location='\\')
```

Delete a task from the task scheduler.

Parameters

- **name** (*str*) – The name of the task to delete.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

```
salt.modules.win_task.edit_task(name=None, location='\\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)
```

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

#### Parameters

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user\_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

---

**Note:** The combination of `user_name` and `password` determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

---

- **description** (*str*) – A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** (*bool*) – A boolean value representing whether or not the task is enabled.
- **hidden** (*bool*) – A boolean value representing whether or not the task is hidden.
- **run\_if\_idle** (*bool*) – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle\_duration** (*str*) – A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **idle\_wait\_timeout** (*str*) – A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

- **idle\_stop\_on\_end** (*bool*) – Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
- **idle\_restart** (*bool*) – Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac\_only** (*bool*) – Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop\_if\_on\_batteries** (*bool*) – Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake\_to\_run** (*bool*) – Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run\_if\_network** (*bool*) – Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network\_id** (*guid*) – GUID value that identifies a network profile.
- **network\_name** (*str*) – Sets the name of a network profile. The name is used for display purposes.
- **allow\_demand\_start** (*bool*) – Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
- **start\_when\_available** (*bool*) – Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart\_every** (*str*) – A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **restart\_count** (*int*) – The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution\_time\_limit** (*bool*, *str*) – The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days
- **force\_stop** (*bool*) – Boolean value that indicates that the task may be terminated by using `TerminateProcess`.
- **delete\_after** (*bool*, *str*) – The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days
- **multiple\_instances** (*str*) – Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:

- Parallel
- Queue
- No New Instance
- Stop Existing

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.info(name, location='\\')`

Get the details about a task in the task scheduler.

**Parameters**

- **name** (*str*) - The name of the task for which to return the status
- **location** (*str*) - A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** A dictionary containing the task configuration

**Return type** dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.list_actions(name, location='\\')`

List all actions that pertain to a task in the specified location.

**Parameters**

- **name** (*str*) - The name of the task for which list actions.
- **location** (*str*) - A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** Returns a list of actions.

**Return type** list

CLI Example:

```
List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.list_folders(location='\\')`

List all folders located in a specific location in the task scheduler.

**Parameters** **location** (*str*) - A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** Returns a list of folders.

**Return type** list

CLI Example:

```
List all folders in the default location
salt 'minion-id' task.list_folders

List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

`salt.modules.win_task.list_tasks(location='\\')`

List all tasks located in a specific location in the task scheduler.

**Parameters** **location** (*str*) – A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** Returns a list of tasks

**Return type** list

CLI Example:

```
List all tasks in the default location
salt 'minion-id' task.list_tasks

List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

`salt.modules.win_task.list_triggers`(*name*, *location*='\')

List all triggers that pertain to a task in the specified location.

**Parameters**

- **name** (*str*) – The name of the task for which list triggers.
- **location** (*str*) – A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** Returns a list of triggers.

**Return type** list

CLI Example:

```
List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.run`(*name*, *location*='\')

Run a scheduled task manually.

**Parameters**

- **name** (*str*) – The name of the task to run.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' task.list_run <task_name>
```

`salt.modules.win_task.run_wait`(*name*, *location*='\')

Run a scheduled task and return when the task finishes

**Parameters**

- **name** (*str*) – The name of the task to run.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt 'minion-id' task.list_run_wait <task_name>
```

`salt.modules.win_task.status(name, location='')`

Determine the status of a task. Is it Running, Queued, Ready, etc.

**Parameters**

- **name** (*str*) – The name of the task for which to return the status
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

**Return type** `str`

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.stop(name, location='')`

Stop a scheduled task.

**Parameters**

- **name** (*str*) – The name of the task to stop.
- **location** (*str*) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

## 21.9.484 salt.modules.win\_timezone

Module for managing timezone on Windows systems.

**class** `salt.modules.win_timezone.TzMapper(unix_to_win)`

**add**(*k*, *v*)

**get\_unix**(*key*, *default=None*)

**get\_win**(*key*, *default=None*)

**list\_unix**()

**list\_win**()

**remove**(*k*)

`salt.modules.win_timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

---

**Note:** The hardware clock is always local time on Windows so this will always return "localtime"

---

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.win_timezone.get_offset()`  
Get current numeric timezone offset from UTC (i.e. -0700)  
**Returns** Offset from UTC  
**Return type** `str`  
CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.win_timezone.get_zone()`  
Get current timezone (i.e. America/Denver)  
**Returns** Timezone in unix format  
**Return type** `str`  
CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.win_timezone.get_zonecode()`  
Get current timezone (i.e. PST, MDT, etc)  
**Returns** An abbreviated timezone code  
**Return type** `str`  
CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.win_timezone.list(unix_style=True)`  
Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

**Parameters** `unix_style` (`bool`) – True returns Unix-style timezones. False returns Windows-style timezones. Default is True  
**Returns** A list of supported timezones  
**Return type** `list`

CLI Example:

```
Unix-style timezones
salt '*' timezone.list

Windows-style timezones
salt '*' timezone.list unix_style=False
```

`salt.modules.win_timezone.set_hwclock(clock)`  
Sets the hardware clock to be either UTC or localtime

---

**Note:** The hardware clock is always local time on Windows so this will always return False

---

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.set_zone(timezone)`  
Sets the timezone using the tzutil.  
**Parameters** `timezone` (`str`) – A valid timezone  
**Returns** True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` - If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.zone_compare`(*timezone*)

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

Parameters **timezone** (*str*) - The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function

Returns True if they match, otherwise False

Return type `bool`

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

### 21.9.485 salt.modules.win\_useradd

Module for managing Windows Users

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

#### depends

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

---

**Note:** This currently only works with local user accounts, not domain accounts

---

`salt.modules.win_useradd.add`(*name*, *password=None*, *fullname=None*, *description=None*, *groups=None*, *home=None*, *homedrive=None*, *profile=None*, *logonscript=None*)

Add a user to the minion.

#### Parameters

- **name** (*str*) - User name
- **password** (*str*, *optional*) - User's password in plain text.
- **fullname** (*str*, *optional*) - The user's full name.
- **description** (*str*, *optional*) - A brief description of the user account.
- **groups** (*str*, *optional*) - A list of groups to add the user to. (see `chgroups`)
- **home** (*str*, *optional*) - The path to the user's home directory.

- **homedrive** (*str*, *optional*) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str*, *optional*) – An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it's default profile directory.
- **logonscript** (*str*, *optional*) – Path to a login script to run when the user logs on.

**Returns** True if successful. False is unsuccessful.

**Return type** `bool`

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.addgroup` (*name*, *group*)

Add user to a group

**Parameters**

- **name** (*str*) – The user name to add to the group
- **group** (*str*) – The name of the group to which to add the user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.chfullname` (*name*, *fullname*)

Change the full name of the user

**Parameters**

- **name** (*str*) – The user name for which to change the full name
- **fullname** (*str*) – The new value for the full name

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.chgroups` (*name*, *groups*, *append=True*)

Change the groups this user belongs to, add `append=False` to make the user a member of only the specified groups

**Parameters**

- **name** (*str*) – The user name for which to change groups
- **groups** (*str*, *list*) – A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append** (*bool*, *optional*) – True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

`salt.modules.win_useradd.chhome` (*name*, *home*, *\*\*kwargs*)

Change the home directory of the user, pass True for `persist` to move files to the new home directory if the old home directory exist.

**Parameters**

- **name** (*str*) – The name of the user whose home directory you wish to change
- **home** (*str*) – The new location of the home directory

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.chhome foo \\filesrv\home\foo True
```

`salt.modules.win_useradd.chprofile`(*name*, *profile*)

Change the profile directory of the user

**Parameters**

- **name** (*str*) – The name of the user whose profile you wish to change
- **profile** (*str*) – The new location of the profile

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.chprofile foo \\filesrv\profiles\foo
```

`salt.modules.win_useradd.current`(*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

**Parameters** **sam** (*bool*, *optional*) – False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

**Returns** Returns username

**Return type** `str`

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.delete`(*name*, *purge=False*, *force=False*)

Remove a user from the minion

**Parameters**

- **name** (*str*) – The name of the user to delete
- **purge** (*bool*, *optional*) – Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (*bool*, *optional*) – Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.getUserSid`(*username*)

Get the Security ID for the user

**Parameters** **username** (*str*) – The user name for which to look up the SID

**Returns** The user SID

**Return type** `str`

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

`salt.modules.win_useradd.getent` (*refresh=False*)

Return the list of all info for all users

**Parameters** **refresh** (*bool, optional*) – Refresh the cached user information. Useful when used from within a state function. Default is False.

**Returns** A dictionary containing information about all users on the system

**Return type** `dict`

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.info` (*name*)

Return user information

**Parameters** **name** (*str*) – Username for which to display information

**Returns**

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password\_changed
- successful\_logon\_attempts
- failed\_logon\_attempts
- last\_logon
- account\_disabled
- account\_locked
- password\_never\_expires
- disallow\_change\_password
- gid

**Return type** `dict`

CLI Example:

```
salt '*' user.info jsnuffy
```

`salt.modules.win_useradd.list_groups` (*name*)

Return a list of groups the named user belongs to

**Parameters** **name** (*str*) – The user name for which to list groups

**Returns** A list of groups to which the user belongs

**Return type** `list`

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.list_users` ()

Return a list of all users on Windows

**Returns** A list of all users on the system

**Return type** `list`

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.removegroup(name, group)`

Remove user from a group

**Parameters**

- **name** (*str*) – The user name to remove from the group
- **group** (*str*) – The name of the group from which to remove the user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.rename(name, new_name)`

Change the username for a named user

**Parameters**

- **name** (*str*) – The user name to change
- **new\_name** (*str*) – The new name for the current user

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.rename jsnuffy jshmoie
```

`salt.modules.win_useradd.setpassword(name, password)`

Set the user's password

**Parameters**

- **name** (*str*) – The user name for which to set the password
- **password** (*str*) – The new password

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.update(name, password=None, fullname=None, description=None, home=None, homedrive=None, logonscript=None, profile=None, expiration_date=None, expired=None, account_disabled=None, unlock_account=None, password_never_expires=None, disallow_change_password=None)`

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

**Parameters**

- **name** (*str*) – The user name to update.
- **password** (*str, optional*) – New user password in plain text.
- **fullname** (*str, optional*) – The user's full name.
- **description** (*str, optional*) – A brief description of the user account.
- **home** (*str, optional*) – The path to the user's home directory.
- **homedrive** (*str, optional*) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str, optional*) – The path to the logon script.
- **profile** (*str, optional*) – The path to the user's profile directory.

- **expiration\_date** (*date, optional*) – The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** (*bool, optional*) – Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration\_date* as well.
- **account\_disabled** (*bool, optional*) – True disables the account. False enables the account.
- **unlock\_account** (*bool, optional*) – True unlocks a locked user account. False is ignored.
- **password\_never\_expires** (*bool, optional*) – True sets the password to never expire. False allows the password to expire.
- **disallow\_change\_password** (*bool, optional*) – True blocks the user from changing the password. False allows the user to change the password.

**Returns** True if successful. False is unsuccessful.

**Return type** bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\server\homeshareob homedrive=U:
```

## 21.9.486 salt.modules.win\_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- *win\_wua.available*
- *win\_wua.list*

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- *win\_wua.get*
- *win\_wua.download*
- *win\_wua.install*
- *win\_wua.uninstall*

The *get* function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The *win\_wua.list* and *win\_wua.get* functions are utility functions. In addition to returning information about updates they can also download and install updates by setting *download=True* or *install=True*. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add *install=True* to install everything on that list.

If you want to download, install, or uninstall specific updates, use *win\_wua.download*, *win\_wua.install*, or *win\_wua.uninstall*. To update your system with the latest updates use *win\_wua.list* and set *install=True*

You can also adjust the Windows Update settings using the *win\_wua.set\_wu\_settings* function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgrp` module.

New in version 2015.8.0.

**depends** salt.utils.win\_update

`salt.modules.win_wua.available` (*software=True, drivers=True, summary=False, skip\_installed=True, skip\_hidden=True, skip\_mandatory=False, skip\_reboot=False, categories=None, severities=None*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

#### Parameters

- **software** (*bool*) – Include software updates in the results (default is True)
- **drivers** (*bool*) – Include driver updates in the results (default is True)
- **summary** (*bool*) –
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) – Skip updates that are already installed. Default is False.
- **skip\_hidden** (*bool*) – Skip updates that have been hidden. Default is True.
- **skip\_mandatory** (*bool*) – Skip mandatory updates. Default is False.
- **skip\_reboot** (*bool*) – Skip updates that require a reboot. Default is False.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

#### Returns

Returns a dict containing either a summary or a list of updates:

```

List of Updates:
{'<GUID>': {'Title': <title>,
 'KB': <KB>,
 'GUID': <the globally unique identifier for the update>
 'Description': <description>,
 'Downloaded': <has the update been downloaded>,
 'Installed': <has the update been installed>,
 'Mandatory': <is the update mandatory>,
 'UserInput': <is user input required>,
 'EULAAccepted': <has the EULA been accepted>,
 'Severity': <update severity>,
 'NeedsReboot': <is the update installed and awaiting
↳reboot>,
 'RebootBehavior': <will the update require a reboot>,
 'Categories': ['<category 1>',
 '<category 2>',
 ...]
 }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
 <category 2>: <total for category 2>,
 ... }
}

```

**Return type** dict

CLI Examples:

```

Normal Usage (list all software updates)
salt '*' win_wua.available

List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=["Critical"]

List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

A summary of all available updates
salt '*' win_wua.available summary=True

A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"] summary=True

```

`salt.modules.win_wua.download(names)`

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `install=True`.

**Parameters** `names` (*str*, *list*) – A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the names parameter

---

**Returns** A dictionary containing the details about the downloaded updates

**Return type** dict

CLI Examples:

```
Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB2131233']
```

`salt.modules.win_wua.get(name, download=False, install=False)`

New in version 2017.7.0.

Returns details for the named update

**Parameters**

- **name** (*str*) – The name of the update you’re searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you’re looking for.
- **download** (*bool*) – Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) – Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

**Returns**

Returns a dict containing a list of updates that match the name if `download` and `install` are both set to `False`. Should usually be a single update, but can return multiple if a partial name is given.

If `download` or `install` is set to `true` it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
 'KB': <KB>,
 'GUID': <the globally unique identifier for the update>,
 'Description': <description>,
 'Downloaded': <has the update been downloaded>,
 'Installed': <has the update been installed>,
 'Mandatory': <is the update mandatory>,
 'UserInput': <is user input required>,
 'EULAAccepted': <has the EULA been accepted>,
 'Severity': <update severity>,
 'NeedsReboot': <is the update installed and awaiting
↳reboot>,
 'RebootBehavior': <will the update require a reboot>,
 'Categories': ['<category 1>',
 '<category 2>',
 ...]
 }
}
```

**Return type** dict

CLI Examples:

```
Recommended Usage using GUID without braces
Use this to find the status of a specific update
```

(continues on next page)

(continued from previous page)

```

salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

Use the following if you don't know the GUID:

Using a KB number
Not all updates have an associated KB
salt '*' win_wua.get KB3030298

Using part or all of the name of the update
Could possibly return multiple results
Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'

```

**salt.modules.win\_wua.get\_needs\_reboot()**

Determines if the system needs to be rebooted.

**Returns** True if the system requires a reboot, otherwise False

**Return type** bool

CLI Examples:

```

salt '*' win_wua.get_needs_reboot

```

**salt.modules.win\_wua.get\_wu\_settings()**

Get current Windows Update settings.

**Returns**

A dictionary of Windows Update settings:

**Featured Updates:** Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only):** Boolean value that indicates whether Group Policy requires the Automatic Updates service.

**Microsoft Update:** Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

**Needs Reboot:** Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated:** Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level:**

**Number 1 to 4 indicating the update level:**

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only):** Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:** Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:** Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:** Time at which Automatic Updates installs or uninstalls updates.

**Return type** dict

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

`salt.modules.win_wua.install(names)`

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the `list_updates` function and set `install=True`.

**Parameters** `names` (*str*, *list*) – A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the `names` parameter

---

**Returns** A dictionary containing the details about the installed updates

**Return type** `dict`

CLI Examples:

```
Normal Usage
salt '*' win_wua.install KB12323211
```

`salt.modules.win_wua.list(software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False)`

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If `download` or `install` is `True` the same list will be downloaded and/or installed.

**Parameters**

- **software** (*bool*) – Include software updates in the results (default is `True`)
- **drivers** (*bool*) – Include driver updates in the results (default is `False`)
- **summary** (*bool*) –
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) – Skip installed updates in the results (default is `False`)
- **download** (*bool*) – (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) – (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers

- Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

### Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
 'KB': <KB>,
 'GUID': <the globally unique identifier for the update>
 'Description': <description>,
 'Downloaded': <has the update been downloaded>,
 'Installed': <has the update been installed>,
 'Mandatory': <is the update mandatory>,
 'UserInput': <is user input required>,
 'EULAAccepted': <has the EULA been accepted>,
 'Severity': <update severity>,
 'NeedsReboot': <is the update installed and awaiting
↪reboot>,
 'RebootBehavior': <will the update require a reboot>,
 'Categories': ['<category 1>',
 '<category 2>',
 ...]
 }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
 <category 2>: <total for category 2>,
 ... }
}
```

**Return type** dict

CLI Examples:

```
Normal Usage (list all software updates)
salt '*' win_wua.list

List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

A summary of all available updates
salt '*' win_wua.list summary=True
```

(continues on next page)

(continued from previous page)

```
A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

`salt.modules.win_wua.set_wu_settings` (*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

**Supported:**

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

**Parameters**

- **level** (*int*) – Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) – Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) – Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) – Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) – Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) – Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** (*str*) – Time at which Automatic Updates installs or uninstalls updates. Must be in the `##:##` 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

**Returns** Returns a dictionary containing the results.

**Return type** `dict`

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

`salt.modules.win_wua.uninstall` (*names*)

New in version 2017.7.0.

Uninstall updates.

**Parameters** **names** (*str, list*) – A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns** A dictionary containing the details about the uninstalled updates

**Return type** `dict`

CLI Examples:

```
Normal Usage
salt '*' win_wua.uninstall KB3121212

As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB1231231']
```

## 21.9.487 salt.modules.win\_wusa

Microsoft Update files management via wusa.exe

**maintainer** Thomas Lemarchand

**platform** Windows

**depends** PowerShell

New in version 2018.3.4.

**salt.modules.win\_wusa.install**(*path*, *restart=False*)

Install a KB from a .msu file.

**Parameters**

- **path** (*str*) – The full path to the msu file to install
- **restart** (*bool*) – True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

**Returns** True if successful, otherwise False

**Return type** bool

**Raise:**

**CommandExecutionError:** If the package is already installed or an error is encountered

CLI Example:

```
salt '*' wusa.install C:/temp/KB123456.msu
```

**salt.modules.win\_wusa.is\_installed**(*name*)

Check if a specific KB is installed.

**Parameters** **name** (*str*) – The name of the KB to check

**Returns** True if installed, otherwise False

**Return type** bool

CLI Example:

```
salt '*' wusa.is_installed KB123456
```

**salt.modules.win\_wusa.list**()

Get a list of updates installed on the machine

**Returns** A list of installed updates

**Return type** list

CLI Example:

```
salt '*' wusa.list
```

**salt.modules.win\_wusa.uninstall**(*path*, *restart=False*)

Uninstall a specific KB.

**Parameters**

- **path** (*str*) – The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **restart** (*bool*) – True to force a restart if required by the installation. Adds the `/forcerestart` switch to the `wusa.exe` command. False will add the `/norestart` switch instead. Default is False

**Returns** True if successful, otherwise False

**Return type** bool

**Raises** `CommandExecutionError` – If an error is encountered

CLI Example:

```
salt '*' wusa.uninstall KB123456

or

salt '*' wusa.uninstall C:/temp/KB123456.msu
```

## 21.9.488 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

**depends** M2Crypto

`salt.modules.x509.create_certificate` (*path=None, text=False, overwrite=True, ca\_server=None, \*\*kwargs*)

Create an X509 certificate.

**path**: Path to write the certificate to.

**text**: If True, return the PEM text without writing to a file. Default False.

**overwrite**: If True (default), `create_certificate` will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

**kwargs**: Any of the properties below can be included as additional keyword arguments.

**ca\_server**: Request a remotely signed certificate from `ca_server`. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the `ca_server`. See `signing_policy` for details. Also, the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer:
 .*:
 - x509.sign_remote_certificate
```

**subject properties**: Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

**C**: 2 letter Country code

**CN**: Certificate common name, typically the FQDN.

**Email**: Email address

**GN**: Given Name

**L**: Locality

**O**: Organization

**OU**: Organization Unit

**SN**: SurName

**ST**: State or Province

**signing\_private\_key**: A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-

signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

**signing\_private\_key\_passphrase:** Passphrase used to decrypt the `signing_private_key`.

**signing\_cert:** A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

**public\_key:** The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public\_key\_passphrase:** If the public key is supplied as a private key, this is the passphrase used to decrypt it.

**csr:** A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints:** X509v3 Basic Constraints extension.

**extensions:** The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the `subjectKeyIdentifier` equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the `hash` value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

**basicConstraints:** X509v3 Basic Constraints

**keyUsage:** X509v3 Key Usage

**extendedKeyUsage:** X509v3 Extended Key Usage

**subjectKeyIdentifier:** X509v3 Subject Key Identifier

**issuerAltName:** X509v3 Issuer Alternative Name

**subjectAltName:** X509v3 Subject Alternative Name

**crlDistributionPoints:** X509v3 CRL Distribution Points

**issuingDistributionPoint:** X509v3 Issuing Distribution Point

**certificatePolicies:** X509v3 Certificate Policies

**policyConstraints:** X509v3 Policy Constraints

**inhibitAnyPolicy:** X509v3 Inhibit Any Policy

**nameConstraints:** X509v3 Name Constraints

**noCheck:** X509v3 OCSP No Check

**nsComment:** Netscape Comment

**nsCertType:** Netscape Certificate Type

**days\_valid:** The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.

**version:** The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.

**serial\_number:** The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.

**serial\_bits:** The number of bits to use when randomly generating a serial number. Defaults to 64.

**algorithm:** The hashing algorithm to be used for signing this certificate. Defaults to sha256.

**copypath:** An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

**prepend\_cn:** If set to True, the CN and a dash will be prepended to the copypath's filename.

**Example:** /etc/pki/issued\_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt

**signing\_policy:** A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the `minions` key is included in the signing policy, only minions matching that pattern (see `match.glob` and `match.compound`) will be permitted to remotely request certificates from that policy.

Example:

```
x509_signing_policies:
 www:
 - minions: 'www*'
 - signing_private_key: /etc/pki/ca.key
 - signing_cert: /etc/pki/ca.crt
 - C: US
 - ST: Utah
 - L: Salt Lake City
 - basicConstraints: "critical CA:false"
 - keyUsage: "critical cRLSign, keyCertSign"
 - subjectKeyIdentifier: hash
 - authorityKeyIdentifier: keyid,issuer:always
 - days_valid: 90
 - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/
↳ pki/myca.key' csr='/etc/pki/myca.csr'}
```

```
salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest="")
```

Create a CRL

**Depends**

- PyOpenSSL Python module

**path:** Path to write the CRL to.

**text:** If True, return the PEM text without writing to a file. Default False.

**signing\_private\_key:** A path or string of the private key in PEM format that will be used to sign the CRL. This is required.

**signing\_private\_key\_passphrase:** Passphrase to decrypt the private key.

**signing\_cert:** A certificate matching the private key that will be used to sign the CRL. This is required.

**revoked:** A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

**include\_expired:** Include expired certificates in the CRL. Default is `False`.

**days\_valid:** The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

**digest:** The digest to use for signing the CRL. This has no effect on versions of `pyOpenSSL` less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key signing_private_key=/etc/pki/ca.
↳key signing_cert=/etc/pki/ca.crt revoked="{ 'compromized-web-key': { 'certificate
↳': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00' }}"
```

`salt.modules.x509.create_csr` (*path=None, text=False, \*\*kwargs*)

Create a certificate signing request.

**path:** Path to write the certificate to.

**text:** If `True`, return the PEM text without writing to a file. Default `False`.

**algorithm:** The hashing algorithm to be used for signing this request. Defaults to `sha256`.

**kwargs:** The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN=
↳'My Cert'
```

`salt.modules.x509.create_private_key` (*path=None, text=False, bits=2048, passphrase=None, cipher='aes\_128\_cbc', verbose=True*)

Creates a private key in PEM format.

**path:** The path to write the file to, either `path` or `text` are required.

**text:** If `True`, return the PEM text without writing to a file. Default `False`.

**bits:** Length of the private key in bits. Default 2048

**passphrase:** Passphrase for encrypting the private key

**cipher:** Cipher for encrypting the private key. Has no effect if `passphrase` is `None`.

**verbose:** Provide visual feedback on stdout. Default `True`

New in version 2016.11.0.

CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.expired` (*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

**certificate:** The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

`salt.modules.x509.get_pem_entries` (*glob\_path*)

Returns a dict containing PEM entries in files matching a glob

**glob\_path:** A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

`salt.modules.x509.get_pem_entry` (*text, pem\_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

**text:** Text containing the X509 PEM entry to be returned or path to a file containing the text.

**pem\_type:** If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI..
↳.-----END CERTIFICATE REQUEST"
```

**salt.modules.x509.get\_private\_key\_size**(*private\_key*, *passphrase=None*)

Returns the bit length of a private key in PEM format.

**private\_key:** A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

**salt.modules.x509.get\_public\_key**(*key*, *passphrase=None*, *asObj=False*)

Returns a string containing the public key in PEM format.

**key:** A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

**salt.modules.x509.get\_signing\_policy**(*signing\_policy\_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

**salt.modules.x509.read\_certificate**(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

**certificate:** The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

**salt.modules.x509.read\_certificates**(*glob\_path*)

Returns a dict containing details of all certificates matching a glob

**glob\_path:** A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

**salt.modules.x509.read\_crl**(*crl*)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

**Depends**

- OpenSSL command line tool

**crl:** A path or PEM encoded string containing the CRL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

`salt.modules.x509.read_csr(csr)`

Returns a dict containing details of a certificate request.

**Depends**

- OpenSSL command line tool

**csr:** A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

`salt.modules.x509.sign_remote_certificate(argdic, **kwargs)`

Request a certificate to be remotely signed according to a signing policy.

**argdic:** A dict containing all the arguments to be passed into the `create_certificate` function. This will become `kwargs` when passed to `create_certificate`.

**kwargs:** `kwargs` delivered from `publish.publish`

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{ 'public_key': '/etc/pki/www.key',
→ 'signing_policy': 'www' }" __pub_id='www1'
```

`salt.modules.x509.verify_crl(crl, cert)`

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

**crl:** The CRL to verify

**cert:** The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

`salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)`

Verify that `'private_key'` matches `'public_key'`

**private\_key:** The private key to verify, can be a string or path to a private key in PEM format.

**public\_key:** The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

**passphrase:** Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
public_key=/etc/pki/myca.crt
```

`salt.modules.x509.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)`

Verify that `certificate` has been signed by `signing_pub_key`

**certificate:** The certificate to verify. Can be a path or string containing a PEM formatted certificate.

**signing\_pub\_key:** The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or private key.

**signing\_pub\_key\_passphrase:** Passphrase to the `signing_pub_key` if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
signing_pub_key=/etc/pki/myca.crt
```

`salt.modules.x509.will_expire(certificate, days)`

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

**certificate:** The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

**salt.modules.x509.write\_pem**(*text, path, overwrite=True, pem\_type=None*)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

**text:** PEM string input to be written out.

**path:** Path of the file to write the PEM out to.

**overwrite:** If True (default), write\_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

**pem\_type:** The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBbugA..." path=/etc/
↳pki/mycert.crt
```

## 21.9.489 salt.modules.xapi\_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. <http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf> . [http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en\\_gb/api/](http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/) . <https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python> . <http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD>

**salt.modules.xapi\_virt.freecpu**()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

**salt.modules.xapi\_virt.freemem**()

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

**salt.modules.xapi\_virt.full\_info**()

Return the node\_info, vm\_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

**salt.modules.xapi\_virt.get\_disks**(*vm\_*)

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

`salt.modules.xapi_virt.get_macs(vm_)`  
Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi_virt.get_nics(vm_)`  
Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi_virt.is_hyper()`  
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.xapi_virt.list_domains()`  
Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)`  
Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]
```

Optional values:

**live** Use live migration

**port** Use a specified port

**node** Use specified NUMA node on target

**ssl** use ssl connection for migration

**change\_home\_server** change home server for managed domains

`salt.modules.xapi_virt.node_info()`  
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.xapi_virt.pause(vm_)`  
Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi_virt.reboot`(*vm\_*)

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

`salt.modules.xapi_virt.reset`(*vm\_*)

Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

`salt.modules.xapi_virt.resume`(*vm\_*)

Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

`salt.modules.xapi_virt.setmem`(*vm\_*, *memory*)

Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

`salt.modules.xapi_virt.setvcpus`(*vm\_*, *vcpus*)

Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

`salt.modules.xapi_virt.shutdown`(*vm\_*)

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

`salt.modules.xapi_virt.start`(*config\_*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

`salt.modules.xapi_virt.stop`(*vm\_*)

Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

`salt.modules.xapi_virt.vcpu_pin`(*vm\_*, *vcpu*, *cpus*)

Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

`salt.modules.xapi_virt.vm_cputime`(*vm\_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
 'your-vm': {
 'cputime' <int>
 'cputime_percent' <int>
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.xapi_virt.vm_diskstats`(*vm\_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
 'your-vm': {
 'io_read_kbs' : 0,
 'io_write_kbs' : 0
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

`salt.modules.xapi_virt.vm_info`(*vm\_=None*)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.xapi_virt.vm_netstats`(*vm\_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
 'your-vm': {
 'io_read_kbs' : 0,
 'io_total_read_kbs' : 0,
 'io_total_write_kbs' : 0,
 'io_write_kbs' : 0
 },
 ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.xapi_virt.vm_state`(*vm\_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

### 21.9.490 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

`salt.modules.xbpspkg.add_repo`(*repo*, *conffile*='/usr/share/xbps.d/15-saltstack.conf')

Add an XBPS repository to the system.

**repo** url of repo to add (persistent).

**conffile** path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

`salt.modules.xbpspkg.available_version`(\**names*, \*\**kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.del_repo`(*repo*)

Remove an XBPS repository from the system.

**repo** url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

`salt.modules.xbpspkg.get_repo(repo, **kwargs)`

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

`salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

**name** The name of the package to be installed.

**refresh** Whether or not to refresh the package database before installing.

**fromrepo** Specify a package repository (url) to install from.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.xbpspkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.xbpspkg.list_repos()`

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.xbpspkg.list_upgrades(refresh=True)`

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.xbpspkg.refresh_db()`

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.xbpspkg.remove(name=None, pkgs=None, recursive=True, **kwargs)`

**name** The name of the package to be deleted.

**recursive** Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

`salt.modules.xbpspkg.upgrade(refresh=True)`

Run a full system upgrade

**refresh** Whether or not to refresh the package database before installing. Default is *True*.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.xbpspkg.upgrade_available(name)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.xbpspkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.491 salt.modules.xfs

Module for managing XFS file systems.

**salt.modules.xfs.defragment**(*device*)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

**salt.modules.xfs.devices**()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

**salt.modules.xfs.dump**(*device, destination, level=0, label=None, noerase=None*)

Dump filesystem device to the media (file, tape etc).

Required parameters:

- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:

- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

**salt.modules.xfs.estimate**(*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

**salt.modules.xfs.info**(*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

`salt.modules.xfs.inventory()`

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

`salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None)`

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: **Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.**
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

`salt.modules.xfs.modify(device, label=None, lazy_counting=None, uuid=None)`

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

`salt.modules.xfs.prune_dump(sessionid)`

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

## 21.9.492 salt.modules.xml

XML file manager

New in version 3000.

`salt.modules.xml.get_attribute(file, element)`

Return the attributes of the matched xpath element.

CLI Example:

```
salt '*' xml.get_attribute /tmp/test.xml "../element[@id='3']"
```

`salt.modules.xml.get_value` (*file, element*)

Returns the value of the matched xpath element

CLI Example:

```
salt '*' xml.get_value /tmp/test.xml "../element"
```

`salt.modules.xml.set_attribute` (*file, element, key, value*)

Set the requested attribute key and value for matched xpath element.

CLI Example:

```
salt '*' xml.set_attribute /tmp/test.xml "../element[@id='3']" editedby "gal"
```

`salt.modules.xml.set_value` (*file, element, value*)

Sets the value of the matched xpath element

CLI Example:

```
salt '*' xml.set_value /tmp/test.xml "../element" "new value"
```

### 21.9.493 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

#### depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

**configuration** This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org/resourcename
 xmpp.password: verybadpass
```

The `resourcename` refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org/salt
 xmpp.password: verybadpass

my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org
 xmpp.password: verybadpass
```

**class** salt.modules.xmpp.**SendMsgBot**(jid, password, recipient, msg)

**classmethod** **create\_multi**(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')

Alternate constructor that accept multiple recipients and rooms

**start**(event)

**class** salt.modules.xmpp.**SleekXMPPMUC**(name="")

**filter**(record)

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

salt.modules.xmpp.**send\_msg**(recipient, message, jid=None, password=None, profile=None)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

salt.modules.xmpp.**send\_msg\_multi**(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳'secret@conference.xmpp.example.com'] 'This is a salt module test'
↳profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳'secret@conference.xmpp.example.com'] 'This is a salt module test'
↳jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

## 21.9.494 salt.modules.yumpkg

Support for YUM/DNF

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

---

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

---

**class** salt.modules.yumpkg.**AvailablePackages**(\*args, \*\*kwargs)

salt.modules.yumpkg.**clean\_metadata**(\*\*kwargs)

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)`

Delete a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.diff(*paths)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters** `path` – Full path to the installed file

**Returns** Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.download(*packages)`

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

---

**Note:** `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

---

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.file_dict(*packages)`

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.file_list(*packages)`

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)`

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.group_diff(name)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.group_info(name, expand=False)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory `packages`, `optional` `packages`, and `default` `packages` keys have been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

**name** Name of the group to query

**expand** [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)`

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name** Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

**skip** Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

**include** Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

---

**Note:** Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

---

`salt.modules.yumpkg.group_list()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

---

**Note:** Requires the appropriate versionlock plugin package to be installed:

- On RHEL 5: yum-versionlock
  - On RHEL 6 & 7: yum-plugin-versionlock
  - On Fedora: python-dnf-plugins-extras-versionlock
- 

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.info_installed(*names, **kwargs)`

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

**Parameters all\_versions** – Include information for all versions of the packages installed on the minion.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

`salt.modules.yumpkg.install`(*name=None, refresh=False, skip\_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update\_holds=False, saltenv='base', ignore\_epoch=False, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to update the yum database before executing.

**reinstall** Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip\_verify** Skip the GPG verification check (e.g., `--nogpgcheck`)

**downloadonly** Only download the packages, do not install.

**version** Install a specific version of the package, e.g. `1.2.3-4.el5`. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

**update\_holds** [False] If `True`, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

CLI Example:

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**ignore\_epoch** [False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to `True`, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {"bar": "1.2.3-4.el5"}]
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]
```

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64
→normalize=False
```

New in version 2014.7.0.

**diff\_attr**: If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
 'old': {
 'version': '<old-version>',
 'arch': '<old-arch>',

 'new': {
 'version': '<new-version>',
 'arch': '<new-arch>'}}}
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

If an attribute list in `diff_attr` is specified, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
 'old': {
 'version': '<old-version>',
 'arch': '<old-arch>'},

 'new': {
 'version': '<new-version>',
 'arch': '<new-arch>'}}
```

`salt.modules.yumpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.list_downloaded()`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.list_holds(pattern='[\\w+](?:[-][^~]+)*', full=True)`

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**pattern** `[\\w+](?:[-][^~]+)*` Regular expression used to match the package name

**full** `[True]` Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches()`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches(refresh=False)`

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...']}
```

**versions\_as\_list**: If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**attr**: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr='["version", "arch"]'
```

`salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)`

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
With byrepo=False (default)
{
 'bash': ['4.1.2-15.el6_5.2',
 '4.1.2-15.el6_5.1',
 '4.1.2-15.el6_4'],
 'kernel': ['2.6.32-431.29.2.el6',
 '2.6.32-431.23.3.el6',
 '2.6.32-431.20.5.el6',
 '2.6.32-431.20.3.el6',
 '2.6.32-431.17.1.el6',
 '2.6.32-431.11.2.el6',
 '2.6.32-431.5.1.el6',
 '2.6.32-431.3.1.el6',
 '2.6.32-431.1.2.0.1.el6',
 '2.6.32-431.el6']
}
With byrepo=True
{
 'base': {
 'bash': ['4.1.2-15.el6_4'],
 'kernel': ['2.6.32-431.el6']
 },
 'updates': {
 'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
 'kernel': ['2.6.32-431.29.2.el6',
 '2.6.32-431.23.3.el6',
 '2.6.32-431.20.5.el6',
 '2.6.32-431.20.3.el6',
 '2.6.32-431.17.1.el6',
 '2.6.32-431.11.2.el6',
 '2.6.32-431.5.1.el6',
 '2.6.32-431.3.1.el6',
 '2.6.32-431.1.2.0.1.el6']
 }
}
```

**fromrepo** [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 2017.7.0.

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 2017.7.0.

**byrepo** [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

**cacheonly** [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the `-C` option to yum/dnf.

New in version 2017.7.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.yumpkg.list_repos` (*basedir=None*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.list_upgrades` (*refresh=True, \*\*kwargs*)

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in pkg states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.yumpkg.mod_repo` (*repo, basedir=None, \*\*kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo** name by which the yum refers to the repo

**name** a human-readable name for the repo

**baseurl** the URL for yum to reference

**mirrorlist** the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

`salt.modules.yumpkg.modified` (*\*packages, \*\*flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size** Include only files where size changed.

**mode** Include only files which file's mode has been changed.

**checksum** Include only files which MD5 checksum has been changed.

**device** Include only files which major and minor numbers has been changed.

**symlink** Include only files which are symbolic link contents.

**owner** Include only files where owner has been changed.

**group** Include only files where group has been changed.

**time** Include only files where modification time of the file has been changed.

**capabilities** Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.parse_arch(name)`

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

`salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

**name** The name of the package to be purged

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.refresh_db(**kwargs)`

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

**repo** Refresh just the specified repo

**disablerepo** Do not refresh the specified repo

**enablerepo** Refresh a disabled repo using this option

**branch** Add the specified branch when refreshing

**disableexcludes** Disable the excludes defined in your config files. Takes one of three options: - **all** - disable all excludes - **main** - disable excludes defined in [main] in yum.conf - **repo id** - disable excludes defined for that repo

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and **--setopt** prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

**name** The name of the package to be removed

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

New in version 2014.7.0.

Remove version locks

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.update` (*name=None, pkgs=None, refresh=True, skip\_verify=False, normalize=True, minimal=False, obsoletes=False, \*\*kwargs*)

New in version 2019.2.0.

Calls `pkg.upgrade` with `obsoletes=False`. Mirrors the CLI behavior of `yum update`. See `pkg.upgrade` for further documentation.

```
salt '*' pkg.update
```

`salt.modules.yumpkg.upgrade` (*name=None, pkgs=None, refresh=True, skip\_verify=False, normalize=True, minimal=False, obsoletes=True, \*\*kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Changed in version 2019.2.0: Added `obsoletes` and `minimal` arguments

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='\*' --enablerepo='somerepo')

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.

**name** The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs=['foo', 'bar']
salt '*' pkg.upgrade pkgs=['foo', {'bar': '1.2.3-4.el5'}]
```

New in version 2016.3.0.

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64
↪normalize=False
```

New in version 2016.3.0.

**minimal** [False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

**obsoletes** [True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

```
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**Note:** To add extra arguments to the yum upgrade command, pass them as key word arguments. For arguments without assignments, pass `True`

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.upgrade_available`(*name*, *\*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.verify`(*\*names*, *\*\*kwargs*)

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.version_cmp`(*pkg1*, *pkg2*, *ignore\_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

**ignore\_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 21.9.495 salt.modules.zabbix module

Support for Zabbix

### optdepends

- zabbix server

**configuration** This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
→password=zabbix _connection_url=http://host/zabbix/
```

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.zabbix.apiinfo\_version** (\*\*connection\_args)

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

### Parameters

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.apiinfo_version
```

**salt.modules.zabbix.compare\_params** (defined, existing, return\_old\_value=False)

New in version 2017.7.

Compares Zabbix object definition against existing Zabbix object.

### Parameters

- **defined** – Zabbix object definition taken from sls file.
- **existing** – Existing Zabbix object taken from result of an API call.
- **return\_old\_value** – Default False. If True, returns dict("old"=old\_val, "new"=new\_val) for rollback purpose.

**Returns** Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

**salt.modules.zabbix.configuration\_import** (config\_file, rules=None, file\_format='xml', \*\*connection\_args)

New in version 2017.7.

Imports Zabbix configuration specified in file to Zabbix server.

### Parameters

- **config\_file** – File with Zabbix config (local or remote)
- **rules** – Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI.)

- **file\_format** – Config file format (default: xml)
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_templates.xml
↪ '{"screens': {'createMissing': True, 'updateExisting': True}}"
```

`salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)`

New in version 2017.7.

Get ID of single Zabbix object specified by its name.

#### Parameters

- **obj** – Zabbix object type
- **params** – Parameters by which object is uniquely identified
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns object ID

`salt.modules.zabbix.get_zabbix_id_mapper()`

New in version 2017.7.

Make ZABBIX\_ID\_MAPPER constant available to state modules.

Returns ZABBIX\_ID\_MAPPER

`salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)`

New in version 2016.3.0.

Create new host

---

**Note:** This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **host** – technical name of the host
- **groups** – groupids of host groups to add the host to
- **interfaces** – interfaces to be created for the host
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** – string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}'
visible_name='Host Visible Name' inventory_mode=0 inventory='{ "alias": "something
↪"}'
```

`salt.modules.zabbix.host_delete`(*hostids*, *\*\*connection\_args*)

Delete hosts.

New in version 2016.3.0.

#### Parameters

- **hostids** – Hosts (hostids) to delete.
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted hosts.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_delete 10106
```

`salt.modules.zabbix.host_exists`(*host=None*, *hostid=None*, *name=None*, *node=None*, *nodeids=None*, *\*\*connection\_args*)

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

#### Parameters

- **host** – technical name of the host
- **hostids** – Hosts (hostids) to delete.
- **name** – visible name of the host
- **node** – name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the node the hosts must belong to (zabbix API < 2.4)
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_exists 'Zabbix server'
```

`salt.modules.zabbix.host_get`(*host=None*, *name=None*, *hostids=None*, *\*\*connection\_args*)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

---

**Note:** This function accepts all optional `host.get` parameters: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **host** – technical name of the host
- **name** – visible name of the host
- **hostids** – ids of the hosts

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.host\_get 'Zabbix server'

`salt.modules.zabbix.host_inventory_get(hostids, **connection_args)`

Retrieve host inventory according to the given parameters. See: [https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory)

New in version 2019.2.0.

#### Parameters

- **hostids** – Return only host interfaces used by the given hosts.
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.host\_inventory\_get 101054

`salt.modules.zabbix.host_inventory_set(hostid, **connection_args)`

Update host inventory items NOTE: This function accepts all standard host: keyword argument names for inventory see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory)

New in version 2019.2.0.

#### Parameters

- **hostid** – ID of the host to update
- **clear\_old** – Set to True in order to remove all existing inventory items before setting the specified items
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** ID of the updated host, False on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.host\_inventory\_set 101054 asset\_tag=jml3322 type=vm clear\_old=True

`salt.modules.zabbix.host_list(**connection_args)`

Retrieve all hosts.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)

- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.host\_list

`salt.modules.zabbix.host_update` (*hostid*, *\*\*connection\_args*)

New in version 2016.3.0.

Update existing hosts

---

**Note:** This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for [host objects](#) and the documentation for [updating hosts](#).

---

#### Parameters

- **hostid** – ID of the host to update
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
- **visible\_name** – string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**Returns** ID of the updated host.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.host\_update 10084 name='Zabbix server2'

`salt.modules.zabbix.hostgroup_create` (*name*, *\*\*connection\_args*)

New in version 2016.3.0.

Create a host group

---

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** – name of the host group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** ID of the created host group.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.hostgroup\_create MyNewGroup

`salt.modules.zabbix.hostgroup_delete` (*hostgroupids*, *\*\*connection\_args*)

Delete the host group.

New in version 2016.3.0.

#### Parameters

- **hostgroupids** – IDs of the host groups to delete
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_delete 23
```

`salt.modules.zabbix.hostgroup_exists` (*name=None, groupid=None, node=None, nodeids=None, \*\*connection\_args*)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

#### Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

`salt.modules.zabbix.hostgroup_get` (*name=None, groupids=None, hostids=None, \*\*connection\_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

---

**Note:** This function accepts all standard `hostgroup.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to
- **nodeids** – IDs of the nodes the host groups must belong to
- **hostids** – return only host groups that contain the given hosts
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_get MyNewGroup
```

`salt.modules.zabbix.hostgroup_list(**connection_args)`

Retrieve all host groups.

New in version 2016.3.0.

**Parameters**

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_list
```

`salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)`

New in version 2016.3.0.

Update existing hosts group

---

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **groupid** – ID of the host group to update
- **name** – name of the host group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of updated host groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

`salt.modules.zabbix.hostinterface_create(hostid, ip_, dns="", main=1, if_type=1, useip=1, port=None, **connection_args)`

New in version 2016.3.0.

Create new host interface

---

**Note:** This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **hostid** – ID of the host the interface belongs to
- **ip** – IP address used by the interface
- **dns** – DNS name used by the interface
- **main** – whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** – port number used by the interface
- **type** – Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** – Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

`salt.modules.zabbix.hostinterface_delete`(*interfaceids*, *\*\*connection\_args*)

Delete host interface

New in version 2016.3.0.

#### Parameters

- **interfaceids** – IDs of the host interfaces to delete
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_delete 50
```

`salt.modules.zabbix.hostinterface_get`(*hostids*, *\*\*connection\_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

---

**Note:** This function accepts all standard `hostinterface.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **hostids** – Return only host interfaces used by the given hosts.
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_get 101054
```

`salt.modules.zabbix.hostinterface_update`(*interfaceid*, *\*\*connection\_args*)

New in version 2016.3.0.

Update host interface

---

**Note:** This function accepts all standard `hostinterface`: keyword argument names differ depending on your

---

zabbix version, see [here](#).

#### Parameters

- **interfaceid** – ID of the hostinterface to update
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

`salt.modules.zabbix.mediatype_create`(*name*, *mediatype*, *\*\*connection\_args*)

Create new mediatype

---

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **mediatype** – media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec\_path** – exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm\_modem** – exec path - Required for sms type, see Zabbix API docs
- **smtp\_email** – email address from which notifications will be sent, required for email type
- **smtp\_helo** – SMTP HELO, required for email type
- **smtp\_server** – SMTP server, required for email type
- **status** – whether the media type is enabled - 0: enabled, 1: disabled
- **username** – authentication user, required for Jabber and Ez Texting types
- **passwd** – authentication password, required for Jabber and Ez Texting types
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

`salt.modules.zabbix.mediatype_delete`(*mediatypeids*, *\*\*connection\_args*)

Delete mediatype

#### Parameters

- **interfaceids** – IDs of the mediatypes to delete
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** ID of deleted mediatype, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_delete 3
```

`salt.modules.zabbix.mediatype_get` (*name=None, mediatypeids=None, \*\*connection\_args*)

Retrieve mediatypes according to the given parameters.

**Parameters**

- **name** – Name or description of the mediatype
- **mediatypeids** – ids of the mediatypes
- **connection\_args** (*optional*) – **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module’s docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module’s docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get>

**Returns** Array with mediatype details, False if no mediatype found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_get name='Email' salt '*' zabbix.mediatype_get mediatypeids="[1, '2', '3']"
```

`salt.modules.zabbix.mediatype_update` (*mediatypeid, name=False, mediatype=False, \*\*connection\_args*)

Update existing mediatype

---

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **mediatypeid** – ID of the mediatype to update
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the updated mediatypes, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

`salt.modules.zabbix.run_query` (*method, params, \*\*connection\_args*)

Send Zabbix API call

**Parameters**

- **method** – actual operation to perform via the API
- **params** – parameters required for specific method
- **connection\_args** (*optional*) – **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module’s docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module’s docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/>

**Returns** Response from Zabbix API

CLI Example: .. code-block:: bash

```
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": "5"}
```

`salt.modules.zabbix.substitute_params` (*input\_object*, *extend\_params=None*, *filter\_key='name'*, *\*\*kwargs*)

New in version 2017.7.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query\_object" and "query\_name".

**Parameters**

- **input\_object** – Zabbix object type specified in state file
- **extend\_params** – Specify query with params
- **filter\_key** – Custom filtering key (default: name)
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Params structure with values converted to string for further comparison purposes

`salt.modules.zabbix.template_get` (*name=None*, *host=None*, *templateids=None*, *\*\*connection\_args*)

Retrieve templates according to the given parameters.

**Parameters**

- **host** – technical name of the template
- **name** – visible name of the template
- **hostids** – ids of the templates
- **connection\_args** (*optional*) – **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get>

**Returns** Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids="[10050, 10001]"
```

`salt.modules.zabbix.user_addmedia` (*userids*, *active*, *mediatypeid*, *period*, *sendto*, *severity*, *\*\*connection\_args*)

Add new media to multiple users.

New in version 2016.3.0.

**Parameters**

- **userids** – ID of the user that uses the media
- **active** – Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** – ID of the media type used by the media
- **period** – Time when the notifications can be sent as a time period
- **sendto** – Address, user name or other identifier of the recipient
- **severity** – Trigger severities to send notifications about
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the created media.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63
```

`salt.modules.zabbix.user_create` (*alias*, *passwd*, *usrgrps*, *\*\*connection\_args*)

New in version 2016.3.0.

Create new zabbix user

---

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **alias** – user alias
- **passwd** – user's password
- **usrgrps** – user groups to add the user to
- **\_connection\_user** – zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**Returns** On success string with id of the created user.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'
```

`salt.modules.zabbix.user_delete` (*users*, *\*\*connection\_args*)

Delete zabbix users.

New in version 2016.3.0.

#### Parameters

- **users** – array of users (userids) to delete
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** On success array with userids of deleted users.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_delete 15
```

`salt.modules.zabbix.user_deletemedia` (*mediaids*, *\*\*connection\_args*)

Delete media by id.

New in version 2016.3.0.

#### Parameters

- **mediaids** – IDs of the media to delete

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_deletemedia 27

`salt.modules.zabbix.user_exists(alias, **connection_args)`

Checks if user with given alias exists.

New in version 2016.3.0.

#### Parameters

- **alias** – user alias
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** True if user exists, else False.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_exists james

`salt.modules.zabbix.user_get(alias=None, userids=None, **connection_args)`

Retrieve users according to the given parameters.

New in version 2016.3.0.

#### Parameters

- **alias** – user alias
- **userids** – return only users with the given IDs
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Array with details of convenient users, False on failure of if no user found.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_get james

`salt.modules.zabbix.user_getmedia(userids=None, **connection_args)`

New in version 2016.3.0.

Retrieve media according to the given parameters

---

**Note:** This function accepts all standard `usermedia.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **userids** – return only media that are used by the given users
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)

- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** List of retrieved media, False on failure.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_getmedia

`salt.modules.zabbix.user_list(**connection_args)`  
Retrieve all of the configured users.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Array with user details.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_list

`salt.modules.zabbix.user_update(userid, **connection_args)`  
New in version 2016.3.0.

Update existing users

---

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **userid** – id of the user to update
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Id of the updated user on success.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.user\_update 16 visible\_name='James Brown'

`salt.modules.zabbix.usergroup_create(name, **connection_args)`  
New in version 2016.3.0.

Create new user group

---

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** – name of the user group

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the created user groups.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.usergroup\_create GroupName

`salt.modules.zabbix.usergroup_delete` (*usergroupids*, *\*\*connection\_args*)

New in version 2016.3.0.

**Parameters**

- **usergroupids** – IDs of the user groups to delete
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the deleted user groups.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.usergroup\_delete 28

`salt.modules.zabbix.usergroup_exists` (*name=None*, *node=None*, *nodeids=None*, *\*\*connection\_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

**Parameters**

- **name** – names of the user groups
- **node** – name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** – IDs of the nodes the user groups must belong to
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash  
salt '\*' zabbix.usergroup\_exists Guests

`salt.modules.zabbix.usergroup_get` (*name=None*, *usrgrpids=None*, *userids=None*, *\*\*connection\_args*)

New in version 2016.3.0.

Retrieve user groups according to the given parameters

---

**Note:** This function accepts all `usergroup_get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **name** – names of the user groups

- **usrgrpids** – return only user groups with the given IDs
- **userids** – return only user groups that contain the given users
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.usergroup\_get Guests

`salt.modules.zabbix.usergroup_list(**connection_args)`

Retrieve all enabled user groups.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.usergroup\_list

`salt.modules.zabbix.usergroup_update(usrgrp_id, **connection_args)`

New in version 2016.3.0.

Update existing user group

---

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **usrgrp\_id** – ID of the user group to update.
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash  
 salt '\*' zabbix.usergroup\_update 8 name=guestsRenamed

`salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)`

Create new host usermacro.

#### Parameters

- **macro** – name of the host usermacro
- **value** – value of the host usermacro
- **hostid** – hostid or templateid

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_create '{$SNMP_COMMUNITY}' 'public' 1
```

`salt.modules.zabbix.usermacro_createglobal`(*macro*, *value*, *\*\*connection\_args*)

Create new global usermacro.

Parameters

- **macro** – name of the global usermacro
- **value** – value of the global usermacro
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

`salt.modules.zabbix.usermacro_delete`(*macroids*, *\*\*connection\_args*)

Delete host usermacros.

Parameters

- **macroids** – macroids of the host usermacros
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_delete 21
```

`salt.modules.zabbix.usermacro_deleteglobal`(*macroids*, *\*\*connection\_args*)

Delete global usermacros.

Parameters

- **macroids** – macroids of the global usermacros
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```

```
salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, host-
 macroids=None, globalmacroids=None, globalmacro=False,
 **connection_args)
```

Retrieve user macros according to the given parameters.

#### Parameters

- **macro** – name of the usermacro
- **hostids** – Return macros for the given hostids
- **templateids** – Return macros for the given templateids
- **hostmacroids** – Return macros with the given hostmacroids
- **globalmacroids** – Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** – if True, returns only global macros
- **connection\_args** (*optional*) – `_connection_user`: zabbix user (can also be set in opts or pillar, see module's docstring) `_connection_password`: zabbix password (can also be set in opts or pillar, see module's docstring) `_connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

**Returns** Array with usermacro details, False if no usermacro found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usermacro_get macro='${SNMP_COMMUNITY}'
```

```
salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)
```

Update existing host usermacro.

#### Parameters

- **hostmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

```
salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)
```

Update existing global usermacro.

#### Parameters

- **globalmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

## 21.9.496 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by [minitage's buildout maker](#)

---

**Note:** The zc.buildout integration is still in beta; the API is subject to change

---

### General notes

You have those following methods:

- upgrade\_bootstrap
- bootstrap
- run\_buildout
- buildout

`salt.modules.zcbuildout.bootstrap(*a, **kw)`  
Run the buildout bootstrap dance (python bootstrap.py).  
**directory** directory to execute in  
**config** alternative buildout configuration file to use  
**runas** User used to run buildout as  
**env** environment variables to set when running  
**buildout\_ver** force a specific buildout version (1 | 2)  
**test\_release** buildout accept test release  
**offline** are we executing buildout in offline mode  
**distribute** Forcing use of distribute  
**new\_st** Forcing use of setuptools >= 0.7  
**python** path to a python executable to use in place of default (salt one)  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**use\_vt** Use the new salt VT to stream output [experimental]  
CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

`salt.modules.zcbuildout.buildout(*a, **kw)`  
Run buildout in a directory.  
**directory** directory to execute in  
**config** buildout config to use  
**parts** specific buildout parts to run  
**runas** user used to run buildout as  
**env** environment variables to set when running  
**buildout\_ver** force a specific buildout version (1 | 2)  
**test\_release** buildout accept test release  
**new\_st** Forcing use of setuptools >= 0.7  
**distribute** use distribute over setuptools if possible

**offline** does buildout run offline  
**python** python to use  
**debug** run buildout with -D debug flag  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**newest** run buildout in newest mode  
**verbose** run buildout in verbose mode (-vvvvv)  
**use\_vt** Use the new salt VT to stream output [experimental]  
 CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout(*a, **kw)`

Run a buildout in a directory.  
**directory** directory to execute in  
**config** alternative buildout configuration file to use  
**offline** are we executing buildout in offline mode  
**runas** user used to run buildout as  
**env** environment variables to set when running  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**newest** run buildout in newest mode  
**force** run buildout unconditionally  
**verbose** run buildout in verbose mode (-vvvvv)  
**use\_vt** Use the new salt VT to stream output [experimental]  
 CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

**directory** directory to execute in  
**offline** are we executing buildout in offline mode  
**buildout\_ver** forcing to use a specific buildout version (1 | 2)  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
 CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

## 21.9.497 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

**depends** requests

**configuration** This module requires a 'zenoss' entry in the master/minion config.

For example:

```

zenoss:
 hostname: https://zenoss.example.com
 username: admin
 password: admin123

```

```

salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost',
 prod_state=1000)

```

A function to connect to a zenoss server and add a new device entry.

**Parameters**

- **device** – (Optional) Will use the grain 'fqdn' by default.
- **device\_class** – (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** – (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod\_state** – (Optional) The prodState to set on the device. If none, defaults to 1000 ( production )

CLI Example: salt '\*' zenoss.add\_device

```

salt.modules.zenoss.device_exists(device=None)

```

Check to see if a device already exists in Zenoss.

**Parameters** **device** – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '\*' zenoss.device\_exists

```

salt.modules.zenoss.find_device(device=None)

```

Find a device in Zenoss. If device not found, returns None.

**Parameters** **device** – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '\*' zenoss.find\_device

```

salt.modules.zenoss.set_prod_state(prod_state, device=None)

```

A function to set the prod\_state in zenoss.

**Parameters**

- **prod\_state** – (Required) Integer value of the state
- **device** – (Optional) Will use the grain 'fqdn' by default.

CLI Example: salt zenoss.set\_prod\_state 1000 hostname

## 21.9.498 salt.modules.zfs

Module for running ZFS command

**codeauthor** Nitin Madhok <nmadhok@clermson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils.zfs

**platform** illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```

salt.modules.zfs.bookmark(snapshot, bookmark)

```

Creates a bookmark of the given snapshot

---

**Note:** Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a `zfs send` command.

This feature must be enabled to be used. See `zpool-features(5)` for details on ZFS feature flags and the bookmarks feature.

---

**snapshot** [string] name of snapshot to bookmark

**bookmark** [string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

`salt.modules.zfs.clone`(*name\_a*, *name\_b*, *\*\*kwargs*)

Creates a clone of the given snapshot.

**name\_a** [string] name of snapshot

**name\_b** [string] name of filesystem or volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

**properties** [dict] additional zfs properties (`-o`)

---

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

---

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

`salt.modules.zfs.create`(*name*, *\*\*kwargs*)

Create a ZFS File System.

**name** [string] name of dataset or volume

**volume\_size** [string] if specified, a zvol will be created instead of a dataset

**sparse** [boolean] create sparse volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

**properties** [dict] additional zfs properties (`-o`)

---

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

---

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{mountpoint: '/export/zfs',
↪ 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{volblocksize:
↪ '512'}" [sparse=True|False]

```

`salt.modules.zfs.destroy`(*name*, *\*\*kwargs*)

Destroy a ZFS File System.

**name** [string] name of dataset, volume, or snapshot

**force** [boolean] force an unmount of any file systems using the unmount -f command.

**recursive** [boolean] recursively destroy all children. (-r)

**recursive\_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive\_all

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.destroy myzpool/mydataset [force=True|False]

```

`salt.modules.zfs.diff`(*name\_a*, *name\_b=None*, *\*\*kwargs*)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

**name\_a** [string] name of snapshot

**name\_b** [string] (optional) name of snapshot or filesystem

**show\_changetime** [boolean] display the path's inode change time as the first column of output. (default = True)

**show\_indication** [boolean] display an indication of the type of file. (default = True)

**parsable** [boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```

salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset

```

`salt.modules.zfs.exists`(*name*, *\*\*kwargs*)

Check if a ZFS filesystem or volume or snapshot exists.

**name** [string] name of dataset

**type** [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume

```

`salt.modules.zfs.get`(*\*dataset*, *\*\*kwargs*)

Displays properties for the given datasets.

**dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] comma-separated list of properties to list, defaults to all

**recursive** [boolean] recursively list children

**depth** [int] recursively list children to depth  
**fields** [string] comma-separated list of fields to include, the name and property field will always be added  
**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.  
**source** [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.  
**parsable** [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

---

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

---

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"
↪ [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
↪ fields=value depth=1
```

`salt.modules.zfs.hold`(*tag*, *\*snapshot*, *\*\*kwargs*)

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

---

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the `zfs destroy` command return EBUSY.

---

**tag** [string] name of tag

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↪ mydataset@myothersnapshot
```

`salt.modules.zfs.holds`(*snapshot*, *\*\*kwargs*)

Lists all existing user references for the given snapshot or snapshots.

**snapshot** [string] name of snapshot

**recursive** [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

`salt.modules.zfs.inherit`(*prop*, *name*, *\*\*kwargs*)

Clears the specified property

**prop** [string] name of property

**name** [string] name of the filesystem, volume, or snapshot

**recursive** [boolean] recursively inherit the given property for all children.

**revert** [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

`salt.modules.zfs.list_`(*name=None*, *\*\*kwargs*)

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

**name** [string] name of dataset, volume, or snapshot

**recursive** [boolean] recursively list children

**depth** [int] limit recursion to depth

**properties** [string] comma-separated list of properties to list, the name property will always be added

**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

**sort** [string] property to sort on (default = name)

**order** [string [ascending|descending]] sort order (default = ascending)

**parsable** [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

`salt.modules.zfs.list_mount`()

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```
salt '*' zfs.list_mount
```

`salt.modules.zfs.mount`(*name=None*, *\*\*kwargs*)

Mounts ZFS file systems

**name** [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)

**overlay** [boolean] perform an overlay mount.

**options** [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing '-a' as name is deprecated and will be removed in Sodium.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

`salt.modules.zfs.promote(name)`

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

---

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The `rename` subcommand can be used to rename any conflicting snapshots.

---

**name** [string] name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

`salt.modules.zfs.release(tag, *snapshot, **kwargs)`

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

---

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the `zfs destroy` command return EBUSY.

---

**tag** [string] name of tag

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
↳mydataset@myothersnapshot
```

`salt.modules.zfs.rename(name, new_name, **kwargs)`

Rename or Relocate a ZFS File System.

**name** [string] name of dataset, volume, or snapshot

**new\_name** [string] new name of dataset, volume, or snapshot

**force** [boolean] force unmount any filesystems that need to be unmounted in the process.  
**create\_parent** [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.  
**recursive** [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

`salt.modules.zfs.rollback`(*name*, *\*\*kwargs*)

Roll back the given dataset to a previous snapshot.

**name** [string] name of snapshot

**recursive** [boolean] destroy any snapshots and bookmarks more recent than the one specified.

**recursive\_all** [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

**force** [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

`salt.modules.zfs.set`(*\*dataset*, *\*\*kwargs*)

Sets the property or list of properties to the given value(s) for each dataset.

**dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g.  
 compression=off

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
↪ canmount=off
```

`salt.modules.zfs.snapshot(*snapshot, **kwargs)`

Creates snapshots with the given names.

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively create snapshots of all descendent datasets.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
↳myotherdataset@yesterday [recursive=True]
```

`salt.modules.zfs.unmount(name, **kwargs)`

Unmounts ZFS file systems

**name** [string] name of the filesystem, you can use None to unmount all mounted filesystems.

**force** [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `'-a'` as name is deprecated and will be removed in Sodium.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

## 21.9.499 salt.modules.zk\_concurrency

### Concurrency controls in zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)`

Get lock (with optional timeout)

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to the hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

**force** Forcibly acquire the lock regardless of available slots

Example:

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

```
salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None,
 max_concurrency=1, timeout=None,
 ephemeral_lease=False, profile=None,
 scheme=None, username=None, password=None,
 default_acl=None)
```

Return an un-ordered list of lock holders

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

```
salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False,
 profile=None, scheme=None,
 username=None, password=None, default_acl=None)
```

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min\_nodes) to appear

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**min\_nodes** The minimum number of nodes expected to be present in the party

**blocking** The boolean indicating if we need to block until min\_nodes are available

Example:

```
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_
↳nodes=3 blocking=True
```

```
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1,
 ephemeral_lease=False, scheme=None, profile=None, user-
 name=None, password=None, default_acl=None)
```

Remove lease from semaphore

**path** The path in zookeeper where the lock is

**zk\_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

### 21.9.500 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

**salt.modules.znc.buildmod**(*\*modules*)  
Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

**salt.modules.znc.dumpconf**()  
Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

**salt.modules.znc.rehashconf**()  
Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

**salt.modules.znc.version**()  
Return server version from znc -version

CLI Example:

```
salt '*' znc.version
```

### 21.9.501 salt.modules.zoneadm

Module for Solaris 10's zoneadm

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zoneadm is not supported by this module!

**salt.modules.zoneadm.attach**(*zone, force=False, brand\_opts=None*)  
Attach the specified zone.  
**zone** [string] name of the zone  
**force** [boolean] force the zone into the "installed" state with no validation

**brand\_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

**salt.modules.zoneadm.boot**(*zone*, *single=False*, *altinit=None*, *smf\_options=None*)

Boot (or activate) the specified zone.

**zone** [string] name or uuid of the zone

**single** [boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit** [string] valid path to an alternative executable to be the primordial process.

**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

**salt.modules.zoneadm.clone**(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

**zone** [string] name of the zone

**source** [string] zone to clone from

**snapshot** [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

**salt.modules.zoneadm.detach**(*zone*)

Detach the specified zone.

**zone** [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

**salt.modules.zoneadm.halt**(*zone*)

Halt the specified zone.

**zone** [string] name or uuid of the zone

---

**Note:** To cleanly shutdown the zone use the shutdown function.

---

CLI Example:

```
salt '*' zoneadm.halt hector
```

**salt.modules.zoneadm.install**(*zone*, *nodataset=False*, *brand\_opts=None*)

Install the specified zone from the system.

**zone** [string] name of the zone

**nodataset** [boolean] do not create a ZFS file system

**brand\_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

`salt.modules.zoneadm.list_zones` (*verbose=True*, *installed=False*, *configured=False*,  
*hide\_global=True*)

List all zones

**verbose** [boolean] display additional zone information

**installed** [boolean] include installed zones in output

**configured** [boolean] include configured zones in output

**hide\_global** [boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

`salt.modules.zoneadm.move` (*zone*, *zonepath*)

Move zone to new zonepath.

**zone** [string] name or uuid of the zone

**zonepath** [string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

`salt.modules.zoneadm.ready` (*zone*)

Prepares a zone for running applications.

**zone** [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

`salt.modules.zoneadm.reboot` (*zone*, *single=False*, *altinit=None*, *smf\_options=None*)

Restart the zone. This is equivalent to a halt boot sequence.

**zone** [string] name or uuid of the zone

**single** [boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit** [string] valid path to an alternative executable to be the primordial process.

**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

`salt.modules.zoneadm.shutdown` (*zone*, *reboot=False*, *single=False*, *altinit=None*, *smf\_options=None*)

Gracefully shutdown the specified zone.

**zone** [string] name or uuid of the zone

**reboot** [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)

**single** [boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit** [string] valid path to an alternative executable to be the primordial process.

**smf\_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

`salt.modules.zoneadm.uninstall` (*zone*)

Uninstall the specified zone from the system.

**zone** [string] name or uuid of the zone

**Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

`salt.modules.zoneadm.verify(zone)`

Check to make sure the configuration of the specified zone can safely be installed on the machine.

**zone** [string] name of the zone

CLI Example:

```
salt '*' zoneadm.verify dolores
```

## 21.9.502 salt.modules.zonecfg

Module for Solaris 10's zonecfg

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

**depend** salt.modules.file

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

`salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)`

Add a resource

**zone** [string] name of zone

**resource\_type** [string] type of resource

**kwargs** [string|int|...] resource properties

CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value=
↳ '(priv=privileged,limit=33554432,action=deny)'
```

`salt.modules.zonecfg.clear_property(zone, key)`

Clear a property

**zone** [string] name of zone

**key** [string] name of property

CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

`salt.modules.zonecfg.create(zone, brand, zonpath, force=False)`

Create an in-memory configuration for the specified zone.

**zone** [string] name of zone

**brand** [string] brand name

**zonpath** [string] path of zone

**force** [boolean] overwrite configuration

CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

`salt.modules.zonecfg.create_from_template`(*zone*, *template*)  
 Create an in-memory configuration from a template for the specified zone.  
**zone** [string] name of zone  
**template** [string] name of template

**Warning:** existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

`salt.modules.zonecfg.delete`(*zone*)  
 Delete the specified configuration from memory and stable storage.  
**zone** [string] name of zone  
 CLI Example:

```
salt '*' zonecfg.delete epyon
```

`salt.modules.zonecfg.export`(*zone*, *path=None*)  
 Export the configuration from memory to stable storage.  
**zone** [string] name of zone  
**path** [string] path of file to export to  
 CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.import_`(*zone*, *path*)  
 Import the configuration to memory from stable storage.  
**zone** [string] name of zone  
**path** [string] path of file to export to  
 CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.info`(*zone*, *show\_all=False*)  
 Display the configuration from memory  
**zone** [string] name of zone  
**show\_all** [boolean] also include calculated values like capped-cpu, cpu-shares, ...  
 CLI Example:

```
salt '*' zonecfg.info tallgeese
```

`salt.modules.zonecfg.remove_resource`(*zone*, *resource\_type*, *resource\_key*, *resource\_value*)  
 Remove a resource  
**zone** [string] name of zone  
**resource\_type** [string] type of resource  
**resource\_key** [string] key for resource selection  
**resource\_value** [string] value for resource selection

**Note:** Set `resource_selector` to `None` for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

`salt.modules.zonecfg.set_property`(*zone*, *key*, *value*)

Set a property

**zone** [string] name of zone

**key** [string] name of property

**value** [string] value of property

CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

`salt.modules.zonecfg.update_resource`(*zone*, *resource\_type*, *resource\_selector*, *\*\*kwargs*)

Add a resource

**zone** [string] name of zone

**resource\_type** [string] type of resource

**resource\_selector** [string] unique resource identifier

**kwargs** [string|int|...] resource properties

---

**Note:** Set `resource_selector` to `None` for resource that do not require one.

---

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory
↳value='(priv=privileged,limit=33554432,action=deny)'
```

## 21.9.503 salt.modules.zookeeper

### Zookeeper Module

**maintainer** SaltStack

**maturity** new

**platform** all

**depends** kazoo

New in version 2018.3.0.

### Configuration

**configuration** This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
zookeeper:
 hosts: zoo1,zoo2,zoo3
 default_acl:
 - username: daniel
 password: test
 read: true
 write: true
 create: true
```

(continues on next page)

(continued from previous page)

```

delete: true
admin: true
username: daniel
password: test

```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```

zookeeper:
 prod:
 hosts: zoo1,zoo2,zoo3
 default_acl:
 - username: daniel
 password: test
 read: true
 write: true
 create: true
 delete: true
 admin: true
 username: daniel
 password: test
 dev:
 hosts:
 - dev1
 - dev2
 - dev3
 default_acl:
 - username: daniel
 password: test
 read: true
 write: true
 create: true
 delete: true
 admin: true
 username: daniel
 password: test

```

`salt.modules.zookeeper.create`(*path*, *value*=", *acls*=None, *ephemeral*=False, *sequence*=False, *makepath*=False, *profile*=None, *hosts*=None, *scheme*=None, *username*=None, *password*=None, *default\_acl*=None)

Create Znode

**path** path of znode to create

**value** value to assign to znode (Default: ")

**acls** list of acl dictionaries to be assigned (Default: None)

**ephemeral** indicate node is ephemeral (Default: False)

**sequence** indicate node is suffixed with a unique index (Default: False)

**makepath** Create parent paths if they do not exist (Default: False)

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.create /test/name daniel profile=prod
```

`salt.modules.zookeeper.delete`(*path*, *version=-1*, *recursive=False*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Delete znode

**path** path to znode

**version** only delete if version matches (Default: -1 (always matches))

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.delete /test/name profile=prod
```

`salt.modules.zookeeper.ensure_path`(*path*, *acls=None*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Ensure Znode path exists

**path** Parent path to create

**acls** list of acls dictionaries to be assigned (Default: None)

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

`salt.modules.zookeeper.exists`(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Check if path exists

**path** path to check

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.exists /test/name profile=prod
```

`salt.modules.zookeeper.get`(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Get value saved in znode

**path** path to check

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get /test/name profile=prod
```

`salt.modules.zookeeper.get_acls`(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Get acls on a znode  
**path** path to znode  
**profile** Configured Zookeeper profile to authenticate with (Default: None)  
**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme** Scheme to authenticate with (Default: 'digest')  
**username** Username to authenticate (Default: None)  
**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

`salt.modules.zookeeper.get_children`(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Get children in znode path  
**path** path to check  
**profile** Configured Zookeeper profile to authenticate with (Default: None)  
**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme** Scheme to authenticate with (Default: 'digest')  
**username** Username to authenticate (Default: None)  
**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

`salt.modules.zookeeper.make_digest_acl`(*username*, *password*, *read=False*, *write=False*, *create=False*, *delete=False*, *admin=False*, *allperms=False*)

Generate acl object

---

**Note:** This is heavily used in the zookeeper state and probably is not useful as a cli module

---

**username** username of acl  
**password** plain text password of acl  
**read** read acl  
**write** write acl  
**create** create acl  
**delete** delete acl  
**admin** admin acl  
**allperms** set all other acls to True

CLI Example:

```
salt minion1 zookeeper.make_digest_acl username=daniel password=myspass
↪allperms=True
```

`salt.modules.zookeeper.set`(*path*, *value*, *version=-1*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Update znode with new value

**path** znode to update

**value** value to set in znode

**version** only update znode if version matches (Default: -1 (always matches))

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

`salt.modules.zookeeper.set_acls`(*path*, *acls*, *version=-1*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Set acls on a znode

**path** path to znode

**acls** list of acl dictionaries to set on the znode

**version** only set acls if version matches (Default: -1 (always matches))

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set_acls /test/name acls='[{"username": "gtmanfred",
↪ "password": "test", "all": True}]' profile=prod
```

### 21.9.504 salt.modules.zpool

Module for running ZFS zpool command

**codeauthor** Nitin Madhok <nmadhok@clemsn.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils.zfs

**platform** illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

`salt.modules.zpool.add`(*zpool*, *\*vdevs*, *\*\*kwargs*)

Add the specified vdev's to the given storage pool

**zpool** [string] Name of storage pool

**vdevs** [string] One or more devices

**force** [boolean] Forces use of device

CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.attach`(*zpool*, *device*, *new\_device*, *force=False*)

Attach specified device to zpool

**zpool** [string] Name of storage pool

**device** [string] Existing device name too

**new\_device** [string] New device name (to be attached to *device*)

**force** [boolean] Forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.clear`(*zpool*, *device=None*)

Clears device errors in a pool.

**Warning:** The device must not be part of an active pool configuration.

**zpool** [string] name of storage pool

**device** [string] (optional) specific device to clear

New in version 2018.3.1.

CLI Example:

```
salt '*' zpool.clear mypool
salt '*' zpool.clear mypool /path/to/dev
```

`salt.modules.zpool.create`(*zpool*, *\*vdevs*, *\*\*kwargs*)

New in version 2015.5.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

**zpool** [string] Name of storage pool

**vdevs** [string] One or more devices

**force** [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.

**mountpoint** [string] Sets the mount point for the root dataset

**altroot** [string] Equivalent to `"-o cachefile=none,altroot=root"`

**properties** [dict] Additional pool properties

**filesystem\_properties** [dict] Additional filesystem properties

**createboot** [boolean] create a boot partition

New in version 2018.3.0.

CLI Examples:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...]
↳ [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
↳ to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
↳ path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
↳ vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...]
↳ [force=True|False]
```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem\_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{ 'property1':
↳ 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] ✘
↳ [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
↳ to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
↳ path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
↳ vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] ✘
↳ [force=True|False]
```

**salt.modules.zpool.create\_file\_vdev**(*size*, \**vdevs*)

Creates file based virtual devices for a zpool

CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [/path/to/vdev2] [...]
```

**Note:** Depending on file size, the above command may take a while to return.

**salt.modules.zpool.destroy**(*zpool*, *force=False*)

Destroys a storage pool

**zpool** [string] Name of storage pool

**force** [boolean] Force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool
```

**salt.modules.zpool.detach**(*zpool*, *device*)

Detach specified device to zpool

**zpool** [string] Name of storage pool

**device** [string] Device to detach

CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

`salt.modules.zpool.exists(zpool)`

Check if a ZFS storage pool is active

**zpool** [string] Name of storage pool

CLI Example:

```
salt '*' zpool.exists myzpool
```

`salt.modules.zpool.export(*pools, **kwargs)`

New in version 2015.5.0.

Export storage pools

**pools** [string] One or more storage pools to export

**force** [boolean] Force export of storage pools

CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

`salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)`

New in version 2016.3.0.

Retrieves the given list of properties

**zpool** [string] Name of storage pool

**prop** [string] Optional name of property to retrieve

**show\_source** [boolean] Show source of property

**parsable** [boolean] Display numbers in parsable (exact) values

New in version 2018.3.0.

CLI Example:

```
salt '*' zpool.get myzpool
```

`salt.modules.zpool.healthy()`

Check if all zpools are healthy

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.healthy
```

`salt.modules.zpool.history(zpool=None, internal=False, verbose=False)`

New in version 2016.3.0.

Displays the command history of the specified pools, or all pools if no pool is specified

**zpool** [string] Optional storage pool

**internal** [boolean] Toggle display of internally logged ZFS events

**verbose** [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

`salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)`

New in version 2015.5.0.

Import storage pools or list pools available for import

**zpool** [string] Optional name of storage pool

**new\_name** [string] Optional new name for the storage pool

**mntopts** [string] Comma-separated list of mount options to use when mounting datasets within the pool.  
**force** [boolean] Forces import, even if the pool appears to be potentially active.  
**altroot** [string] Equivalent to "-o cachefile=None,altroot=root"  
**dir** [string] Searches for devices or files in dir, multiple dirs can be specified as follows: `dir="dir1,dir2"`  
**no\_mount** [boolean] Import the pool without mounting any file systems.  
**only\_destroyed** [boolean] Imports destroyed pools only. This also sets `force=True`.  
**recovery** [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don't import it nolog: allow import without log device, recent transactions might be lost

---

**Note:** If feature flags are not support this forced to the default of 'false'

---

**Warning:** When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

**properties** [dict] Additional pool properties

---

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

---

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

**salt.modules.zpool.iostat** (*zpool=None, sample\_time=5, parsable=True*)

Display I/O statistics for the given pools

**zpool** [string] optional name of storage pool

**sample\_time** [int] seconds to capture data before output default a sample of 5 seconds is used

**parsable** [boolean] display data in pythonc values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:

```
salt '*' zpool.iostat myzpool
```

**salt.modules.zpool.labelclear** (*device, force=False*)

New in version 2018.3.0.

Removes ZFS label information from the specified device

**device** [string] Device name; must not be part of an active pool configuration.

**force** [boolean] Treat exported or foreign devices as inactive

CLI Example:

```
salt '*' zpool.labelclear /path/to/dev
```

**salt.modules.zpool.list\_** (*properties='size, alloc, free, cap, frag, health', zpool=None, parsable=True*)

New in version 2015.5.0.

Return information about (all) storage pools  
**zpool** [string] optional name of storage pool  
**properties** [string] comma-separated list of properties to list  
**parsable** [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

---

**Note:** The name property will always be included, while the frag property will get removed if not available

---

**zpool** [string] optional zpool

---

**Note:** Multiple storage pool can be provided as a space separated list

---

CLI Example:

```
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

`salt.modules.zpool.offline`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are offline

**Warning:** By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

**zpool** [string] name of storage pool  
**vdevs** [string] One or more devices  
**temporary** [boolean] Enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

`salt.modules.zpool.online`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are online

**zpool** [string] name of storage pool  
**vdevs** [string] one or more devices  
**expand** [boolean] Expand the device to use all available space.

---

**Note:** If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

---

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

`salt.modules.zpool.reguid`(*zpool*)

Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

`salt.modules.zpool.reopen(zpool)`

Reopen all the vdevs associated with the pool

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

`salt.modules.zpool.replace(zpool, old_device, new_device=None, force=False)`

Replaces `old_device` with `new_device`

---

**Note:** This is equivalent to attaching `new_device`, waiting for it to resilver, and then detaching `old_device`.

The size of `new_device` must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

---

**zpool** [string] Name of storage pool

**old\_device** [string] Old device to replace

**new\_device** [string] Optional new device

**force** [boolean] Forces use of `new_device`, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

`salt.modules.zpool.scrub(zpool, stop=False, pause=False)`

Scrub a storage pool

**zpool** [string] Name of storage pool

**stop** [boolean] If True, cancel ongoing scrub

**pause** [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

---

**Note:** Pause is only available on recent versions of ZFS.

If both `pause` and `stop` are True, then `stop` will win.

---

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set(zpool, prop, value)`

Sets the given property on the specified pool

**zpool** [string] Name of storage pool  
**prop** [string] Name of property to set  
**value** [string] Value to set for the specified property  
 New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

**salt.modules.zpool.split**(*zpool*, *newzpool*, *\*\*kwargs*)  
 New in version 2018.3.0.

Splits devices off pool creating newpool.

---

**Note:** All vdevs in pool must be mirrors. At the time of the split, *newzpool* will be a replica of *zpool*.

After splitting, do not forget to import the new pool!

---

**zpool** [string] Name of storage pool  
**newzpool** [string] Name of new storage pool  
**mountpoint** [string] Sets the mount point for the root dataset  
**altroot** [string] Sets altroot for newzpool  
**properties** [dict] Additional pool properties for newzpool

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

---

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{ 'readonly': 'on' }"
```

---

CLI Example:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

**salt.modules.zpool.status**(*zpool=None*)

Return the status of the named zpool

**zpool** [string] optional name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.status myzpool
```

**salt.modules.zpool.upgrade**(*zpool=None*, *version=None*)

New in version 2016.3.0.

Enables all supported features on the given pool

**zpool** [string] Optional storage pool, applies to all otherwise  
**version** [int] Version to upgrade to, if unspecified upgrade to the highest possible

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See `zpool-features(5)` for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

### 21.9.505 salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

**depends**

- rpm Python module. Install with `zypper install rpm-python`

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

**class** salt.modules.zypperpkg.**Wildcard**(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4\*' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

**Parameters** **ptn** – Pattern

**Returns** Query range

**Z\_OP** = ['<', '<=', '=', '>=', '>']

salt.modules.zypperpkg.**add\_lock**(packages, \*\*kwargs)

Add a package lock. Specify packages to lock by exact name.

CLI Example:

```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>, <package2>, <package3>
salt '*' pkg.add_lock pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.**clean\_locks**()

Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypperpkg.**del\_repo**(repo)

Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

`salt.modules.zypperpkg.diff(*paths)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters** `path` – Full path to the installed file

**Returns** Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.zypperpkg.download(*packages, **kwargs)`

Download packages to the local disk.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.zypperpkg.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypperpkg.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypperpkg.get_repo(repo, **kwargs)`

Display a repo.

CLI Example:

```
salt '*' pkg.get_repo alias
```

`salt.modules.zypperpkg.info_available(*names, **kwargs)`

Return the information of the named package available for the system.

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

**Parameters**

- **names** – Names of the packages to get information about.

- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.  
Valid attributes are: version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **errors** – Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.  
Valid attributes are: ignore, report
- **all\_versions** – Include information for all versions of the packages installed on the minion.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
salt '*' pkg.info_installed <package1> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor errors=report
```

`salt.modules.zypperpkg.install`(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip\_verify=False, version=None, ignore\_repo\_failure=False, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a 'zypper refresh' before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**fromrepo** Specify a package repository to install from.

**downloadonly** Only download the packages, do not install.

**skip\_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

**version** Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. '>1.2.3-4'). This parameter is ignored if `pkgs` or `sources` is passed.

**resolve\_capabilities** If this option is set to True zypper will take capabilities into account. In this case names which are just provided by a package will get installed. Default is False.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
→rpm"}]'
```

**ignore\_repo\_failure** Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

**diff\_attr**: If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
 'old': {
 'version': '<old-version>',
 'arch': '<old-arch>'},

 'new': {
 'version': '<new-version>',
 'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

If an attribute list is specified in `diff_attr`, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
 'old': {
 'version': '<old-version>',
 'arch': '<old-arch>'},

 'new': {
 'version': '<new-version>',
 'arch': '<new-arch>'}}}
```

`salt.modules.zypperpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.list_downloaded()`

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.zypperpkg.list_installed_patches()`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.zypperpkg.list_installed_patterns()`

List installed patterns on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

`salt.modules.zypperpkg.list_locks()`

List current package locks.

Return a dict containing the locked package with attributes:

```
{ '<package>': {'case_sensitive': '<case_sensitive>',
 'match_type': '<match_type>',
 'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

`salt.modules.zypperpkg.list_patches(refresh=False)`

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.zypperpkg.list_patterns(refresh=False)`

List all known patterns from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patterns
```

`salt.modules.zypperpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{ '<package_name>': '<version>[,<version>...]' }
```

**versions\_as\_list:** If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**attr:** If a list of package attributes is specified, returned value will contain them in addition to version, eg:

```
{'<package_name>': [{'version' : 'version', 'arch' : 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

**removed:** not supported

**purge\_desired:** not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version"', "arch"]'
```

**salt.modules.zypperpkg.list\_products** (*all=False, refresh=False*)

List all available or installed SUSE products.

**all** List all products available or only installed. Default is False.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

**salt.modules.zypperpkg.list\_provides** (*\*\*kwargs*)

New in version 2018.3.0.

List package provides of installed packages as a dict. {'<provided\_name>': ['<package\_name>', '<package\_name>', ...]}

CLI Examples:

```
salt '*' pkg.list_provides
```

**salt.modules.zypperpkg.list\_repo\_pkgs** (*\*args, \*\*kwargs*)

New in version 2017.7.5,2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If *byrepo* is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
With byrepo=False (default)
{
 'bash': ['4.3-83.3.1',
 '4.3-82.6'],
 'vim': ['7.4.326-12.1']
}
```

(continues on next page)

(continued from previous page)

```
{
 'OSS': {
 'bash': ['4.3-82.6'],
 'vim': ['7.4.326-12.1']
 },
 'OSS Update': {
 'bash': ['4.3-83.3.1']
 }
}
```

**fromrepo** [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo** [False] When True, the return data for each package will be organized by repository.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

`salt.modules.zypperpkg.list_repos()`

Lists all repos.

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.zypperpkg.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades on this system

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.zypperpkg.mod_repo(repo, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo** or **alias** alias by which Zypper refers to the repo

**url**, **mirrorlist** or **baseurl** the URL for Zypper to reference

**enabled** Enable or disable (True or False) repository, but do not remove if disabled.

**refresh** Enable or disable (True or False) auto-refresh of the repository.

**cache** Enable or disable (True or False) RPM files caching.

**gpgcheck** Enable or disable (True or False) GPG check for this repository.

**gpgautoimport** [False] If set to True, automatically trust and import public GPG key for the repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a `mirrorlist` is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

`salt.modules.zypperpkg.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size** Include only files where size changed.

**mode** Include only files which file's mode has been changed.

**checksum** Include only files which MD5 checksum has been changed.

**device** Include only files which major and minor numbers has been changed.

**symlink** Include only files which are symbolic link contents.

**owner** Include only files where owner has been changed.

**group** Include only files where group has been changed.

**time** Include only files where modification time of the file has been changed.

**capabilities** Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.zypperpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.zypperpkg.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.zypperpkg.parse_arch(name)`

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

`salt.modules.zypperpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

**salt.modules.zypperpkg.refresh\_db()**

Force a repository refresh by calling `zypper refresh --force`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

**salt.modules.zypperpkg.remove**(*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

**salt.modules.zypperpkg.remove\_lock**(*packages, \*\*kwargs*)

Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs=['foo', 'bar']
```

**salt.modules.zypperpkg.resolve\_capabilities**(*pkgs, refresh, \*\*kwargs*)

New in version 2018.3.0.

Convert name provides in `pkgs` into real package names if `resolve_capabilities` parameter is set to `True`. In case of `resolve_capabilities` is set to `False` the package list is returned unchanged.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**resolve\_capabilities** If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

```
salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl
```

`salt.modules.zypperpkg.search(criteria, refresh=False, **kwargs)`

List known packages, available to the system.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**match (str)** One of *exact*, *words*, *substrings*. Search for an *exact* match or for the whole *words* only. Default to *substrings* to patch partial words.

**provides (bool)** Search for packages which provide the search strings.

**recommends (bool)** Search for packages which recommend the search strings.

**requires (bool)** Search for packages which require the search strings.

**suggests (bool)** Search for packages which suggest the search strings.

**conflicts (bool)** Search packages conflicting with search strings.

**obsoletes (bool)** Search for packages which obsolete the search strings.

**file\_list (bool)** Search for a match in the file list of packages.

**search\_descriptions (bool)** Search also in package summaries and descriptions.

**case\_sensitive (bool)** Perform case-sensitive search.

**installed\_only (bool)** Show only installed packages.

**not\_installed\_only (bool)** Show only packages which are not installed.

**details (bool)** Show version and repository

CLI Examples:

```
salt '*' pkg.search <criteria>
```

`salt.modules.zypperpkg.upgrade(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

**dryrun** If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

**dist\_upgrade** Perform a system dist-upgrade. Default: False

**fromrepo** Specify a list of package repositories to upgrade from. Default: None

**novendorchange** If set to True, no allow vendor changes. Default: False

**skip\_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
 'new': '<new-version>'}}
```

CLI Example:

```

salt '*' pkg.upgrade
salt '*' pkg.upgrade dist_upgrade=True fromrepo='["MyRepoName"]' !
↪novendorchange=True
salt '*' pkg.upgrade dist_upgrade=True dryrun=True

```

`salt.modules.zypperpkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```

salt '*' pkg.upgrade_available <package name>

```

`salt.modules.zypperpkg.verify(*names, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```

salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']

```

`salt.modules.zypperpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

```

`salt.modules.zypperpkg.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `ver1 < ver2`, 0 if `ver1 == ver2`, and 1 if `ver1 > ver2`. Return None if there was a problem making the comparison.

**ignore\_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```

salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'

```

## A REST API for Salt

### depends

- CherryPy Python module.

Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.

### optdepends

- ws4py Python module for websockets support.

### client\_libraries

- Java: <https://github.com/SUSE/salt-netapi-client>
- Python: <https://github.com/saltstack/pepper>

**setup** All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include `salt-api` in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

1. Install the PyOpenSSL package.
2. Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

```
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the [full external auth instructions](#).
5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!))

```
rest_cherrypy:
 port: 8000
 ssl_cert: /etc/pki/tls/certs/localhost.crt
 ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

**configuration** All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

#### **port** Required

The port for the webserver to listen on.

**host** [`0.0.0.0`] The socket interface for the HTTP server to listen on.

**debug** [`False`] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

**log\_access\_file** Path to a file to write HTTP access logs.

New in version 2016.11.0.

**log\_error\_file** Path to a file to write HTTP error logs.

New in version 2016.11.0.

**ssl\_cert** The path to a SSL certificate. (See below)

**ssl\_key** The path to the private key for your SSL certificate. (See below)

**ssl\_chain** (Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

- disable\_ssl** A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!
- webhook\_disable\_auth** [False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.
- webhook\_url** [/hook] Configure the URL endpoint for the *Webhook* entry point.
- thread\_pool** [100] The number of worker threads to start up in the pool.
- socket\_queue\_size** [30] Specify the maximum number of HTTP connections to queue.
- expire\_responses** [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.
- Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire\_responses" configuration setting, which corresponds to the `timeout_monitor` setting in CherryPy, is no longer supported in CherryPy versions  $\geq 12.0.0$ .
- max\_request\_body\_size** [1048576] Maximum size for the HTTP request body.
- collect\_stats** [False] Collect and report statistics about the CherryPy server
- Reports are available via the *Stats* URL.
- stats\_disable\_auth** [False] Do not require authentication to access the `/stats` endpoint.
- New in version 2018.3.0.
- static** A filesystem path to static HTML/JavaScript/CSS/image assets.
- static\_path** [/static] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.
- enable\_sessions** [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.
- New in version 2017.7.0.
- app** [index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.
- Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom `X-Auth-Token` header instead and consider disabling the `enable_sessions` setting.
- Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.
- app\_path** [/app] The URL prefix to use for serving the HTML file specified in the `app` setting. This should be a simple name containing no slashes.
- Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.
- root\_prefix** [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

## Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

For example, using curl:

```
curl -sSk https://localhost:8000/login \
 -H 'Accept: application/x-yaml' \
 -d username=saltdev \
 -d password=saltdev \
 -d eauth=pam
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
 -H 'Accept: application/x-yaml' \
 -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \
 -d client=local \
 -d tgt='*' \
 -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
Write the cookie file:
curl -sSk https://localhost:8000/login \
 -c ~/cookies.txt \
 -H 'Accept: application/x-yaml' \
 -d username=saltdev \
 -d password=saltdev \
 -d eauth=auto

Read the cookie file:
curl -sSk https://localhost:8000 \
 -b ~/cookies.txt \
 -H 'Accept: application/x-yaml' \
 -d client=local \
 -d tgt='*' \
 -d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
 'username': 'saltdev',
 'password': 'saltdev',
 'eauth': 'auto',
 })
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
 'client': 'local',
 'tgt': '*',
 'fun': 'test.arg',
 'arg': ['foo', 'bar'],
 'kwarg': {'baz': 'Baz!'},
```

(continues on next page)

(continued from previous page)

```

]])
 >>> resp.json()
 {'return': [{
 ...snip...
]]}

```

**See also:**

You can bypass the session handling via the [Run](#) URL.

**Usage**

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```

% curl -sSi https://localhost:8000 -H 'Content-type: application/json'
→ -d '[{
 "client": "local",
 "tgt": "*",
 "fun": "test.ping"
 }]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]

{"return": [{"jerry": true}]}

```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full [Client APIs](#) documentation, but in short:

- "local" uses [LocalClient](#) which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses [RunnerClient](#) which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- "wheel" uses [WheelClient](#) which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the [key wheel module](#) exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the [full list of client interfaces](#).

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not.

LocalClient also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. RunnerClient and WheelClient are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions – the *test.arg execution function* using LocalClient and the *test.arg runner function* using RunnerClient; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json'
→ ' -d '
[
 {
 "client": "local",
 "tgt": "*",
 "fun": "test.arg",
 "arg": ["positional arg one", "positional arg two"],
 "kwarg": {
 "keyword arg one": "Hello from a minion",
 "keyword arg two": "Hello again from a minion"
 }
 },
 {
 "client": "runner",
 "fun": "test.arg",
 "keyword arg one": "Hello from a master",
 "keyword arg two": "Runners do not support positional args"
 }
]
HTTP/1.1 200 OK
[...snip...]
{
 "return": [
 {
 "jerry": {
 "args": [
 "positional arg one",
 "positional arg two"
],
 "kwargs": {
 "keyword arg one": "Hello from a minion",
 "keyword arg two": "Hello again from a minion",
 [...snip...]
 }
 },
 [...snip; other minion returns here...]
 },
 {
 "args": [],
 "kwargs": {
 "keyword arg two": "Runners do not support positional args",
 "keyword arg one": "Hello from a master"
 }
 }
]
}
```

One more example, this time with more commonly used functions:

```

curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/
↪json' -d '
[
 {
 "client": "local",
 "tgt": "*",
 "fun": "state.sls",
 "kwarg": {
 "mods": "apache",
 "pillar": {
 "lookup": {
 "wwwdir": "/srv/httpd/htdocs"
 }
 }
 }
 },
 {
 "client": "runner",
 "fun": "cloud.create",
 "provider": "my-ec2-provider",
 "instances": "my-centos-6",
 "image": "ami-1624987f",
 "delvol_on_destroy": true
 }
]
'
HTTP/1.1 200 OK
[...snip...]
{
 "return": [
 {
 "jerry": {
 "pkg_|-install_apache_|-httpd_|-installed": {
 [...snip full state return here...]
 }
 }
 }
 [...snip other minion returns here...]
],
 {
 [...snip full salt-cloud output here...]
 }
]
}

```

### Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures – and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt’s CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \
-b ~/cookies.txt \
-d client=runner \
-d fun='jobs.lookup_jid' \
-d jid='20150129182456704682'
```

---

### urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
-H "Accept: application/json" \
-d username='myapiuser' \
--data-urlencode password='1234+' \
-d eauth='pam'
```

---

## Performance Expectations and Recommended Usage

This module provides a thin wrapper around *Salt's Python API*. Executing a Salt command via `rest_cherry.py` is directly analogous to executing a Salt command via Salt's CLI (which also uses the Python API) – they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn't do it at the CLI don't do it via this API.

### Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

### Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. `rest_cherry.py` can be configured not to time-out long responses via the

`expire_responses` setting, and both *LocalClient* and *RunnerClient* have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/
↪json' -d '[
 {
 "client": "local",
 "tgt": "*",
 "fun": "test.sleep",
 "kwarg": {"length": 30},
 "timeout": 60
 },
 {
 "client": "runner",
 "fun": "test.sleep",
 "kwarg": {"s_time": 30},
 "timeout": 60
 }
]
```

## Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt's job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt's *Returner system*.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt's event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherry.py` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

## Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherry.py` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt's Python API, also keep an eye on the performance of Salt when testing.

## Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in [issue 26505](#), but until that issue is closed `rest_cherry.py` will remain the officially recommended REST API.

## Deployment

The `rest_cherry.py` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

### `salt-api` using the CherryPy server

The default configuration is to run this module using `salt-api` to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

### Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with `mod_wsgi` or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherry.py` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
 ServerName example.com
 ServerAlias *.example.com

 ServerAdmin webmaster@example.com

 LogLevel warn
 ErrorLog /var/www/example.com/logs/error.log
 CustomLog /var/www/example.com/logs/access.log combined

 DocumentRoot /var/www/example.com/htdocs

 WSGIScriptAlias / /path/to/salt/netapi/rest_cherry.py/wsgi.py
</VirtualHost>
```

## REST URI Reference

/

### `class salt.netapi.rest_cherry.py.app.LowDataAdapter`

The primary entry point to Salt's REST API

#### `GET()`

An explanation of the API with links of where to go next

#### `GET /`

##### Request Headers

- **Accept** – the desired response format.

##### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
```

**POST**

Mock out specified imports.

This allows autodoc to do its thing without having oodles of req'd installed libs. This doesn't work with `import * imports`.

This Mock class can be configured to return a specific values at specific names, if required.

<http://read-the-docs.readthedocs.org/en/latest/faq.html#i-get-import-errors-on-libraries-that-depend-on-c-modules>

**/login**

**class** salt.netapi.rest\_cherry.py.app.**Login**(\*args, \*\*kwargs)

Log in to receive a session token

*Authentication information.*

**GET()**

Present the login interface

**GET /login**

An explanation of how to log in.

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: text/html
```

**POST(\*\*kwargs)**

*Authenticate* against Salt's eauth system

**POST /login**

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

**Form Parameters**

- **eauth** – the eauth backend configured for the user
- **username** – username
- **password** – password

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```
curl -si localhost:8000/login \
-c ~/cookies.txt \
-H "Accept: application/json" \
-H "Content-type: application/json" \
-d '{
 "username": "saltuser",
 "password": "saltuser",
 "eauth": "auto"
}'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;␣
↳Path=/

{"return": {
 "token": "6d1b722e",
 "start": 1363805943.776223,
 "expire": 1363849143.776224,
 "user": "saltuser",
 "eauth": "pam",
 "perms": [
 "grains.*",
 "status.*",
 "sys.*",
 "test.*"
]
}}
```

## /logout

### class salt.netapi.rest\_cherry.py.app.Logout

Class to remove or invalidate sessions

#### POST()

Destroy the currently active session and expire the session cookie

## /minions

### class salt.netapi.rest\_cherry.py.app.Minions

Convenience URLs for working with minions

#### GET (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

#### GET /minions/ (*mid*)

##### Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

##### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
 grains.items:
 ...
```

#### POST (*\*\*kwargs*)

Start an execution command and immediately return the job id

#### POST /minions

##### Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

##### Response Headers

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

##### Status Codes

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
 -b ~/cookies.txt \
 -H "Accept: application/x-yaml" \
 -d '["tgt": "*", "fun": "status.diskusage"]'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
 minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
 _links:
 jobs:
 - href: /jobs/20130603122505459265
```

## /jobs

**class** salt.netapi.rest\_cherry.py.app.**Jobs**

**GET** (*jid=None, timeout=""*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET** /jobs/ (*jid*)

List jobs or show a single job from the job cache.

**Request Headers**

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
 Arguments:
 - '3'
 Function: test.fib
 Start Time: 2012, Nov 30 10:46:33.606931
 Target: jerry
 Target-type: glob
```

**Example request:**

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
 - '3'
 Function: test.fib
 Minions:
 - jerry
 Start Time: 2012, Nov 30 10:46:33.606931
 Target: '*'
 Target-type: glob
 User: saltdev
 jid: '20121130104633606931'
return:
- jerry:
 - - 0
 - 1
 - 1
 - 2
 - 6.9141387939453125e-06
```

**/run****class** salt.netapi.rest\_cherrypy.app.Run

Run commands bypassing the *normal session handling*

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest\_cherry.py simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the `mk_token` function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

#### POST ( *\*\*kwargs* )

Run commands bypassing the *normal session handling* Other than that this URL is identical to the *root URL* (/).

#### POST /run

An array of lowstate data describing Salt commands must be sent in the request body.

##### Status Codes

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

#### Example request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
 "client": "local",
 "tgt": "*",
 "fun": "test.ping",
 "username": "saltdev",
 "password": "saltdev",
 "eauth": "auto"
}]'
```

#### Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
 "client": "local",
 "tgt": "*",
 "fun": "test.ping",
 "token": "<salt eauth token here>"
}]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username": "saltdev",
→ "password": "saltdev", "eauth": "auto"}]
```

#### Example response:

```

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
 ms-1: true
 ms-2: true
 ms-3: true
 ms-4: true

```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

#### Example SSH client request:

```

curl -sS localhost:8000/run \
 -H 'Accept: application/x-yaml' \
 -d client='ssh' \
 -d tgt='*' \
 -d fun='test.ping'

```

```

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=ssh&tgt=*&fun=test.ping

```

#### Example SSH response:

```

return:
- silver:
 fun: test.ping
 fun_args: []
 id: silver
 jid: '20141203103525666185'
 retcode: 0
 return: true
 success: true

```

## /events

### **class** salt.netapi.rest\_cherry.py.app.Events

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

*Events & Reactor***GET** (*token=None, salt\_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

**GET /events**

## Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

## Query Parameters

- **token** – **optional** parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt\_token** – **optional** parameter containing a raw Salt *eauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

## Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

## Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4
→', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid':
→'20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd
→': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
 var saltEvent = JSON.parse(message.data);
```

(continues on next page)

(continued from previous page)

```

 console.log(saltEvent.tag, saltEvent.data);
};

```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream `_before_` creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available [adjacent to this file](#). It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherryypy` instance.

Or using CORS:

```

var source = new EventSource('/events?
↳token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});

```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```

curl -NsS localhost:8000/events | \
 while IFS= read -r line ; do
 echo $line
 done

```

Here is an example of using `awk` to filter events based on tag:

```

curl -NsS localhost:8000/events | \
 awk '
 BEGIN { RS=""; FS="\n" }
 $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
 '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
↳", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_
↳01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions
↳": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
↳"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
↳": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
↳"id": "jerry"}}

```

## /hook

### class salt.netapi.rest\_cherry.py.app.Webhook

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

---

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

**This is a generic interface and securing it is up to you!**

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices – always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

---

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
 - |
 curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"
```

See also:

*Events & Reactor, reactor*

### POST (\*args, \*\*kwargs)

Fire an event in Salt with a custom event tag and data

#### POST /hook

##### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available
- **413** – request body is too large

Example request:

```
curl -sS localhost:8000/hook \
 -H 'Content-type: application/json' \
 -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
```

(continues on next page)

(continued from previous page)

```
Content-Type: application/json
{"foo": "Foo!", "bar": "Bar!"}
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json
{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014

Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
 'headers': {
 'X-My-Secret-Key': 'F0fAgoQjIT@W',
 'Content-Length': '37',
 'Content-Type': 'application/json',
 'Host': 'localhost:8000',
 'Remote-Addr': '127.0.0.1'},
 'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
 cmd.state.sls:
 - tgt: 'application*'
 - arg:
 - myapp.deploy
 - kwarg:
 pillar:
 revision: {{ revision }}
{% endif %}
```

## /keys

### class salt.netapi.rest\_cherrypy.app.Keys

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

#### GET (*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

#### GET /keys/ (*mid*)

List all keys or show a specific key

##### Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

##### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
 local:
 - master.pem
 - master.pub
 minions:
 - jerry
 minions_pre: []
 minions_rejected: []
```

Example request:

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
 minions:
 jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b

```

**POST** (*\*\*kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the *key.gen\_accept*.

---

**Note:** A note about curl Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

---

Example partial kickstart script to bootstrap a new minion:

```

%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
 -d mid=jerry \
 -d username=kickstart \
 -d password=kickstart \
 -d eauth=pam \
 | tar -C /etc/salt/pki/minion -xf -

mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end

```

**POST** /keys

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```

curl -sSk https://localhost:8000/keys \
 -d mid=jerry \
 -d username=kickstart \
 -d password=kickstart \
 -d eauth=pam \
 -o jerry-salt-keys.tar

```

```

POST /keys HTTP/1.1
Host: localhost:8000

```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 10240

```

(continues on next page)

(continued from previous page)

```
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub00000644000000000000000000000000000000000000703000000000000010730 0ustar ☒
->0000000000000000
```

**/ws****class** salt.netapi.rest\_cherry.py.app.**WebSocketEndpoint**

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

*Events & Reactor***GET** (*token=None, \*\*kwargs*)

Return a websocket connection of Salt's event stream

**GET** **/ws/** (*token*)

**Query format\_events** The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

**Reqheader X-Auth-Token** an authentication token from *Login*.**Status 101** switching to the websockets protocol**Status 401** authentication required**Status 406** requested Content-Type not available**Example request:**

```
curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: "$(echo -n $RANDOM | base64)" \
localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

**Example response:**

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```
Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

Look at https://pypi.python.org/pypi/websocket-client/ for more
examples.
while listening_to_events:
 print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

## /stats

### class salt.netapi.rest\_cherry.py.app.Stats

Expose statistics on the running CherryPy server

#### GET()

Return a dump of statistics collected from the CherryPy server

#### GET /stats

##### Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

##### Response Headers

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

#### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

## 21.10.2 rest\_tornado

### A non-blocking REST API for Salt

#### depends

- tornado Python module

**configuration** All authentication is done through Salt's *external auth* system which requires additional configuration not described here.

In order to run `rest_tornado` with the salt-master add the following to the Salt master config file.

```
rest_tornado:
 # can be any port
 port: 8000
 # address to bind to (defaults to 0.0.0.0)
 address: 0.0.0.0
 # socket backlog
 backlog: 128
 ssl_cert: /etc/pki/api/certs/server.crt
 # no need to specify ssl_key if cert and key
 # are in one single file
 ssl_key: /etc/pki/api/certs/server.key
 debug: False
 disable_ssl: False
 webhook_disable_auth: False
 cors_origin: null
```

### Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *SaltAuthHandler* URL.

The token may be sent in one of two ways:

- Include a custom header named *X-Auth-Token*.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the *RunSaltAPIHandler* URL.

### CORS

`rest_tornado` supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the *cors\_origin* config key.

You can allow all origins by settings *cors\_origin* to `*`.

You can allow only one origin with this configuration:

```
rest_tornado:
 cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
 cors_origin:
 - http://salt.yourcompany.com
 - http://salt-preprod.yourcompany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, `rest_tornado` will check if the Origin header is in the allowed list if it's the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It's complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

## Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

### Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

Data sent in `POST` and `PUT` requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

**lowstate** A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the *LocalClient()* Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```
[{
 "client": "local",
 "tgt": "*",
 "fun": "test.fib",
 "arg": ["10"]
},
{
 "client": "runner",
 "fun": "jobs.lookup_jid",
 "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no gaurantees that all commands will run. Meaning that if test.fib (from the example above) had an exception, the API would still execute "jobs.lookup\_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
 ms-2: true
- ms-1: foo
 ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
 ms-2: true
```

---

### x-www-form-urlencoded

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the **curl** command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one`, `arg=two` will be sent as `arg[]=one`, `arg[]=two`. This is not supported; send JSON or YAML instead.

---

## A Websockets add-on to saltnado

### depends

- tornado Python module

In order to enable `saltnado_websockets` you must add `websockets: True` to your saltnado config block.

```
rest_tornado:
 # can be any port
 port: 8000
 ssl_cert: /etc/pki/api/certs/server.crt
 # no need to specify ssl_key if cert and key
 # are in one single file
 ssl_key: /etc/pki/api/certs/server.key
 debug: False
 disable_ssl: False
 websockets: True
```

## All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -s localhost:8000/login \
 -H "Accept: application/json" \
 -d username='salt' \
 -d password='salt' \
 -d eauth='pam'
```

Which results in the response

```
{
 "return": [{
 "perms": [".*", "@runner", "@wheel"],
 "start": 1400556492.277421,
 "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
 "expire": 1400599692.277422,
 "user": "salt",
 "eauth": "pam"
 }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado client`.

```

Note, you must be authenticated!

from websocket import create_connection

Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

Get Salt's "real time" event stream.
ws.send('websocket client ready')

Simple listener to print results of Salt's "real time" event stream.
Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
 print ws.recv() # Salt's "real time" event data as serialized JSON.

Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

Please refer to https://github.com/liris/websocket-client/issues/81 when using a
↳self signed cert

```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

### Formatted Events

Exposes formatted "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```

% curl -si localhost:8000/login \
 -H "Accept: application/json" \
 -d username='salt' \
 -d password='salt' \
 -d eauth='pam'

```

Which results in the response

```
{
 "return": [{
 "perms": [".*", "@runner", "@wheel"],
 "start": 1400556492.277421,
 "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
 "expire": 1400599692.277422,
 "user": "salt",
 "eauth": "pam"
 }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```
Note, you must be authenticated!

from websocket import create_connection

Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

Get Salt's "real time" event stream.
ws.send('websocket client ready')

Simple listener to print results of Salt's "real time" event stream.
Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
 print ws.recv() # Salt's "real time" event data as serialized JSON.

Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

Please refer to https://github.com/liris/websocket-client/issues/81 when using a
↳self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

### Example responses

Minion information is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
  - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minion removal

```
Not all grains are shown
data: {
 "minions": {
 "minion1": {
 "id": "minion1",
 "grains": {
 "kernel": "Darwin",
 "domain": "local",
 "zmqversion": "4.0.3",
 "kernelrelease": "13.2.0"
 }
 }
 }
}
```

Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
 "jobs": {
 "20140609153646699137": {
 "tgt_type": "glob",
 "jid": "20140609153646699137",
 "tgt": "*",
 "start_time": "2014-06-09T15:36:46.700315",
 "state": "complete",
 "fun": "test.ping",
 "minions": {
 "minion1": {
 "return": true,
 "retcode": 0,
 "success": true
 }
 }
 }
 }
}
```

## Setup

### REST URI Reference

- /
- /login
- /minions
- /jobs
- /run
- /events
- /hook

/

```
class salt.netapi.rest_tornado.saltornado.SaltAPIHandler(application, request,
**kwargs)
```

Main API handler for base "/"

**dispatch()**

Dispatch all lowstates to the appropriate clients

**get()**

An endpoint to determine salt-api capabilities

**GET /**

Request Headers

- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 83

{"clients": ["local", "local_async", "runner", "runner_async"], "return":
 ↳ "Welcome"}
```

**post()**

Send one or more Salt commands (lowstates) in the request body

**POST /**

## Request Headers

- **X-Auth-Token** – a session token from *SaltAuthHandler*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

## Response Headers

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

## Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

*lowstate* data describing Salt commands must be sent in the request body.

**Example request:**

```
curl -si https://localhost:8000 \
 -H "Accept: application/x-yaml" \
 -H "X-Auth-Token: d40d1e1e" \
 -d client=local \
 -d tgt='*' \
 -d fun='test.ping' \
 -d arg
```

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Length: 36
Content-Type: application/x-www-form-urlencoded

fun=test.ping&arg&client=local&tgt=*
```

**Example response:**

Responses are an in-order list of the *lowstate*'s return data. In the event of an exception running a command the return will be a string instead of a mapping.

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
 ms-1: true
 ms-2: true
 ms-3: true
 ms-4: true
```

---

**multiple commands**

Note that if multiple *lowstate* structures are sent, the Salt API will execute them in serial, and will not stop execution upon failure of a previous job. If you need to have commands executed in order and stop on failure please use compound-command-execution.

---

## /login

**class** salt.netapi.rest\_tornado.saltornado.**SaltAuthHandler**(*application*, *request*, *\*\*kwargs*)

Handler for login requests

### get()

All logins are done over post, this is a parked endpoint

#### GET /login

Status Codes

- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 401 Unauthorized
Content-Type: application/json
Content-Length: 58

{"status": "401 Unauthorized", "return": "Please log in"}
```

### post()

*Authenticate* against Salt's eauth system

#### POST /login

Request Headers

- **X-Auth-Token** – a session token from *SaltAuthHandler*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

Form Parameters

- **eauth** – the eauth backend configured for the user
- **username** – username
- **password** – password

Status Codes

- **200** – success
- **400** – bad request
- **401** – authentication required
- **406** – requested Content-Type not available
- **500** – internal server error

Example request:

```
curl -si localhost:8000/login \
-H "Accept: application/json" \
-d username='saltuser' \
-d password='saltpass' \
-d eauth='pam'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/x-www-form-urlencoded
Accept: application/json

username=saltuser&password=saltpass&eauth=pam
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;␣
↳Path=/

{"return": {
 "token": "6d1b722e",
 "start": 1363805943.776223,
 "expire": 1363849143.776224,
 "user": "saltuser",
 "eauth": "pam",
 "perms": [
 "grains.*",
 "status.*",
 "sys.*",
 "test.*"
]
}}
```

**/minions**

**class** salt.netapi.rest\_tornado.saltnado.**MinionSaltAPIHandler** (*application, request, \*\*kwargs*)

A convenience endpoint for minion related functions

**get** (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

**GET** **/minions/** (*mid*)

Request Headers

- **X-Auth-Token** – a session token from *SaltAuthHandler*.
- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```

HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
 grains.items:
 ...

```

**post()**

Start an execution command and immediately return the job id

**POST /minions****Request Headers**

- **X-Auth-Token** – a session token from *SaltAuthHandler*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

**Response Headers**

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

*lowstate* data describing Salt commands must be sent in the request body. The *client* option will be set to `local_async()`.

**Example request:**

```

curl -sSi localhost:8000/minions \
-H "Accept: application/x-yaml" \
-d tgt='*' \
-d fun='status.diskusage'

```

```

POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 26
Content-Type: application/x-www-form-urlencoded

tgt=*&fun=status.diskusage

```

**Example response:**

```

HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
 minions: [ms-4, ms-3, ms-2, ms-1, ms-0]

```

## /jobs

**class** salt.netapi.rest\_tornado.saltnado.**JobsSaltAPIHandler** (*application*, *request*, *\*\*kwargs*)

A convenience endpoint for job cache data

**get** (*jid=None*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET /jobs/ (*jid*)**

List jobs or show a single job from the job cache.

**Status Codes**

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
 Arguments:
 - '3'
 Function: test.fib
 Start Time: 2012, Nov 30 10:46:33.606931
 Target: jerry
 Target-type: glob
```

**Example request:**

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
 - '3'
 Function: test.fib
```

(continues on next page)

(continued from previous page)

```

Minions:
- jerry
Start Time: 2012, Nov 30 10:46:33.606931
Target: '*'
Target-type: glob
User: saltdev
jid: '201211130104633606931'
return:
- jerry:
 - - 0
 - 1
 - 1
 - 2
 - 6.9141387939453125e-06

```

## /run

**class** salt.netapi.rest\_tornado.saltnado.**RunSaltAPIHandler**(*application*, *request*, *\*\*kwargs*)

Endpoint to run commands without normal session handling

### post()

Run commands bypassing the *normal session handling*

### POST /run

This entry point is primarily for "one-off" commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the root URL (/).

*lowstate* data describing Salt commands must be sent in the request body.

#### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```

curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='local' \
-d tgt='*' \
-d fun='test.ping' \
-d username='saltdev' \
-d password='saltdev' \
-d eauth='pam'

```

```

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=local&tgt=*&fun=test.ping&username=saltdev&password=saltdev&eauth=pam

```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
 ms-1: true
 ms-2: true
 ms-3: true
 ms-4: true

```

## /events

**class** salt.netapi.rest\_tornado.saltnado.**EventsSaltAPIHandler** (*application, request, \*\*kwargs*)

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

[Events & Reactor](#)

### get()

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

### GET /events

#### Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

```

HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400
data: {'tag': '', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0
→ ']}}

data: {'tag': '20130802115730568475', 'data': {'jid': '20130802115730568475',
→ 'return': True, 'retcode': 0, 'success': True, 'cmd': '_return', 'fun':
→ 'test.ping', 'id': 'ms-1'}}

```

The event stream can be easily consumed via JavaScript:

```
<!-- Note, you must be authenticated! -->
var source = new EventSource('/events');
source.onopen = function() { console.debug('opening') };
source.onerror = function(e) { console.debug('error!', e) };
source.onmessage = function(e) { console.debug(e.data) };
```

Or using CORS:

```
var source = new EventSource('/events', {withCredentials: true});
```

Some browser clients lack CORS support for the EventSource() API. Such clients may instead pass the *X-Auth-Token* value as an URL parameter:

```
curl -NsS localhost:8000/events/6d1b722e
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the *data:* and *tag:* prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's *-N* flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
 while IFS= read -r line ; do
 echo $line
 done
```

Here is an example of using *awk* to filter events based on tag:

```
curl -NsS localhost:8000/events | \
 awk '
 BEGIN { RS=""; FS="\n" }
 $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
 '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
↪", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_
↪01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions
↪": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
↪"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
↪": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
↪"id": "jerry"}}
```

## /hook

**class** salt.netapi.rest\_tornado.saltnado.WebhookSaltAPIHandler (*application, request, \*\*kwargs*)

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

**This is a generic interface and securing it is up to you!**

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices – always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
 - 'curl -sS http://saltapi-url.example.com:8000/hook/travis/build/success -d
 ↪branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"'
```

See also:

*Events, Reactor*

**post** (*tag\_suffix=None*)

Fire an event in Salt with a custom event tag and data

**POST /hook**

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available
- **413** – request body is too large

Example request:

```
curl -sS localhost:8000/hook -d foo='Foo!' -d bar='Bar!'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/x-www-form-urlencoded

foo=Foo&bar=Bar!
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `http://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014

Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
 'headers': {
 'X-My-Secret-Key': 'F0fAgoQjIT@W',
 'Content-Length': '37',
 'Content-Type': 'application/json',
 'Host': 'localhost:8000',
 'Remote-Addr': '127.0.0.1'},
 'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- salt/netapi/hook/mycompany/build/*:
 - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
 cmd.state.sls:
 - tgt: 'application*'
 - arg:
 - myapp.deploy
 - kwarg:
 pillar:
 revision: {{ revision }}
{% endif %}
```

### 21.10.3 rest\_wsgi

#### A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

#### Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.

- All responses are in JSON.

See also:

[rest\\_cherry.py](#)

The `rest_cherry.py` module is more full-featured, production-ready, and has builtin security features.

## Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

### Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with `mod_wsgi` or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

### salt-api using a development-only server

If run directly via the `salt-api` daemon it uses the `wsgiref.simple_server()` that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption;** please note that raw Salt authentication credentials must be sent with every HTTP request.

#### Running this module via salt-api is not recommended!

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
 port: 8001
```

## Usage examples

### POST /

Example request for a basic `test.ping`:

```
% curl -sS -i \
 -H 'Content-Type: application/json' \
 -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
 ↪"local","tgt":"*","fun":"test.ping}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": ↪
 ↪true}]}
```

Example request for an asynchronous `test.ping`:

```
% curl -sS -i \
 -H 'Content-Type: application/json' \
 -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
 ↪"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2",
 ↪ "ms--1", "ms--0"]}]}
```

Example request for looking up a job ID:

```
% curl -sS -i \
 -H 'Content-Type: application/json' \
 -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
 ↪"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
 ↪true}]}
```

**form lowstate** A list of lowstate data appropriate for the *client* interface you are calling.

**status 200** success

**status 401** authentication required

## 21.11 output modules

Follow one of the below links for further information and examples

<a href="#"><i>highstate</i></a>	Outputter for displaying results of state runs
<a href="#"><i>json_out</i></a>	Display return data in JSON format
<a href="#"><i>key</i></a>	Display salt-key output
<a href="#"><i>nested</i></a>	Recursively display nested data
<a href="#"><i>newline_values_only</i></a>	Display values only, separated by newlines
<a href="#"><i>no_out_quiet</i></a>	Display no output
<a href="#"><i>no_return</i></a>	Display output for minions that did not return
<a href="#"><i>overstatestage</i></a>	Display clean output of an overstate stage
<a href="#"><i>pony</i></a>	Display Pony output data structure
<a href="#"><i>pprint_out</i></a>	Python pretty-print (pprint)
<a href="#"><i>profile</i></a>	Display profiling data in a table format
<a href="#"><i>progress</i></a>	Display return data as a progress bar
<a href="#"><i>raw</i></a>	Display raw output data structure

Continued on next page

Table 11 – continued from previous page

<code>table_out</code>	Display output in a table format
<code>txt</code>	Simple text outputter
<code>virt_query</code>	virt.query outputter
<code>yaml_out</code>	Display return data in YAML format

### 21.11.1 salt.output.highstate

#### Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

**state\_verbose** By default `state_verbose` is set to `True`, setting this to `False` will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of `True` and no changes will not be printed

**state\_output**: The highstate outputter has six output modes, `full`, `terse`, `mixed`, `changes` and `filter`

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
  - for `exclude`, `state.highstate` expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: `exclude=True,`
  - for `terse`, `state.highstate` expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

The output modes have one modifier:

`full_id`, `terse_id`, `mixed_id`, `changes_id` and `filter_id` If `_id` is used, then the corresponding form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

**state\_tabular**: If `state_output` uses the terse output, set this to `True` for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If `state_output`: `filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None, True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:
Summary for twd

Succeeded: 1 (changed=1)
Failed: 0

Total states run: 1
```

Example output with no special settings in configuration files:

```
myminion:

 ID: test.ping
 Function: module.run
 Result: True
 Comment: Module function test.ping executed
 Changes:

 ret:
 True

Summary for myminion

Succeeded: 1
Failed: 0

Total: 0
```

`salt.output.highstate.output(data, **kwargs)`

The HighState Outputter is only meant to be used with the `state.highstate` function, or a function that returns highstate return data.

### 21.11.2 salt.output.json\_out

#### Display return data in JSON format

**configuration** The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

CLI Example:

```
salt '*' foo.bar --out=json
```

```
salt.output.json_out.output(data, **kwargs)
 Print the output data in JSON
```

### 21.11.3 salt.output.key

#### Display salt-key output

The salt-key command makes use of this outputter to format its output.

```
salt.output.key.output(data, **kwargs)
 Read in the dict structure generated by the salt key API methods and print the structure.
```

### 21.11.4 salt.output.nested

#### Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:

 foo:

 bar:
 baz
 dictionary:

 abc:
 123
 def:
 456
 list:
 - Hello
 - World
```

```
class salt.output.nested.NestDisplay(retcode=0)
 Manage the nested display contents
display(ret, indent, prefix, out)
 Recursively iterate down through data structures to determine output
```

**ustring**(*indent, color, msg, prefix=*, *suffix=*, *endc=None*)

`salt.output.nested.output`(*ret, \*\*kwargs*)  
Display ret data

### 21.11.5 salt.output.newline\_values\_only

#### Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`, or `yaml`) may be more suitable.

#### Example 1

```
salt '*' foo.bar --out=newline_values_only
```

#### Input

```
{
 'myminion': ['127.0.0.1', '10.0.0.1'],
 'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

#### Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

#### Example 2

```
salt '*' foo.bar --out=newline_values_only
```

## Input

```
{
 'myminion': 8,
 'second-minion': 10
}
```

## Output

```
8
10
```

`salt.output.newline_values_only.output(data, **kwargs)`  
Display modified ret data

### 21.11.6 salt.output.no\_out\_quiet

#### Display no output

No output is produced when this outputter is selected

CLI Example:

```
salt '*' foo.bar --out=quiet
```

`salt.output.no_out_quiet.output(ret, **kwargs)`  
Don't display data. Used when you only are interested in the return.

### 21.11.7 salt.output.no\_return

#### Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
 Minion did not return
```

#### **class** salt.output.no\_return.NestDisplay

Create generator for nested output

**display**(ret, indent, prefix, out)

Recursively iterate down through data structures to determine output

`salt.output.no_return.output(ret, **kwargs)`

Display ret data

### 21.11.8 salt.output.overstatestage

#### Display clean output of an overstate stage

This outputter is used to display *Orchestrate Runner* stages, and should not be called directly.

```
salt.output.overstatestage.output(data, **kwargs)
```

Format the data for printing stage information from the overstate system

### 21.11.9 salt.output.pony module

#### Display Pony output data structure

**depends**

- ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

CLI Example:

```
salt '*' foo.bar --out=pony
```

```
salt.output.pony.output(data, **kwargs)
```

Mane function

### 21.11.10 salt.output.pprint\_out

#### Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

CLI Example:

```
salt '*' foo.bar --out=pprint
```

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
 'dictionary': {'abc': 123, 'def': 456},
 'list': ['Hello', 'World']}}}
```

`salt.output.pprint_out.output(data, **kwargs)`  
Print out via pretty print

### 21.11.11 salt.output.profile

#### Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

CLI Example:

```
salt '*' state.apply something --out=profile
```

Attempt to output the returns of `state.sls` and `state.highstate` as a table of names, modules and durations that looks somewhat like the following:

name	mod.fun	duration (ms)
I-fail-unless-stmt	other.function	-1.0000
old-minion-config	grains.list_present	1.1200
salt-data	group.present	48.3800
/etc/salt/minion	file.managed	63.1450

To get the above appearance, use settings something like these:

```
out.table.separate_rows: False
out.table.justify: left
out.table.delim: ' '
out.table.prefix: ''
out.table.suffix: ''
```

`salt.output.profile.output(data, **kwargs)`  
Display the profiling data in a table format.

### 21.11.12 salt.output.progress

Display return data as a progress bar

`salt.output.progress.output`(*ret, bar, \*\*kwargs*)  
Update the progress bar

`salt.output.progress.progress_iter`(*progress*)  
Initialize and return a progress bar iter

### 21.11.13 salt.output.raw

#### Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

CLI Example:

```
salt '*' foo.bar --out=raw
```

Example output:

```
salt '*' foo.bar --out=table
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 123, 'def': 456}}}}
```

`salt.output.raw.output`(*data, \*\*kwargs*)  
Rather basic...

### 21.11.14 salt.output.table\_out

#### Display output in a table format

New in version 2017.7.0.

The `table` outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:

comment:

out:

| Active | Interface | Last Move | Mac | Moves | Static | Vlan |
-----|-----|-----|-----|-----|-----|-----|
| True | ae1.900 | 0.0 | 40:A6:77:5A:50:01 | 0 | False | 111 |
-----|-----|-----|-----|-----|-----|
| True | ae1.111 | 0.0 | 64:16:8D:32:26:58 | 0 | False | 111 |
-----|-----|-----|-----|-----|-----|
| True | ae1.111 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False | 111 |
-----|-----|-----|-----|-----|-----|
| True | ae1.111 | 0.0 | 8C:60:4F:73:2D:7C | 0 | False | 111 |
-----|-----|-----|-----|-----|-----|
| True | ae1.222 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False | 222 |
-----|-----|-----|-----|-----|-----|
```

(continues on next page)

(continued from previous page)

```

| True | ae1.222 | 0.0 | F4:0F:1B:76:9D:97 | 0 | False | 222 |

result:

```

CLI Example:

```
salt '*' foo.bar --out=table
```

```
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-', delim='|',
 justify='center', separate_rows=True, prefix='|',
 suffix='|', width=50, wrapfunc=None)
```

Manage the table display content.

**display**(ret, indent, out, rows\_key=None, labels\_key=None)  
Display table(s).

**display\_rows**(rows, labels, indent)  
Prepares row content and displays.

**prepare\_rows**(rows, indent, has\_header)  
Prepare rows content to be displayed.

**ustring**(indent, color, msg, prefix="", suffix="", endc=None)  
Build the unicode string to be displayed.

**wrap\_onspace**(text)  
When the text inside the column is longer then the width, will split by space and continue on the next line.

salt.output.table\_out.**output**(ret, \*\*kwargs)

Display the output as table.

Parameters

- **nested\_indent**(\*) – integer, specify the left alignment.
- **has\_header**(\*) – boolean specifying if header should be displayed. Default: True.
- **row\_delimiter**(\*) – character to separate rows. Default: \_.
- **delim**(\*) – character to separate columns. Default: " | ".
- **justify**(\*) – text alignment. Default: center.
- **separate\_rows**(\*) – boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **prefix**(\*) – character at the beginning of the row. Default: " | ".
- **suffix**(\*) – character at the end of the row. Default: " | ".
- **width**(\*) – column max width. Default: 50.
- **rows\_key**(\*) – display the rows under a specific key.
- **labels\_key**(\*) – use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title**(\*) – display title when only one table is selected (using the rows\_key argument).

### 21.11.15 salt.output.txt

#### Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

CLI Example:

```
salt '*' foo.bar --out=txt
```

`salt.output.txt.output`(*data*, *\*\*kwargs*)  
Output the data in lines, very nice for running commands

### 21.11.16 salt.output.virt\_query

#### virt.query outputter

Used to display the output from the `virt.query` runner.

`salt.output.virt_query.output`(*data*, *\*\*kwargs*)  
Display output for the salt-run virt.query function

### 21.11.17 salt.output.yaml\_out

#### Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

CLI Example:

```
salt '*' foo.bar --out=yaml
```

Example output:

CLI Example:

```
saltmine:
 foo:
 bar: baz
 dictionary:
 abc: 123
 def: 456
 list:
 - Hello
 - World
```

`salt.output.yaml_out.output`(*data*, *\*\*kwargs*)  
Print out YAML using the block mode

## 21.12 pillar modules

<code>cmd_json</code>	Execute a command and read the output as JSON.
<code>cmd_yaml</code>	Execute a command and read the output as YAML.
<code>cmd_yamllex</code>	Execute a command and read the output as YAMLEX.
<code>cobbler</code>	A module to pull data from Cobbler via its API into the Pillar dictionary

Continued on next page

Table 12 – continued from previous page

<i>confidant</i>	An external pillar module for getting credentials from confidant.
<i>consul_pillar</i>	Use Consul K/V as a Pillar source with values parsed as YAML
<i>csvpillar</i>	Store key/value pairs in a CSV file
<i>digicert</i>	Digicert Pillar Certificates
<i>django_orm</i>	Generate Pillar data from Django models through the Django ORM
<i>ec2_pillar</i>	Retrieve EC2 instance data for minions for <code>ec2_tags</code> and <code>ec2_tags_list</code>
<i>etcd_pillar</i>	Use etcd data as a Pillar source
<i>file_tree</i>	The <code>file_tree</code> external pillar allows values from all files in a directory tree to be imported as Pillar data.
<i>foreman</i>	A module to pull data from Foreman via its API into the Pillar dictionary
<i>git_pillar</i>	Use a git repository as a Pillar source
<i>gpg</i>	Decrypt pillar data through the builtin GPG renderer
<i>hg_pillar</i>	Use remote Mercurial repository as a Pillar source.
<i>hiera</i>	Use hiera data as a Pillar source
<i>http_json</i>	A module that adds data to the Pillar structure retrieved by an http request
<i>http_yaml</i>	A module that adds data to the Pillar structure retrieved by an http request
<i>libvirt</i>	Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner
<i>makostack</i>	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
<i>mongo</i>	Read Pillar data from a mongodb collection
<i>mysql</i>	Retrieve Pillar data by doing a MySQL query
<i>netbox</i>	A module that adds data to the Pillar structure from a NetBox API.
<i>neutron</i>	Use Openstack Neutron data as a Pillar source.
<i>nodegroups</i>	Nodegroups Pillar
<i>pepa</i>	Pepa
<i>pillar_ldap</i>	Use LDAP data as a Pillar source
<i>postgres</i>	Retrieve Pillar data by doing a postgres query
<i>puppet</i>	Execute an unmodified puppet_node_classifier and read the output as YAML.
<i>reclass_adapter</i>	Use the "reclass" database as a Pillar source
<i>redismod</i>	Read pillar data from a Redis backend
<i>s3</i>	Copy pillar data from a bucket in Amazon S3
<i>saltclass</i>	SaltClass Pillar Module
<i>sql_base</i>	Retrieve Pillar data by doing a SQL query
<i>sqlcipher</i>	Retrieve Pillar data by running a SQLCipher query
<i>sqlite3</i>	Retrieve Pillar data by doing a SQLite3 query
<i>stack</i>	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
<i>svn_pillar</i>	Clone a remote SVN repository and use the filesystem as a Pillar source
<i>varstack_pillar</i>	Use <code>Varstack</code> data as a Pillar source

Continued on next page

Table 12 – continued from previous page

<code>vault</code>	Vault Pillar Module
<code>venafi</code>	Venafi Pillar Certificates
<code>virtkey</code>	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
<code>vmware_pillar</code>	Pillar data from vCenter or an ESXi host

### 21.12.1 salt.pillar.cmd\_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.cmd_json.ext_pillar` (*minion\_id, pillar, command*)

Execute a command and read the output as JSON

### 21.12.2 salt.pillar.cmd\_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yaml.ext_pillar` (*minion\_id, pillar, command*)

Execute a command and read the output as YAML

### 21.12.3 salt.pillar.cmd\_yamllex

Execute a command and read the output as YAMLEX.

The YAMLEX data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yamllex.ext_pillar` (*minion\_id, pillar, command*)

Execute a command and read the output as YAMLEX

### 21.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

#### Configuring the Cobbler ext\_pillar

The same cobbler.\* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```

ext_pillar:
- cobbler:
 key: cobbler # Nest results within this key. By default, values are not nested.
 only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password

```

## Module Documentation

`salt.pillar.cobbler.ext_pillar` (*minion\_id*, *pillar*, *key=None*, *only=()*)  
Read pillar data from Cobbler via its API.

### 21.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

#### Configuring the Confidant module

The module can be configured via `ext_pillar` in the minion config:

```
ext_pillar:
```

- `confidant`:

```
 profile: # The URL of the confidant web service url: 'https://confidant-production.example.com'
 # The context to use for KMS authentication auth_context: from: example-production-
 iad to: confidant-production-iad user_type: service # The KMS master key to use for au-
 thentication auth_key: "alias/authnz" # Cache file for KMS auth token token_cache_file:
 /run/confidant/confidant_token # The duration of the validity of a token, in minutes to-
 ken_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally
 best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk
 key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1
```

```
 depends confidant-common, confidant-client
```

## Module Documentation

`salt.pillar.confidant.ext_pillar` (*minion\_id*, *pillar*, *profile=None*)  
Read pillar data from Confidant via its API.

### 21.12.6 salt.pillar.consul\_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

```
depends
```

- `python-consul`

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
 consul.host: 127.0.0.1
 consul.port: 8500
 consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
 consul.scheme: http
 consul.consistency: default
 consul.dc: dev
 consul.verify: True
```

All parameters are optional.

The `consul.token` requires `python-consul >= 0.4.7`.

If you have a multi-datacenter Consul cluster you can map your `pillarenv`s` to your data centers by providing a dictionary of mappings in `consul.dc` field:

```
my_consul_config:
 consul.dc:
 dev: us-east-1
 prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
 consul.dc:
 ^dev-.*$: dev-datacenter
 ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
 consul.dc:
 ^(?P<env>.*): '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
 - consul: my_consul_config

ext_pillar:
 - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
 - consul: my_consul_config
 - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
 - consul: my_consul_config root=salt/%(minion_id)s
 - consul: my_consul_config root=salt/%(role)s
 - consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```

ext_pillar:
 - consul: my_consul_config root=salt-shared
 - consul: my_other_consul_config root=salt-private/%(minion_id)s

```

If using the role or environment grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```

role: my-minion-role
environment: dev

```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```

ext_pillar:
 - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"

```

The data from Consul can be merged into a nested key in Pillar.

```

ext_pillar:
 - consul: my_consul_config pillar_root=consul_data

```

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting `expand_keys` to `false`.

```

ext_pillar:
 - consul: my_consul_config expand_keys=false

```

`salt.pillar.consul_pillar.consul_fetch(client, path)`  
Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`  
Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path, expand_keys)`  
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`  
Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value, expand_keys)`  
Perform data formatting to be used as pillar data and merge it with the current pillar data

### 21.12.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```

ext_pillar:
 - csv: /path/to/file.csv

or

ext_pillar:

```

(continues on next page)

(continued from previous page)

```
- csv:
 path: /path/to/file.csv
 namespace: 'subkey'
 fieldnames:
 - col1
 - col2
 - col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named "jerry":

```
{
 'role': 'web',
 'env': 'prod',
}
```

`salt.pillar.csvpillar.ext_pillar` (*mid*, *pillar*, *path*, *idkey='id'*, *namespace=None*, *fieldnames=None*, *restkey=None*, *restval=None*, *dialect='excel'*)

Read a CSV into Pillar

#### Parameters

- **path** (*str*) – Absolute path to a CSV file.
- **idkey** (*str*) – (Optional) The column name of minion IDs.
- **namespace** (*str*) – (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) – (Optional) if the first row of the CSV is not column names they may be specified here instead.

## 21.12.8 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
 - digicert: True
```

`salt.pillar.digicert.ext_pillar` (*minion\_id*, *pillar*, *conf*)

Return an existing set of certificates

## 21.12.9 salt.pillar.django\_orm

Generate Pillar data from Django models through the Django ORM

**maintainer** Micah Hausler <micah.hausler@gmail.com>

**maturity** new

### Configuring the `django_orm` `ext_pillar`

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```

ext_pillar:
- django_orm:
 pillar_name: my_application
 project_path: /path/to/project/
 settings_module: my_application.settings
 env_file: /path/to/env/file.sh
 # Optional: If your project is not using the system python,
 # add your virtualenv path below.
 env: /path/to/virtualenv/

 django_app:

 # Required: the app that is included in INSTALLED_APPS
 my_application.clients:

 # Required: the model name
 Client:

 # Required: model field to use as the key in the rendered
 # Pillar. Must be unique; must also be included in the
 # ``fields`` list below.
 name: shortname

 # Optional:
 # See Django's QuerySet documentation for how to use .filter()
 filter: {'kw': 'args'}

 # Required: a list of field names
 # List items will be used as arguments to the .values() method.
 # See Django's QuerySet documentation for how to use .values()
 fields:
 - field_1
 - field_2

```

This would return pillar data that would look like

```

my_application:
 my_application.clients:
 Client:
 client_1:
 field_1: data_from_field_1
 field_2: data_from_field_2
 client_2:
 field_1: data_from_field_1
 field_2: data_from_field_2

```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from `values()` changes if a ManyToMany is present.

```

ext_pillar:
- django_orm:
 pillar_name: djangotutorial
 project_path: /path/to/mysite
 settings_module: mysite.settings

 django_app:
 mysite.polls:
 Choices:
 name: poll__question
 fields:
 - poll__question
 - poll__id
 - choice_text
 - votes

```

## Module Documentation

`salt.pillar.django_orm.ext_pillar`(*minion\_id*, *pillar*, *pillar\_name*, *project\_path*, *settings\_module*, *django\_app*, *env=None*, *env\_file=None*, *\*args*, *\*\*kwargs*)

Connect to a Django database through the ORM and retrieve model fields

### Parameters

- **pillar\_name** (*str*) – The name of the pillar to be returned
- **project\_path** (*str*) – The full path to your Django project (the directory `manage.py` is in)
- **settings\_module** (*str*) – The settings module for your project. This can be found in your `manage.py` file
- **django\_app** (*str*) – A dictionary containing your apps, models, and fields
- **env** (*str*) – The full path to the virtualenv for your Django project
- **env\_file** (*str*) – An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

### 21.12.10 salt.pillar.ec2\_pillar

Retrieve EC2 instance data for minions for `ec2_tags` and `ec2_tags_list`

The minion id must be the AWS instance-id or value in `tag_match_key`. For example set `tag_match_key` to `Name` to have the minion-id matched against the tag 'Name'. The tag contents must be unique. The value of `tag_match_value` can be 'uqdn' or 'asis'. if 'uqdn', then the domain will be stripped before comparison.

Additionally, the `use_grain` option can be set to `True`. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

---

**Note:** If you are using `use_grain: True` in the configuration for this external pillar module, the minion must have `metadata_server_grains` enabled in the minion config file (see also [here](#)).

It is important to also note that enabling the `use_grain` option allows the minion to manipulate the pillar data returned, as described above.

---

The optional `tag_list_key` indicates which keys should be added to `ec2_tags_list` and be split by `tag_list_sep` (by default `;`). If a tag key is included in `tag_list_key` it is removed from `ec2_tags`. If a tag does not exist it is still included as an empty list.

..note:: As with any master configuration change, restart the salt-master daemon for changes to take effect.

```
ext_pillar:
- ec2_pillar:
 tag_match_key: 'Name'
 tag_match_value: 'asis'
 tag_list_key:
 - Role
 tag_list_sep: ';'
 use_grain: True
 minion_ids:
 - trusted-minion-1
 - trusted-minion-2
 - trusted-minion-3
```

This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```
salt.pillar.ec2_pillar.ext_pillar(minion_id, pillar, use_grain=False, minion_ids=None,
 tag_match_key=None, tag_match_value='asis',
 tag_list_key=None, tag_list_sep=';')
```

Execute a command and read the output as YAML

### 21.12.11 salt.pillar.etcd\_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

#### depends

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
- etcd: my_etcd_config

ext_pillar:
- etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
- etcd: my_etcd_config
- etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```

ext_pillar:
- etcd: my_etcd_config root=/salt/%(minion_id)s

```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```

ext_pillar:
- etcd: my_etcd_config root=/salt-shared
- etcd: my_other_etcd_config root=/salt-private/%(minion_id)s

```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```

etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value

```

```

salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
 Check etcd for all data

```

### 21.12.12 salt.pillar.file\_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

---

**Note:** This is an external pillar and is subject to the *rules and constraints* governing external pillars.

---

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

#### Example `file_tree` Pillar

##### Master Configuration

```

ext_pillar:
- file_tree:
 root_dir: /srv/ext_pillar
 follow_dir_links: False
 keep_newline: True

```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to `False`. If `follow_dir_links` is set to `True`, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the *pillar\_roots* of the environment specified by *pillarenv*. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *file.managed* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 keep_newline:
 - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 render_default: jinja|yaml
 renderer_blacklist:
 - gpg
 renderer_whitelist:
 - jinja
 - yaml
 template: True
```

### Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:

 apache:
```

(continues on next page)

(continued from previous page)

```

config.d:

 00_important.conf:
 <important_config important_setting="yes" />
 20_bob_extra.conf:
 <bob_specific_cfg has_freeze_ray="yes" />
corporate_app:

settings:

 common_settings:
 // This is the main settings file for the corporate
 // internal web app
 main_setting: probably
 bob_settings:
 role: bob

```

**Note:** The leaf data in the example shown is the contents of the pillar files.

```

salt.pillar.file_tree.ext_pillar(minion_id, pillar, root_dir=None, follow_dir_links=False,
 debug=False, keep_newline=False, render_default=None,
 renderer_blacklist=None, renderer_whitelist=None, tem-
 plate=False)

```

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```

ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 render_default: jinja|yaml
 renderer_blacklist:
 - gpg
 renderer_whitelist:
 - jinja
 - yaml
 template: True

```

#### Parameters

- **minion\_id** – The ID of the Minion whose pillar data is to be collected
- **pillar** – Unused by the `file_tree` pillar module
- **root\_dir** – Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow\_dir\_links** – Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

**Warning:** Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

**Warning:** Symbolic links that lead to infinite recursion are not filtered.

- **debug** – Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **keep\_newline** – Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the [Python fnmatch package](#)) for which end-of-file newlines are to be kept.

`keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the `root_dir`.

```
ext_pillar:
- file_tree:
 root_dir: /srv/ext_pillar
 keep_newline:
 - apache/config.d/*
 - corporate_app/settings/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **render\_default** – Override Salt's `default global renderer` for the `file_tree` pillar.

```
render_default: jinja
```

- **renderer\_blacklist** – Disallow renderers for pillar files.

```
renderer_blacklist:
- json
```

- **renderer\_whitelist** – Allow renderers for pillar files.

```
renderer_whitelist:
- yaml
- jinja
```

- **template** – Enable templating of pillar files. Defaults to `False`.

### 21.12.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

#### Configuring the Foreman ext\_pillar

Set the following Salt config to setup Foreman as external pillar source:

```

ext_pillar:
 - foreman:
 key: foreman # Nest results within this key
 only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme

```

The following options are optional:

```

foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True

```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

#### Module Documentation

`salt.pillar.foreman.ext_pillar(minion_id, pillar, key=None, only=())`  
 Read pillar data from Foreman via its API.

### 21.12.14 salt.pillar.git\_pillar

#### Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```

base:
 '*':
 - foo

```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
 'dev-*':
 - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#)), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

---

## Configuring `git_pillar` for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described [here](#).

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

---

Here is an example `git_pillar` configuration:

```
ext_pillar:
- git:
 # Use 'prod' instead of the branch name 'production' as the environment
 - production https://gitserver/git-pillar.git:
 - env: prod
 # Use 'dev' instead of the branch name 'develop' as the environment
 - develop https://gitserver/git-pillar.git:
 - env: dev
 # No per-remote config parameters (and no trailing colon), 'qa' will
 # be used as the environment
 - qa https://gitserver/git-pillar.git
 # SSH key authentication
 - master git@other-git-server:pillardata-ssh.git:
 # Pillar SLS files will be read from the 'pillar' subdirectory in
 # this repository
 - root: pillar
 - privkey: /path/to/key
 - pubkey: /path/to/key.pub
 - passphrase: CorrectHorseBatteryStaple
 # HTTPS authentication
 - master https://other-git-server/pillardata-https.git:
 - user: git
 - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the `git_pillar` configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
 - git:
 - production https://gitserver/git-pillar.git:
 - env: prod
```

If `__env__` is specified as the branch name, then `git_pillar` will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

**Note:** The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion's `pillarenv` or the master's `git_pillar_base` will be used.

Here's an example of using `__env__` as the `git_pillar` environment:

```
ext_pillar:
 - git:
 - __env__ https://gitserver/git-pillar.git:
 - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
 '*':
 - bar
```

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

**Note:** The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

## How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git ext_pillar` configuration. Consider the following:

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001

ext_pillar:
- etcd: my_etcd_config
- git:
 - master https://mydomain.tld/foo.git:
 - root: pillar
 - master https://mydomain.tld/bar.git
 - master https://mydomain.tld/baz.git
 - dev https://mydomain.tld/qux.git
- git:
 - master https://mydomain.tld/abc.git
 - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.
2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

---

**Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

---

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that `pillarenv`. A `pillarenv` can also be specified for a given minion or set of minions when *running states*, by using the `pillarenv` argument. The CLI `pillarenv` will override one set in the minion config file. So, assuming that a `pillarenv` of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a `pillarenv` of `dev`, which would mean that it would then ignore any items from the `base` `pillarenv`. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes' top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This "failover" logic is called a *directory overlay*, and it is also used by `file_roots` and `:conf_minion['pillar_roots']`. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then

the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of `git_pillar` remotes having access to files in other repos which share the same environment can be disabled by setting `git_pillar_includes` to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

## Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
 'web*':
 - common
 - web.server.nginx
 - web.server.apdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.apdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to `False`):

```
ext_pillar:
 - git:
 - master https://mydomain.tld/pillar-common.git
 - master https://mydomain.tld/pillar-nginx.git
 - master https://mydomain.tld/pillar-apdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```
ext_pillar:
 - git:
 - master https://mydomain.tld/pillar-common.git
 - master https://mydomain.tld/pillar-nginx.git:
 - mountpoint: web/server/
 - master https://mydomain.tld/pillar-apdata.git:
 - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

### Note:

- Leading and trailing slashes on the mountpoints are optional.

- Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
  - Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
  - Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.
- 

## all\_saltenvs

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. `pillarenvs`). This allows a single branch/tag to appear in all `saltenvs`. Example:

```
ext_pillar:
- git:
 - __env__ https://mydomain.tld/top.git
 - all_saltenvs: master
 - __env__ https://mydomain.tld/pillar-nginx.git:
 - mountpoint: web/server/
 - __env__ https://mydomain.tld/pillar-appdata.git:
 - mountpoint: web/server/
```

## git\_pillar\_update\_interval

New in version 3000.

This option defines the default update interval (in seconds) for `git_pillar` remotes. The update is handled within the global loop, hence `git_pillar_update_interval` should be a multiple of `loop_interval`.

```
git_pillar_update_interval: 120
```

```
salt.pillar.git_pillar.ext_pillar(minion_id, pillar, *repos)
 Checkout the ext_pillar sources and compile the resulting pillar SLS
```

## 21.12.15 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin `stack` pillar you could do something like this:

```
ext_pillar:
- stack: /path/to/stack.cfg
- gpg: {}
```

Set `gpg_keydir` in your config to adjust the `homedir` the renderer uses.

```
salt.pillar.gpg.ext_pillar(minion_id, pillar, *args, **kwargs)
```

### 21.12.16 salt.pillar.hg\_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
 - hg: ssh://hg@example.co/user/repo
```

**class** salt.pillar.hg\_pillar.Repo(*repo\_uri*)

Deal with remote hg (mercurial) repository for Pillar

**close**()

Cleanup mercurial command server

**pull**()

**update**(*branch='default'*)

Ensure we are using the latest revision in the hg repository

salt.pillar.hg\_pillar.ext\_pillar(*minion\_id, pillar, repo, branch='default', root=None*)

Extract pillar from an hg repository

salt.pillar.hg\_pillar.update(*repo\_uri*)

Execute an hg pull on all the repos

### 21.12.17 salt.pillar.hiera

Use hiera data as a Pillar source

salt.pillar.hiera.ext\_pillar(*minion\_id, pillar, conf*)

Execute hiera and return the data

### 21.12.18 salt.pillar.http\_json module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_JSON ext\_pillar

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:
 - http_json:
 url: http://example.com/api/minion_id
 ::TODO::
 username: username
 password: password
```

If the `with_grains` parameter is set, grain keys wrapped in can be provided (wrapped in `<>` brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_json:
 url: http://example.com/api/<nodename>
 with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion\_id:

```
ext_pillar:
- http_json:
 url: http://example.com/api/%s
```

## Module Documentation

`salt.pillar.http_json.ext_pillar` (*minion\_id*, *pillar*, *url*, *with\_grains=False*)

Read pillar data from HTTP response.

### Parameters

- **url** (*str*) – Url to request.
- **with\_grains** (*bool*) – Whether to substitute strings in the url with their grain values.

**Returns** A dictionary of the pillar data to add.

**Return type** `dict`

### 21.12.19 salt.pillar.http\_yaml module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_YAML ext\_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
- http_yaml:
 url: http://example.com/api/minion_id
 ::TODO::
 username: username
 password: password
```

If the `with_grains` parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_yaml:
 url: http://example.com/api/<nodename>
 with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion\_id:

```
ext_pillar:
- http_json:
 url: http://example.com/api/%s
```

## Module Documentation

`salt.pillar.http_yaml.ext_pillar` (*minion\_id*, *pillar*, *url*, *with\_grains=False*)

Read pillar data from HTTP response.

**Parameters**

- **url** (*str*) – Url to request.
- **with\_grains** (*bool*) – Whether to substitute strings in the url with their grain values.

**Returns** A dictionary of the pillar data to add.

**Return type** `dict`

### 21.12.20 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

**depends** `certtool`

`salt.pillar.libvirt.ext_pillar` (*minion\_id*, *pillar*, *command*)

Read in the generated libvirt keys

`salt.pillar.libvirt.gen_hyper_keys` (*minion\_id*, *country='US'*, *state='Utah'*, *locality='Salt Lake City'*, *organization='Salted'*, *expiration\_days='365'*)

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 21.12.21 salt.pillar.makostack module

Simple and flexible YAML `ext_pillar` which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack `ext_pillar` is a direct ripoff of the 'stack' `ext_pillar`, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- all these rendered files are then parsed as `yaml`.
- then all `yaml` dicts are merged in order, with support for the following. merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`.
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments.

### Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure MakoStack in 3 different ways:

## Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
- makostack: /path/to/stack.cfg
```

## List of config files

You can also provide a list of config files:

```
ext_pillar:
- makostack:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
```

## Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- makostack:
 pillar:environment:
 dev: /path/to/dev/stack.cfg
 prod: /path/to/prod/stack.cfg
 grains:custom:grain:
 value:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
 opts:custom:opt:
 value: /path/to/stack0.cfg
```

## Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
- bar
- baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
 fur:
 foo:
 - bar
 - baz
```

## MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with `'/'`, however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch'] }.yml
oscodenames/%{ __grains__['oscodename'] }.yml
% for role in pillar.get('roles', []):
roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── osarchs/
│ ├── amd64.yml
│ └── armhf.yml
├── oscodenames/
│ ├── wheezy.yml
│ └── jessie.yml
├── roles/
│ ├── web.yml
│ └── db.yml
└── minions/
 ├── test-1-dev.yml
 └── test-2-dev.yml
```

## Overall process

In the above MakoStack configuration, given that `test-1-dev` minion is an `amd64` platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of `yml` files:

- `stack`: the MakoStack pillar data object that has currently been merged (data from previous `yml` files in MakoStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous `yml` files in MakoStack configuration) through the `stack` variable.

Once a `yml` file has been preprocessed by mako, we obtain a Python dict - let's call it `yml_data` - then, MakoStack will merge this `yml_data` dict in the main `stack` dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge `yml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### **merge-last** (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

### merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> merge-last   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> merge-first   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - developer       - sysadmin   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> remove   <b>tom:</b>   <b>mat:</b> </pre>	<pre> <b>users:</b>   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> overwrite   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

`salt.pillar.makostack.ext_pillar` (*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

### 21.12.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

**depends** pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

## Configuring the Mongo ext\_pillar

The Mongo ext\_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
 - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
 ↪ [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

## Module Documentation

```
salt.pillar.mongo.ext_pillar(minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None,
 re_replace="", fields=None)
```

Connect to a mongo database and read per-node pillar information.

### Parameters

- **collection** (\*) – The mongodb collection to read data from. Defaults to 'pillar'.
- **id\_field** (\*) – The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern** (\*) – If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re\_replace** (\*) – Use as the replacement value in node ids matched with *re\_pattern*. Defaults to `''`. Feel free to use backreferences here.
- **fields** (\*) – The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

### 21.12.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` ext\_pillar for MySQL.

**maturity** new

**depends** python-mysqldb

**platform** all

## Configuring the mysql ext\_pillar

Use the 'mysql' key under ext\_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

### Complete example

```
mysql:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'
 port: 3306
 ssl:
 cert: /etc/mysql/client-cert.pem
 key: /etc/mysql/client-key.pem

ext_pillar:
 - mysql:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

### class salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

#### extract\_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.ext\_pillar(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries against MySQL, merge and return as a dict

## 21.12.24 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.

New in version 2019.2.0.

### Configuring the NetBox ext\_pillar

```
ext_pillar:
 - netbox:
 api_url: http://netbox_url.com/api/
 api_token: 123abc
```

Create a token in your NetBox instance at [http://netbox\\_url.com/user/api-tokens/](http://netbox_url.com/user/api-tokens/)

The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the napalm proxy-minion:

```
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the napalm proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the napalm proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another proxy key in pillar\_roots (or git\_pillar) with just the passwd key and use *salt.renderers.gpg* to encrypt the value. If any additional options for the proxy setup are needed they should also be configured in pillar\_roots.

Other available options:

**site\_details: True** Whether should retrieve details of the site the device belongs to.

**site\_prefixes: True** Whether should retrieve the prefixes of the site the device belongs to.

**salt.pillar.netbox.ext\_pillar** (*minion\_id, pillar, \*args, \*\*kwargs*)  
Query NetBox API for minion data

### 21.12.25 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

#### depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my_openstack_config:
 keystone.user: 'admin'
 keystone.password: 'password'
 keystone.tenant: 'admin'
 keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
 keystone.region_name: 'RegionOne'
 keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
 - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
 - neutron: my_openstack_config
 - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

#### ext\_pillar:

- neutron: my\_openstack\_config neutron\_networks

`salt.pillar.neutron.ext_pillar` (*minion\_id, pillar, conf*)  
Check neutron for all data

### 21.12.26 salt.pillar.nodegroups

#### Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of *nodegroups* which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

#### Command Line

```
salt-call pillar.get nodegroups
local:
 - class_infra
 - colo_sj
 - state_active
 - country_US
 - type_saltmaster
```

#### Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
 - nodegroups:
 pillar_name: 'nodegroups'
```

`salt.pillar.nodegroups.ext_pillar` (*minion\_id, pillar, pillar\_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

#### Parameters

- **minion\_id** – used for compound matching nodegroups
- **pillar** – provided by salt, but not used by nodegroups ext\_pillar
- **pillar\_name** – optional name to use for the pillar, defaults to 'nodegroups'

**Returns** a dictionary which is included by the salt master in the pillars returned to the minion

### 21.12.27 salt.pillar.pepa

#### Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

#### Configuring Pepa

```
extension_modules: /srv/salt/ext
ext_pillar:
 - pepa:
```

(continues on next page)

(continued from previous page)

```

resource: host # Name of resource directory and sub-key in
↳pillars
 sequence: # Sequence used for hierarchical substitution
 - hostname: # Name of key
 name: input # Alias used for template directory
 base_only: True # Only use templates from Base environment, i.e.
↳no staging
 - default:
 - environment:
 - location..region:
 name: region
 - location..country:
 name: country
 - location..datacenter:
 name: datacenter
 - roles:
 - osfinger:
 name: os
 - hostname:
 name: override
 base_only: True
 subkey: True # Create a sub-key in pillars, named after the
↳resource in this case [host]
 subkey_only: True # Only create a sub-key, and leave the top level
↳untouched

pepa_roots: # Base directory for each environment
 base: /srv/pepa/base # Path for base environment
 dev: /srv/pepa/base # Associate dev with base
 qa: /srv/pepa/qa
 prod: /srv/pepa/prod

Use a different delimiter for nested dictionaries, defaults to '..' since some keys
↳may use '.' in the name
#pepa_delimiter: ..

Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
environment: dev

Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
saltversion: 0.17.4

Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
salt: warning
salt.loaded.ext.pillar.pepa: debug

```

Pepa can also be used in Master-less SaltStack setup.

## Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
 hostname

positional arguments:
 hostname Hostname

optional arguments:
 -h, --help show this help message and exit
 -c CONFIG, --config CONFIG
 Configuration file
 -d, --debug Print debug info
 -g GRAINS, --grains GRAINS
 Input Grains as YAML
 -p PILLAR, --pillar PILLAR
 Input Pillar as YAML
 -n, --no-color No color output
 -v, --validate Validate output
```

## Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test\_example\_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
 - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```
network..dns..servers:
 - 10.0.0.1
 - 10.0.0.2
time..ntp..servers:
 - ntp1.amer.example.com
 - ntp2.amer.example.com
 - ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

**Example:**

osfinger: Fedora-19

**Would become:**

fedora\_19.yaml

**Nested dictionaries**

In order to create nested dictionaries as output you can use double dot “..” as a delimiter. You can change this using “pepa\_delimiter” we choose double dot since single dot is already used by key names in some modules, and using “:” requires quoting in the YAML.

**Example:**

```
network..dns..servers:
- 10.0.0.1
- 10.0.0.2
network..dns..options:
- timeout:2
- attempts:1
- ndots:1
network..dns..search:
- example.com
```

**Would become:**

```
network:
 dns:
 servers:
 - 10.0.0.1
 - 10.0.0.2
 options:
 - timeout:2
 - attempts:1
 - ndots:1
 search:
 - example.com
```

**Operators**

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

**Example:**

```

network..dns..search..merge():
- foobar.com
- dummy.nl
owner..immutable(): Operations
host..printers..unset():

```

## Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

## Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

**File Example: host/validation/network.yaml**

```

network..dns..search:
 type: list
 allowed:
 - example.com

network..dns..options:
 type: list
 allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
 type: list
 schema:
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
 type: boolean

network..interfaces..{{ interface }}..fqdn:
 type: string
 regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
 type: string
 regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

```

(continues on next page)

(continued from previous page)

```

network..interfaces..{{ interface }}..ipv4:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

```

Convert key/value to tree

`salt.pillar.pepa.validate` (*output*, *resource*)

Validate Pepa templates

### 21.12.28 salt.pillar.pillar\_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

#### Configuring the LDAP ext\_pillar

The basic configuration is part of the [master configuration](#).

```

ext_pillar:
 - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml

```

**Note:** When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the salt-master process will attempt to parse its content.

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

### Configuring the LDAP searches

The file is processed using *Salt's Renderers <renderers>* which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the 'id' grain which is verified through the minion's key/cert.

### Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

### Configuration

```

salt-users:
 server: ldap.company.tld
 port: 389
 tls: true
 dn: 'dc=company,dc=tld'
 binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
 bindpw: bi7ieBai5Ano
 referrals: false
 anonymous: false
 mode: map
 dn: 'ou=users,dc=company,dc=tld'
 filter: '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
 ↪
 attrs:
 - cn
 - displayName
 - givenName
 - sn
 lists:
 - memberOf

search_order:
 - salt-users

```

### Result

```
{
 'salt-users': [
 {
 'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',
 'displayName': 'John Doe'
 'givenName': 'John'
 'sn': 'Doe'
 'memberOf': [
 'cn=it-admins,ou=groups,dc=company,dc=tld',
 'cn=team01,ou=groups,dc=company'
]
 },
 {
 'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',
 'displayName': 'Jane Doe',
 'givenName': 'Jane',
 'sn': 'Doe',
 'memberOf': [
 'cn=it-admins,ou=groups,dc=company,dc=tld',
 'cn=team02,ou=groups,dc=company'
]
 }
]
}
```

`salt.pillar.pillar_ldap.ext_pillar` (*minion\_id*, *pillar*, *config\_file*)  
Execute LDAP searches and return the aggregated data

### 21.12.29 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

**maturity** new  
**depends** psycopg2  
**platform** all

#### Complete Example

```
postgres:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'

ext_pillar:
 - postgres:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

**class** salt.pillar.postgres.**POSTGRESExtPillar**

This class receives and processes the database rows from POSTGRES.

**extract\_queries** (*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.postgres.**ext\_pillar** (*minion\_id, pillar, \*args, \*\*kwargs*)

Execute queries against POSTGRES, merge and return as a dict

**21.12.30 salt.pillar.puppet**

Execute an unmodified puppet\_node\_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

salt.pillar.puppet.**ext\_pillar** (*minion\_id, pillar, command*)

Execute an unmodified puppet\_node\_classifier and read the output as YAML

**21.12.31 salt.pillar.reclass\_adapter**

Use the "reclass" database as a Pillar source

This `ext_pillar` plugin provides access to the `reclass` database, such that Pillar data for a specific minion are fetched using `reclass`.

You can find more information about `reclass` at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
ext_pillar:
 - reclass:
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
 reclass_source_path: ~/code/reclass

ext_pillar:
 - reclass: *reclass

master_tops:
 reclass: *reclass
```

If you want to run `reclass` from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

salt.pillar.reclass\_adapter.**ext\_pillar** (*minion\_id, pillar, \*\*kwargs*)

Obtain the Pillar data from `reclass` for the given `minion_id`.

### 21.12.32 salt.pillar.redismod

#### Read pillar data from a Redis backend

New in version 2014.7.0.

##### depends

- redis Python module (on master)

#### Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

#### Configuring the Redis ext\_pillar

```
ext_pillar:
 - redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)`

Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)`

Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if `pillar_key` is not set.

`pillar_key` Pillar key to return data into

`salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')`

Looks for key in redis matching `minion_id`, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

`pillar_key` Pillar key to return data into

### 21.12.33 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
 - s3:
 bucket: my.fancy.pillar.bucket
 keyid: KASKFJWAKJASJKDAJKSD
 key: ks1adfdLKDALSFKSD93q032sdDasdfasdfsadkf
 multiple_env: False
 environment: base
 prefix: somewhere/overthere
```

(continues on next page)

(continued from previous page)

```

verify_ssl: True
service_url: s3.amazonaws.com
kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
s3_cache_expire: 30
s3_sync_on_update: True
path_style: False
https_enable: True

```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a 'subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to `False`. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to `True`. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in `ext_pillar` for each environment rather than specifying `multiple_env`. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```

class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True,
 kms_keyid=None, location=None, path_style=False,
 https_enable=True)

```

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
 location=None, multiple_env=False, environment='base', pre-
 fix="", service_url=None, kms_keyid=None, s3_cache_expire=30,
 s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

### 21.12.34 salt.pillar.saltclass

#### SaltClass Pillar Module

```
ext_pillar:
- saltclass:
- path: /srv/saltclass
```

For additional configuration instructions, see the `saltclass` module

```
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Compile pillar data

### 21.12.35 salt.pillar.sql\_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an `ext_pillar`. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

`maturity` new

`platform` all

#### Theory of `sql_base` `ext_pillar`

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

#### Configuring a `sql_base` `ext_pillar`

The `sql_base` `ext_pillar` cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql\_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```

ext_pillar:
- sql_base:
 - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"

```

Or you can pass in a mapping

```

ext_pillar:
- sql_base:
 main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"

```

The query can be provided as a string as we have just shown, but they can be provided as lists

```

ext_pillar:
- sql_base:
 - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 2

```

Or as a mapping

```

ext_pillar:
- sql_base:
 - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 depth: 2

```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {"b": b, "c": c, "d": d}}
- With depth 2: {a: {b: {"c": c, "d": d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```

ext_pillar:
- sql_base:
 - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
↳minion_id != %s"
 depth: 2
 - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 depth: 2
 ignore_null: True

```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string '1,3' will result in:

```
a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
 ^ ^
```

These columns define list grouping

```
{a: [
 {c: [
 {e: 1},
 {g: 2}
]},
 {h: [
 {j: 3, k: 4 }
]}
]}
}}
```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

#### More complete example for MySQL (to also show configuration)

```
mysql:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'

ext_pillar:
 - mysql:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

#### **class** salt.pillar.sql\_base.SqlBaseExtPillar

This class receives and processes the database rows in a database agnostic way.

**as\_list** = False

**depth** = 0

**enter\_root**(*root*)

Set `self.focus` for kwarg queries

**extract\_queries** (*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

**fetch** (*minion\_id, pillar, \*args, \*\*kwargs*)

Execute queries, merge and return as a dict.

**field\_names** = None

**focus** = None

**ignore\_null** = False

**num\_fields** = 0

**process\_fields** (*field\_names, depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

**process\_results** (*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

**result** = None

**with\_lists** = None

### 21.12.36 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLCipher.

**maturity** new

**depends** pysqlcipher (for py2) or pysqlcipher3 (for py3)

**platform** all

#### Configuring the sqlcipher ext\_pillar

Use the 'sqlcipher' key under ext\_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
 database: /var/lib/salt/pillar-sqlcipher.db
 pass: strong_pass_phrase
 timeout: 5.0
```

### Complete Example

```
sqlcipher:
 database: '/var/lib/salt/pillar-sqlcipher.db'
 pass: strong_pass_phrase
 timeout: 5.0

ext_pillar:
 - sqlcipher:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE ?'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

#### **class** salt.pillar.sqlcipher.SQLCipherExtPillar

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

### 21.12.37 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

`sqlite3` is included in the `stdlib` since Python 2.5.

This module is a concrete implementation of the `sql_base` `ext_pillar` for SQLite3.

**platform** all

#### Configuring the `sqlite3` `ext_pillar`

Use the `'sqlite3'` key under `ext_pillar` for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, `timeout` is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

### Complete Example

```
sqlite3:
 database: '/var/lib/salt/pillar.db'
 timeout: 5.0

ext_pillar:
 - sqlite3:
 fromdb:
```

(continues on next page)

(continued from previous page)

```

query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE ?'
depth: 5
as_list: True
with_lists: [1,3]

```

**class** salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext\_pillar(*minion\_id*, *pillar*, \*args, \*\*kwargs)

Execute queries against SQLite3, merge and return as a dict

**21.12.38 salt.pillar.stack**

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

PillarStack is a custom saltstack ext\_pillar which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbnet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments

**Installation**

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack ext\_pillar is as simple as dropping the stack.py file in the <extension\_modules>/pillar directory (no external python module required), given that extension\_modules is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

## Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file. However, you can configure PillarStack in 3 different ways:

### Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
 - stack: /path/to/stack.cfg
```

### List of config files

You can also provide a list of config files:

```
ext_pillar:
 - stack:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
```

### Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
 - stack:
 pillar:environment:
 dev: /path/to/dev/stack.cfg
 prod: /path/to/prod/stack.cfg
 grains:custom:grain:
 value:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
 opts:custom:opt:
 value: /path/to/stack0.cfg
```

### PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)

- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of yaml files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
│ ├── xxx.yml
│ └── yyy.yml
├── osarchs/
│ ├── amd64.yml
│ └── armhf.yml
├── oscodenames/
│ ├── wheezy.yml
│ └── jessie.yml
├── roles/
│ ├── web.yml
│ └── db.yml
└── minions/
 ├── test-1-dev.yml
 └── test-2-dev.yml
```

## Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml

- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of `yml` files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous `yml` files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of `jinja2` to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous `yml` files in PillarStack configuration) through the `stack` variable.

Once a `yml` file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yml_data` - then, PillarStack will merge this `yml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### **merge-last (default) strategy**

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

### merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> merge-last   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> merge-first   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - developer       - sysadmin   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> remove   <b>tom:</b>   <b>mat:</b> </pre>	<pre> <b>users:</b>   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   <b>__:</b> overwrite   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users:   - tom   - root</pre>	<pre>users:   - __: merge-last   - mat</pre>	<pre>users:   - tom   - root   - mat</pre>
<pre>users:   - tom   - root</pre>	<pre>users:   - __: merge-first   - mat</pre>	<pre>users:   - mat   - tom   - root</pre>
<pre>users:   - tom   - root</pre>	<pre>users:   - __: remove   - mat   - tom</pre>	<pre>users:   - root</pre>
<pre>users:   - tom   - root</pre>	<pre>users:   - __: overwrite   - mat</pre>	<pre>users:   - mat</pre>

`salt.pillar.stack.ext_pillar` (*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

### 21.12.39 salt.pillar.svn\_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
 - svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
 '*':
 - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
 - svn: trunk svn://svnserver/repo
 - svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
 '*':
 - bar
```

**class** salt.pillar.svn\_pillar.**SvnPillar**(*branch, repo\_location, root, opts*)  
Deal with the remote SVN repository for Pillar

**pillar\_dir**()

Returns the directory of the pillars (repo cache + branch + root)

**update**()

salt.pillar.svn\_pillar.**ext\_pillar**(*minion\_id, pillar, repo\_string*)

Execute a command and read the output as YAML

### 21.12.40 salt.pillar.varstack\_pillar

Use [Varstack](#) data as a Pillar source

#### Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
 - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of varstack on how this file is evaluated.

salt.pillar.varstack\_pillar.**ext\_pillar**(*minion\_id, pillar, conf*)

Parse varstack data and return the result

### 21.12.41 salt.pillar.vault module

Vault Pillar Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the [execution module docs](#). Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext\_pillar section in the Salt master configuration.

```
ext_pillar:
 - vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key 'password' as you they will collide:

If you want to nest results under a `nesting_key` name use the following format:

**ext\_pillar:**

- **vault:** conf: path=secret/salt nesting\_key: vault\_key\_name

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, `auth` and `master`.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

**ext\_pillar:**

- **vault:** path=secret/salt
- **vault:** path=secret/root
- **vault:** path=secret/minions/{minion}/pass

You can also use nesting here as well. Identical nesting keys will get merged.

**ext\_pillar:**

- **vault:**
  - conf:** path=secret/salt
  - nesting\_key:** keyname1
- **vault:**
  - conf:** path=secret/root
  - nesting\_key:** keyname1
- **vault:**
  - conf:** path=secret/minions/{minion}/pass
  - nesting\_key:** keyname2

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

path=secret/salt

Key Value --- salt-passwd badpasswd1

path=secret/root

Key Value --- root-passwd rootbadpasswd1

path=secret/minions/{minion}/pass

Key Value --- minion-passwd minionbadpasswd1

```
#Nesting Key not defined
```

**local:**

-----

salt-passwd:  
  badpasswd1

**root-passwd:**  
  rootbadpasswd1

**minion-passwd:**

(continues on next page)

(continued from previous page)

```

minionbadpasswd1
#Nesting Key defined
local:

 keyname1:

 salt-passwd:
 badpasswd1
 root-passwd:
 rootbadpasswd1
 keyname2:

 minion-passwd:
 minionbadpasswd1

```

`salt.pillar.vault.ext_pillar` (*minion\_id, pillar, conf, nesting\_key=None*)  
Get pillar data from Vault for the configuration `conf`.

### 21.12.42 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates.

To configure this module, set `venafi` to `True` in the `ext_pillar` section of your master configuration file:

```

ext_pillar:
 - venafi: True

```

`salt.pillar.venafi.ext_pillar` (*minion\_id, pillar, conf*)  
Return an existing set of certificates

### 21.12.43 salt.pillar.virtkey

Accept a key from a hypervisor if the `virt` runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar` (*hyper\_id, pillar, name, key*)  
Accept the key for the VM on the hyper, if authorized.

### 21.12.44 salt.pillar.vmware\_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

#### depends

- `pyVmomi`

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the `'os'` or `'virtual'` grain are not `'VMWare'`, `'ESXi'`, or `'VMWare ESXi'`.

## Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the 'vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

## Configuring the VMWare pillar

The required minimal configuration in the salt master ext\_pillar setup:

```
ext_pillar:
 - vmware:
 host: <vcenter/esx host>
 username: <user to connect with>
 password: <password>
```

Optionally, the following keyword arguments can be passed to the ext\_pillar for customized configuration:

**pillar\_key** Optionally set the pillar key to return the data into. Default is `vmware`.

**protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is `443`.

**property\_name** Property name to match the minion id against. Defaults to `name`.

**property\_types** Optionally specify a list of pyVmomi vim types to search for the minion id in 'property\_name'. Default is `['VirtualMachine']`.

For example, to search both `vim.VirtualMachine` and `vim.HostSystem` object types:

```
ext_pillar:
 - vmware:
 host: myesx
 username: root
 password: complex_password
 property_types:
 - VirtualMachine
 - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

---

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

---

```

ext_pillar:
 - vmware:
 host: myvcenter
 username: my_user
 password: my_pass
 replace_default_attributes: True
 property_types:
 - VirtualMachine:
 - config:
 - bootOptions:
 - bootDelay
 - bootRetryDelay
 - HostSystem:
 - datastore:
 - name

```

The above `ext_pillar` example would return a pillar like the following for a `VirtualMachine` object that's name matched the minion id:

```

vmware:
 config:
 bootOptions:
 bootDelay: 1000
 bootRetryDelay: 1000

```

If you were to retrieve these virtual machine attributes via `pyVmomi` directly, this would be the same as

```

vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptions.bootRetryDelay

```

The above `ext_pillar` example would return a pillar like the following for a `HostSystem` object that's name matched the minion id:

```

vmware:
 datastore:
 - name: Datastore1
 - name: Datastore2

```

The 'datastore' property of a `HostSystem` object is a list of datastores, thus a list is returned.

**replace\_default\_attributes** If custom attributes are specified by the `property_types` parameter, `replace_default_attributes` determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

---

**Note:** vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

---

```

salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)

```

Check vmware/vcenter for all data

## 21.13 proxy modules

<i>arista_pyeapi</i>	Arista pyeapi
<i>cimc</i>	Proxy Minion interface module for managing Cisco Integrated Management Controller devices
<i>chronos</i>	Chronos
<i>cimc</i>	Proxy Minion interface module for managing Cisco Integrated Management Controller devices
<i>cisconso</i>	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
<i>dummy</i>	This is the a dummy proxy-minion designed for testing the proxy minion subsystem.
<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>netmiko_px</i>	Netmiko
<i>nxos</i>	Proxy Minion for Cisco NX OS Switches
<i>nxos_api</i>	Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
<i>panos</i>	Proxy Minion interface module for managing Palo Alto firewall devices
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in <a href="https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example">https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example</a>
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.

### 21.13.1 salt.proxy.arista\_pyeapi

#### Arista pyeapi

New in version 2019.2.0.

Proxy module for managing Arista switches via the eAPI using the `pyeapi` library.

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)>

**maturity** new

**depends** pyeapi

**platform** unix

**Note:** To understand how to correctly enable the eAPI on your switch, please check <https://eos.arista.com/arista-eapi-101/>.

## Dependencies

The `pyeapi` Proxy module requires `pyeapi` to be installed: `pip install pyeapi`.

## Pillar

The `pyeapi` proxy configuration requires the following parameters in order to connect to the network device:

**transport:** **https** Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

**host:** **localhost** The IP address or DNS host name of the connection device.

**username:** **admin** The username to pass to the device to authenticate the eAPI connection.

**password** The password to pass to the device to authenticate the eAPI connection.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**enablepwd** The enable mode password if required by the destination node.

All the arguments may be optional, depending on your setup.

## Proxy Pillar Example

```
proxy:
 proxytype: pyeapi
 host: router1.example.com
 username: example
 password: example
```

`salt.proxy.arista_pyeapi.call(method, *args, **kwargs)`  
Calls an arbitrary `pyeapi` method.

`salt.proxy.arista_pyeapi.conn()`  
Return the connection object.

`salt.proxy.arista_pyeapi.init(opts)`  
Open the connection to the Arista switch over the eAPI.

`salt.proxy.arista_pyeapi.initialized()`  
Connection finished initializing?

`salt.proxy.arista_pyeapi.ping()`  
Connection open successfully?

`salt.proxy.arista_pyeapi.shutdown(opts)`  
Closes connection with the device.

### 21.13.2 salt.proxy.cimc module

#### Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

`codeauthor` Spencer Ervin <spencer\_ervin@hotmail.com>

**maturity** new

**depends** none

**platform** unix

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices) to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```

proxy:
 proxytype: cimc
 host: <ip or dns name of cimc host>
 username: <cimc username>
 password: <cimc password>

```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to `cimc`.

### host

The location, or ip/dns, of the cimc host. Required.

### username

The username used to login to the cimc host. Required.

### password

The password used to login to the cimc host. Required.

`salt.proxy.cimc.get_config_resolver_class`(*cid=None, hierarchical=False*)  
The `configResolveClass` method returns requested managed object in a given class.

`salt.proxy.cimc.grains()`

Get the grains from the proxied device

`salt.proxy.cimc.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.cimc.init(opts)`

This function gets called when the proxy starts up.

`salt.proxy.cimc.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.cimc.logon()`

Logs into the cimc device and returns the session cookie.

`salt.proxy.cimc.logout(cookie=None)`

Closes the session with the device.

`salt.proxy.cimc.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.cimc.prepare_return(x)`

Converts the etree to dict

`salt.proxy.cimc.set_config_modify(dn=None, inconfig=None, hierarchical=False)`

The `configConfMo` method configures the specified managed object in a single subtree (for example, DN).

`salt.proxy.cimc.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.3 salt.proxy.chronos module

#### Chronos

Proxy minion for managing a Chronos cluster.

#### Dependencies

- *chronos execution module (salt.modules.chronos)*

#### Pillar

The chronos proxy configuration requires a 'base\_url' property that points to the chronos endpoint:

```
proxy:
 proxytype: chronos
 base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init(opts)`

Perform any needed setup.

`salt.proxy.chronos.ping()`

Is the chronos api responding?

`salt.proxy.chronos.shutdown` (*opts*)

For this proxy shutdown is a no-op

### 21.13.4 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

#### Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister

- Fortinet
- Nominum DCS
- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

**codeauthor** *Anthony Shaw* <[anthony.shaw@dimensiondata.com](mailto:anthony.shaw@dimensiondata.com)>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

### Dependencies

- pynso Python module

### PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

### Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
 proxytype: cisco
 host: <ip or dns name of host>
 port: 8080
 use_ssl: false
 username: <username>
 password: password
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `cisco`.

**host**

The location, or IP/dns, of the Cisco NSO API host. Required.

**username**

The username used to login to the Cisco NSO host, such as `admin`. Required.

**passwords**

The password for the given user. Required.

**use\_ssl**

Whether to use HTTPS messaging to speak to the API.

**port**

The port that the Cisco NSO API is running on, 8080 by default

**Salt Proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisconso host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

`salt.proxy.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

Parameters

- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) – an ID of the rollback to restore

`salt.proxy.cisconso.get_data(datastore, path)`

Get the configuration of the device tree at the given path

Parameters

- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) – The device path, a list of element names in order, comma separated

Returns The network configuration at that tree

Return type dict

```
salt cisco-nso cisconso.get_data devices
```

`salt.proxy.cisconso.get_rollback(name)`

Get the backup of stored a configuration rollback

Parameters **name** (str) – Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot

`salt.proxy.cisconso.get_rollbacks()`

Get a list of stored configuration rollbacks

`salt.proxy.cisconso.grains()`

Get the grains from the proxy device.

`salt.proxy.cisconso.init(opts)`

`salt.proxy.cisconso.ping()`

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

`salt.proxy.cisconso.set_data_value(datastore, path, data)`

Get a data entry in a datastore

Parameters

- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) – The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) – The new value at the given path

Return type bool

Returns True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.5 salt.proxy.dummy module

This is the a dummy proxy-minion designed for testing the proxy minion subsystem.

`salt.proxy.dummy.fns()`

`salt.proxy.dummy.grains()`  
Make up some grains

`salt.proxy.dummy.grains_refresh()`  
Refresh the grains

`salt.proxy.dummy.init(opts)`

`salt.proxy.dummy.initialized()`  
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.dummy.package_install(name, **kwargs)`  
Install a "package" on the REST server

`salt.proxy.dummy.package_list()`  
List "packages" installed on the REST server

`salt.proxy.dummy.package_remove(name)`  
Remove a "package" on the REST server

`salt.proxy.dummy.package_status(name)`  
Check the installation status of a package on the REST server

`salt.proxy.dummy.ping()`  
Degenerate ping

`salt.proxy.dummy.service_list()`  
List "services" on the REST server

`salt.proxy.dummy.service_restart(name)`  
Restart a "service" on the REST server

`salt.proxy.dummy.service_start(name)`  
Start a "service" on the dummy server

`salt.proxy.dummy.service_status(name)`  
Check if a service is running on the REST server

`salt.proxy.dummy.service_stop(name)`  
Stop a "service" on the dummy server

`salt.proxy.dummy.shutdown(opts)`  
For this proxy shutdown is a no-op

`salt.proxy.dummy.test_from_state()`  
Test function so we have something to call from a state :return:

`salt.proxy.dummy.upgrade()`  
"Upgrade" packages

`salt.proxy.dummy.uptodate()`  
Call the REST endpoint to see if the packages on the "server" are up to date.

### 21.13.6 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

### Dependencies

- pyVmomi Python Module
- ESXCLI

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

### ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
 proxytype: esxi
 host: <ip or dns name of esxi host>
 username: <ESXi username>
 passwords:
 - first_password
 - second_password
 - third_password
 credstore: <path to credential store>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

### host

The location, or ip/dns, of the ESXi host. Required.

### username

The username used to login to the ESXi host, such as `root`. Required.

### passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion—it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

---

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a True result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

### protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is `443`.

### credstore

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

---

**Note:** HOME variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure HOME is set for the proxy process.

---

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *salt.modules.vsphere* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in *salt.modules.vsphere* instead of *salt.modules.esxi*.

## States

Associated states are thoroughly documented in *salt.states.esxi*. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the *salt.modules.esxi.cmd* shim. It then calls whatever is passed in `cmd` inside the *salt.modules.vsphere* module. Passes the return through from the `vsphere` module.

**cmd** The command to call inside `salt.modules.vsphere`

**args** Arguments that need to be passed to that command.

**kwargs** Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.get_details()`

Return the proxy details

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.esxi.init(opts)`

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

`salt.proxy.esxi.is_connected_via_vcenter()`

`salt.proxy.esxi.ping()`

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.

CLI Example:

```
salt esxi-host test.ping
```

`salt.proxy.esxi.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.7 salt.proxy.fx2

#### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

#### Dependencies

- *iDRAC Remote execution module (salt.modules.dracr)*
- *Chassis command shim (salt.modules.chassis)*
- *Dell Chassis States (salt.states.dellchassis)*
- Dell's `racadm` command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar toplevel that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
 host: <ip or dns name of chassis controller>
 admin_username: <iDRAC username for the CMC, usually 'root'>
 fallback_admin_username: <username to try if the first fails>
 passwords:
 - first_password
 - second_password
 - third_password
 proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion—it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is!!!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

### salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. It's first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

## States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

`salt.proxy.fx2.admin_password()`

Return the `admin_password` in the `DETAILS` dictionary, or 'calvin' (the Dell default) if there is none present

`salt.proxy.fx2.admin_username()`

Return the `admin_username` in the `DETAILS` dictionary, or `root` if there is none present

`salt.proxy.fx2.chconfig(cmd, *args, **kwargs)`

This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.

### Parameters

- **cmd** – The command to call inside `salt.modules.dracr`
- **args** – Arguments that need to be passed to that command
- **kwargs** – Keyword arguments that need to be passed to that command

**Returns** Passthrough the return from the `dracr` module.

`salt.proxy.fx2.find_credentials()`

Cycle through all the possible credentials and return the first one that works

`salt.proxy.fx2.grains()`

Get the grains from the proxied device

`salt.proxy.fx2.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.fx2.host()`

`salt.proxy.fx2.init(opts)`

This function gets called when the proxy starts up. We check `opts` to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent `DETAILS` dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

**Returns** Returns `False` if the chassis didn't respond, `True` otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 21.13.8 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `'/srv/pillar/details.sls'`

```
proxy:
 proxytype: junos
 host: <ip or dns name of host>
 username: <username>
 port: 830
 password: <secret>
```

In `'/srv/pillar/top.sls'` map the device details with the proxy name.

```
base:
 'vmx':
 - details
```

After storing the device information in the pillar, configure the proxy in `'/etc/salt/proxy'`

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

`salt.proxy.junos.alive(opts)`

Validate and return the connection status with the remote device.

New in version 2018.3.0.

`salt.proxy.junos.conn()`

`salt.proxy.junos.get_serialized_facts()`

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.initialized()`

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 21.13.9 salt.proxy.marathon module

#### Marathon

Proxy minion for managing a Marathon cluster.

## Dependencies

- *marathon execution module (salt.modules.marathon)*

## Pillar

The marathon proxy configuration requires a 'base\_url' property that points to the marathon endpoint:

```
proxy:
 proxytype: marathon
 base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`  
Perform any needed setup.

`salt.proxy.marathon.ping()`  
Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`  
For this proxy shutdown is a no-op

### 21.13.10 salt.proxy.napalm

#### NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

New in version 2016.11.0.

Proxy minion for managing network devices via [NAPALM](#) library.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

The `napalm` proxy module requires [NAPALM](#) library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

---

**Note:** Beginning with Salt release 2017.7.3, it is recommended to use `napalm >= 2.0.0`. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check [this document](#). While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main `napalm` package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM's base capabilities and configure the `provider` option (see below).

---

## Pillar

The napalm proxy configuration requires the following parameters in order to connect to the network device:

**driver** Specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).

**host** The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

**username** The username to be used when connecting to the device.

**passwd** The password needed to establish the connection.

---

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

---

**optional\_args** Dictionary with the optional arguments. Check the complete list of supported [optional arguments](#).

**always\_alive: True** In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

**provider: napalm\_base** The library that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

**multiprocessing: False** Overrides the `multiprocessing` option, per proxy minion. The `multiprocessing` option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the `multiprocessing` option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
 proxytype: napalm
 driver: junos
 host: core05.nrt02
 username: my_username
 passwd: my_password
 optional_args:
 port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
 proxytype: napalm
 driver: ios
 fqdn: cr1.th2.par.as1234.net
 username: salt
```

(continues on next page)

```
password: ''
provider: custom_napalm_base
```

**See also:**

- *NAPALM grains: select network devices based on their characteristics*
- *NET module: network basic features*
- *Network config state: Manage the configuration using arbitrary templates*
- *NAPALM YANG state: Manage the configuration according to the YANG models (OpenConfig/IETF)*
- *Network ACL module: Generate and load ACL (firewall) configuration*
- *Network ACL state: Manage the firewall configuration*
- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- *Routes details*
- *SNMP configuration module*
- *Users configuration management*

**Note:** Beginning with release codename 2019.2.0, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need execute a command on the device but connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead: `salt '*' net.arp username=my-alt-usr force_reconnect=True`.

`salt.proxy.napalm.alive`(*opts*)

Return the connection status with the remote device.

New in version 2017.7.0.

`salt.proxy.napalm.call`(*method*, *\*args*, *\*\*kwargs*)

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

**Parameters**

- **method** – specifies the name of the method to be called
- **params** – contains the mapping between the name and the values of the parameters needed to call the method

**Returns** A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call

- `comment` (string): provides more details in case the call failed
- `traceback` (string): complete traceback in case of exception. Please submit an issue including this traceback on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'
 **{
 'commands': [
 'show version',
 'show chassis fan'
]
 })
```

`salt.proxy.napalm.fns()`  
Method called by NAPALM grains module.

`salt.proxy.napalm.get_device()`  
Returns the network device object.

`salt.proxy.napalm.get_grains()`  
Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh()`  
Refresh the grains.

`salt.proxy.napalm.init(opts)`  
Opens the connection with the network device.

`salt.proxy.napalm.initialized()`  
Connection finished initializing?

`salt.proxy.napalm.ping()`  
Connection open successfully?

`salt.proxy.napalm.shutdown(opts)`  
Closes connection with the device.

### 21.13.11 salt.proxy.netmiko\_px

#### Netmiko

New in version 2019.2.0.

Proxy module for managing network devices via [Netmiko](#).

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)> & Kirk Byers <[ktbyers@twb-tech.com](mailto:ktbyers@twb-tech.com)>

**maturity** new

**depends** netmiko

**platform** unix

#### Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

## Pillar

The `netmiko` proxy configuration requires the following parameters in order to connect to the network device:

- `device_type` - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron
  - `brocade_nos`: Brocade NOS
  - `brocade_vdx`: Brocade NOS
  - `brocade_vyos`: VyOS
  - `checkpoint_gaia`: Check Point GAIa
  - `calix_b6`: Calix B6
  - `ciena_saos`: Ciena SAOS
  - `cisco_asa`: Cisco SA
  - `cisco_ios`: Cisco IOS
  - `cisco_nxos`: Cisco NX-oS
  - `cisco_s300`: Cisco S300
  - `cisco_tp`: Cisco TpTcCe
  - `cisco_wlc`: Cisco WLC
  - `cisco_xe`: Cisco IOS
  - `cisco_xr`: Cisco XR
  - `coriant`: Coriant
  - `dell_force10`: Dell Force10
  - `dell_os10`: Dell OS10
  - `dell_powerconnect`: Dell PowerConnect
  - `eltex`: Eltex
  - `enterasys`: Enterasys
  - `extreme`: Extreme
  - `extreme_wing`: Extreme Wing

- f5\_ltm: F5 LTM
- fortinet: Fortinet
- generic\_termserver: TerminalServer
- hp\_comware: HP Comware
- hp\_procurve: HP Procurve
- huawei: Huawei
- huawei\_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper\_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv\_optiswitch: MrvOptiswitch
- netapp\_cdot: NetAppcDot
- netscaler: Netscaler
- ovs\_linux: OvsLinux
- paloalto\_panos: PaloAlto Panos
- pluribus: Pluribus
- quanta\_mesh: Quanta Mesh
- ruckus\_fastiron: Ruckus Fastiron
- ubiquiti\_edge: Ubiquiti Edge
- ubiquiti\_edgeswitch: Ubiquiti Edge
- vyatta\_vyos: VyOS
- vyos: VyOS
- brocade\_fastiron\_telnet: Brocade Fastiron over Telnet
- brocade\_netiron\_telnet: Brocade Netiron over Telnet
- cisco\_ios\_telnet: Cisco IOS over Telnet
- apresia\_aeos\_telnet: Apresia AEOS over Telnet
- arista\_eos\_telnet: Arista EOS over Telnet
- hp\_procurve\_telnet: HP Procurve over Telnet
- hp\_comware\_telnet: HP Comware over Telnet
- juniper\_junos\_telnet: Juniper Junos over Telnet
- calix\_b6\_telnet: Calix B6 over Telnet
- dell\_powerconnect\_telnet: Dell PowerConnect over Telnet
- generic\_termserver\_telnet: TerminalServer over Telnet
- extreme\_telnet: Extreme Networks over Telnet
- ruckus\_fastiron\_telnet: Ruckus Fastiron over Telnet

- `cisco_ios_serial`: Cisco IOS over serial port
- `ip` - IP address of target device (not required if `host` is provided)
- `host` - Hostname of target device (not required if `ip` is provided)
- `username` - Username to authenticate against target device, if required
- `password` - Password to authenticate against target device, if required
- `secret` - The enable password if target device requires one
- `port` - The destination port used to connect to the target device
- `global_delay_factor` - Multiplication factor affecting Netmiko delays (default: 1)
- `use_keys` - Connect to target device using SSH keys (default: `False`)
- `key_file` - Filename path of the SSH key file to use
- `allow_agent` - Enable use of SSH key-agent
- `ssh_strict` - Automatically reject unknown SSH host keys (default: `False`, which means unknown SSH host keys will be accepted)
- `system_host_keys` - Load host keys from the user's "known\_hosts" file (default: `False`)
- `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: 90)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)
- `always_alive` - In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by setting this option to `False`. By default this option is set to `True` (maintains the connection with the remote network device)
- `multiprocessing` - Overrides the `multiprocessing` option, per proxy minion, as the Netmiko communication channel is mainly SSH (default: `False`)

### Proxy Pillar Example

```
proxy:
 proxytype: netmiko
 device_type: juniper_junos
 host: router1.example.com
 username: example
 password: example
```

```

proxy:
 proxytype: netmiko
 device_type: cisco_ios
 ip: 1.2.3.4
 username: test
 use_keys: true
 secret: w3@k

```

`salt.proxy.netmiko_px.alive(opts)`  
Return the connection status with the network device.

`salt.proxy.netmiko_px.args()`  
Return the Netmiko device args.

`salt.proxy.netmiko_px.call(method, *args, **kwargs)`  
Calls an arbitrary netmiko method.

`salt.proxy.netmiko_px.conn()`  
Return the connection object.

`salt.proxy.netmiko_px.init(opts)`  
Open the connection to the network device managed through netmiko.

`salt.proxy.netmiko_px.initialized()`  
Connection finished initializing?

`salt.proxy.netmiko_px.ping()`  
Connection open successfully?

`salt.proxy.netmiko_px.shutdown(opts)`  
Closes connection with the device.

### 21.13.12 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```

proxy:
 proxytype: nxos
 host: 192.168.187.100
 username: admin
 password: admin
 prompt_name: switch
 ssh_args: '-o PubkeyAuthentication=no'
 key_accept: True

```

**proxytype** (REQUIRED) Use this proxy minion `nxos`

**host** (REQUIRED) ip address or hostname to connect to

**username** (REQUIRED) username to login with

**password** (REQUIRED) password to use to login with

**prompt\_name** (REQUIRED, this or `prompt_regex` below, but not both) The name in the prompt on the switch. Recommended to use your device's hostname.

**prompt\_regex** (REQUIRED, this or *prompt\_name* above, but not both) A regular expression that matches the prompt on the switch and any other possible prompt at which you need the proxy minion to continue sending input. This feature was specifically developed for situations where the switch may ask for confirmation. *prompt\_name* above would not match these, and so the session would timeout.

Example:

```
dc01-switch-01#.*|\(y\|n\) \?.*
```

This should match

```
dc01-switch-01#
```

or

```
Flash complete. Reboot this switch (y/n)? [n]
```

If neither *prompt\_name* nor *prompt\_regex* is specified the prompt will be defaulted to

```
.*#
```

which should match any number of characters followed by a # at the end of the line. This may be far too liberal for most installations.

**ssh\_args** Any extra args to use to connect to the switch.

**key\_accept** Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the *salt.modules.nxos* execution module.

**salt.proxy.nxos.add\_config**(*lines*)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↳operator'
```

---

**Note:** For more than one config added per command, lines should be a list.

---

**salt.proxy.nxos.check\_password**(*username*, *password*, *encrypted=False*)

Check if passed password is the one assigned to user

```
salt '*' nxos.cmd check_password username=admin password=admin
salt '*' nxos.cmd check_password username=admin \
password='$$2fWw02vK$7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYydGT3E.A' \
encrypted=True
```

**salt.proxy.nxos.check\_role**(*username*, *role*)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

**salt.proxy.nxos.delete\_config**(*lines*)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↳network-operator'
```

---

**Note:** For more than one config deleted per command, lines should be a list.

---

`salt.proxy.nxos.find(pattern)`

Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

---

**Note:** This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole `show_run` output.

---

`salt.proxy.nxos.get_roles(username)`

Get roles that the username is assigned from switch

```
salt '*' nxos.cmd get_roles username=admin
```

---

`salt.proxy.nxos.get_user(username)`

Get username line from switch

```
salt '*' nxos.cmd get_user username=admin
```

---

`salt.proxy.nxos.grains()`

Get grains for proxy minion

```
salt '*' nxos.cmd grains
```

---

`salt.proxy.nxos.grains_refresh()`

Refresh the grains from the proxy device.

```
salt '*' nxos.cmd grains_refresh
```

---

`salt.proxy.nxos.init(opts=None)`

Required. Can be used to initialize the server connection.

`salt.proxy.nxos.initialized()`

`salt.proxy.nxos.ping()`

Ping the device on the other end of the connection

```
salt '*' nxos.cmd ping
```

---

`salt.proxy.nxos.remove_user(username)`

Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

---

`salt.proxy.nxos.replace(old_value, new_value, full_match=False)`

Replace string or full line matches in switch's running config

If `full_match` is set to `True`, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

---

`salt.proxy.nxos.sendline(command)`

Run command through switch's cli

```
salt '*' nxos.cmd sendline 'show run | include "^username admin password"'
```

`salt.proxy.nxos.set_password`(*username*, *password*, *encrypted=False*, *role=None*, *crypt\_salt=None*, *algorithm='sha256'*)

Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
 password='$5$2fWw02vK$s7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYyDGT3E.A' \
 encrypted=True
```

`salt.proxy.nxos.set_role`(*username*, *role*)

Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

`salt.proxy.nxos.show_run`()

Shortcut to run `show run` on switch

```
salt '*' nxos.cmd show_run
```

`salt.proxy.nxos.show_ver`()

Shortcut to run `show ver` on switch

```
salt '*' nxos.cmd show_ver
```

`salt.proxy.nxos.shutdown`(*opts*)

Disconnect

`salt.proxy.nxos.system_info`()

Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

`salt.proxy.nxos.unset_role`(*username*, *role*)

Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

### 21.13.13 salt.proxy.nxos\_api module

Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Proxy module for managing Cisco Nexus switches via the NX-API.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**platform** any

#### Usage

**Note:** To be able to use this module you need to enable NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_0101.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html) for more details.

## Pillar

The `nxos_api` proxy configuration requires the following parameters in order to connect to the network switch:

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLerror: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

All the arguments may be optional, depending on your setup.

## Proxy Pillar Example

```
proxy:
 proxytype: nxos_api
 host: switch1.example.com
 username: example
 password: example
```

`salt.proxy.nxos_api.get_conn_args()`  
Returns the connection arguments of the Proxy Minion.

`salt.proxy.nxos_api.init(opts)`  
Open the connection to the Nexsu switch over the NX-API.

As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (`show clock`) which doesn't come with much overhead and it's sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

`salt.proxy.nxos_api.initialized()`  
Connection finished initializing?

`salt.proxy.nxos_api.ping()`  
Connection open successfully?

`salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)`  
Executes an RPC request over the NX-API.

`salt.proxy.nxos_api.shutdown(opts)`  
Closes connection with the device.

### 21.13.14 salt.proxy.panos module

#### Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

```
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix
```

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply 'panos') to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

#### Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)
- Panorama Pass-Through (API Key)

### Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.

```
proxy:
 proxytype: panos
 host: <ip or dns name of panos host>
 username: <panos username>
 password: <panos password>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

### host

The location, or ip/dns, of the panos host. Required.

### username

The username used to login to the panos host. Required.

### password

The password used to login to the panos host. Required.

### Direct Device (API Key)

Palo Alto devices allow for access to the XML API with a generated 'API key' \_ instead of username and password.

```
proxy:
 proxytype: panos
 host: <ip or dns name of panos host>
 apikey: <panos generated api key>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

### host

The location, or ip/dns, of the panos host. Required.

### apikey

The generated XML API key for the panos host. Required.

### Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```
proxy:
 proxytype: panos
 serial: <serial number of panos host>
 host: <ip or dns name of the panorama server>
 username: <panorama server username>
 password: <panorama server password>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

### serial

The serial number of the panos host. Required.

### host

The location, or ip/dns, of the Panorama server. Required.

### username

The username used to login to the Panorama server. Required.

## password

The password used to login to the Panorama server. Required.

## Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated 'API key' for authentication.

```
proxy:
 proxytype: panos
 serial: <serial number of panos host>
 host: <ip or dns name of the panorama server>
 apikey: <panos generated api key>
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

## serial

The serial number of the panos host. Required.

## host

The location, or ip/dns, of the Panorama server. Required.

## apikey

The generated XML API key for the Panorama server. Required.

```
salt.proxy.panos.call(payload=None)
```

This function captures the query string and sends it to the Palo Alto device.

```
salt.proxy.panos.grains()
```

Get the grains from the proxied device

```
salt.proxy.panos.grains_refresh()
```

Refresh the grains from the proxied device

```
salt.proxy.panos.init(opts)
```

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

```
salt.proxy.panos.initialized()
```

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

```
salt.proxy.panos.is_required_version(required_version='0.0.0')
```

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

`salt.proxy.panos.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.panos.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.15 salt.proxy.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the [Meet hue](#) instructions.

To configure the proxy minion:

```
proxy:
 proxytype: philips_hue
 host: [hostname or ip]
 user: [username]
```

**class** `salt.proxy.philips_hue.Const`

Constants for the lamp operations.

`COLOR_BLUE = {'hue': 46920, 'sat': 254}`

`COLOR_DAYLIGHT = {'xy': [0.3806, 0.3576]}`

`COLOR_GREEN = {'hue': 25500, 'sat': 254}`

`COLOR_ORANGE = {'hue': 12000, 'sat': 254}`

`COLOR_PINK = {'xy': [0.3688, 0.2095]}`

`COLOR_PURPLE = {'xy': [0.3787, 0.1724]}`

`COLOR_RED = {'hue': 0, 'sat': 254}`

`COLOR_WHITE = {'xy': [0.3227, 0.329]}`

`COLOR_YELLOW = {'xy': [0.4432, 0.5154]}`

`LAMP_OFF = {'on': False, 'transitiontime': 0}`

`LAMP_ON = {'on': True, 'transitiontime': 0}`

`salt.proxy.philips_hue.call_alert(*args, **kwargs)`

Lamp alert

Options:

- `id`: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- `on`: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

`salt.proxy.philips_hue.call_blink(*args, **kwargs)`

Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- `id`: Specifies a device ID. Can be a comma-separated values. All, if omitted.

- **pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

**salt.proxy.philips\_hue.call\_brightness** (\*args, \*\*kwargs)

Set an effect to the lamp.

Arguments:

- **value**: 0~255 brightness of the lamp.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **transition**: Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

**salt.proxy.philips\_hue.call\_color** (\*args, \*\*kwargs)

Set a color to the lamp.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- **transition**: Transition 0~200.

Advanced:

- **gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

**salt.proxy.philips\_hue.call\_effect** (\*args, \*\*kwargs)

Set an effect to the lamp.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type**: Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

**salt.proxy.philips\_hue.call\_lights** (\*args, \*\*kwargs)

Get info about all available lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- **value**: 150~500.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

`salt.proxy.philips_hue.init(cnf)`  
Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`  
Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`  
Shuts down the service.

### 21.13.16 salt.proxy.rest\_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion\\_rest\\_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

`salt.proxy.rest_sample.alive(opts)`

`salt.proxy.rest_sample.fix_outage()`

`salt.proxy.rest_sample.fns()`

`salt.proxy.rest_sample.grains()`  
Get the grains from the proxied device

`salt.proxy.rest_sample.grains_refresh()`  
Refresh the grains from the proxied device

`salt.proxy.rest_sample.id(opts)`  
Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

`salt.proxy.rest_sample.init(opts)`

`salt.proxy.rest_sample.initialized()`  
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.rest_sample.package_install(name, **kwargs)`  
Install a "package" on the REST server

`salt.proxy.rest_sample.package_list()`  
List "packages" installed on the REST server

`salt.proxy.rest_sample.package_remove(name)`  
Remove a "package" on the REST server

`salt.proxy.rest_sample.package_status(name)`  
Check the installation status of a package on the REST server

`salt.proxy.rest_sample.ping()`  
Is the REST server up?

`salt.proxy.rest_sample.service_list()`  
List "services" on the REST server

`salt.proxy.rest_sample.service_restart(name)`  
Restart a "service" on the REST server

`salt.proxy.rest_sample.service_start(name)`  
Start a "service" on the REST server

`salt.proxy.rest_sample.service_status(name)`  
Check if a service is running on the REST server

`salt.proxy.rest_sample.service_stop(name)`

Stop a "service" on the REST server

`salt.proxy.rest_sample.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.rest_sample.test_from_state()`

Test function so we have something to call from a state :return:

`salt.proxy.rest_sample.uptodate(name)`

Call the REST endpoint to see if the packages on the "server" are up to date.

### 21.13.17 salt.proxy.ssh\_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

`salt.proxy.ssh_sample.fns()`

`salt.proxy.ssh_sample.grains()`

Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`

Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`

Install a "package" on the ssh server

`salt.proxy.ssh_sample.package_list()`

List "packages" by executing a command via ssh This function is called in response to the salt command  
..code-block::bash salt target\_minion pkg.list\_pkgs

`salt.proxy.ssh_sample.package_remove(name)`

Remove a "package" on the ssh server

`salt.proxy.ssh_sample.parse(out)`

Extract json from out.

**Parameter** out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`

Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`

Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`

Restart a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`

Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`  
Stop a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`  
Disconnect

## 21.14 queue modules

---

`pgjsonb_queue`

New in version 2016.3.0.

---

`sqlite_queue`

New in version 2014.7.0.

---

### 21.14.1 salt.queues.pgjsonb\_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

**depends** python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.password: 'salt'
queue.pgjsonb.dbname: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
 id SERIAL PRIMARY KEY,
 data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'!
↪ backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

`salt.queues.pgjsonb_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.pgjsonb_queue.handle_queue_creation(queue)`

`salt.queues.pgjsonb_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.pgjsonb_queue.list_items(queue)`  
List contents of a queue

`salt.queues.pgjsonb_queue.list_length(queue)`  
Provide the number of items in a queue

`salt.queues.pgjsonb_queue.list_queues()`  
Return a list of Salt Queues on the Salt Master

`salt.queues.pgjsonb_queue.pop(queue, quantity=1, is_runner=False)`  
Pop one or more or all items from the queue return them.

### 21.14.2 salt.queues.sqlite\_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

`salt.queues.sqlite_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.sqlite_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.sqlite_queue.list_items(queue)`  
List contents of a queue

`salt.queues.sqlite_queue.list_length(queue)`  
Provide the number of items in a queue

`salt.queues.sqlite_queue.list_queues()`  
Return a list of Salt Queues on the Salt Master

`salt.queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)`  
Pop one or more or all items from the queue return them.

## 21.15 roster modules

<i>ansible</i>	Read in an Ansible inventory file or script
<i>cache</i>	The <code>cache</code> roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over <code>salt-ssh</code> .
<i>cloud</i>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<i>clustershell</i>	This roster resolves hostname in a <code>pdsh/clustershell</code> style.
<i>flat</i>	Read in the roster from a flat file using the renderer system

Continued on next page

Table 15 – continued from previous page

<i>range</i>	This roster resolves targets from a range server.
<i>scan</i>	Scan a netmask or ipaddr for open ssh ports
<i>sshconfig</i>	Parses roster entries out of Host directives from SSH config
<i>terraform</i>	Dynamic roster from terraform current state

### 21.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
↪port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
↪ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh -N all test.ping
salt.gtmanfred.com:
 True
home:
 True
[~]# salt-ssh -N desktop test.ping
home:
 True
[~]# salt-ssh -N computers test.ping
salt.gtmanfred.com:
 True
home:
 True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
 True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
 "servers": [
 "salt.gtmanfred.com"
],
 "desktop": [
 "home"
],
```

(continues on next page)

(continued from previous page)

```

"computers": {
 "hosts": [],
 "children": [
 "desktop",
 "servers"
]
},
"_meta": {
 "hostvars": {
 "salt.gtmanfred.com": {
 "ansible_ssh_user": "gtmanfred",
 "ansible_ssh_host": "127.0.0.1",
 "ansible_sudo_pass": "password",
 "ansible_ssh_port": 22
 },
 "home": {
 "ansible_ssh_user": "gtmanfred",
 "ansible_ssh_host": "12.34.56.78",
 "ansible_sudo_pass": "password",
 "ansible_ssh_port": 23
 }
 }
}
}'

```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```

[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
 True

```

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

`salt.roster.ansible.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)  
 Return the targets from the ansible inventory\_file Default: /etc/salt/roster

### 21.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster\_order per config key default order changed to industry-wide best practices CIDR range selection

#### Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

#### The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

```

• roster_order:
 host: id # use the minion id as hostname

```

You can define lists of parameters as well, the first result from the list will become the value.

### Selecting a host

```

default
roster_order:
 host:
 - ipv6-private # IPv6 addresses in private ranges
 - ipv6-global # IPv6 addresses in global ranges
 - ipv4-private # IPv4 addresses in private ranges
 - ipv4-public # IPv4 addresses in public ranges
 - ipv4-local # loopback addresses

```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```

roster_order:
 host:
 - global|public|private|local # Both IPv6 and IPv4 addresses in that range
 - 2000::/3 # CIDR networks, both IPv4 and IPv6 are supported

```

### Using cached data

Several cached libraries can be selected using the `library: ``` prefix, followed by the library key. This can be referenced using the same ```` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```

roster_order:
 host:
 - grain: fqdn_ip4 # Lookup this grain
 - mine: network.ip_addrs # Mine data lookup works the same

 password: sdb://vault/ssh_pass # Salt SDB URLs are also supported

 user:
 - pillar: ssh:auth:user # Lookup this pillar key
 - sdb://osenv/USER # Lookup this env var through sdb

 priv:
 - pillar: # Lists are also supported
 - salt:ssh:private_key
 - ssh:auth:private_key

```

`salt.roster.cache.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 21.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.extract_ipv4`(*roster\_order*, *ipv4*)

Extract the preferred IP address from the `ipv4` grain

`salt.roster.cloud.targets`(*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the flat yaml file, checks `opts` for location but defaults to `/etc/salt/roster`

### 21.15.4 salt.roster.clustershell

This roster resolves hostname in a `pdsh/clustershell` style.

**depends** `clustershell`, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.targets`(*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets

### 21.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

`salt.roster.flat.targets`(*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the flat yaml file, checks `opts` for location but defaults to `/etc/salt/roster`

### 21.15.6 salt.roster.range module

This roster resolves targets from a range server.

**depends** `seco.range`, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

`salt.roster.range.target_glob`(*tgt*, *hosts*)

`salt.roster.range.target_range`(*tgt*, *hosts*)

`salt.roster.range.targets`(*tgt*, *tgt\_type='range'*, *\*\*kwargs*)

Return the targets from a range query

### 21.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

**class** salt.roster.scan.**RosterMatcher**(tgt, tgt\_type)

Matcher for the roster data structure

**targets**()

Return ip adrs based on netmask, sitting in the "glob" spot because it is the default

salt.roster.scan.**targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

**class** salt.roster.sshconfig.**RosterMatcher**(raw, tgt, tgt\_type)

Matcher for the roster data structure

**get\_data**(minion)

Return the configured ip

**ret\_glob\_minions**()

Return minions that match via glob

**targets**()

Execute the correct tgt\_type routine and return

salt.roster.sshconfig.**parse\_ssh\_config**(lines)

Parses lines from the SSH config to create roster targets.

**Parameters** **lines** – Individual lines from the ssh config file

**Returns** Dictionary of targets in similar style to the flat roster

salt.roster.sshconfig.**targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.9 salt.roster.terraform

#### Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the [Terraform Salt](#) provider.

It exposes all salt\_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

#### Basic Example

Given a simple salt-ssh tree with a Saltfile:

```

salt-ssh:
 config_dir: etc/salt
 max_procs: 30
 wipe_ssh: True

```

and etc/salt/master:

```

root_dir: .
file_roots:
 base:
 - srv/salt
pillar_roots:
 base:
 - srv/pillar
roster: terraform

```

In the same folder as your Saltfile, create terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a `salt_host` resource:

```

resource "salt_host" "dbminion" {
 salt_id = "dbserver"
 host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
 user = "root"
 passwd = "linux"
}

```

You can use the `count` attribute to create multiple roster entries with a single definition. Please refer to the [Terraform Salt provider](#) for more detailed examples.

`salt.roster.terraform.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Returns the roster from the terraform state file, checks `opts` for location, but defaults to `terraform.tfstate`

## 21.16 runner modules

<i>asam</i>	Novell ASAM Runner
<i>auth</i>	Authentication runner for creating, deleting, and managing eauth tokens.
<i>bgp</i>	BGP Finder
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>ddns</i>	Dynamic DNS Runner
<i>digicertapi</i>	Support for Digicert.
<i>doc</i>	A runner module to collect and display the inline documentation from the various module types
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>event</i>	Module for sending events using the runner system.
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>filesERVER</i>	Directly manage the Salt filesERVER plugins
<i>git-pillar</i>	Runner module to directly manage the git external pillar

Continued on next page

Table 16 – continued from previous page

<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up and what hosts are down
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This module helps include encrypted passwords in pillars, grains and salt state files.
<i>net</i>	NET Finder
<i>network</i>	Network tools to run from the Master
<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty
<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors
<i>salt</i>	This runner makes Salt's execution modules available on the salt master.
<i>saltutil</i>	The Saltutil runner is used to sync custom types to the Master.
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>smartos_vmadm</i>	Runner for SmartOS minions control vmadm
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and servers no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>vault</i>	
	<b>maintainer</b> SaltStack
<i>venafiapi</i>	Support for Venafi
<i>virt</i>	Control virtual machines via Salt
<i>vistara</i>	Vistara Runner
<i>winrepo</i>	Runner to manage Windows software repo

### 21.16.1 salt.runners.asam

#### Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
 prov1.domain.com
 username: "testuser"
 password: "verybadpass"
 prov2.domain.com
 username: "testuser"
 password: "verybadpass"
```

---

**Note:** Optionally, protocol and port can be specified if the Fan-Out Driver server is not using the defaults. Default is protocol: `https` and port: `3451`.

---

**salt.runners.asam.add\_platform**(*name, platform\_set, server\_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

**salt.runners.asam.list\_platform\_sets**(*server\_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

**salt.runners.asam.list\_platforms**(*server\_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

**salt.runners.asam.remove\_platform**(*name, server\_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

### 21.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

**salt.runners.auth.del\_token**(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.mk_token(**load)`

Create an eauth token using provided credentials

Non-root users may specify an expiration date – if allowed via the `token_expire_user_override` setting – by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
 token_expire=94670856

Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
 token_expire=$(expr \(365 * 24 * 60 * 60 \) * 3)
```

### 21.16.3 salt.runners.bgp

#### BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

#### Configuration

- Minion (proxy) config

The `bgp.neighbors` function must be appened in the list of `mine_functions`:

```
mine_functions:
 bgp.neighbors: []
```

Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

**tgt:** \* From what minions will collect the mine data. Default: \* (collect mine data from all minions)

**tgt\_type:** **glob** Minion matching expression form. Default: `glob`.

**return\_fields** What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

Some fields cannot be removed:

- `as_number`: the AS number of the neighbor

- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.
- `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.
- `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
 bgp:
 tgt: 'edge*'
 tgt_type: 'glob'
 return_fields:
 - up
 - connection_state
 - previous_connection_state
 - suppress_4byte_as
 - holdtime
 - flap_count
 outputter: yaml
```

`salt.runners.bgp.neighbors(*asns, **kwargs)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

**asns** A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

**device** Filter by device name (minion ID).

**ip** Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

**network** Search neighbors within a certain IP network.

**title** Custom title.

**display: True** Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

In addition, any field from the output of the `neighbors` function from the `NAPALM BGP module` can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
```

Device	AS Number	Neighbor Address	State	#Active/Received/Accepted/Damped	Policy IN	Policy OUT
edge01.bjm01	13335	172.17.109.11	Established	0/398/398/0	import-policy	export-policy
edge01.bjm01	13335	172.17.109.12	Established	397/398/398/0	import-policy	export-policy
edge01.flw01	13335	192.168.172.11	Established	1/398/398/0	import-policy	export-policy
edge01.oua01	13335	172.17.109.17		Established 0/0/0/0	import-policy	export-policy
edge01.bjm01	15169	2001::1	Established	102/102/102/0	import-policy	export-policy
edge01.bjm01	15169	2001::2	Established	102/102/102/0	import-policy	export-policy
edge01.tbq01	13335	192.168.172.17		Established 0/1/1/0	import-policy	export-policy

## 21.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases

must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock`(*role*, *remote=None*, *\*\*kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git\_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

---

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a `role` of `gitfs` is equivalent to running `salt-run filesserver.clear_lock backend=git`.

---

**role** Which type of lock to remove (gitfs, git\_pillar, or winrepo)

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all github.com remotes.

**type** [update,checkout,mountpoint] The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: `mountpoint` lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.clear_grains`(*tgt=None*, *tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine`(*tgt=None*, *tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func`(*tgt=None*, *tgt\_type='glob'*, *clear\_mine\_func\_flag=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.cloud` (*tgt, provider=None*)

Return cloud cache data for target.

---

**Note:** Only works with glob matching

---

**tgt** Glob Target to match minion ids

**provider** Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.fetch` (*bank, key, cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.flush` (*bank, key=None, cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.grains` (*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

**tgt** Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt Sodium release.

**tgt\_type** The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

`salt.runners.cache.list_`(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.mine`(*tgt=None*, *tgt\_type='glob'*, *\*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar`(*tgt=None*, *tgt\_type='glob'*, *\*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions if `tgt` is set. If `tgt` is not set will return cached pillars for all minions.

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.store`(*bank*, *key*, *data*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

## 21.16.5 salt.runners.cloud

### The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.action`(*func=None*, *cloudmap=None*, *instances=None*, *provider=None*, *instance=None*, *opts=None*, *\*\*kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

`salt.runners.cloud.create`(*provider*, *instances*, *opts=None*, *\*\*kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance \
 image=ami-1624987f size='t1.micro' ssh_username=ec2-user \
 securitygroup=default delvol_on_destroy=True
```

**salt.runners.cloud.destroy**(*instances, opts=None*)  
Destroy the named vm(s)

**salt.runners.cloud.full\_query**(*query\_type='list\_nodes\_full'*)  
List all available cloud provider data

**salt.runners.cloud.list\_images**(*provider='all'*)  
List cloud provider images for the given providers

**salt.runners.cloud.list\_locations**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.list\_sizes**(*provider='all'*)  
List cloud provider sizes for the given providers

**salt.runners.cloud.map\_run**(*path=None, opts=None, \*\*kwargs*)  
Execute a salt cloud map file

**salt.runners.cloud.profile**(*prof=None, instances=None, opts=None, \*\*kwargs*)  
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

**salt.runners.cloud.query**(*query\_type='list\_nodes'*)  
List cloud provider data for all providers

**salt.runners.cloud.select\_query**(*query\_type='list\_nodes\_select'*)  
List selected nodes

## 21.16.6 salt.runners.ddns

### Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

**salt.runners.ddns.add\_host**(*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)  
Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳ salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.create**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)  
Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.delete`(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳0.0.1 5 A
```

`salt.runners.ddns.delete_host`(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳keyring 10.0.0.1 5
```

`salt.runners.ddns.update`(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

---

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

---

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

### 21.16.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall ([jphall@saltstack.com](mailto:jphall@saltstack.com)).

Before using this module you need to register an account with Digicert's CertCentral.
